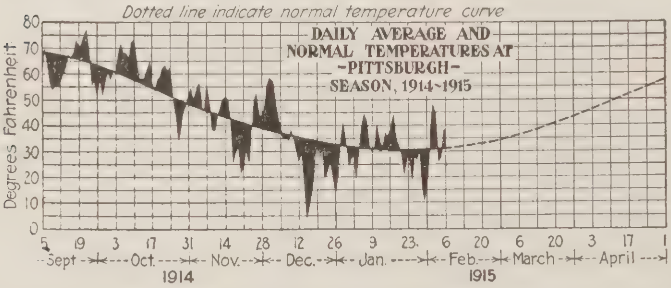
Note—Steamers are indicated by **bold face** type, all others being schooners.

OHIO VALLEY

PITTSBURGH

Demand slightly improved in some quarters. Negotiations on Apr. 1 contracts not yet under way. Prices unchanged. Operations at close to 60% of capacity.

Domestic demand is now at a fair rate, the weather being moderately cold, while the dealers, not having laid in any stocks to speak of, are steady buyers. There has been a slight additional increase in demand from manufacturers, but chiefly on regular contracts, purchases of free coal by manufacturers being light. Railroad consumption is about the same as earlier in the year.



While very few twelve-month contracts for coal expired Dec. 31 there is a relatively large number to expire Mar. 31. So far as can be learned no active negotiations are yet under way and both buyers and sellers seem to be somewhat reserved. The buyers expect to be able to close at lower rates than a year ago and the sellers probably feel that the expectation is more or less justified by conditions.

There is about the usual amount of shading on free coal as demand is not heavy and operators are usually found who are anxious to dispose of a limited tonnage. Ordinary quotations remain as follows for prompt lots: Slack, 90c.@$1; nut and slack, $1.05; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district. Mining operations in the district are at close to 60% of capacity.

COLUMBUS

Warmer weather has again slackened the demand. Operations less active than formerly and buying is limited. Small sizes still strong.

The higher temperatures of the past week have caused a decrease in the domestic demand and buying from this time on will be from hand to mouth. The tone of the market is not as good as formerly and future prospects are dependent upon weather conditions.

Stocks in the hands of retailers are larger and with the coming of the warmer weather they have not been selling as much. Contrary to the usual custom, there were fewer cancellations of orders during the recent warm spell than formerly. Dealers have been content to let shipments come forward, taking their chances on some wintry weather before spring. A strong preference for Pocahontas and the fancy grades is still shown in the retail trade. Hocking lump is also in good demand. Retail prices are firm at the levels which have prevailed for some time.

Steam business is still slow and there are no hopes for immediate improvement. Railroads are taking a little more tonnage for the movement of trains. Ordinary manufacturing is not improving much. Quite a few steam contracts expire soon and considerable attention is being devoted to their renewal. The best feature of the steam trade is the demand for fine sizes which are firm because of the curtailed production of lump. Nut, pea and slack is quoted as high as 70c. and coarse slack bout 10c. less.

Production during the past week has shown a decrease due to the warmer weather and also to floods which have put a number of mines in the Pomeroy Bend district out of commission. The Hocking Valley produced about 45% of normal and the same figures prevail in the Crooksville, Cambridge and Jackson district. Pomeroy Bend produced about 60 per cent.

Prices in the Ohio field are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.50	$1.60	.....
Inch and a quarter	1.45	1.50	$1.45
Three-quarter inch	1.35	1.40	1.35
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	0.65	0.70	0.65
Coarse slack	0.55	0.60	0.55

CINCINNATI

Milder weather, and lack of railroad and industrial buying have set the trade back and prices are lower. Prospects are not encouraging.

The absence of any winter weather has enabled domestic consumers to get along with less fuel than heretofore, which, together with the continued industrial depression, has forced the market to a lower level than for some time. Prices have been substantially reduced, consignment mine-run being offered in small quantities as low as 75c., with quotations of 95c. at the mines. As usual, however, reductions have failed to stimulate immediate buying, large consumers continuing to hold off, awaiting the expected revival in business.

Some members of the trade continue optimistic for an active spring business. The railroads are expected to be heavy buyers of all kinds of supplies, which will aid the manufacturing industries materially. But at the moment the market is about as slow as it could be, and producers have relinquished hopes of any real winter business.

COKE

CONNELLSVILLE

Continued light demand for prompt furnace coke and prices a shade easier. Production by furnace ovens sharply increased, owing to more steel-works furnaces blowing in.

Demand for coke from the merchant operators has not increased, as blowing in of blast furnaces is still confined to steel interests that make coke themselves. Their coke production has been increased very considerably, while the merchant ovens maintain the same gait as formerly. The prompt furnace-coke market has been under such continuous pressure, with coke constantly offered and scarcely any takers, that prices have receded a trifle further and standard grade can sometimes be picked up at $1.50, a total decline of 10c. within 30 days. The contracts made for three and six months at $1.65@1.70 now look much better to the operators than they did when made. There are no further developments in connection with the Thompson failure at Uniontown. The market is quotable as follows: Prompt furnace, $1.50@1.55; contract furnace to Apr. 1, $1.60; prompt foundry, $2@2.40; contract foundry, nominal, $2.15@2.35, per net ton at oven.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Jan. 30 at 242,608 tons, a gain of 28,398 tons, made entirely by the furnace ovens, and shipments at 240,240 tons, an increase of 28,233 tons.

Buffalo—Shippers are obliged to be content with supplying the ordinary demand and watching for the expected stir in the iron market that must take place before there is any upturn in coke. Prices appear to be at the bottom, so that when any change does take place it will have to be for the better. Quotations rule on the basis of $4.25 for best Connellsville foundry and $3.30 for stock coke.

Columbus—Coke trade is more active in central Ohio and prices are ruling firm all along the line.

Chicago—Shipments of domestic coke have been absorbed as fast as made at good figures. There has been some recession in the prices of furnace and foundry coke for which the demand is indifferent. Prices are as follows: Byproduct, $4.60@4.95; Connellsville, $4.60@4.80; Wise County 72-hr. (select), $4.60@4.75; gas coke, $4@4.25.

SOUTHERN

BIRMINGHAM

Orders light, dealers holding off for spring prices. Steam grades show a very slight improvement.

A few scattering orders have been received for lump coal, but the tonnage moved is very light. The dealers are probably waiting until the spring prices go into effect on the first of the month, which will mean a reduction of about 50c. per ton on the regular schedule, although the prices now being obtained are but very little higher than the spring circular.

Steam coal, while showing some slight improvement, is far from normal, though some inquiries are being received on requirements for contracts. Shipments are light, and prices remain about the same. Blacksmith coal is moving satisfactorily, but the tonnage from now on will begin to fall off. There is practically no change in the pig-iron situation.

LOUISVILLE

Steam movement continues slow and the market is generally soft with prices weak.

The movement of the steam sizes has not shown any considerable improvement, although it is more active than for several weeks. Generally speaking the market is soft. Top prices are $1.75 for block coal, 90c. to $1 for 6-in. run-of-mine and 60 to 70c. for nut and slack, all prices f.o.b. mines. The range is downward from these figures, with summer prices more or less generally prevailing.

MIDDLE WESTERN

INDIANAPOLIS

Mines working only half-time. Steam grades moving slowly. Domestic lump in fair demand, but not up to normal. Prices unchanged at the mines.

The weather has been milder but not sufficiently so to make much difference in the consumption. The domestic lump trade is still the best factor and is just now feeling some impetus from a restocking movement.

The steam trade is somewhat draggy and operators have about concluded it will not improve much until the usual spring acceleration. Mine prices are: 75c. for screenings; $1 to $1.10 for mine-run; $1.25 for steam lump; $1.65 for best domestic lump. Some small "independents" in the city are cutting retail prices 25 to 50c. a ton under the schedule of the members of the retailers association. The prevailing retail prices are:

Anthracite chestnut	$8.50	Kanawha lump, forked	$4.75
Anthracite egg and stove	8.25	Hocking lump, forked	4.75
Anthracite grade	8.00	Hocking washed egg	5.00
Pocahontas lump, forked	6.25	Luhrig lump, forked	4.75
Pocahontas lump, shoveled	5.75	Luhrig washed egg	5.00
Pocahontas mine run	4.75	Linton No. 4 lump, forked	3.75
Pocahontas nut and slack	3.75	Indiana lump, forked	3.50
Blossburg smithing	5.50	Indiana lump and egg, screened	3.00
Cannel lump	6.50	Connellsville lump coke	6.50
Jackson (Ohio) forked	5.50	Indianapolis by-product coke	6.50

CHICAGO

Prices sagging and domestic demand sluggish. Steam coals soft. Anthracite business steady.

Mild weather has ruled during the past week and the tendency has been towards a slackening demand and softening prices. A small amount of demurrage coal is now on track and it is reported that consignment coal from all directions is en route to this market. It becomes increasingly difficult to quote staple prices for this market.

The West Virginia smokeless coal has fallen off as much as 50c. in the price of lump. Some of the operators are trying to hold to old figures on prepared sizes, but most of them seem to have abandoned circular quotations and are slaughtering prices.

Most of the Illinois domestic coal is being sold at $1.50, and a considerable quantity of Indiana domestic has been disposed of in the open market at $1.40. Screenings are averaging 60c. to 65c., and the indifferent absorption tends to bearishness.

Franklin and Williamson County domestic coals sold as low as $1.35 but screenings are slightly firmer than elsewhere in Illinois. Saline County coals are also weak.

The Indiana mines are averaging about three days per week, and it is evident that some of the operators are trying to force the market. Considerable 6-in. lump from the No. 5 vein is being sold in the Indianapolis market as low as $1.25

There is a little better movement of lump from the Springfield district, and screenings have been sold as low as 55c.

It is still hard to obtain fixed prices on Eastern Kentucky coals; it is reported that quite a tonnage of consignment coal is being sacrificed at low figures and it is evident that the area of distribution is widening.

Some Hocking coal on demurrage has been sold at sacrifice prices, but shipments from the mines seem to be at list.

A dull tone seems to prevail in anthracite. Independent operators are quoting prices 10c. to 30c. below circular, but there is little free coal on hand. The demand for egg seems to be improving, and chestnut is steady.

Prices f.o.b. mines are as follows:

	Franklin Co.	Springfield	Sullivan	Clinton	Carterville
Lump	$1.50@1.75	$1.50	....	$1.50@1.60	$1.50@1.75

KANSAS CITY

Wholesale business slow and at slightly lower prices than last year. The market is heavy due to the over-production. Zero weather relieved the tension slightly.

Coal dealers, both wholesale and retail, are hoping that spring will bring a resumption of activities in industrial lines as this is the only thing that will relieve the sluggishness in the Kansas City market. An instance of the curtailed consumption is the closing of half a dozen large cement factories in western Missouri. Several trainloads a day of steam coal are shipped to these plants alone when in operation. Overproduction is reported as a result of a general lessening of the demand.

Shipments to or from Kansas City have been light, with practically no movement of coal Westward. Prices have not declined, but remain at a low level. Steam coal is selling at from 2 to 10c. lower than at this time last year, a margin which is improved slightly over the December record. Extremely cold weather toward the close of January stimulated the domestic demand so that the trade in lump and nut is not so much affected by the over-production.

ST. LOUIS

Coals of all kinds selling at less than cost. Steam grades demoralized. Heavy over production. Curtailment of operations.

Coal from all fields is now going at a figure below the cost of production. The local market is unable to take care of the tonnage offered, and it is impossible to get prices back to where they should be, with the surplus that is continually coming in. Weather conditions are not favorable and the continued business depression has demoralized the steam market.

Only those who have the greater portion of their tonnage under contract are opimistic; shippers in the open market are having an extremely hard time of it and there is nothing in sight to indicate better conditions, unless it is a severe spell of real winter weather. This would bring relief in some quarters, and perhaps better prices.

The over-production is the worst in the Williamson and Franklin County field and it is expected that the coming week will see a curtailment on the part of the larger operators.

A small tonnage of anthracite moved in during the past week or ten days, but there is no general demand for it. Smokeless has dropped out of the market almost entirely.

The prevailing circular is:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	....	$2.00	$1.25	....	....
3-in. lump	....	....	1.40	....	....
6-in. lump	$1.30@1.60	....	1.50	$1.15@1.25	$1.25

MILWAUKEE

Summary of situation for the past season. Tonnage falls below the previous year.

Milwaukee experienced a falling off in coal receipts during 1914, but the showing is better than was expected. The receipts aggregated 5,120,543 tons, against 5,551,478 tons in 1913, a loss of 430,965 tons, or 7.8%. Of this loss 183,450 tons must be credited to hard coal and 247,515 to soft the grades. According to the records of the canals at Sault Ste. Marie, Mich., the ports on Lake Superior suffered a decline of 22.4%.

There were two reasons for this falling off in so far as Milwaukee is concerned, and the same is no doubt true of competing ports. The unusually mild winter of 1913-14 left the yards with much larger stocks on hand than is usual at the onset of summer, and the slow outward movement due to the industrial depression throughout the country added to the backwardness of the situation. The loss in receipts was quite evenly distributed throughout the calendar months. All but two months of the season show declines from the records of 1913, July making a gain of 206,807 tons and August 97,676 tons. December receipts were unusually light, because of the fact that all of the yards were loaded to the utmost limit. This lack of storage room checked receiving business at the close. There are a few cargoes afloat in the harbor at present, but not as many as is the case in normal years.

Dealers report a more satisfactory condition of business than was experienced in the fall. The unusually sharp weather during the first few weeks of winter stimulated the movement of anthracite coal for heating purposes, while a noticeable betterment of conditions in manufacturing sections led to increasing sales of steam coal. While the average temperature has not been severe, it is cold enough to call for a steady consumption of fuel. The prospect is that the coming spring will find the various yards in a much more satisfactory condition than they were at the beginning of the receiving season of 1914.

The following table compiled by the Lehigh Valley Coal Sales Co. shows the wholesale prices of coal at Milwaukee during the year 1914:

Mo.	Wyoming and Cross Creek Anthracite, Egg, Stove and Nut		Pocahontas Screened	Cannel Kentucky	Steam Coal Splint	Hock.	Screened Yough.	Pocahontas Mine Run
Jan.	$6.83	$7.08	$5.25	$6.75	$3.55	$3.55	$3.55	$3.50
Feb.	6.83	7.08	5.25	6.75	3.55	3.55	3.55	3.50
Mar.	6.83	7.08	5.25	6.75	3.55	3.55	3.55	3.50
Apr.	6.35	6.60	4.75	6.75	3.55	3.55	3.55	3.50
May	6.45	6.70	4.75	6.75	3.55	3.55	3.55	3.50
June	6.55	6.80	4.75	6.75	3.55	3.55	3.55	3.50
July	6.65	6.90	4.75	6.75	3.55	3.55	3.55	3.50
Aug.	6.76	7.00	4.75	6.75	3.55	3.55	3.55	3.50

Oct.	6.85	7.10	4.75	6.75	3.55	3.55	3.55	3.50
Nov.	6.85	7.10	4.75	6.75	3.55	3.55	3.55	3.50
Dec.	6.85	7.10	5.00	6.75	3.55	3.55	3.55	3.50

PORTLAND

Steamer "Cricket" arrives with 500 tons of Pennsylvania anthracite. Cool weather moderates and lighter business is expected from now on. Prolonged cold weather helped the situation but the winter business has not been good. Western mines reduce prices.

The American steamer "Cricket" has arrived here with 500 tons of Pennsylvania anthracite for the Independent Coal & Ice Co. The vessel was delayed getting here because of towing another vessel through the Canal.

The cool weather that has prevailed for several weeks is now begining to moderate and it is expected that the domestic demand will fall off. In spite of the cold weather, dealers say that the volume of business this winter was not up to the expectations, consumers having bought sparingly and not more than absolutely necessary.

The Pennsylvania anthracite is selling at $14 per ton retail, and half tons at the same rate, this price being quoted on account of the shipment arriving after the break in the cold weather.

Wholesalers here are getting the benefit of rate cutting between the Utah and Wyoming mines to the extent of 50c. a ton, but as there is no telling how long the reduction will continue the cut has had no effect on retail prices.

SPOKANE

Coal war between Wyoming and Utah operators for the markets of Idaho.

Although a coal war has broken out in southern Idaho in the vicinity of Nampa, coal prices in other parts of this section remain steady. Naturally this trouble is benefiting the consumers there, having reduced the price of coal to a large degree. The fight seems to be between the Wyoming and Utah operators and was brought about through a charge of boycotting the Wyoming coal.

Spokane and vicinity are finding no fluctuation in coal prices and the quality that was prevailing last year has been improved. Unless a decided change in the weather is made, there is no expectation of any change in prices.

PRODUCTION AND TRANSPORTATION STATISTICS

ANTHRACITE SHIPMENTS

Anthracite shipments for January, 1914-15, and the twelve months of 1914-13, were as follows:

	January		12 Months	
	1915	1914	1914	1913
Phila. & Reading	760,757	1,015,126	11,998,779	12,914,887
Lehigh Valley	954,072	810,588	13,136,759	13,011,370
Cent. R.R. N.J.	608,296	704,491	8,924,936	9,092,433
Del. Lack. & West	575,538	618,938	9,912,578	9,903,541
Del. & Hudson	623,947	586,893	7,313,541	7,094,258
Pennsylvania	451,200	536,118	6,434,937	6,351,756
Erie	577,007	706,303	8,268,585	8,192,352
Ont. & Western	183,718	197,275	2,352,486	2,509,031
Lehigh & New. Eng	96,794	104,912	....	....
Total	4,831,329	5,280,644	68,342,601	69,069,628

Stocks at Tidewater Jan. 31 were 798,125 tons as compared with 669,833 tons Dec. 31.

PENNSYLVANIA RAILROAD

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for December and twelve months of 1913 and 1914, in short tons:

	December		Twelve Months	
	1914	1913	1914	1913
Anthracite	977,929	1,012,125	11,201,150	10,711,335
Bituminous	3,755,675	4,354,729	47,769,227	51,526,267
Coke	621,774	880,962	9,548,354	13,892,825
Total	5,355,378	6,247,316	68,518,731	76,330,427

BALTIMORE & OHIO

The following is a statement of coal and coke tonnage moved over this system and affiliated lines during October, November and December of 1914:

	October		November		December	
	1914	1913	1914	1913	1914	1913
Coal	2,662,377	3,250,220	2,324,271	2,939,975	2,227,899	3,005,914
Coke	208,866	388,337	185,466	343,387	232,594	269,998
Total	2,871,243	3,638,557	2,509,737	3,283,362	2,460,493	3,275,912

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for October and the preceding two months of the years 1913 and 1914:

	August		September		October	
State	1913	1914	1913	1914	1913	1914
Missouri	178,949	201,992	250,763	233,195	317,466	280,958
Kansas	451,968	453,675	474,237	569,114	609,827	632,784
Arkansas	178,904	157,803	201,782	160,233	209,693	186,990
Oklahoma	289,949	244,103	297,213	254,973	340,915	319,439
Totals	1,099,770	1,057,573	1,223,995	1,217,515	1,477,901	1,420,171

I. C. C. No. 6464—Crows Nest Pass Coal Co. vs. Great Northern Ry. Co.

Demurrage charges on certain cars of coal at Republic, Wash., found to have been assessed in accordance with tariff provisions and complaint dismissed.

FOREIGN MARKETS

GREAT BRITAIN

Jan. 29—The market is firm for both prompt and forward loading. Quotations are approximately as follows:

Best Welsh steam	$4.92@5.04	Best Monmouthshires	$4.26@4.32
Best seconds	4.56@4.68	Seconds	3.78@3.90
Seconds	4.32@4.44	Best Cardiff smalls	3.42@3.54
Best dry coals	4.56@4.68	Cargo smalls	2.88@3.12

The price for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freight—Rates generally remain at very high levels and are today approximately as follows:

Gibraltar	$6.00	Naples	$7.20	Las Palmas	$5.28
Malta	6.48	Venice, Ancona	9.00	St. Vincent	5.52
Marseille	5.79	Alexandria	7.20	Rio Janeiro	7.08
Algiers	6.17	Port Said	7.20	Monte Video	6.24
Genoa	5.79			River Plate	6.48

CONSULAR NOTES

The American Consular Office has been informed by an agent in one of the Mediterranean countries that he desires the address of American exporters of coal who are prepared to furnish large quantities. It is stated that this man has placed a large trial order with his government. References are given. Delivery is to be made at destination.

FINANCIAL DEPARTMENT

Lackawanna Coal & Lumber Company

President W. L. Connell of this company reports under date of Oct. 1, 1914, as follows:

Summary of Properties—When the improvements and plans now under way are completed, the company will have: (1) Paint Creek Collieries Co. operating eight thoroughly equipped mines. (2) Griffith Collieries Co. operating a large colliery on the Coal River property. (3) Highland Lumber Co., operating one mill at Seth, W. Va., and two mills in Virginia. (4) Merchandise sales of 10 stores and rents of 1200 houses. These operations include only the first of many mines to be opened on the 53,000 acres owned in fee, and take no account of any profits realizable from natural gas. When these additional sources of profit become effective, the net earnings, the management believes, will be sufficient not only to pay its fixed charges, but to provide a surplus for dividends on the stock.

Paint Creek Collieries Co.—This company, whose capital stock is nearly all owned, has under lease 14,235 acres in two tracts on Paint Creek and Brier Creek in Kanawha and Fayette counties, W. Va., including 950 acres recently acquired. It is now operating 8 mines, which it is improving, electrifying and equipping, viz.: (1) Paint Creek Mine, completely operated by electricity, with large modern tipple, 36,000 ft. of track, 2 electric main haulage locomotives, 10 electric gathering locomotives, 10 electric undercutters and 500 mine cars. Except for a retarding conveyor, already ordered, the mine is completely modernized. (2) Banner Mine lies on the opposite side of the mountain from Paint Creek mine and is working the same seams of coal from the opposite direction. (3) Grose Mine, to be modernized for operation electrically on the same general plan as at Paint Creek Mine, with erection of a modern tipple, retarding conveyor, several hundred cars, etc. Contracts for equipment already let. (4) Scranton and Wacomah mines, scheduled for early improvement; new equipment is on the way to increase the capacity. (5) Green Brier mine, now being reopened. With the new tipple completed in November, will add at least 1000 tons per day to production of Paint Creek mines. (6) Detroit mine, also being re-opened; when the tracks are re-laid in Nov. 1914, will provide an additional tonnage of 750 tons per day. (7) Reynolds mine on Brier Creek. Completely re-built and furnished with new coal-handling and screening equipment. When the inside workings are fully developed should produce 1200 tons per day.

Upon the completion of the improvements now under way at the mines of the Paint Creek Collieries Co., and the installation of the electrical appliances in our sub-stations, thereby giving to the various operations their maximum electrical power, there is no reason why the output of the Paint Creek Collieries Co. should not exceed 1,000,000 tons per annum.

Wages—The basis first offered to the employees was refused and the strike of 1912 was called, which lasted for 18 months, the men not only being idle, but some of the tipples destroyed and many improvements laid waste. Finally, a new basis of wages was fixed upon and the company enjoyed peace for a period of 8 months, during which it had to reorganize its working forces and re-establish the market for its coal. In 1914 the Paint Creek Collieries Co. entered upon separate negotiations with the miners, with the result that the scale agreed upon eight months before was re-established, with the exception that the rate paid for mining splint coal, was fixed at 29c. per ton subject to arbitration, and has since been fixed at that figure by decision of five arbitrators. This basis for machine mining upon the Paint Creek Collieries will remain undisturbed for a period of three years. The scale of wages is now as low as that paid by any mining company in the Kanawha district and places the mines upon a fair and profitable basis.

Griffith Collieries Co.—The Chesapeake & Ohio Ry., which now reaches Seth on the Coal River property, has announced its intention to extend its Coal River branch for a considerable distance through our lands to connect with its Cabin Creek branch at Whitesville. This will open up an entirely new section, much of which it is proposed to lease for development on a royalty basis. The first such contracts have been made with the Griffith Collieries Co., a subsidiary of the Lackawanna Coal & Lumber Co., which owns all its capital stock and will receive not only a royalty on the coal mined, but the profits above fixed charges. The Griffith Collieries Co. has leased 2500 acres and will erect at the terminus of the company's own railroad a colliery with a capacity of 4000 tons per day. A tram road 3½ miles long has been graded to bring the coal to the tipple and plans for the tipple and coal-handling equipment are ready. The plans provide for the model mining town of Griffith (all owned by the company), with 300 to 500 houses for mine workers (large boarding-house already completed), and lighted from one of our neighboring gas wells. The Griffith lease contains six veins of coal, four above water level. Veins thick and of high quality.

Highland Lumber Co., Inc.—This subsidiary of the Lackawanna Coal & Lumber Co. has combined all of the latter's lumber operations, and has taken over its locomotives, cars, logging equipment and lumber business generally in West Virginia for a cash consideration and will pay an annual rental for its mill, houses, store and other buildings at Seth and $4 per 1000 ft. for all timber cut from its lands. The ownership of the mill and all the standing timber is still vested in the Lackawanna Coal & Lumber Co., which also owns all the common stock of the Highland Lumber Co., Inc., and will receive all of that company's profits on both the West Virginia and Virginia operations after fixed charges and dividends on such prefered stock as may be issued. The Lumber Co. is preparing to construct a railroad and two mills on its 30,000-acre tract in Virginia The profits per 1000 ft. should be even larger than at Seth, where $108,000 was earned last year.

Company Stores, Etc.—The Paint Creek Collieries Co. is now operating six stores and rents over 600 houses to its mine workers and the Highland Lumber Co. conducts a highly successful store at Seth and rents 50 houses to employees. Eventually, with the town of Griffith fully established, there will be, in all, at least 1200 houses and 10 stores.

Prospecting for Gas and Oil—The prospecting of the properties for gas and oil has met with promising results. One gas well, producing 500,000 cu.ft., has been struck in Nicholas County, and the towns of Swiss and Jody are now supplied therefrom. On the Coal River property in Boone County, 5 gas wells have been developed, having a total capacity of 4,750,000 cu.ft. per day, and the town of Seth is being supplied from one of them. Two other wells are now being drilled on this property. The striking of gas in five widely separated localities in Boone County, it is thought, indicates that at least 10,000 acres of the property is underlaid with natural gas.

BALANCE SHEET OF LACKAWANNA COAL & LUMBER CO.

Assets—	Sept. 1 '14	June 1 '13	Liabilities—	Sept. 1 '14	June 1 '13

Coal Contracts Pending

Contracts listed in this department are authoritative in every respect except where the source of information is questionable, in which event it is noted. All contracts are listed promptly on receipt and only repeated when additional information becomes available or in the last issue previous to the day on which bids will be closed. Liberal remuneration will be paid for all legitimate notices of this kind sent in.

Contract No. 73—Washington, D. C.—Sealed proposals will be received until 11 a.m., Feb. 15, for furnishing and delivering bituminous coal, either at Washington, D. C., or at Alexandria, Va., for the steamer on duty at Fort Washington, Md. (p. 275). Address, J. B. Houston, Depot Quartermaster, Washington, D. C.

Contract No. 81—Philadelphia, Penn.—Sealed proposals will be received until noon, Feb. 17, for furnishing and delivering about 29,000 tons of bituminous coal to the floating plant employed in the Philadelphia Engineer District of the United States Government during the period beginning Mar. 1, 1915, and ending June 30, 1916 (p. 275). Address, Col. Geo. A. Zinn, 815 Witherspoon Building, Philadelphia, Pennsylvania.

Contract No. 84—New York, N. Y.—Sealed bids will be received until 10:30 a.m., Feb. 15, for furnishing and delivering 75 tons of stove coal. A deposit of 1½% of the amount involved must accompany each bid and the contract to be completed during the current year. Address Contract Clk. Lamb, Room 1034, Department of Charities, Municipal Bldg., New York.

Contract No. 85—Baltimore, Md.—Henry Sonneborn & Co., Pratt and Paca Sts., Baltimore, will be in the market about March. 1, for 3500 to 4000 tons of standard mine-run coal. Address Pur. Agt., A. Mainzer, Baltimore, Md.

Contract No. 86—Hinsdale, Ill.—The Municipal Electric Light Plant, at this place, will be in the market about the first of next month for 4000 tons of screenings. The approximate cost is 90c. per ton at the mine and Purity coal is commonly used. The contract is let on a competitive basis. Address, Mgr. H. H. Bristol, Municipal Electric Light Plant, Hinsdale, Ill.

Contract No. 87—New York, N. Y.—Sealed bids will be received until 11 a.m., Feb. 18, for furnishing and delivering anthracite and semi-bituminous coal. The security required will be 30% of the total bid and delivery is to be made as may be directed. Address Comr., Katherine Bement Davis, Department of Correction, Municipal Bldg., New York.

Contract No. 88—Vincennes, Ind.—The City Electric Lighting Co., at this place, contracts for about 5000 tons of mine-run coal and screenings sometime during March. The approximate cost is $1.45 for mine-run and $1.15 for screenings and the business is done on a competitive basis. Address Mgr., A. J. Hetz, The City Electric Lighting Co., Vincennes, Indiana.

Contract No. 89—Washington, D. C.—Telegraphic bids were requested by the Bureau of Supplies and Accounts ,Navy Dept., Washington, until noon, Feb. 10, for either the transportation of coal or coal and transportation, delivery to be made at the naval coaling station at Key West, Fla., and Portsmouth, N. H. About 5000 tons are required at Key West and 12,000 tons at Portland, deliveries to be started before Mar. 1, 1915 and completed by Mar. 20. Bidders were to state dates on which deliveries were to be made. A daily discharge rate of 400 tons at Portsmouth and 350 tons at Key West is guaranteed. Address Paymaster-General of the Navy, Samuel McGowan, Washington, D. C.

Contract No. 90—New York, N. Y.—Sealed bids will be received until 10 a.m., Feb. 17, for furnishing and delivering 350 gross tons, more or less, of anthracite coal. The security required will be 30% of the total bid and a certified check of 5% must accompany each bid. Delivery will be as required and the contract is to be completed before Mar. 1. Address Chn. of the Comn., Alrick H. Man, Board of Trustees of Hunter College, Dept. of Education, Park Ave. and 59th St., New York.

Contract No. 91—Jackson, Ohio—Bids were received on Feb. 1, for furnishing coal to the electric light plant for a period of eleven months ending Dec. 31, 1915. Bids were to specify the kind, grade, quality and cost per ton of 2000 lb., delivered in bins at the electric light plant in such quantities as required. Address Dir. of Pub. Ser., R. L. Lamb, Jackson, Ohio.

Contract No. 92—Kennebunk, Maine—The electric light department, at this place, will be in the market about Mar. 1 for 375 long tons of Georges Creek coal. The usual contracting figure is about $5 per ton. The award is made on a competitive basis. Address Supt. I. H. Wells, Electric Light Dept., Kennebunk, Maine.

Contract No. 93—Jersey City, N. J.—Bids will be received until 10 a.m., Feb. 24, for furnishing and delivering 2500 gross tons of best quality pea coal at the power house. Address, Clk. of the Bd., John C. Sweeney, Boulevard Commissioners, County Court House, Jersey City, N. J.

CONTRACTS AWARDED

Contract No. 47—Batesville, Ark.—This contract (p. 231), which provides for furnishing about 1800 tons of mine-run coal, has been awarded to the McAlister Fuel Co. at $1.75 per ton. Address Supt., W. H. Walkup, Batesville Water & Light Plant, Batesville, Ark.

Contract No. 64—Columbus, Ohio—The bids on this contract (p. 231) which provides for furnishing 725 tons of bituminous lump coal were as follows, per ton: Dublin Avenue Coal Co., $2.472; Homer C. Gill, $2.45; Fletcher-Williams Coal Co., $2.39; M. A. Suydam & Co., $2.34; George J. Igel, $2.34 (awarded contract). Address Dir. of Pub. Safety, B. L. Barger, Columbus, Ohio.

Contract No. 68—Sheridan, Wyo.—This contract (p. 231) which provides for furnishing and delivering screened lump coal within the city, for one year, commencing Feb. 5, has been awarded to Jack Gregg, Sheridan, at $4940. Address, County Clk. James J. Withrow, Sheridan, Wyo.

CONTRACT NOTES

The Townsend Grace Co., Baltimore, Md., consumes about 1400 tons of Ralphton grade coal. Address the Pur. Agt., S. G. Wolf, Townsend Grace Co., Baltimore.

The Celina Electric Light & Water Wks. has awarded a contract to the Kanawha Valley Coal Co., Charleston, W. Va., for furnishing coal at 85c. per ton for Logan mine run. Address Supt., C. W. Howard, Celina Electric Light & Water Wks., Celina, Ohio.

Bernheimer Bros., Baltimore, Md., use about 500 tons of standard mine-run soft coal per month. At present no contract exists. Address, Herman Bernheimer, of Bernheimer Bros., Baltimore.

The Secretary of the Interior, Washington, D. C., has awarded a contract for furnishing 2000 tons of coal for use on the work in connection with the storage unit of the Yakima Irrigation Project, to the Roslyn Fuel Co., North Yakima, Wash., at $2.75 per ton.

The Emerson Tower Bldg., Baltimore, Md., uses about 500 tons of coal annually. Address the Pur. Agt. Parker Cook, Baltimore, Md.

Hamburger Bros. & Co., Baltimore, Md., use from 350 to 400 tons of soft coal per month. In general, this company buys under contract, but at present gets its supply in the spot market. Address the Pur. Agt. Philip Hamburger, 16 South Eutaw St.

The Commission of Paducah, Ky., is having tests made of the pea and slack coal submitted by four companies who are bidding for furnishing the city's coal supply for 1915. The contract provides for about 250 tons of mine-run and 1500 tons of pea and slack coal.

L. Grief & Bro., Eutaw & German St., Baltimore, Md., buy 2000 tons of Georges Creek coal per year. This company usually purchases in the spot market, but will consider bids for furnishing contracts. Address the Pur. Agt., Rose Engle, Baltimore, Md.

Published Weekly by HILL PUBLISHING COMPANY
Tenth Avenue at Thirty-sixth Street, New York, N. Y.
JOHN A. HILL, Pres. ROB'T McKEAN, Sec'y.
Cable Address, "COAGE," N. Y.

Correspondence suitable for the columns of COAL AGE solicited and paid for. Name and address of correspondents must be given—not necessarily for publication. Subscription price $3 per year, in advance, for 52 numbers to any postoffice in the United States or possessions, and Mexico. $4 to Canada. $5 or its equivalent to any other foreign country.

Subscribers in Great Britain, Europe and the British Colonies in the Eastern Hemisphere may send their subscriptions to the London Office, 6 Bouverie St., London, E. C., England. Notice to change address should be written to the New York Office in every instance.

Advertising copy should reach New York Office by Thursday of week prior to date of issue. Entered as second class matter, October 14, 1911, at the Postoffice at New York, New York, under the Act of March 3, 1879.

VOLUME 7 FEBRUARY 20, 1915 NUMBER 8

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD—HEAT NOT A FURNACE FOR YOUR FOE SO HOT THAT IT DO SINGE THYSELF: *Page* 319

Down in Alabama an illiterate darkey who had worked in one of the mines was sharp enough to give a severe singeing to one of those pernicious individuals commonly known as a "shyster" lawyer. COAL AGE, Vol. 7.

IDEAS AND SUGGESTIONS: *Pages* 320-321

Blocking Worry, Trouble and Expense—Put Yourself in the Other Fellow's Place—A Safety Device for Underground Slopes.

*REOPENING THE GRAYSON MINE IN ILLINOIS: *Pages* 322-324

A dangerous mine fire was extinguished by sealing up the shafts. Rescue corps succeeded in opening up the workings without any serious mishaps. Methods of gas analysis. Permissible explosives adopted. E. C. Lee. COAL AGE, Vol. 7.

DRYING WASHED COAL: *Page* 325

Giving capacities of centrifugal driers installed at Mine No. 8 of the Tennessee Coal, Iron & R.R. Co., near Birmingham, Ala. Comparative economy in the use of the drier in coal-washing plants. Saving effected in fine coal that otherwise is lost. This recovery amounts to several hundred tons a month. Tabulated results in the washing of coal. F. E. Butcher. COAL AGE, Vol. 7.

*ELECTRIC ARC WELDING IN MINE REPAIR SHOP: *Pages* 326-330

The apparatus required, as well as the possibilities of this process of repair, are here enumerated. An inspection of the scrap heap at any coal mine will reveal the opportunities for saving which this process possesses. E. S. Zuck. COAL AGE, Vol. 7.

*THE HAMPTON ROADS COALS—III: *Pages* 331-334

This third installment of the series takes up the New River and Kanawha district coals in the same detail as the other districts have been treated. The fourth and concluding installment will appear in an early issue. F. R. Wadleigh. COAL AGE, Vol. 7.

EXTRACTS FROM A SUPERINTENDENT'S DIARY: *Page* 334

THE LABOR SITUATION: *Page* 335

Attempts to settle the eastern Ohio dispute fail. The conciliators concede the operators' argument. Trouble in Oklahoma ordered at an end by national union officials. COAL AGE, Vol. 7.

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

IT has always been one of my strong beliefs that the readers of a paper should have a lot to say about the *kind* of advertising that is printed in that paper. And there's no reason why they can't if they will only make themselves and their ideas known.

For instance, when you answer an advertisement why don't you tell the advertiser where you saw it, and, if it hasn't given you the information you want, tell him so. He'll be glad to know it, and your suggestion will help to make that advertising more instructive and informative to other readers.

* * *

AN EXAMPLE of the lack of get-together between reader and advertiser came to hand recently in the two letters which I quote here.

The Fairmont Mining Machinery Co., of Fairmont, W. Va., wrote us awhile ago: "Our records on inquiries show that we have received more inquiries from our advertising in Coal Age than in any other paper, although we have no figures relative to the amount of business realized from these inquiries."

And then comes a letter from J. R. Sharp, General Superintendent of the Consolidated Indiana Coal Co. office at Sullivan, Ind., which reads: "I have been a subscriber to Coal Age for the past three years and have read the editorials with a great deal of interest. We see that this paper goes to each of our mine foremen and consider the subscription price a good investment.

"We recently bought some Fairmont mining pumps, which were brought to our notice through an ad in Coal Age."

You see the Fairmont people sold those pumps through their advertising, but they don't know it.

A little closer relations between buyer and seller, through advertising, would be a mighty good thing for both.

* * *

NEXT MONDAY, the 22d, is George Washington's birthday, and it just occurs to me that when we talk about "truth in advertising" perhaps we owe something of the idea to our first President. At least when he confessed his guilt in the cherry tree incident he did more to advertise the truth in America than anyone else has ever been able to do.

And I venture to say that if Washington were alive today, he would be an enthusiastic reader of the ads—because he would want to know the truth about anything he might need to buy.

COAL AGE

Vol. 7 NEW YORK, FEBRUARY 20, 1915 No. 8

"Heat Not a Furnace for Your Foe so Hot that It Do Singe Thyself"

MR. SHAKESPEARE wrote that, and it's pretty good advice. We have just learned of an instance where a "shyster" lawyer suffered a severe singeing in the manner indicated. Sounds too good to be true—does it not?—but it's a fact nevertheless.

A superintendent, who is a friend of ours, received a letter from a certain lawyer reading something like this:—

> "John Doe, an employee of your company, was injured at one of your coal mines last week through the negligence of your company and has just gone through a serious operation at the L——— Hospital. I have just entered suit against your company for him. He has $75.00 due him on your last month's payroll, and I request that you forward that amount to me on Saturday, your regular pay day."

The superintendent investigated and failed to find John Doe on the payroll, and he immediately wrote the lawyer to that effect.

The lawyer replied with:—

> "You are evidently mistaken. The following persons witnessed the accident."
>
> Then followed a list of five names.

Imagine the surprise and joy of the superintendent when his timekeeper reported that not one of the names furnished by the attorney had ever appeared on the company's payroll.

He lost no time in again communicating with the attorney and this time he included a few pertinent questions, as a basis for future correspondence. He hasn't received a reply as yet.

However, in a roundabout way, he learned that a certain ignorant, illiterate darkey had succeeded in getting an advance of $30.00 from the lawyer in question, and the lawyer has not seen fit to prosecute the offender.

The darkey, under another name, had really dug coal at our friend's camp some years before, and thus was able to tell a plausible story to the attorney. He had been slightly injured through his own carelessness while loafing in the city, and had succeeded in gaining admittance to a charity ward of a hospital where the attorney's "ambulance chaser" discovered him.

The case, as described by the darkey, looked good to the attorney, and the $75.00 of (imaginary) wages due certainly justified a $30.00 advance. In fact, he had often made advances when the would-be client suggested that he must have money to live on.

For years, we have been trying through laws and appeals to public opinion to make the shyster trade unprofitable, but so far, to our knowledge, not one shyster have we vanquished.

All honor to the darkey for his victory as well as for his suggestion. We will willingly furnish bond to any of his imitators who land in jail.

Ideas and Suggestions

Blocking Worry, Trouble and Expense

By Alabama

Many men who are entrusted with the business of management pin too much faith in reports and spend too much time in perusing and following them up. The more exhaustive they can be made, the better some of these men seem to like them and the more time they spend on them. Minor officials and heads of departments are forced to give too much of their time to formulating these reports and answering letters about them from the men who think they are indispensable. This goes on month after month and grows more vexatious to all concerned. Some of the letters often sting pretty hard because most men about a coal mine carry their mail in their pockets and to read and think about letters of criticism throughout the hours of work does not tend to raise a man's real practical value to the company that employs him.

It is all right to have reports. They are necessary to the management of any concern. But far too many executives have yet to learn that the purpose which they try to accomplish by too many such voluminous documents can be obtained in an easier, simpler way; and at the same time put an effective block in the way of worry, trouble and expense.

You ask "How can it be done?" Here's the answer:

1—Set up a definite schedule of the requirements (daily, weekly or monthly) of your mine. In the case of labor establish a definite quota of men allowed for each occupation and require your timekeeper to advise you at once when the quota for any given occupation is exceeded. For materials used, provide a schedule showing the quantities of all supplies that you want to keep close track of, which it will be allowable to issue daily, weekly or monthly as you say.

2—On the forms used for various reports provide an extra column for showing labor or material used in excess of requirements. This will show at a glance what the mine appears to be using above what your knowledge and experience has shown to be necessary.

Mine executives who adopt this plan will accomplish two very important things. The first is that of establishing a definite standard for labor and materials necessary to operate normally one or a number of plants. The setting up of such standards will require hard study on the part of the management, but when this is once firmly established and lived up to, there is little doubt that it will result in the elimination of certain expense sustained previously.

Another benefit obtained under this plan is that of eliminating the time and trouble involved in scanning and comparing lengthy reports in an effort to dig out the items appearing too big, etc. In this plan the essential thing in connection with the scrutiny of reports will be to watch carefully the columns showing "Excess of Requirements." In fact after the men all along the line thoroughly understand that anything used in excess of the established schedule requires special approval and complete explanation; they will live pretty close to the line drawn.

The essence of the whole scheme lies in getting away from the practical effects of following the principle that where foremen are allowed to use any number of men or any amount of material, they will usually be able to get by with their explanations; and adopting the better principle that where a definite requirement is set up, men can be taught or made to live up to same.

The plan offers an excellent opportunity for blocking or preventing that waste of money and time which all mine managers are interested in eliminating. It is working on the principle of buying and using only what one needs which nearly always means living within one's means. Men who operate coal mines will certainly be interested in anything which will help to bring this about for them.

Let us hear from any who think the plan is worth trying.

Put Yourself in the Other Fellow's Place

By M. D. Cooper*

In your office, when a foreigner with a command of only a few English words comes in to try to explain that he believes there is a mistake in his statement of earnings and deductions, it will help some if you put yourself in his place. Try to realize the difficulties of his position. He is probably handicapped not only by his limited knowledge of English, but the chances are that his calculations are incorrect while his statement is right as it stands.

How much better it is then to win his loyalty and respect by reasonable explanations, rather than to send him away grumbling and dissatisfied, perhaps with a shouted command ringing in his ears and consigning him to a tropical region. There are offices at mines where the men in those offices do not know or else fail to remember that they hold their jobs because the diggers they are so ready to chastise are there loading coal. Offices are not very generally kept up at mines where no coal is produced.

In dealing with a man whose position is either higher or lower than your own, bear in mind that his perspective differs from yours. If you are a fireboss and you go to your superintendent for a house for your family, you, of course, regard the question of a house as of very considerable importance. The superintendent, however, is probably making changes in housing every day and therefore your application is just one of the regular incidents of his day's work. Do not be surprised then if he seems to fail to attach as much importance to the matter as you do. On the other hand, if you are the superintendent or any other official, it is well to remember that any statement of yours, regardless of its importance to you, may loom up large to one of your subordinates. Make your conversation clear and explicit. If you make no promises, you will have none to break.

---

*Ellsworth, Penn.

Many Pretend to Misunderstand

In the mine you sometimes hear a man say that he does not know what the boss expects him to do on a certain job. Let him put himself in the boss' place, and reason it out. In nine cases out of ten, the apparent failure to understand orders is due to the fact that the thing to be done is a little out of the ordinary or perhaps a little more difficult than usual. The easiest refuge is found in pretending to misunderstand. A successful pit-boss in Pennsylvania makes it a practice to size up a job from the standpoint of the men under him. His men know that he understands them and their work and that he can't be fooled.

In cases of special danger, it is a questionable practice for one in authority to send a man to work in a place where he is unwilling to remain to supervise the work.

Mistakes will always be made. Whether a man be pit-boss or digger, he must realize that the other is sure to make a mistake now and then. But by putting yourself in the other fellow's place, misunderstandings will almost always be avoided. Circumstances will then be found to explain in part at least the reason for mistakes. In any case, it pays to judge a man not on the basis of his separate mistakes, but rather on the relation of these mistakes to the total amount of work or good that he accomplishes, which is the only equitable basis for judgment.

Put yourself in the other fellow's place. It is the surest way to avoid friction and misunderstandings. It promotes respect and good will. Moreover, it pays because it gets the best results without the inevitable loss that always follows in the train of discord of any kind.

A Safety Appliance for Underground Slopes

By William McMahon*

For many years past, we have heard much of the active work going on in and about the mines looking toward the prevention of accidents. It is gratifying to learn that in many cases employers and employees are coöperating in a safety-first campaign. Too much cannot be written about this subject as statistics show that since this movement was actively taken up, the number of accidents has greatly decreased.

A feature which is highly gratifying is the greatly increased number of articles appearing in the technical journals regarding the many safety devices which are being installed in and around the mines. I am sure these articles and the sketches accompanying them will appeal to all those interested in mining, for in nearly every instance someone will be certain to get an idea applicable to the particular case in which he is interested.

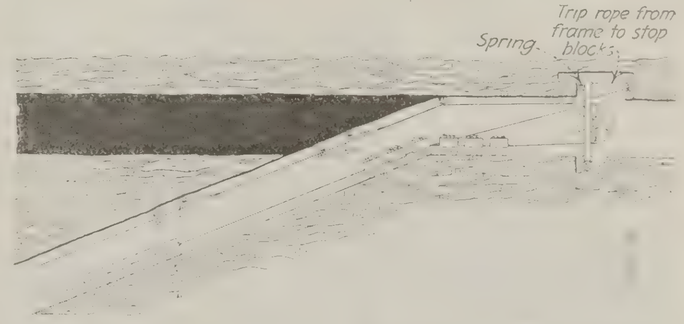
The following description is of a safety device which I installed some few years ago at a mine where I was engaged. At this development the coal bed pitched somewhat, and the coal was gotten to the bottom by gravity, the loaded cars coming down the slope pulling the empties up. Many accidents occurred due to loaded cars breaking their couplings at the top of the slope, or sometimes entire loaded trips would be pushed over the knuckle before the rope was firmly attached to them. This not only caused considerable delay and expense, but, what was vastly worse, endangered the lives of the men who were engaged on the slope.

Stop Blocks Were Installed

The frequency of these accidents was considerably decreased by the installation of this device which consisted of a series of stop blocks placed above the loaded track and operated automatically from the pulley frame at the top of the slope. The principle of operation of this device may be clearly understood by reference to the accompanying drawing.

As may be seen in the drawing, the head sheave was carried upon a frame hinged at its lower end and free to move through a limited vertical arc. The trip-rope governing the blocks over the loaded track is attached to the upper end of this swinging frame, passing over a suitably placed pulley so as to receive a reversal of direction before passing down the slope to the trips, or stop blocks.

Whenever a trip of loaded or empty cars, or both, was upon the slope and exerting a pull upon the head sheave, the tilting frame swung to its foremost position, raising the stop blocks thus allowing the loaded trip of cars to pass down the incline. Should a trip break away, however, the pressure on the head sheave would be released, and the stop blocks would have sufficient weight to draw the tilting sheave frame backward, the blocks meanwhile descending and stopping the trip of loaded cars.



Arrangement of Cable, Trip Rope and Safety Blocks

It was found in some cases, however, that when a loaded trip had been pushed over the knuckle that the stop blocks were raised to their proper position, but the jerk on the car couplings sometimes caused a breakage in the middle of the trip, releasing three or four cars. The weight of the remainder of the trip was sufficient to hold the stop blocks up out of the way so that the runaway cars could pass down the slope to the landing at the bottom, tieing up the entire entry.

The addition of the springs shown in the drawing, when properly adjusted, entirely eliminated this sort of trouble. If, for instance, three or four cars break away when pushed over the knuckle, the springs, although compressed fully by the first shock when relieved of the weight of the cars which broke away, immediately expand, lowering the stop blocks if not to their proper position at least enough to intercept and stop the passage of the runaways.

Reopening the Grayson Mine in Illinois

By E. C. Lee*

SYNOPSIS—A dangerous mine fire was extinguished by sealing up the shafts. Rescue corps succeeded in opening up the workings without any serious mishaps. Methods of gas analysis. Permissible explosives adopted.

The No. 6 Mine of the Saline County Coal Co., which was sealed up on Nov. 11, 1914, in order to extinguish a fire in the face of the 1st and 2d West Stub Entries off the 3d and 4th South West, was opened on Dec. 26, 1914, by helmetmen from the Illinois Mine Rescue Stations and from the Saline County Coal Company.

This mine is located on the Louisville & Nashville R.R., at Grayson, about 2½ miles out of Eldorado and was acquired by the Saline County Coal Co. about two years ago. The seam worked is the No. 5 of the Illinois Geological Survey Correlation, which in this mine is from 5 to 7 ft. thick. The mining is done by machines of the Morgan-Gardner type, and the coal is shot down by the use of black powder. The following is the proximate analysis of coal from this bed in this vicinity, as made by the Illinois Coal-Mining Investigations. The first analysis of the coal is "as received," with total moisture; the second analysis is "dry," or moisture free.[1]

No. 6 Mine of Saline County Coal Co., Grayson, Ill.

No. of Analysis	Moisture	Volatile Matter	Fixed Carbon	Ash	Sulphur	B.t.u.	Unit Coal B.t.u.
1	6.75	35.49	48.72	9.04	2.92	12,276	
2	Dry	38.06	52.25	9.69	3.13	13,165	14,812

"The roof of the No. 5 bed in this district is a shale varying from light gray to black, and locally may be laminated and interbedded with bone and stringers of coal for a distance of 3 ft. above the seam. The roof usually contains also many concretions of iron pyrites called 'nigger-heads.' These have more cohesion with the rest of the roof material than do the nigger-heads of the Danville district.

"The floor is fireclay which in places contains much sand and heaves badly when wet. The bed does not lie as flat as the No. 6, but contains many hills and rolls causing grades as high as 15 per cent. in the entries of some mines. The coal is not pinched out at these hills, but follows their contours with undiminished thickness."[2]

The Mine Was Gassy

The output of No. 6 mine is about 1200 tons per day, about 225 men being employed. No firing of shots is done while the men are at work, shotfirers being employed for this purpose, and firerunners following them to extinguish any fires which may be caused by the shots. Some sections of the workings generate much marsh gas, but soon after the mine was acquired by the Saline County Coal Co., the fan was enlarged and the airways cleaned up so as to produce an adequate supply of air for diluting and removing this gas. The fan is 16 ft. in diameter and of Crawford & McCrimmon type, with 4-ft. blades, producing 100,000 cu.ft. of air per minute at 84 revolutions per minute.

On the night of Nov. 10, the firerunner discovered a fire in the face of the 2d West off the 4th South West, and, after attempting to extinguish it himself, went out for assistance. The fire was fought by the employees of the mine for several hours, when it was discovered that the face of the 1st West was also afire, the fire extending back of the inside crosscut. Assistance was sent from the No. 3 mine of the company, at Harrisburg, the men being accompanied by Supt. George W. Morris, Geo. Bagwell, formerly superintendent of the O'Gara Coal Co., John Wunderlick, assistant mine manager, Saline Co. Mine No. 2, and Walter Scott, superintendent of the Benton mine-rescue car, who was in Harrisburg on his vacation.

It was known that the roof at the face was in very bad condition, and it was decided that the proper thing to do was to seal off the two entries and smother the fire. Accordingly, a canvas stopping was built across the 2d West between rooms 8 and 9, so as to shut off from the fire the main ventilating current, which in these entries is ordinarily about 12,000 cu.ft. of air per minute.

The men then went through the door marked "D1" on the map, and began the erection of a stopping on the 1st West between rooms 8 and 9. These two stoppings, with one in the crosscut between rooms 8 and 9, would have sealed off the face of the entries, but as the men were finishing the second stopping, a slight explosion, probably of gas produced by the fire, drove them from the work. A glance at the map will show that, on account of the way in which rooms were broken through to the entries above, the erection of seals enough to cut off the fire area would have been a task calling for weeks of work, rather than a few hours; and, recognizing this fact and being unwilling to have the men work any longer in a dangerous place, Superintendent Morris decided that the only thing left was the sealing up of the entire mine, by closing both the hoisting and the fan shafts. The men were accordingly withdrawn and the shafts sealed at the surface.

[1] Bulletin 6 of the Illinois Coal-Mining Investigations, page 6.

[2] Bulletin 6 of the Illinois Coal-Mining Investigations, page 10.

HOW THE SHAFTS WERE SEALED

The seals over all the shafts were constructed in the same way, mine rails being first laid across the shaft to provide a foundation for the other material. Across these was laid a single course of 3-in. planks, covered with a double thickness of heavy canvas or brattice cloth. A box was then built around the shaft, extending past its edge 2 ft. on each side, and the entire box filled with sand to a depth of about 2 ft. The box was then braced by packing a wall of clay tightly around the outside.

The fan drift was also sealed, but necessarily in a somewhat different manner. Nearest the shaft was built a wall of ship-lath, faced with wood fiber. Eight inches from this was another wall of boards, the space between being filled with sand. Next to the boards was 10 in. of clay, this being supported by another wall of ship-lath, faced with wood fiber. In order to insure a tight joint, the walls of the fan drift were finally covered with cement.

On Dec. 11, just a month after the shafts had been sealed, I accompanied Engineer H. I. Smith, of the U. S. Bureau of Mines, on a visit to the mine for the purpose of investigating the conditions. Several samples of the gaseous mixture inside the mine were taken, using both vacuum and citrate-of-magnesia bottles. The pneumatic signal tube in the hoisting-engine room was opened, a ¾-in. cap being obtained on a Koehler safety lamp held near the opening. The time of the visit was fortunately during a period when the barometric reading was comparatively low, and the samples were obtained without much difficulty. Samples were taken at both the hoisting and fan shafts, the latter being obtained by unscrewing the pressure gage. Mr. Smith and I a little later ran an analysis of these gases, using for the purpose an Orsat gas analysis cabinet owned by the Illinois Miners' and Mechanics' Institute, finding the following mixture:

Carbon dioxide	1.63
Oxygen	6.25
Methane	11.14
Nitrogen	79.10
	98.12

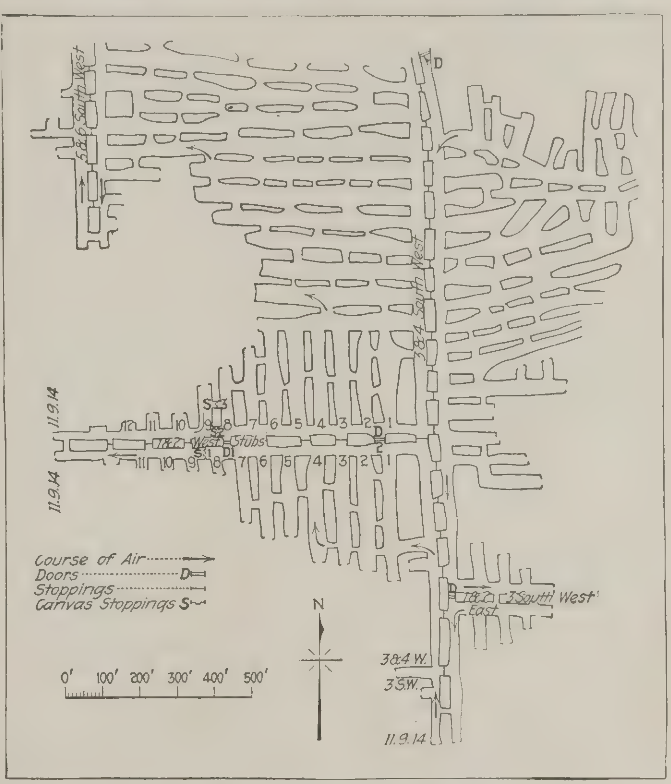
It will be noted that these proportions are not absolutely correct, but they are sufficiently accurate to be used as a guide in determining the condition of the air in the mine. The fact that these results were later checked by the Bureau of Mines leads me to the belief that a description of the simple apparatus used in making the analysis might be of benefit in a paper like this.

METHOD EMPLOYED IN ANALYZING THE GASES

The Orsat belonging to the Miners' and Mechanics' Institute is one made by the Central Scientific Co., and consists of a burette and three pipettes, connected by a train. The burette has a capacity of 100 c.c., and is finely graduated. It is inclosed in a larger tube, which is filled with water, so as to keep the temperature approximately uniform during the analysis. The first pipette contains potassium hydroxide solution, for the removal of the carbon dioxide in the gas; the second contains an alkaline solution of pyrogallic acid, for absorbing the oxygen; and the third is filled with an ammoniacal solution of copper chloride, for the absorption of carbon monoxide.

A second cabinet accompanies this, used for the determination of methane. The pipette in this cabinet contains a small platinum wire, which is connected up to an electric current and heated up, so as to burn the methane. The remaining gas is then run through the first pipette again, and the carbon dioxide formed by the burning of the methane is removed. The sample is then returned to the burette and the contraction in volume due to this absorption of carbon dioxide is recorded. Bulletin 42 of the Bureau of Mines gives an excellent description of this apparatus and the method of operating it.

At the time the samples were taken, readings of some of the charts from the pressure gage were taken. A chart made during the time the fan was in operation showed a minimum reading of 0.9 from 6 p.m. to 7 a.m., and a maximum reading of 1.2 from 9 a.m. to 4:15 p.m. on Oct. 29. The chart made on Dec. 10, the day before the samples were taken, showed the following readings: —0.1 from 7 a.m. to 8:45 a.m.; —0.05 to 2:30 p.m.; 0.0 to 4:15 p.m.; —0.1 to 7:15 p.m.; and 0.0 to 7 a.m. During the time of taking the samples, from 2:45 p.m. to 4:15 p.m. on Dec. 11, the gage varied from 0.3 to —0.2.



MAP OF THE GRAYSON MINE

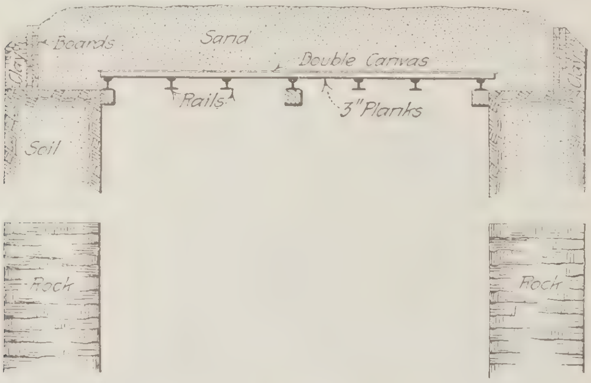
After these analyses were run, Superintendent Morris, taking into consideration the experience of other operators in the southern Illinois field, decided to reopen the mine on Dec. 26, and go into the fire area; if the fire was then found to be out, the fan might then be started. Accordingly a request for help was made to the Illinois Mine-Rescue Commission, and Superintendent Towal, of the Benton station, and Superintendent Scott, of the Herrin substation, went to the mine.

Two types of apparatus were used, the Draeger and the Fleuss, the Draegers being the property of the company, and the Fleuss coming from the rescue stations. During the work some little trouble was experienced with the privately owned apparatus, but in justice to the manufacturers it should be recognized that the apparatus belonging to a coal company, where there is but little use for them, do not generally receive the same attention that is given to those from the rescue stations.

The work of opening the mine was directed by Superintendent Morris, Mining Engineer Reuben Williams, H. I. Smith of the U. S. Bureau of Mines, James Walker, county inspector of mining, and John Winterbottom, mine manager; to whom each corps reported on their return to the surface and from whom each new corps received definite instructions before entering the mine.

The Shaft Was Unsealed

The seal was removed from the top of the hoisting shaft at about 11 a.m. Dec. 26. The air shaft was not opened. The first team wearing breathing apparatus entered the mine at 1 p.m. This team consisted of Walter Scott; John Hopkins, assistant mine manager; and Bertram Peak. It should be remembered that when the shafts were sealed, the first stopping had been built, and as the men withdrew, Mr. Scott opened the door just outside the stopping, so as to partially short-circuit the air, if there should be any circulating. The men also opened the door between the air shaft and the hoisting shaft to short-circuit the air, in an attempt to establish a base for their operations at the foot of the shaft. It was found, however, that to establish such a base at the shaft bottom would necessitate the construction of several stoppings, and the attempt was therefore abandoned and all operations conducted from the surface. A little trouble was experienced with one of the apparatus, and the party returned to the top, having been under about an hour.



Method of Sealing Shaft

The second party, consisting of James Towal, Walter Scott, John Hopkins, James Pepper and Bertram Peak, entered the mine at 3 p.m., the first three equipped with state apparatus and the other two wearing those belonging to the company. These men explored the haulageway up to the fall on the fire and examined the stoppings and other conditions. They estimated the temperature in the neighborhood of the fall as being 100 deg. F. or greater. This party returned at 4:50 p.m., having worn the apparatus one hour and fifty minutes.

The Air Shaft Is Next Uncovered

The cover was removed from the top of the air shaft at about 5:30 p.m. Upon the removal of the first board under the canvas, four men were caught in the released gases, and ten more were overcome in trying to rescue them. The fan was started immediately to blow fresh air over them, and at the same time the oxygen apparatus were sent for. Before the apparatus had been obtained the men had been rescued. They recovered quickly, but that night became very nervous and shook violently. Their sleep was accompanied by horrible dreams. After the men were recovered the fan was stopped, and the seal removed by men wearing oxygen apparatus.

The third party consisted of Scott, Pepper, Peak, Hopkins and Watson, the first three wearing Fleuss and the last two Draegers. They entered the mine at 8 p.m., and returned at 8:40 p.m. because the last two men had trouble with their apparatus. Operations were then suspended until four more rescue apparatuses were obtained from the Benton station. These arrived at about 3 p.m. Sunday, Dec. 27, and the fourth party, consisting of Scott, Watson, Law, Pepper and Peak, entered the mine at 3:30 p.m. They returned at 4:45 p.m., having lost their route and failed to reach the fire area. The temperature on the parting outbye the 4th South West was reported by them as 78 deg. Fahrenheit.

The Fire Area Is Reached

The fifth party, Towal, Cathcart, Futrell, Biggs and Hopkins, entered the mine at 6:30 p.m. and explored the 4th South West entries and rooms. They selected places for stoppings, dug five holes through the fall, set four props, and returned to the top at 8:10 p.m. The sixth party entered the mine at 9:30 p.m., traveled to the fire area and tightened the fifth prop, nailed on the canvas and carried props into the crosscut in the inside room, returning to the top at 11:10 p.m.

The seventh party, under Towal, entered at 12 midnight, traveled to the fire area, a distance of 2700 ft., set four props, in the crosscut between rooms 8 and 9, put in two side braces, and returned to the top at 1:15. The apparatus used by this party was not fully charged when they started. The eighth party, under Scott, entered at 2:35 a.m. They nailed on the canvas, closed the doors left open to short-circuit the air and returned to the top at 3:30 a.m. The temperature in Room 9 off the 4th South West was 82.5 deg. F. The fan was started at 4:05 a.m., and the men left the mine at 8 a.m., leaving everything in a satisfactory condition.

Because of the size of the fall in the faces of the two entries where the fire was, these entries will be sealed off for some time yet, so as to insure that the fire is extinguished. After the ventilation had been restored, the temporary stoppings built by the helmetmen were reinforced by stoppings of a more permanent character. The mine was inspected by County Inspector James Walker on Saturday, Jan. 2, and found in good condition. Hoisting of coal was resumed on Monday, Jan. 4.

Adopt Precautionary Measures

In order to prevent a recurrence of such a fire, the use of permissible explosives has been introduced in the mine, and a demonstrator has been giving instructions to the miners on the proper use of the explosives. A further precaution adopted by the company is that of having the firerunners follow the shotfirers at an interval of about a half-hour, whereas formerly the firerunners did not begin their work until after the shotfirers had finished theirs. The firerunners work in pairs until they have covered the entire mine, after which they separate, and return over different courses, to insure that no fires will be missed.

Drying Washed Coal

By F. E. Butcher*

SYNOPSIS—Giving capacities of centrifugal driers installed at Mine No. 8, of the Tennessee Coal, Iron & R.R. Co., near Birmingham, Ala. Comparative economy in the use of the drier in coal-washing plants. Saving effected in fine coal that otherwise is lost. This recovery amounts to several hundred tons a month. Tabulated results in the washing of coal.

Last spring we completed the building of a coal-washing plant for the Tennessee Coal, Iron & R.R. Co., at their No. 8 mine, just outside of Birmingham, Ala. Included in that plant were two of our centrifugal driers. The nominal capacity of the plant was 100 tons per hour, or 50 tons per hour for each of the two driers.

The writer has just seen a letter written by Mr. Robert Hamilton, consulting engineer of the T. C., I. & R.R. Co. to one of our friends, advising that the driers have given no trouble and that the moisture in the coal coming from the driers is reduced to about 7½ per cent. The letter states further that, with both machines running, an output of 1100 tons has easily been handled in ten hours; and with only one machine in operation they have handled 750 tons in 10 hours. In other words, they have demonstrated a number of times that it is entirely feasible to operate these machines at the rate of 75 tons per hour.

This plant is so designed that the washed coal coming from the jigs flows directly into the driers together with a large amount of water. There is at least as much water as there is coal; and the coal is delivered constantly with the moisture content already noted above. This 7½ per cent. of moisture content includes about 2 per cent. internal moisture, so that the surface moisture is reduced to approximately 5 per cent.

So far as the cost of doing this drying is concerned, it is a little difficult to give any definite data, because we have all been carefully feeling our way, in this matter, and are hardly prepared to make a definite statement about this feature. There is one thing certain, however, and that is that this system is very much cheaper than any previously known system. As all are undoubtedly aware it has been customary either to drain the coal slowly, by a system of drainage bins, or to build large drainage pits and allow the coal to stand in these bins or pits for from 24 to 60 hr.; and then the coal would have to be rehandled from these bins or pits to the cars or loading bins.

The expense of installing either bins or pits is, of course, much larger than the original investment in centrifugal driers. The driers, however, possess the further advantage that they get rid of a lot of dewatering elevator equipment, which is expensive both to install and to maintain. Without a question of a doubt, the coal-washing plant at the T. C., I. & R.R. mine No. 8 is the simplest plant in the world, so far as its flow-sheet and operation are concerned; and Mr. Hamilton, and also the executive officers of the T. C., I. & R.R. Co., have assured us that, in their opinion, it is the best coal-washing plant in the world, from the standpoint of results accomplished.

There is nothing to wear out about the centrifugal drier, except the fine perforated screens, and the renewal of these screens is an inexpensive matter. The total cost of drying coal, at the rate noted above, is the power consumption, which amounts to from 20 to 25 hp. It would take almost that much power to drive a properly designed dewatering elevator capable of handling an output of 75 tons per hour; and such a dewatering elevator would deliver coal having from 15 to 25 per cent. moisture. On the other hand, the drier delivers coal with the moisture content previously mentioned.

There is a further important advantage in the use of a centrifugal drier. The water from the drier contains some solid matter in the form of extremely fine coal. This fine coal amounts, according to carefully conducted experiments, to about 1½ per cent. of the total material handled through the drier. In some cases, the amount of this fine material going through the drier screens is larger. All of this water coming from the drier with the finely divided coal that it contains goes to a central sump, from which it is elevated, by a centrifugal pump, to a cone settling tank about 40 ft. in diameter and nearly 70 ft. high. This cone settling tank delivers the fine coal, from a valve at the bottom of the tank, directly to the driers where it is again entrained with the coarse coal coming from the jigs, and thus provides an additional recovery for the plant. The overflow water from the large settling tank goes back to the jigs again as feed water.

This additional recovery of extremely fine coal, which is of course the highest-grade coal about the plant, amounts to several hundred tons each month and is consequently an economy that is not possible in the ordinary coal-washing plant where dewatering elevators are used. Mr. Hamilton also states, in his letter, that this large tank has operated continuously since early in July, without any attention, repairs or changes of any kind being necessary. Owing to unusual demands this washery has been operated most of the time on double-shift.

I believe that the following memoranda showing some recent results in the operation of this washery will be of interest to readers of Coal Age. Note that the washed coal carries an ash content of only 4.71 per cent. and, further, that this ash content in the washed coal has not varied more than 0.3 of 1 per cent., at any time during the past five months. This emphasizes the close and accurate control that is possible in these machines. Four of these driers are installed in the plant of the Pennsylvania Steel Co., Steelton, Penn., but we are not in a position to give as intelligent an idea of what this plant is doing, because we have received as yet no data from them.

ANALYSIS OF COAL FOR WEEK ENDING OCT. 24, 1914

	Volatile Matter	Fixed Carbon	Ash	Sulphur
Raw coal	31.31	58.06	10.63	1.88
Washed coal	32.60	62.69	4.71	1.47
Boiler coal	26.53	48.53	23.94	3.17

PERCENTAGE OF REFUSE (SPECIFIC GRAVITY 1.37)

Float	6.4	Yielding ash	4.71	Sul.	1.59
Sink	93.6	Yielding ash	68.55	Sul.	4.95

SEPTEMBER RECORD

Raw coal	100.0
Washed coal	87.3
Boiler coal	6.4
Refuse	6.3

Electric Arc Welding in Mine Repair Shops

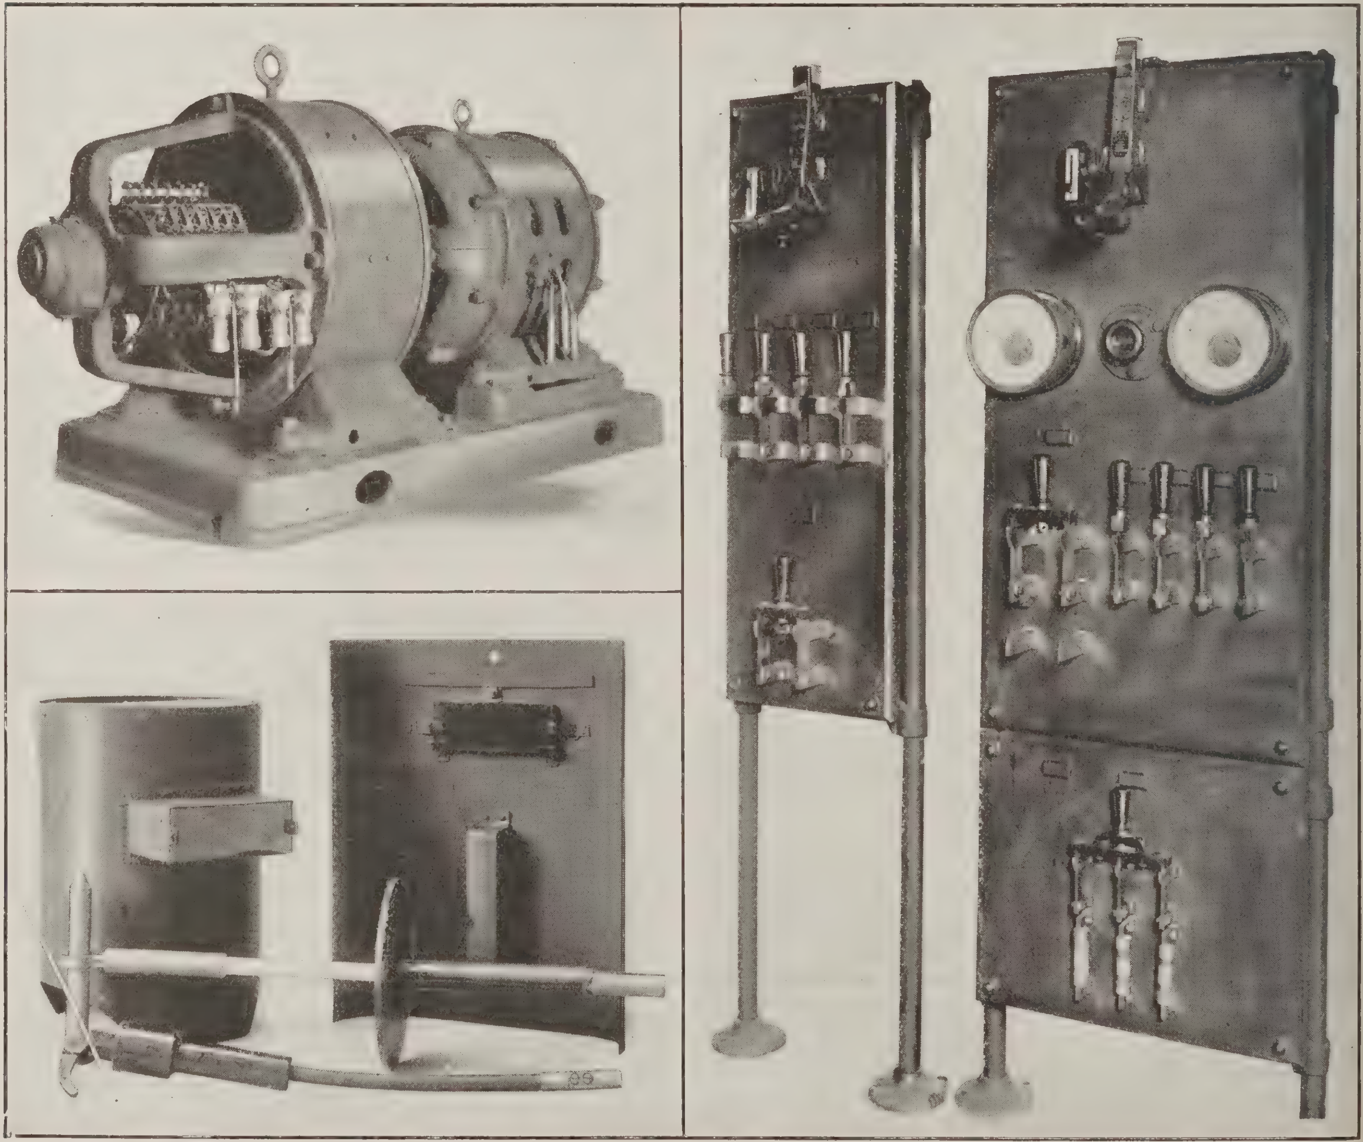
By E. S. Zuck*

SYNOPSIS—The apparatus required, as well as the possibilities of this process of repair, are here enumerated. An inspection of the scrap heap at any coal mine will reveal the opportunities for saving which this process possesses.

The application of the electric arc process of welding has been growing rapidly in recent years, and it is now used extensively in foundries, machine shops and railway repair shops, both electric and steam. In the latter, it has been found specially efficient in repairing worn or broken parts of locomotives and cars, and in many cases the savings made in two or three months' operation have equaled the original cost of the welding apparatus. The mining industry, being a large user of machinery of one kind or another, should also be able to realize large savings by using arc welding in repair shops.

Arc welding may be described as the utilization of the heat of the electric arc to melt and fuse together the two materials to be welded. Two processes are in common use today, known respectively as the carbon and the metallic electrode processes. In both cases, one side of an electric circuit is connected to the article to be welded, while to the other side is attached an electrode, which consists in one instance of a carbon or graphite rod and in the other of an iron or steel rod.

The process of welding includes three distinct operations, viz., preparation of the work, striking the arc, manipulation of the electrode, filling material and the article being welded.



Figs. 1, 3 and 4. Showing Low-Voltage Motor-Generator Set, Switchboard and Tools Used in Electric Welding

---

*Westinghouse Electric & Manufacturing Co., East Pittsburgh, Penn.

Preparation of the Work

It is absolutely essential that the article to be welded be free from dirt, grease, scale and other foreign matter. Failure to observe this rule carefully is without question responsible for 90 per cent. of the failures in arc welding. It is necessary in many cases to resort to chipping so that the weld may be started on bright metal. A good stiff wire brush is also useful in cleaning the work.

Having thoroughly cleaned the work, the next step is to prepare the spot to be welded by shaping it to receive the weld. If a crack in a plate or bar is to be repaired, it should be chipped out with cold chisel and hammer so that a V-shaped groove is formed. If a broken casting is to be repaired, temporary supports for the broken member will be required. Projections such as lugs or lifting bails may have to be built up, and molding blocks of iron, carbon or fireclay will be required. Occasionally it will be advisable to preheat the metal before welding, so as to avoid cooling stresses and insure even contraction. A furnace for preheating will therefore be required. This may be constructed of ordinary firebrick, a gas flame being preferably used to bring the metal up to a cherry-red heat.

Striking the Arc

The operation of cleaning the article and preparing it for welding having been completed, one side of the welding circuit should be connected to the work. If the piece is small, this is most conveniently accomplished by having an iron table on which to place the article, the table being permanently connected to one side of the welding circuit. Where the article is large, the current conductor can be fastened to it with a clamp or simply hooked on without clamping. If the carbon electrode is used, filling material should be within easy reach. The operator then touches the electrode to the work and instantly withdraws it, thus striking the arc.

The carbon electrode should be withdrawn to a distance of two or more inches from the work. Little difficulty will be experienced in striking the carbon arc. With the metallic arc, the electrode has a tendency to stick and will frequently "freeze" to the work. Moreover, the arc is quite short, and in fact can seldom be operated longer than $\frac{3}{16}$ in. The operator must feed the electrode down into the weld at about the same rate as that at which it melts off, and the electrode must be held perfectly steady or the arc will be broken. A good plan for a beginner is to start with the carbon arc, and as skill is acquired, he can progress to the more difficult metallic arc process. It will often assist materially in the latter if the operator provides himself with a steady rest for his arm.

Manipulation of the Arc and Weld

After the arc is struck it is allowed to play on the piece, and if the carbon electrode is used, this is given a rotary motion by hand. With the metallic process the electrode is itself both the heating element and filling material, and the arc is allowed to play on the exact spot where it is desired to deposit the metal. With the carbon electrode, the filling material should be added a little at a time, the arc, of course, being continued meanwhile until the metal is thoroughly melted and the weld made.

As soon as the metal commences to cool it should be hammered thoroughly in order to prevent sponginess and to give it a finer grain. Hammering the weld also tends to work out any scale or slag which may have formed during the welding stage. Skillful operators endeavor to perform the entire welding operation with a minimum number of applications of the arc, avoiding interruption and breaking of the arc as much as possible.

Direct current is most suitable for welding, and in fact must be used for the metallic electrode process. The carbon process requires a current of from 300 to 400 amp., and the drop across the arc will vary from 30 to 40 volts, depending on the amount of current and the length of the arc. On the other hand, the metallic electrode rarely requires more than 130 amp. with a drop across the arc of from 20 to 25 volts.

Since the drop across the arc is quite low, it follows that arc welding is inherently a low-voltage application of power, and consequently, where specially designed welding outfits are installed, a low-voltage generator operating at from 70 to 75 volts is universally employed. On account of the difficulty of maintaining a constant current across the arc, and on account of the manner in which the arc must be struck, it is not possible to operate it directly on the generator voltage. It is, therefore, necessary to connect in series with the arc a resistance which is used to steady it, and to limit the current which will flow when the electrode is touched to the work. This is often called the "ballast resistance" and as such is a common feature of all direct-current arc lamps.

Welding can be done from high-potential circuits, such as 125, 250 and 500 volts. This practice cannot be recommended, however, where much work is done, as it is wasteful of power, especially on 250- and 500-volt circuits. The usual practice is to install a motor generator, such as is shown in Fig. 1, the generator being a direct-current compound-wound machine, delivering 70 to 75 volts, while the motor is of suitable characteristics for the local power circuit.

If electric power is not available, a steam or gas engine may be used to drive the generator. Machines having commutating poles should be used, as severe overloads may occur quite frequently.

For work in connection with mine repair shops it is best to install low-voltage generators in the locality where most of the welding will be done. At the outlying points where it may be desirable to do occasional welding, rheostats may be used in connection with the direct-current haulage circuit, the potential being reduced to the 30 or 40 volts required at the arc. An excellent size of generator to employ is one having a capacity of 300 amp., as this size permits the use of both processes.

As mentioned above, it is not possible to operate the arc directly from the generator or other electric circuit. Resistance must be placed in series in order to steady the arc and limit the current which will flow at the instant of striking, and also to furnish the means whereby the current and voltage of the arc may be regulated. To regulate the current a simple arrangement of switches and resistance is shown schematically in Fig. 2. This plan of connections can be used either with a low-voltage welding generator or with higher potential circuits, such as 250 and 500 volts. The only difference is in the ohmic value of the resistance which, of course, must be higher for the 250- and 500-volt circuits.

The manipulation of this control scheme is so simple as to require little explanation. The operator closes the circuit-breaker and the two-pole knife-switch in succession, and then by closing one or more of the single-pole switches adjusts the resistance to give the current required. The current depends, of course, on the work and whether the carbon or metallic process is used. Fig. 3 shows a view of typical control panels for welding, the outlet panel being used when it is desired to have several operators work simultaneously.

Before leaving this scheme of control, particular attention is called to the polarity, the electrode being marked negative. There are several reasons for this. First, the positive pole provides nearly 75 per cent. of the total heat of the arc, and if the work being welded is positive, the heat is where it is most required. In the second place, there is a tendency, when the carbon electrode is used, for particles of carbon to be carried into the molten metal from the electrode, and since carbon hardens steel, the weld will be so hard that it will be impossible to machine or work it with tools. If, however, the electrode is made the negative, then the flow of current is from the weld to the electrode. This has been found to restrict the amount of carbon carried into the weld by the arc to a very small amount, so that little hardening of the material results. Hardening of the weld can also be further prevented by using a long arc—not less than 3 in. in length.

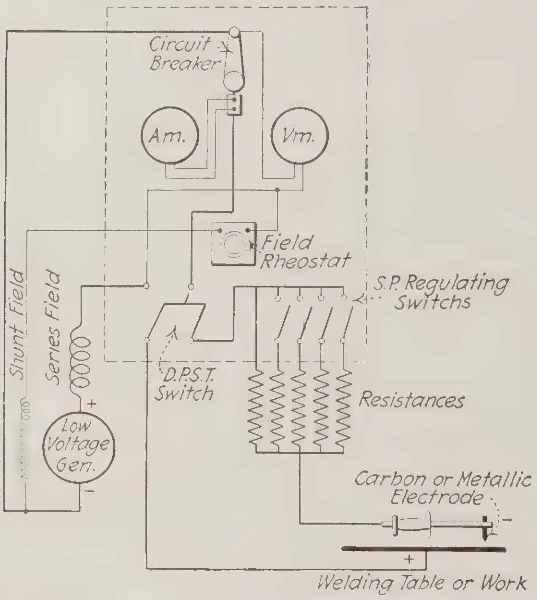


FIG. 2. DIAGRAM OF CONNECTIONS FOR ELECTRIC WELDING

This matter of polarity is also of importance in cases where it is desirable to do welding from the mine haulage circuit, one side of which is grounded. It is usually the case that the trolley wire is positive. It will not do, therefore, to connect the positive wire to the article to be welded without insulating the latter from the ground, otherwise a short-circuit would take place. If the article to be welded is placed on wooden supports, which will insulate it from the ground, then no trouble will occur, and if much welding is to be done it may be found best to make the trolley wire the negative, because with this arrangement no insulating supports will be required for the work. The operator, however, should stand on an insulated platform or mat when working with the welding electrode on the ungrounded side.

In addition to the welding generator and its control equipment, protective coverings for the operator, and electrode holders are required. The electric arc makes a brilliant light, which is highly actinic. If the body is exposed to the bare arc a burn takes place which is quite similar to severe sun-burn. The skin reddens and finally peels off.

It is necessary, therefore, that the entire body of the operator be covered. Ordinary clothing is sufficient protection for the trunk and limbs, while the hands should be protected by gloves, and the operator should not work with his sleeves rolled up or shirt front open. Special protection must be provided for the head, two forms of which are shown in Fig. 4. The hood or helmet, shown to the left, entirely covers the head, and is provided with a colored-glass window through which the workman observes the welding operation. The glass in this window is specially selected to cut off the rays which are harmful to the eyes, and also to reduce the brilliancy of the arc to a degree comfortable to them.

The hood must be used when carbon welding is being done, as this process requires that filling material be added to the weld from time to time, so that both hands must be free. The shield shown to the right in Fig. 4 is used for metallic electrode welding, and is simply held in front of the face, thus affording sufficient protection, since the metallic arc is not so powerful as the carbon arc.

Fig. 4 also shows the two types of electrode holders. The electrode for carbon welding is a hard, solid graphite rod about 8 in. long and ¾ in. in diameter. Although occasionally broken, it does not wear away rapidly, and consequently does not require frequent renewal. The best metallic electrode material is Swedish or Norway iron wire about ⅛ or $\frac{3}{16}$ in. diameter, cut in lengths about 12 in. long. These are consumed quite rapidly, about one per minute, and the holder is designed so that new electrodes can be quickly and easily inserted.

The application of electric arc welding to the repair of machinery, no matter of what type, can be classified under three heads—building up; filling in; welding together.

BUILDING UP

Machinery of all kinds is subject to wear which manifests itself in various ways. The kind of wear which can be repaired most efficiently by the arc welding process is that where friction has gradually ground or worn away the metal. Means are provided in all well designed apparatus to take up some of this wear, but there are limits beyond which it is necessary to replace the worn part. Repair of such parts is, therefore, a "building-up" process, by which it is restored to its original form and dimensions.

There are many examples of this application. Fig. 6 shows a case where the threads on the end of an armature shaft had become so badly worn that they would no longer hold the nut. New metal was welded onto the shaft and the lower view shows the appearance of the rough weld. The upper view shows the same shaft after it was turned and new threads cut. The complete operation in this case cost 65c. and saved more than a new shaft, because this armature was of an old design and not arranged so that the shaft could be pressed out and a new one substituted without disturbing the windings.

Other examples of this class of welding are found in the building up of keyways in shafts, gears and pinions which have become worn and battered so that they no

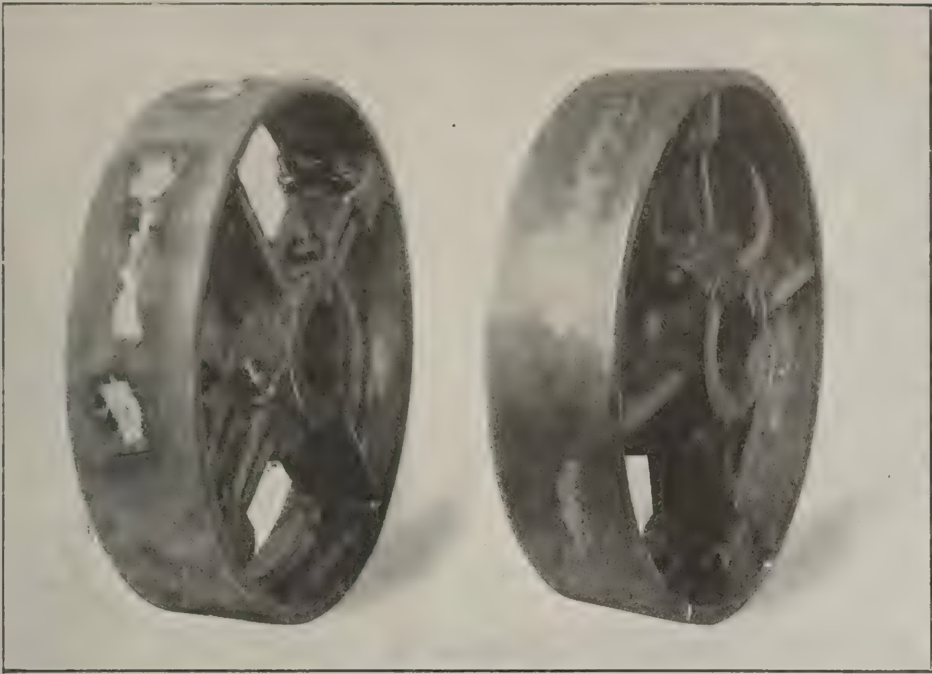

FIG. 5. BLOW-HOLES IN A PULLEY REPAIRED BY ELECTRIC WELDING BEFORE FINAL FINISHING WAS COMPLETE

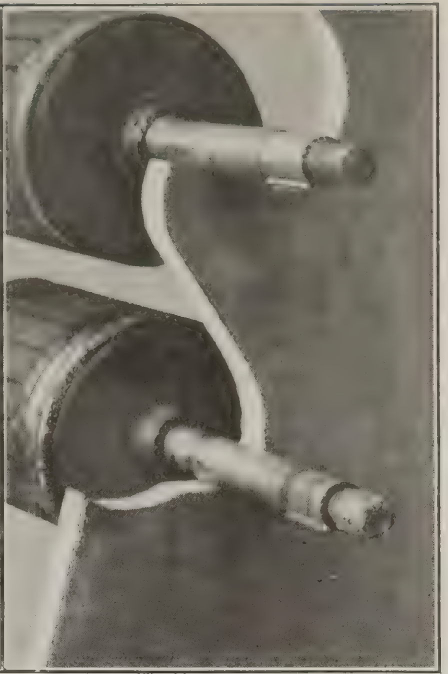

FIG. 6. REPAIR OF A WORNOUT THREAD ON ARMATURE SHAFT

longer afford a tight fit for the key. It is simply necessary to fill them up by the metallic electrode process, after which new keyways can be cut in the same place. Brake rods and the like connected at the ends by pins are apt to have the holes therefor worn elliptical, thus causing lost motion and perhaps failure to operate properly. These elliptical holes can be easily filled up and new ones drilled.

A striking example of this class of repair work is found in steam railroad shops in the case of flat spots on locomotive drivers. When these develop it was formerly necessary to remove the drive wheels and turn the entire rim down to the same diameter in the wheel lathe. This operation was expensive, and also required considerable time during which the locomotive was idle. The new way is to weld fresh metal onto these flat spots by the electric arc, and then grind or file them down to a smooth surface. These operations can both be performed without removing the drivers from the locomotive, and the net saving in money often amounts to over $200.

FILLING IN

Although filling in may appear to be the same as the first process mentioned, nevertheless it is applied to a somewhat different class of work. The filling-in process is peculiarly applicable in repairing steel castings defective by reason of blow-holes, sand-holes etc. The distinction is that the defects have not been caused by wear. This application is common in foundries and machine shops. An example is shown in Fig. 5. The face of a cast-steel brake wheel developed bad blow-holes when partly machined. These have been filled up by the electric arc process, after which the machining has been completed.

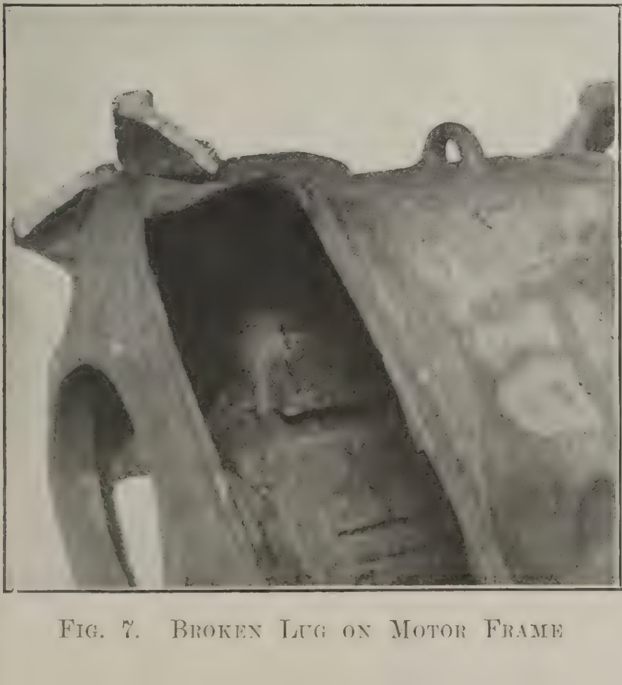

FIG. 7. BROKEN LUG ON MOTOR FRAME

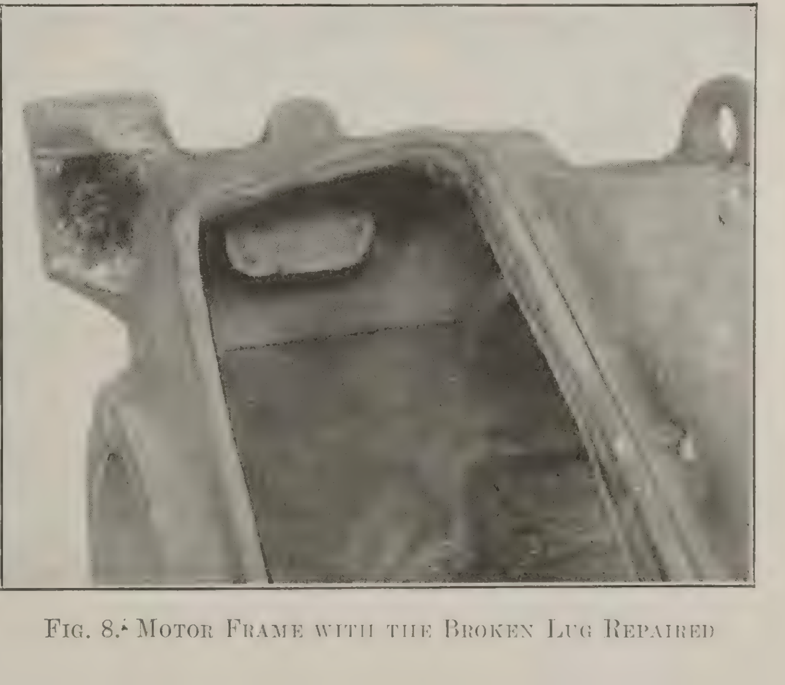

FIG. 8. MOTOR FRAME WITH THE BROKEN LUG REPAIRED

Welding Together

As the name implies, this operation consists in welding together the broken parts of machinery and equipment. This demands considerable care and skill, because the strength of the weld is usually of prime importance in such repairs. A most ingenious application is shown in Fig. 10. Six cast-steel motor frames were received from the foundry lacking the supports for the axle-bearing brackets. This was truly a serious defect, and the case looked hopeless. Arc welding came to the rescue, however, saving the frames and a considerable amount of money as well. Steel bars of suitable dimensions were prepared, and as shown in the picture were securely welded in place. One of the welds is seen plainly at the lower left corner of the motor frame. These welded supports have given entire satisfaction, apparently being as strong as those in a perfect casting.

Another example of this type of repair is shown in Fig. 7. This shows a cast-steel motor frame with a corner broken off. In Fig. 8 the broken piece has been securely welded in place and so skillfully has the work been done, that it is difficult to distinguish the weld.

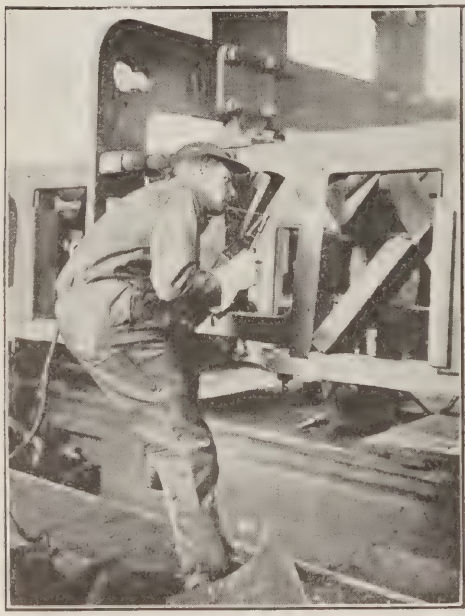

Fig. 9. Welding a Locomotive Frame

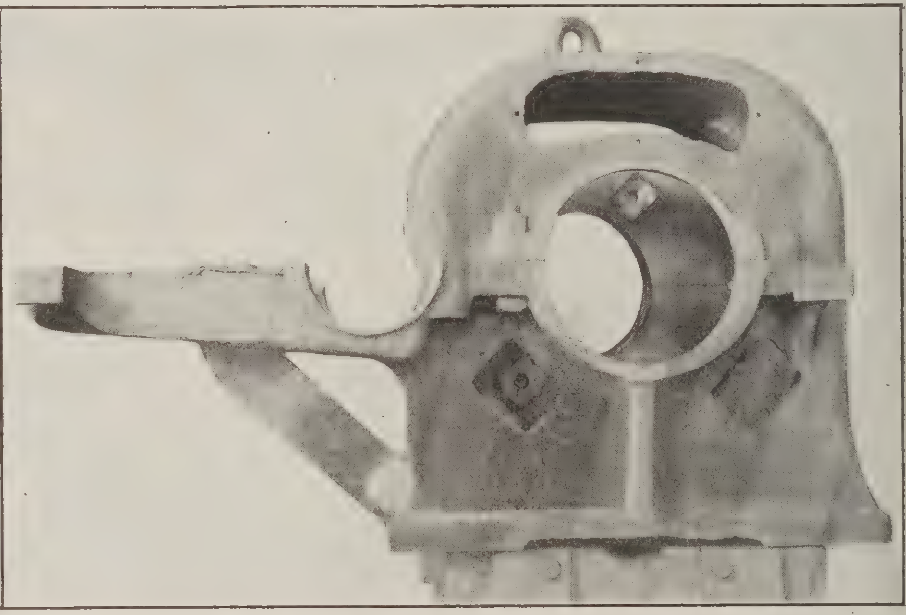

Fig. 10. A Brace Welded to the Bearing Bracket of a Motor Casing

A railroad-shop application is shown in Fig. 9, where a broken frame of a steam locomotive has been repaired by electric welding. The operator has used the metallic electrode process—the arc is not in use and the weld is shown in white. Note how the crack was first notched or V'd out so as to receive the weld properly. In the same manner a broken mine-locomotive frame of the cast-steel bar type could be easily repaired without loss of strength in the frame. The cost of welding the steam-locomotive frame shown in Fig. 9 was $3.29.

The question often arises as to what materials are suited for repairing by electric arc welding. Cast steel, rolled steel, wrought iron and malleable iron can all be welded successfully with uniform results in the hands of experienced workmen. Malleable iron does not weld quite so easily, however, as the other materials mentioned. Cast iron, on the other hand, is not as suitable for welding as steel and wrought iron. It is crystalline rather than fibrous in structure, and furthermore has the peculiarity that it passes abruptly from a solid to a liquid condition, there being no intermediate stage during which it is more or less plastic. The principal difficulty seems to lie in controlling the hardness of the weld, which is usually so hard that machining is impossible despite all precautions.

Probably the best method of procedure is to heat the casting before welding to a white-hot condition and then weld, using the metallic electrode process.

After welding the piece should be thoroughly annealed. If, however, it is not necessary to machine the weld, the above method may not be necessary, although the results of welding are apt to be unreliable and uncertain no matter how skillfully the work be done. If a weld in cast iron will save the day, by all means try it, but do not be disappointed if the results are unsatisfactory.

There are many applications of arc welding in mine repair shops which could be mentioned. Only a thorough examination of the scrap pile can reveal its possibilities, and even then, when once facilities for welding have been provided, new applications will be constantly appearing. It is not experimental in any sense of the term, and should be included in the equipment of every shop engaged in the repair and maintenance of any considerable amount of equipment.

* * *

Canadian Mining Institute will hold its seventeenth annual meeting in Toronto, Can., Wednesday, Thursday and Friday, Mar. 3, 4 and 5. Headquarters will be at the King Edward Hotel. The Eastern Canadian Passenger Association has conceded special transportation privileges to members and their friends attending the meeting, based on the lowest first-class fare for the round trip on certificate plan. The conditions under which these are granted are as follows: (1) A single first-class ticket must be purchased not more than three days (Sunday not to be counted) prior to the opening of the meeting. (2) A standard certificate of such purchase must be obtained from the ticket agent issuing the transportation. (3) The certificate must be indorsed by the secretary of the institute and stamped by a representative of the railways, who will be in attendance at the secretary's office, The King Edward Hotel. (4) A fee of 25c. is charged for the validation of the certificate. Secretary S. Mortimor Lamb, Ritz-Carlton Hotel, Montreal, Que.

The Hampton Roads Coals--III

By F. R. Wadleigh*

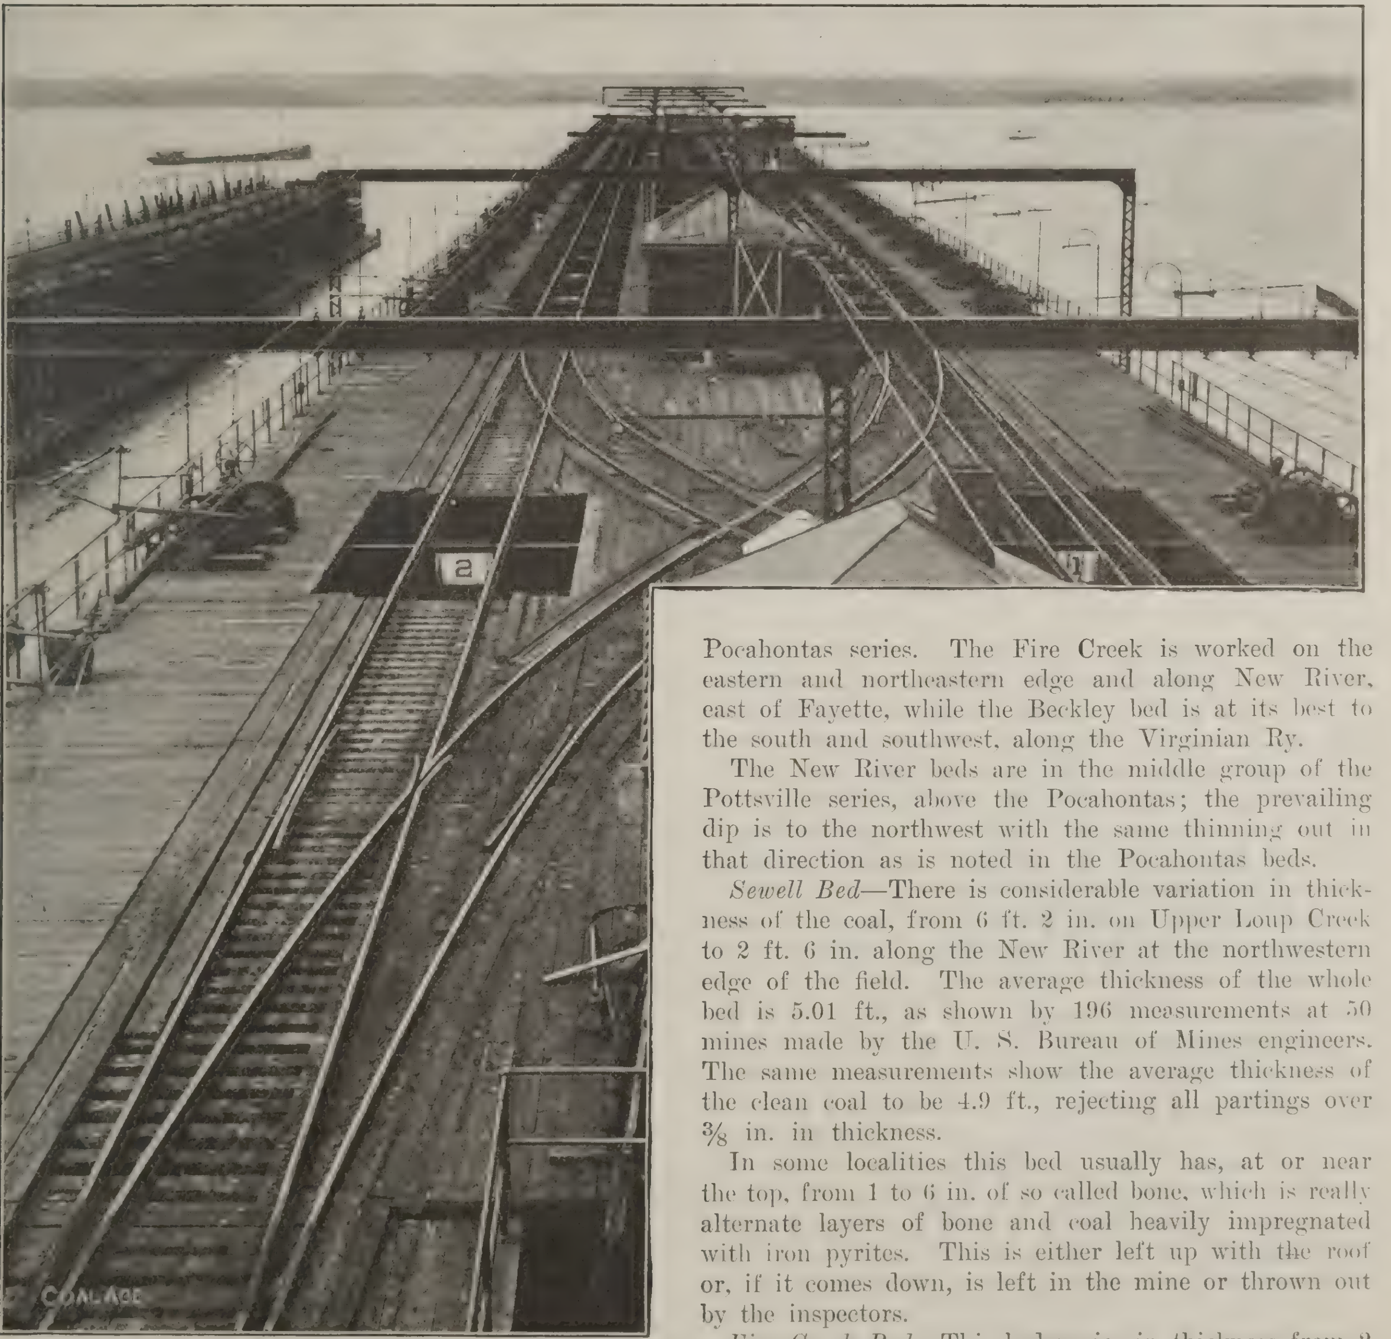
SYNOPSIS—This third installment of this series takes up the New River and Kanawha district coals in the same detail as the other districts have been treated. The fourth and concluding installment will appear in an early issue.

In 1873, the first New River coal was shipped to the East; and 10 years later, when the first shipment of Pocahontas coal was made, the output of New River district was 405,000 tons per annum. From that date to the end of 1913, 104,531,000 tons of New River coal have been shipped. From the Chesapeake & Ohio New River field comes about 63 per cent. of the total output of New River coal.

Coal Beds

The beds mined are the Sewell, Fire Creek and Beckley. The coal from each bed is of the same character, structure and appearance, but with some variation in content, as shown later on; the greatest development is in the Sewell bed, which also covers the most territory. It is worthy of note that at no locality yet developed are more than two of these beds of workable thickness.

The Sewell bed underlies the whole New River area and is correlated with one of the upper beds in the Pocahontas series. The Fire Creek is worked on the eastern and northeastern edge and along New River, east of Fayette, while the Beckley bed is at its best to the south and southwest, along the Virginian Ry.



THE N. & W. RY. CO.'S NEW NO. 4 PIER

The New River beds are in the middle group of the Pottsville series, above the Pocahontas; the prevailing dip is to the northwest with the same thinning out in that direction as is noted in the Pocahontas beds.

Sewell Bed—There is considerable variation in thickness of the coal, from 6 ft. 2 in. on Upper Loup Creek to 2 ft. 6 in. along the New River at the northwestern edge of the field. The average thickness of the whole bed is 5.01 ft., as shown by 196 measurements at 50 mines made by the U. S. Bureau of Mines engineers. The same measurements show the average thickness of the clean coal to be 4.9 ft., rejecting all partings over 3/8 in. in thickness.

In some localities this bed usually has, at or near the top, from 1 to 6 in. of so called bone, which is really alternate layers of bone and coal heavily impregnated with iron pyrites. This is either left up with the roof or, if it comes down, is left in the mine or thrown out by the inspectors.

Fire Creek Bed—This bed varies in thickness from 2 ft. 6 in. on Piney Creek at the east to 6 ft. 11 in. about four miles west of Thurmond. The average thickness is 4.14 ft., as shown by 68 measurements in 20 mines made by the U. S. Bureau of Mines engineers. The average thickness of the clean coal, rejecting partings over ⅜ in. in thickness, is 4.05 ft.

---

*Consulting engineer, 426 Real Estate Trust Bldg., Philadelphia.

Beckley Bed—This bed shows greater local difference of thickness owing to rolls and the variations in the bone or slate partings; where the total thickness is greatest, the partings are also the largest. As high as 11 ft. has been measured, varying down to 4½ ft. in the same mine.

The average thickness as shown by the Bureau of Mines measurements at 35 places in 10 mines is 5.33 ft., the average for the clean coal being 4.94 ft. Measurements by the West Virginia Survey in 22 mines show an average of 5.3 ft.

The slate or bone partings in all these beds vary both in thickness and relative position. In the Sewell and Fire Creek beds, where they thin down to 3 or 3½ ft., the coal is often clean from roof to floor.

Description of Coal

In 1878 a report was issued by the Bureau of Steam Engineering, U. S. Navy, on trials of New River coal, comparing it with anthracite and Georges Creek. This report says:

> New River coal is a first-class steam-producing fuel, 9 per cent. better than anthracite and 5 per cent. better than Georges Creek. Moderately coking, it burned freely, swelled slightly and coked properly, proving a first-class steam coal, well suited for steamship use. It was partly in lump and partly in dust, the latter at once cohering in the fire by coking. This coal requires but little labor in the furnace to work it.

This description applies equally well to the New River coal shipped today. It is of similar structure and appearance to Pocahontas coal, will average lower in ash, slightly higher in volatile and sulphur and has about the same variation in fusing temperature of the ash. It also averages somewhat higher in heat value. Like Pocahontas, it is a strong coking coal, burning with a short white flame and intense heat.

ANALYSES OF CARGO SHIPMENTS FROM HAMPTON ROADS DURING THE PAST THREE YEARS

	12 Cargoes		17 Cargoes		18 Cargoes		48 Cargoes		Slack
	Avr.	Best	Avr.	Best	Avr.	Best	Avr.	Best	
Moisture, dry coal	.....	.....	2.66	.....	0.80	0.80	.....	.....	.....
Volatile matter	20.65	21.50	20.22	21.00	20.58	22.19	21.63	19.2	19.92
Fixed carbon	73.54	73.06	72.58	74.40	74.15	73.53	72.99	77.9	74.64
Ash	.....	5.44	5.62	4.60	4.48	4.28	5.24	2.9	5.00
Sulphur	0.94	0.94	0.91	0.92	0.87	0.80	0.93	0.65	0.83
B.t.u.	.....	.....	14,815	14,942	14,900	15,314	.....	.....	15,018

Supplemental Notes—Average of 51 cargoes as delivered showed 2.49 per cent. moisture. Highest B.t.u. value in 70 cargoes (dry coal) was 15,260, the ash content being 2.90 per cent.; the average of the 70 cargoes was 14,879 B.t.u. The coal in the 12- and 17-cargo lots was from the Sewell and Fire Creek seams and the cargoes averaged 5000 tons each; these two sets of analyses, and that for the slack coal, were made by the Bureau of Mines, and the balance by Navy Department inspectors at Hampton Roads. The average analyses of 29 cargoes showed: Moisture, 2.81; ash, 5.55; B.t.u., 14,812, the maximum B.t.u. being 15,110 and the ash, 3.94. The slack analysis is given to show the average composition of the small coal.

As regards friability, the two coals may be considered about the same; if there is any difference, the New River coal has a slight advantage, as there are a few small areas in the latter district where the coal is distinctly harder than elsewhere in either field. For instance, there is one small mine in the Sewell bed where the run-of-mine coal will average 60 per cent. over 1½-in. screens by actual weight, as against an average of 30 to 35 per cent. in the rest of the field; at another large mine, the average over 1½ in. will run about 46 per cent. There is also an operation in the Beckley bed where the run-of-mine coal will average 50 to 55 per cent. lump and egg sizes.

A 5000-ton cargo of New River coal sent to the Italian Railways was tested for the percentage of small coal by running a large sample over screens 6 ft. 8 in. long, 3 ft. 3 in. wide and bars ¾ in. apart, inclined at an angle of 45 deg.; 35 per cent. of this coal went over the screens, the coal having been handled five times from the mine car.

The New River coals show an increase in volatile matter from the southeast to the north and northwest, exactly opposite to the Pocahontas coals in this respect. This variation applies, however, as a rule, to the Sewell bed alone, the Fire Creek and Beckley showing comparatively little change.

There is also a variation in the sulphur content of the New River coals, which applies almost entirely to the Sewell bed. This variation cannot be placed geographically and follows no direction, although it is most evident in one particular area, near the center of the field.

The variations in volatile and sulphur are as follows, according to the Bureau of Mines analysis, composite samples:

	Volatile			Sulphur		
Bed	From	To	Avr.	From	To	Avr.
Sewell	13.50	25.50	20.07	1.71	0.51	0.82
Fire Creek	14.54	19.42	16.98	0.97	0.47	0.66
Beckley	12.57	17.50	14.79	1.12	0.56	0.77

The ash content shows but little variation in all of the New River coals. Of the three beds, the Fire Creek is slightly higher in ash. The amount of oxygen in these coals also shows small variations and is remarkably low, which fact, with the small amount of ash, explains to a large extent their high heating value.

The ash-fusing temperature of the New River coals shows similar variations to the Pocahontas, from as low as 2200 to over 2600 deg. F. in the coal *as shipped;* some of this variation is doubtless due to difference in the preparation or cleaning.

In 1909, the U. S. Geol. Survey inspectors took samples from nearly all of the mines in the New River and Pocahontas coal fields. In the accompanying table the average analyses are figured from those as given in Bulletin No. 22, Bureau of Mines. In obtaining the averages given, the analysis of the composite sample from each mine was used.

MINE SAMPLES OF NEW RIVER COALS BY THE U. S. GEOL. SURVEY

Kanawha District Coals

The higher-volatile coals from the Chesapeake & Ohio district, a considerable tonnage of which is now being shipped from Hampton Roads, are generally known as Kanawha splint and Kanawha gas coals, rather a misleading classification. "Splints" refers to the laminated fracture of the coal and its supposed resemblance to the Scotch splint coals in that particular. The term Kanawha gas is applied indiscriminately to coals coming mainly from the No. 2 Gas, Eagle and Powellton beds running from 30 to 36 per cent. volatile and used for many purposes. All of these coals come from the Kanawha district, in which there are six beds mined.

In ascending the series of beds, the coal changes, the lower ones containing some hard, splinty layers which increase in thickness until in the upper beds the coal is nearly all hard and of laminated structure, mining out in cubical or oblong blocks; it also has an increased percentage of volatile, and as a rule is somewhat lower in sulphur and with a higher ash-fusing temperature than the gas coals. In fact, many of the Kanawha splint coals may be considered as practically nonclinkering, the ash-fusing temperature showing over 2900 deg. F. in some instances.

The coals in this field were mined a number of years previous to the opening of the New River field. As far back as 1840 they were used at the salt works near Charleston, W. Va., and previous to the Civil War they were shipped by water to the Ohio markets, as they still are to some extent.

Eagle—Analysis No. 1 is the average of samples of air dried coal from 15 different mines, according to the W. Va. Geol. Surv. Analysis No. 2 is the average of 6 samples from one mine where the coal was 7 ft. thick at its best.

No. 2 Gas—Analysis No. 3 is of an average sample from 34 mines, according to the W. Va. Geol. Surv. Analysis No. 4 is of a shipment of mine-run coal, according to the U. S. Bureau Mines Bull. No. 22.

Winifrede—Analyses Nos. 5 and 6 are shipment samples of 1½-in. coal, according to a private report of the Fuel Testing Co. Analysis No. 7 is the same of 2-in. slack and nut. Analysis No. 8 is the average of samples from five mines, according to the W. Va. Geol. Surv., Bull. No. 2. The ash-fusing temperature of the sample used in analysis No. 7 was 2910 deg. F.

Powellton—Analysis No. 9 is of mine samples, according to the W. Va. Geol. Surv., Bull. No. 2. Analysis No. 10 is of a shipment sample, according to the U. S. Bureau of Mines, Bull. No. 22. Analysis No. 11 is of a shipment of 13 cars sampled and analyzed by the U. S. Geol. Surv.

Cedar Grove—Analysis No. 12 is of shipment samples, according to the U. S. Bureau of Mines, Bull. No. 22. Analysis No. 13 is the average of mine samples from five different mines, according to the W. Va. Geol. Surv., Bull. No. 2.

Coalburg—Analysis No. 14 is the average of air dried samples from 13 mines on the C. & O. Ry., according to the W. Va. Geol. Surv. Analysis No. 15 is a shipment sample of 1½-in. lump, according to a private report of the Fuel Testing Company.

Stockton-Belmont—Analysis No. 16 is an average from five mines, according to the W. Va. Geol. Surv., Bull. No. 2.

No. 5 Block—Analysis No. 17 is an average from ten mines, according to the W. Va. Geol. Surv., Bull. No. 2. Analysis No. 18 is the best obtained when making the analysis of No. 17.

There is no doubt that these coals will meet with an increasing demand at tidewater, as they are sold at a cheaper f.o.b. price than the New River Pocahontas coals and, for some purposes, give almost as good results, especially as locomotive fuel.

Typical analyses of the coal from each of these beds are given herewith, beginning with the lowest.

As in the Norfolk & Western fields, these coals are in the Kanawha series, the lower (gas) coals being softer, of columnar structure and lower volatile, and the upper beds containing the so called splint coals.

KANAWHA SPLINT COALS

Nearly all of the splint coals are shipped to the West, where they are largely used by railroads, at power plants, gas works, in the manufacture of malleable iron and for domestic heating. Large shipments are also made to storage plants on the Great Lakes, as these coals stock well and are comparatively free from liability to spontaneous combustion.

The name "splint coals" refers solely to their fracture and not to their appearance, as they are clean and lumpy, but break in layers across the seam instead of breaking with the vertical fracture of the New River and Pocahontas coals. While the latter fuels will average about 35 to 40 per cent. lump at the mines, the splint grades will run 70 to 75 per cent., the coal coming out in large blocks, which stand severe handling. For this reason, these coals are in great demand for use where a lumpy fuel is required, as on locomotives.

It will be seen from the analyses that all of these coals are low in sulphur, comparing favorably in this respect with the New River Pocahontas coals; and what is of more importance, the ash of the splints, while higher than in the other coals mentioned, is practically nonfusible and makes little or no clinkers.

These coals are very easy to fire, ignite readily, burn a long flame and give little waste of unconsumed fuel in the ash. In addition to the high percentage of lumps, they will get up steam quickly, are capable of giving high rates of combustion and a high evaporation per square foot of heating surface (the latter points being desirable features in locomotive operation) and throw comparatively few sparks, requiring also little slicing or raking of the fires.

For metallurgical purposes, especially in the making of malleable iron, these coals give excellent results, as they are low in sulphur and burn with a long flame and no clinkers. They also give good results in either gas-producers or in direct heating.

Owing to these many excellent properties, these fuels are readily sold in the Middle West. For many purposes they are also given preference over the semi-bituminous coals of higher theoretical heating value, such as New River and Pocahontas, especially with various types of overfeed stokers.

For domestic use the Kanawha splints always bring good prices and are in great demand, as they ignite readily, make a beautiful fire and do not injure the grates and heating surfaces.

In general, these coals are adapted for almost every use. They are among the best locomotive fuels in the country, good steam coals, either for hand firing or in stokers, and are excellent coking coals; they are largely used for the manufacture of illuminating gas, and are well suited for producer-gas work.

KANAWHA GAS COALS

It is worthy of mention that a coal from the No. 2 Gas bed gave the highest results of all coals tested, both in evaporation under boilers and in gas-producers, at the St. Louis testing plant of the U. S. Geol. Survey.

Eagle Bed Coal—This bed is correlated with the War

Eagle coals on the Norfolk & Western. It is an excellent steam coal and one of the best coking coals, especially for byproduct ovens. The bed varies in thickness from 4 to 7 feet.

No. 2 Gas Coal Bed—The greatest developments in the Kanawha field are in this bed, as it covers the largest area and varies from five to over ten feet in thickness. It is a good coking coal, an excellent all-around steam fuel, one of the best locomotive fuels in the country and suitable for gas-producer plants and heating furnaces; it is also largely used for the manufacture of illuminating gas and is much in demand for use in automatic stokers.

As might be expected, there is some variation in the constituents of this coal in different localities. As regards heat value, it is at its best near the eastern and southern edge, along the Virginian Ry. territory. There is also quite a little variation in the structure and hardness of the coal in this bed; in some localities it is all rather soft and of columnar structure, while at all other places there is a more or less thick section of a hard splinty coal in the bed.

This coal, as well as that from the Eagle bed, is now extensively used at byproduct coke ovens, mixed with a certain percentage of the lower-volatile New River-Pocahontas coals. The resultant mixture gives about 25 per cent. volatile, which insures a high yield of both coke and byproducts as well as a better product structurally.

Winifrede Bed—This bed covers a large area and considerable new development is now going on, as it is one of the best splint coals in the region. There is a certain amount of the softer "gas" coal in this bed, making it a good all around steam, furnace and domestic fuel, and there is no better coal of its class in the country. The new developments toward the southwest are showing even better than the original openings along the Kanawha River, the volatile matter and ash decreasing and the heat value increasing.

Powellton Bed—This bed underlies a comparatively limited area, with only eight mines opened. It is, however, superior to most of the Kanawha coals for steam or coke making; it is a soft, friable coal of columnar structure, resembling the New River product. The thickness of the bed varies from 4½ to 6 feet.

Cedar Grove Bed—This is the lowest of the splint coal beds. It is largely used for domestic purposes, but is also good steam fuel. It is rather softer than the higher splint coals and the thickness of the bed varies from 2 ft. 10 in. to 3 ft. 6 inches.

Coalburg Bed—This bed has the greatest development of any of the splint coals, covering a large area and varying from 4 to 8 ft. in thickness. Like the Winifrede bed, it contains layers of softer "gas" coal and at one mine a 6- to 8-in. layer of cannel coal. It is interesting to note that these two beds are never both found of workable thickness in the same locality. What has already been said about the splint coals generally applies also to this bed.

Stockton-Belmont Bed—This is another of the splint coal beds, the coal from which is largely used for domestic purposes. It covers a wide territory, the thickness of the bed running from 4 to 12 ft., with partings.

No. 5 Block Bed—This bed in the Alleghany series is identical with the Lower Kittanning of Pennsylvania and the Roaring Creek of northern West Virginia, where, however, it is a semibituminous coal. In the Kanawha field it is a hard, splinty fuel, high in volatile, with layers of softer coal. It is a good steam and domestic coal.

KENTUCKY FIELD

It is probable that some of the coals from this field may come to Hampton Roads in the future, but owing to the freight rate differential, they are of no importance at this time and will not be included in this description, except to say that they are bituminous coking and gas coals.

(*To be concluded*)

Extracts from a Superintendent's Diary

We men have a way of assuming that the weight of the world is entirely upon our shoulders, and we take ourselves seriously in consequence; in fact, if any of our women graciously offer to share the burden with us, we are apt to become quite disconcerted and grave.

But now and then our well meant importance suffers a shock and before our equilibrium is entirely restored we are treated to a little surprise.

For more than a year now I have been giving ear to any suggestion that seemed to offer possibilities toward building up the moral atmosphere of our village; sanitary requirements, housing conditions, street improvements, amusements; in fact, any suggestion was welcomed and an investigation followed. In spite of my desires and best efforts, results have not been satisfactory, and last night I remarked to my wife that it seemed to me that some of the women of our camp were inspiration proof.

My wife put down the embroidery, on which she had been working, deliberately, and in a very impressive manner said: "Say that again, and don't choke on the word women."

I obeyed instructions.

"And now," continued my wife, "will you please recall for my benefit some of the impressive conversations you have had with these women from which they might be expected to absorb inspiration?"

I hesitated; he who hesitates is lost.

My wife followed up the advantage and became eloquent. She always waxes eloquent when she realizes her superiority.

"You men, what do you know about inspiring women? Isn't it about time that you learned that the only way to build up the morals of a community is to listen to the women of the community, instead of attempting to instruct them? What do men know about morals, anyway?"

When my wife addresses me as "men" I do not attempt to interrupt her conversation; experience has taught me that it is not wise, and so I allowed her to continue.

"You build houses that are intended for homes to be ruled over by women, and yet you never discuss the plans with a woman for comment or approval. You decide on sanitary regulations that are to make these homes habitable and you tell the men that they must carry them out. And yet all of the regulations must be carried out by the women if they are carried out at all.

"You decide that you will insist on a certain moral standard for your citizens, and the next day you men appoint a company physician who will eventually drive every woman who craves motherhood out of your camp. A moral atmosphere and no mothers! We lived in such a town in New Mexico."

Fortunately, one of my mine foremen came by for a little conference just then and I was allowed to retire peacefully from my wife's presence.

"Mack," I said to the foreman after we had concluded the business which had brought him to our house, "what do you think would happen if we made an effort to take all of the women in the camp into our confidence whenever matters of social and moral welfare were under discussion?"

"But how would we go about it?" ventured Mack.

"Personal interviews, of course," I replied.

Mack gave me a searching look to see if I were in dead earnest, and then he began to grin.

"Say, Mr. Thompson," he said, "my wife has a jealous streak in her; how about Mrs. Thompson?"

Mack didn't expect a reply, so I didn't disappoint him.

The Labor Situation

SYNOPSIS—Attempts to settle the eastern Ohio dispute fail. The conciliators concede the operators' argument. Trouble in Oklahoma ordered at an end by national union officials.

Failure again marked the efforts of the miners and operators in the eastern Ohio field to arrive at a wage agreement. The conferences which had been held in Columbus, continuing for more than two weeks, were adjourned sine die last week without any tangible results. The miners' representatives finally and conclusively refused the plan of arbitration suggested and Secretary-Treasurer Green announced after a conference of miners' officials that no plan of arbitration would be accepted. Thus all the talking went for naught and the mines are still idle.

The federal investigators Daniel J. Keefe and Hywel Davies completed their work and left for Washington, D. C., to submit it to the Department of Labor. A partial report was given out before leaving which will undoubtedly be included in the complete summary, and some of this we quote as follows:

The Federal Conciliators Support the Operators

It has been said by the miners that the present mining price in the state of Ohio is the equivalent of the price paid under the old contract. The miners say that their equivalent to the mining price is based on the screening percentage of the whole state. But the operators contend that the Policy Committee of the United Mine Workers of America, approved by referendum vote, instructed that each district, sub-district or group of districts was to renew its old contract, except where the method of mining coal has been changed by law or otherwise. In such places the price to be paid for mine run would be the equivalent of the price paid per ton for screened coal.

It has been said that percentages in the Hocking Valley district were 72 lump and 28 screenings, and that the equivalent of the price in that district would be 49.64c.; while in the Cambridge field the percentages were 68 and 32, and the price for that would be 47c.; while in the eastern Ohio field the percentages are 64 and 36 and the price for mine run should be 44.61c. If this is true, it would show that the Hocking Valley district has received a reduction of 2.64c. on the equivalent price they paid under the old contract; and that the price for the Cambridge district of 47c. per ton is equivalent to the price paid last year. So that if the miners and operators should conclude a contract on any price less than the price paid or established in the state of Ohio, the operators in the Hocking Valley could not make serious objection to it, because they have already received a reduction of 2.64c. on the last year's price. And if the percentage is correct for the Cambridge field, the operators there could not advance any argument why their scale should be lowered.

The eastern Ohio district includes Harrison, Belmont and Jefferson Counties and a small portion of Monroe. But the northwestern part of Jefferson County belongs to the Bergholz district, and a small part of Harrison is also not included as part of the eastern Ohio area.

The Freight Question

A protest was filed recently with Governor Willis against the rates on coal from Hocking Valley points destined for Lake Erie. These are alleged to be discriminatory in favor of West Virginia coal, by the United Mine Workers of Ohio. John Moore, president of the Ohio miners, told Governor Willis that there is no truth in reports that eastern Ohio miners will support the Gallagher senate bill, which seeks to amend the mine-run law by permitting miners and operators to sign a contract on another basis than the mine-run system. The governor was told by the committee that railroads charge 75c. a ton for hauling Ohio-mined coal from Armitage, Athens County, Ohio, to Toledo, while they haul West Virginia coal from the same point for 35 cents.

The Work of Starting a Pump Too Heavy for a Mine Foreman

Three representatives of the International body of the United Mine Workers were obliged to make a trip to Spadra, Okla., recently to restore discipline among 150 striking miners, who had refused to recognize their contracts with two of the mines at that place, and who remained idle against the orders of their district managers. The miners disregarded a telegram from President White, instructing them to resume work and submit their grievance to the district board of the union and operators, as provided in their contract.

Upon learning this, Mr. White sent Vice-President William McLaughlin, District President Edward Cunningham, and International Organizer Rube Fern to Spadra as his personal representatives. Not until their arrival did the miners return to work. The mines in which the trouble occurred are those of the Spadra Creek Coal & Mining Co. and the Eureka Mining Co.

The miners went on strike first in the early part of January, but returned to work at the direction of their district managers. The sole grievance was their objection to the custom in the Eureka company's mine of having the mine foreman start and stop the electric pump and attend to oiling it. The miners demanded that a pumpman be hired for that duty.

They did not submit the question to the board for arbitration, and under the terms of the contract, the operators assessed the stipulated penalty for failure to do so. The men protested against this penalty, and a second time quit work, still without the consent of their district managers. President White's agents persuaded them to submit their grievance in the proper way, and the question of hiring a pumpman is now pending before the district board of operators and miners.

The President's Colorado Coal Commission

The commission appointed by President Wilson, consisting of Seth Low, Charles W. Mills and Patrick Gilday, on Jan. 19 wrote to the "open-shop" operators of Colorado, drawing attention to the arrangement of the Colorado Fuel & Iron Co., by which the men have formed a species of union to confer with the employing company on the conditions of employment and other matters of concern. The commission points out "that any plan under existing conditions is likely to be received more cordially and be acted upon more successfully if it reaches its final form in coöperation with the President's commission, and that it would be likely to be better received by the public."

In reply 71 operators, having in their employ 7546 men and producing 5,024,193 tons in 1914, declare that they watch the action of the "Fuel company" with interest, but are skeptical as to its success. They declare that the laws requiring them to recognize union labor are unconstitutional, and that checkweighman have always been conceded to the miners. They call attention to the fact that the Colorado legislature, now in session, is about to provide a board of mediation, so that one like that in the anthracite region is unnecessary.

The National Elections of United Mine Workers' Union

The national election of officers for the United Mine Workers' Union is now reported closed, with John P. White, president, receiving 153,389 votes; Frank J. Hayes, vice-president, 150,558 votes; William Green, secretary, 122,768 votes. John P. White and Frank J. Hayes were unopposed, but William Green had an opponent in J. L. Sims, who received 45,378 votes.

It is creditable to the union that White, who has had nothing but defeats to his credit, with the exception of the victory in the West Virginia strike, and who, faced by bad times, has not raised wages appreciably anywhere, has been returned to office. It shows that the miners are not fickle, and are willing to follow a leader of character even if success does not fall to his lot.

Hand Firing of Boilers

"Hand Firing Soft Coal Under Power-Plant Boilers," is the title of Technical Paper 80, just issued by the United States Bureau of Mines, as an aid to the firemen employed in manufacturing establishments throughout the United States.

The paper, which contains descriptions of methods of firing soft coal under power-plant boilers and of methods of handling fire so as to make the least smoke and to get the most heat from the fuel, seeks to meet the needs of the men, many without a technical education, who are employed in small plants of 1000 to 2000 hp. capacity. For this reason the language used is plain and simple, and technical terms have been avoided as far as possible.

The publication under "General Directions on Firing Soft Coal," makes the following statements:

The Fire Should Be Uniformly Thin

When burning bituminous coal under power-plant boilers the best results are obtained if the fires are kept level and rather thin. The best thickness of the fires is 4 to 10 in., depending on the character of the coal and the strength of the draft. The coal should be fired in small quantities and at short intervals. The fuel bed should be kept level and in good condition by spreading the fresh coal only over the thin places where the coal tends to burn away and leave the grate bare.

Leveling or disturbing the fuel bed in any way should be avoided as much as possible; it means more work for the fireman and is apt to cause the formation of troublesome clinker. Furthermore, while the fireman is leveling the fires a large excess of air enters the furnace, and this excess impairs efficiency.

The ash-pit door should be kept open. A large accumulation of refuse anywhere under the grates should be avoided, as it may cause an uneven distribution of air. Whenever a coal shows a tendency to clinker, water should be kept in the ash pit. All regulation of draft should be done with the damper and not with the ash-pit doors.

Making the Charge Even

In firing, the fireman should place the coal on the thin spots of the fuel bed. Thin and thick spots will occur even with the most careful firing, because the coal never burns at a uniform rate over the entire grate area. In places where the air flows freely through the fuel bed the coal burns faster than in places where the flow of air is less. The cause of this variation in the flow of air through the different parts of the fuel bed may be differences in the size of the coal, accumulations of clinker, or the fusing of the coal to a hard crust. Where the coal burns rapidly, the thin places form.

Before throwing the fresh coal into the furnace the fireman should take a quick look at the fuel bed and note the thin spots. In a well-kept fire these spots can usually be recognized by the bright, hot flame. The thick places have either a sluggish smoky flame or none at all. In order to place the coal over the thin places the fireman should take a rather small quantity of coal on his scoop, for it is much easier to place the coal where it is needed with small shovelfuls than with large ones.

Coal Does Not Burn in High Places

The coal should be placed on the thin places in rather thin layers. If the fireman attempts to fill up the deep hollows in the fuel bed at one firing, the freshly fired coal may fuse into a hard crust thus choking the flow of air, causing the fuel to burn slowly and starting new high places. If the high places in the fuel bed are missed on one or two firings the hard crust at the surface will gradually burn through or crack, thus allowing more air to flow through, and the place will get back to its normal condition.

Of course, if the high place in the fuel bed is caused by clinker the flow of air will not be free until the clinker is removed with the fire tool. Whatever may be the cause of the high places in the fuel bed, the fireman should remember that they are places where the coal does not burn. There is no use in placing coal on such a place.

When Firings Are Infrequent

If the firings are too far apart the coal in the thin spots may burn out entirely, allowing a large excess of air to enter the furnace in streams. If those streams of air are not properly mixed with the gases from the coal, only a small percentage of the air is used for combustion, and most of it passes out of the furnace, depriving the boiler of considerable heat.

If, for instance, air enters the furnace at atmospheric temperature, say 75 deg. F., and leaves the boiler at about 575 deg. F., it carries away the heat that was absorbed in raising its temperature 500 deg. F. This heat is lost to the boiler. Another loss of heat occurs when holes form in the fuel bed, because pieces of unburned coal fall through the grate when the fireman attempts to cover the holes with fresh coal. Therefore, in order to avoid the formation of holes, firings should be made at short intervals, particularly if, for any reason, the fuel bed must be kept thin.

Copies of Technical Paper 80 may be obtained by addressing the Director of the Bureau of Mines, Washington, D. C.

⁂

A Portable Dead-Weight Tester

The accompanying illustrations represent a new portable device for testing pressure gages by dead weight. Differential pistons have been utilized to create a hydraulic multiplication, and friction between the parts has been minimized, says *Power* for Nov. 3. The gage to be tested need not be removed from its working position after putting in a tee below the gage. This instrument may be used with or without tubing and tripod to reach an elevated gage or as a bench machine without a tripod. The oil used to transmit pressure to the gage also serves to keep the working parts lubricated.

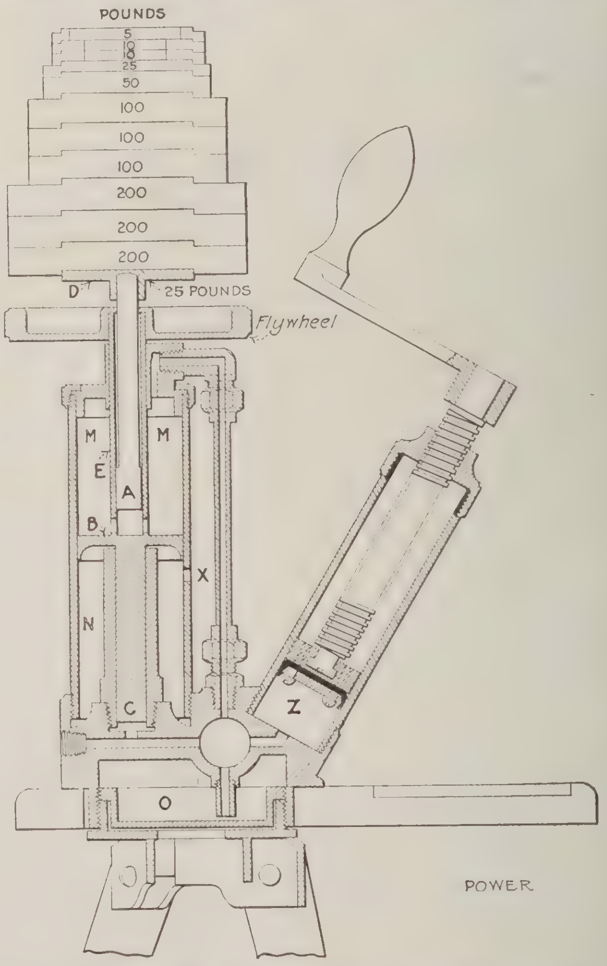

Fig. 1. Section through Portable Dead-Weight Tester

The design is based on the fact that the pressure applied to the surface of a fluid is transmitted to every part of it. Referring to Fig. 1, the area *B* is an exact multiple of the area A. If the area B, for example, is 20 times that of A, and a one-pound weight is placed on the tray of the piston D, its pressure is transmitted undiminished to each surface unit of area B. In other words, the area B is exerting a pressure of 20 lb. on the area C. For example, let the area C be ⅕ sq.in. Hence the weight registered by the gage is 20 × 1 × 5 or 100 lb. per sq.in. In the same way the proportions of the plungers have been worked out to read pressure in kilograms per square centimeter. Decreasing either or both of the areas A and C, B remaining constant (for manufacturing purposes), the gage reading increases. If A and C increase, the pressure under C decreases.

As the weight employed is multiplied from 1 to 500 times, according to the capacity of the machine, so likewise the retarding effect of the friction would be multiplied. This serious obstacle has been overcome by the attachment of the flywheel to the piston E. The inertia of the floating weights allows the piston E to rotate around the piston D free from the effect of friction. The flywheel, carrying with it the piston E, eliminates the effect of friction within the cylinder, thus allowing the weights employed to give their true multiplied weight. The weight of the pistons is regulated in different instruments to give a reading of an even five on the gage for convenience. This is known as the initial constant and in high-capacity instruments is 25 lb. Therefore, when the weights, 1000 lb., are placed on the tray, the gage, if correct, should read 1025 lb. If it fails to register according to the weights used plus the initial, the error is at once evident. The constant value of a dead-weight test makes it the only true test.

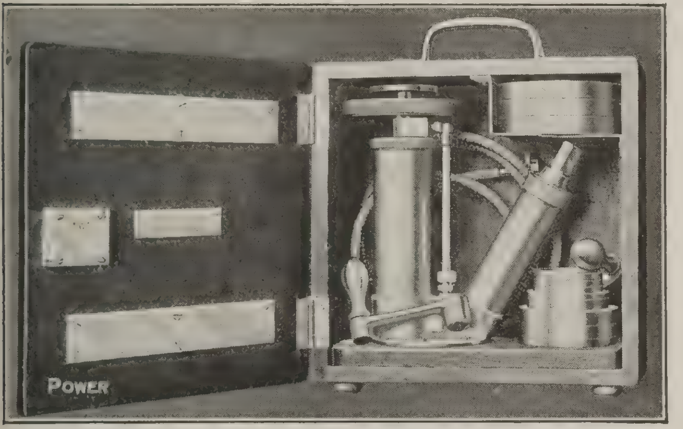

FIG. 2. TESTER IN CASE

This instrument is initially filled by immersing the tube in a vessel of oil and unscrewing the handle shown at the left of Fig. 1. This fills the oil cylinder Z, after which it is conveyed to the gage when attached and below the areas A and C. The direction of flow is controlled by the three-way cock. When the test has been made, the oil is stored for the next test in the reservoirs N and O, which are connected by a duct, and to the reservoir M, if desired. Air compression below the area B is eliminated by the hole X.

This equipment may be packed in a case, Fig. 2, its weight being but 17 lb. for tests from 1000 to 5000 lb. and as low as 13 lb. for tests to 500 lb. Heretofore, 200 lb. dead weight has been necessary on the ordinary ⅕-sq.in. tester to make a test to only 1000 lb.

This instrument was invented by Richard C. Cox, Cambridge, Mass., and is manufactured by the Simplex Tester Co., Brattle Building, Harvard Square, Cambridge, Mass.

Recent Legal Decisions

Damages Recoverable for Conversion of Coal—When a railway company converts to its own use coal entrusted to it for transportation, the damages recoverable by the owner are measurable by the reasonable market value of the fuel at the place where the appropriation occurs. (Texas Court of Civil Appeals; Campbell vs. Q., A. & P. Ry. Co.; 170 Southwestern Reporter, 859.)

Place Where Coal Company May Be Sued—A coal company organized under the laws of Maryland, operating mines in Pennsylvania, and authorized to do business in New York, may be sued in any one of the states for injury to a miner sustained in Pennsylvania. (United States District Court, Northern District of New York; Teti vs. Consolidated Coal Co.; 217 Federal Reporter, 443.)

Surrender of Leases—The mere fact that a lessee of coal lands indicates a purpose in the future to surrender his lease, and make no further payments to the lessor, and his subsequent failure to make payments, does not establish a surrender. The president of a corporation, as such, has no implied authority to surrender a lease belonging to the company. The release must be evidenced by corporate action the same as a conveyance of property. (West Virginia Supreme Court of Appeals; Laing vs. Price; 83 Southeastern Reporter, 497.)

Assumption of Risk by Miner—Where a miner was required to sound the roof of his working place and set props after blasting, he assumed the risk of being injured through a fall of slate where he started to remove coal without conforming to that custom. And this is so although he was only 20 years old, it appearing that he had worked in the mine more than a year and understood the nature of his work as well as if he had been an adult. (Kentucky Court of Appeals; Music's Administrator vs. Northeast Coal Co.; 170 Southwestern Reporter, 971.)

⁂

The Efficiency Expert

The devil opened the furnace door
And heaved in a shovel of coal,
When out there popped on the scorching floor
A truculent, half-baked soul.
"Look here, good devil," it said, "I pray
You will pardon my seeming haste,
I am—you must listen to what I say—
Appalled at your awful waste!

"Two-thirds of your heat goes up the flue,
Your coal is but half consumed;
If a modern plant should compete with you
This business were surely doomed.
Your times and motions I've studied well,
As you hustle the sinners in,
And I find you have here but a third-rate hell
For the way it is run is a sin!"

The devil grabbed up that critic then
With an angry shake and a flirt,
And said, "Go back to the world of men,
You efficiency expert!
If you stay down here you will get my job,"
(Here he uttered a dismal groan),
"But if you go" (here he gave a sob),
"You will fix up a hell of your own!"

Editorials

The Rockefeller Foundation

Among the illustrious personages who testified before the Industrial Relations Committee was one George W. Kirchwey, professor of law in Columbia University. We cannot help quoting his testimony, for it points out a real danger existing in the Rockefeller Foundation, which it is to be hoped we shall escape, but which, in all true Americanism, we feel assured of meeting even if we do not escape it.

Mr. Kirchwey is said to have made the following remarks. We presume they have not been glossed over, and we make somewhat broadly the assertion that we think we understand a part of them, just as we comprehend a small part of the publications of many other of our college professors who are writing on economics, not always with conspicuous clarity.

> I should say that there was grave doubt as to whether the court would interfere with the Rockefeller Foundation by dissolution or otherwise if it undertook to use its funds in an educational campaign against workmen's compensation acts and against widows' compensation.
>
> That it might furnish publicity agents to the Colorado Fuel & Iron Co. is a possible contingency that I have considered.
>
> I should say that was extremely doubtful because of the fact that it is promoting a specific business enterprise there, and it would, I think, be very hard for it to persuade a respectable court that was not wholly under the influence, let us say, of the Colorado Fuel & Iron Co., but that there is a proper use of the corporation's funds.
>
> I believe it could hire strikebreakers in the present state of public judicial opinion. Perhaps 10 years from now, no. It depends upon the progress of public opinion in the meantime.

Now there *is* and we will not deny it, a distinct danger that the Rockefeller Foundation may be put to bad uses. It may, for instance, engage such men as George W. Kirchwey, Scott Nearing, formerly instructor in economics at Swarthmore College, Pennsylvania, Richard Theodore Ely, professor of political economics at the University of Wisconsin, Henry Rogers Seager, professor of political economy at Columbia University, and even James Henry Brewster of the University of Colorado. With such men leading public opinion it might strive to bind capital with the cords of labor so seriously as to strangle the one and starve the other.

The men we have mentioned have already been appointed to positions largely paid, at least in most cases, out of foundations created by rich men like John D. Rockefeller, Sr. Their conclusions are probably wholly opposed to those of the men who donated their money to found the professorships and to build the colleges in which their lectures are delivered. In the sense, however, that their income is derived from the donations of rich men and that increased influence can be secured only by further contributions from the same source, these men are themselves the "hirelings of capital." We do not see that this fact has restrained their liberty.

All we do see is that Mr. Kirchwey desires to restrict the liberties of others. He does not believe in free speech for any one who disagrees with himself. Liberty to his narrow mind is permission to live on the benefactions of capital and spurn the hand that bestows it. He would muzzle all other men who do not agree with him but have an idea that a liberal man is to be honored no matter how rich he may be, if his actions are honorable.

He is afraid that the Rockefeller Foundation, being, as he believes, a stepchild of the Colorado Fuel & Iron Co., will be opposed to pensions. We deny the relationship between the two, but if the coal company has commanding influence over the foundation it is quite likely that the latter will *advocate* pensions, seeing that the former has already established them.

In a degree we are afraid of the foundation until the legislature puts a clause in the constitution of that body excluding Mr. Kirchwey and all like him from participating in its affairs. But we are confident that it can do little harm, no matter into whose hands it may fall. We are not afraid of discussion, for we do not fear that the good judgment of the public will be much swayed by specious arguments.

⁂

Coastwise Freights

No subject has been more discussed in the coastwise trade since the first of the year than the spectacular advance in ocean freight rates. There has been a worldwide shortage of ocean freighters since the war began, but it took five months for it to cause any advance in rates on the Atlantic seaboard. As far back as September the first steam colliers were withdrawn from their usual service between Hampton Roads and New England to take grain to Europe, but the bituminous trade was so depressed that this loss of available ships did not greatly handicap coal shippers. Even when the number increased and sailing vessels began to be chartered for South America their absence was hardly felt.

It remained for the prolonged bad weather to bring forcibly to the coal trade that there was an actual shortage of boats coastwise and a few urgent orders were enough to send freights from 65 to 70c. up to $1 to $1.10, all within three or four days. There the flurry stopped; pressing requirements were supplied, enough bottoms were found for the business offering, but rates have been held firm on the $1 basis.

Meanwhile a few more coal steamers had been chartered on terms up to $45,000 per month for a 7500-ton ship, some fore-and-aft schooners had closed at $3500 to $5000 per month for the Mediterranean, all to take cotton, and today there is no disputing the fact that there is only enough tonnage for a very modest movement of bituminous coastwise during the current season. The bottoms that can be brought from off the lakes are few in number and ill-suited for the trade, and the coal interests face a situation as complex as it is unusual.

The agencies that have transportation of their own have only enough ships to care for their requirements for such a year as 1914; they are hardly in position to undertake more. On the other hand, the shippers who are dependent on bottoms in the open market have so far been unable to cover their requirements for the year at less than the current rate, and this in a market that insists on a delivered price.

The shippers *with* transportation set out to collect a premium for it, but general conditions were not encouraging enough to induce buyers to enter the market, except at a very slight advance over last year. These shippers therefore have sacrificed most of their extra profit. It is true they have some contracts, and those without bottoms have not, but consumers who have bought will draw from the same sources as last year and those who have not bought are more than likely to wait for propositions from those supplying them between now and Apr. 1. In other words, there is a stalemate; the one shipper wants to realize an extra profit on his transportation and can do so to only a small degree; the other wants to get transportation that will allow him to compete, and cannot. The results will be very much restricted shipments, at least for a while, after the 1914-1915 arrangements have expired.

The problem is, will present freights hold? If they do, then either those who own transportation will profit largely or the shippers without will be forced to net back a much smaller return to the mines in order to compete.

The Water Problem in the Anthracite Region

The amount of water to be handled in the anthracite region has probably reached a maximum, though greater depth will probably make the pumping of it year by year more difficult.

It is generally thought that the amount pumped should increase proportionately with the tonnage, but where the area over which operation takes place is but little increased this may not happen. The water enters the mines and is pumped out, and the rainfall is a better criterion of the water to be discharged than the tonnage mined. Of course much of the water in the anthracite regions is removed by tunnels. One long series of connected ditches connects the Forest City mines of the Hillside Coal & Iron Co. with the Coal Brook mine of the Delaware & Hudson Co., at Carbondale, and thence the water runs by gravity to the surface.

The Lausanne tunnel has a series of passages 13 miles long draining 14 collieries in the Panther Creek basin between Mauch Chunk and Tamaqua. The tunnel, 7500 ft. long, and its various connections took some few years to construct, so that the effect of its driving cannot be definitely traced to any one year. Connections were made between 1910 and 1913.

The first Oneida tunnel in Schuylkill County, 5600 ft. long, was driven about the same time. It relieved 5 large mine pumps. Later in 1913 another Oneida tunnel was driven 7030 ft. long which laid off 20 large pumping units, one of which was lifting water 500 ft.

It is largely to these changes that the reduction in water pumped is due. Still, unwatering the mines is an extremely heavy burden, far greater than that which troubles bituminous mines anywhere. A Welsh mine records as an exceptionally heavy inflow 8 tons per ton mined. The average rate in the anthracite field of this country is seen to be much heavier despite all that has been done to convey to the surface all waters entering the mine above drainage level and to prevent the inflow of surface waters.

The billions of tons pumped per annum seem almost unbelievable and lay a heavy burden on the cost of producing anthracite. The table we publish below will be found extremely interesting from this point of view. Unfortunately we learn that the water raised by skips is not included as water pumped.

CAPACITY OF PUMPS AND WATER PUMPED IN GALLONS PER MINUTE, TONS PER YEAR AND TONS PER TON OF COAL PRODUCED FROM 1903 TO 1913

Year	Capacity of Pumps Lifting Water to Surface, Gal. per Min.	Capacity of Pumps Lifting Water to Surface, Tons per Year	Capacity in Tons per Ton of Coal Produced	Gal. of Water Pumped per Min.	Tons of Water Pumped per Year	Tons of Water Pumped per Ton of Coal Produced
1903	745,690	1,634,179,635	21.7	447,351	980,369,716	13.0
1904	770,286	1,692,703,485	23.0	446,120	980,348,700	13.3

Destination vs. Delivered Weights

There is a disposition on the part of prominent Indiana and Illinois operators to get together on certain features of contract business which have tended to materially reduce revenue in past years. One example in particular is the elimination of destination weights, and a disinclination to sell coal on a delivered basis.

Some of the consumers of steam coal, more especially public service corporations, contend that they should buy coal not only at destination weights but on a delivered basis. The competition for their tonnage, which is of considerable volume, has been so keen that this point has usually been conceded. The loss on shipments sold in this way has been found to approximate from 3c. to 6c. per ton because the operator is obliged to not only absorb the shrinkage in transit but assume the responsibility for pilferage, or any claims for loss or damage which arise before delivery to consignee.

The larger producers are discussing these questions with more frequency lately. Inasmuch as they are obliged to pay the miners for every ton of coal loaded at the pit mouth, they feel that all sales should be made at the same weights.

Looking Ahead

The next issue of COAL AGE will contain a valuable article describing a longwall conveyor and loader for use in thin seams. This machine can be moved forward as fast as the face advances. Actual results covering its use in Canadian mines are given. Another article next week will cover in detail the equipment and operations of a new mine in Utah. The mine is worked on the three-entry plan, the pit cars being weighed by an automatic recording machine. Coal dust is burned as fuel under the boilers. Other articles in this same number will deal with "Our Export Opportunities," "A Serious Accident Due to Flooding in a Canadian Mine," "Practical Rules for Cutting Mine Timber," "Facts the Consumer Should Know When Purchasing Coal," "A New Electric Mine Lamp." The March 6 issue of COAL AGE will be devoted exclusively to "hoisting and hauling," and will contain seven of the most valuable articles on these subjects that have ever been published.

Sociological Department

Kindergartens of the Colorado Fuel & Iron Co.

SYNOPSIS—The Colorado Fuel & Iron Co. has probably the only kindergartens to be found in the coal-mine villages of the United States. These have been established for many years and are quite popular among the employees.

We read a few weeks ago in the papers the statements of the union leaders about the illiteracy in the coal-mining camps of the Colorado Fuel & Iron Co., and as even we are prone to believe just what our union friends tell us, we were disposed to concede that the company had probably shown no particular energy in school work and had settled itself down to accept pioneer conditions with illiteracy and poor schools as part of the natural drawbacks.

But receiving a copy of the medical and sociological reports of the company for 1913-1914 we were led to ask Dr. R. W. Corwin for copies of earlier bulletins, and, after getting all he could supply, we importuned J. F. Welborn for more, and so we find that the Colorado Fuel & Iron Co., far from being a laggard in educational matters, was a leader in 1903 and still is unexcelled by any other coal operators in 1915.

CHARGE OF ILLITERACY IN COLORADO FUEL & IRON CO. CAMPS

If there is any illiteracy in the Colorado Fuel & Iron Co.'s camps the discredit of that fact must be laid principally to the individuals themselves or to the lack of fostering care of their native countries. If the leaders of these men in their revolts against order had done one-hundredth part as much for them as their employers, they might with much better grace condemn the company for the illiteracy of their followers.

But it is of kindergartens we would speak today, and first we would quote from the "Annual Report of the Sociological Department of the Colorado Fuel & Iron Co., 1903-1904." The summary of the welfare work of the company was made by Dr. R. W. Corwin, who was both chief surgeon of the Minnequa hospital and superintendent of the sociological department. He is now general manager of the work, and the Rev. E. S. Gaddis is superintendent. And, since 1906, a new president of the company rules instead of F. J. Hearne, namely J. F. Welborn. But the sociological department and the kindergartens are still active, and therefore we need no apology for quoting extensively from the report above mentioned. Please remember, however, that it was written in 1904, over ten years ago.

A REPORT MADE TEN YEARS AGO

The spread of the kindergarten movement during the last twenty or thirty years has been a significant fact in the educational life of America. From the first kindergarten started by Elizabeth Peabody and a few other women, who firmly believed in Froebel and his principles, they have come to be a part of the incorporated school systems in most of our large cities. But kindergartens in a mining community and supported entirely by a mining corporation are, as far as we know, unknown outside the camps of the Colorado Fuel & Iron Co.

The aim of the kindergarten is to develop the three-fold nature of the child—his physical, mental and spiritual self—and his creative self activity. The kindergarten is but the first step in the process of education; it is the stepping stone between the home and the school.

THIRTEEN VILLAGE KINDERGARTENS

The company is now supporting kindergartens in each of the following camps: Sopris, Rouse, Starkville, Engleville, El Moro, Pictou, Primero, Segundo, Tercio, Berwind-Tabasco, Redstone and Crested Butte, while a new one is to be opened Sept. 1 at Walsen mine, thus making a total of 13 in all. Within the last 12 months the school boards at Berwind-Tabasco, Primero, Segundo and Tercio have been paying the salaries of their kindergarten teachers or have been issuing certificates of indebtedness covering advances made by the company for this purpose. In all the other camps except Redstone, the company assumes not only the operating expenses but the teachers' salaries as well.

COLORADO FUEL & IRON COMPANY-PUEBLO-COLORADO
FREE KINDERGARTENS IN MINING CAMPS

AWARD IN 1904 FOR FREE KINDERGARTENS

PECULARITIES OF WORK IN THIS FIELD

Our constituency makes necessary a few noteworthy differences in methods from those of the ordinary kindergarten. Many of the children come to us with no knowledge of English. This makes the first work with them difficult, but it is astonishing how soon they learn to speak and sing. Because of the deficiency in language a greater degree of occupation and construction work is given, since the children can imitate the teacher's work long before they can understand or follow language. An extensive use is made of pictures and objects.

The kindergartner is obliged to employ more than the usual amount of rhythm work and physical culture as the little bodies are often stiff and untrained. Many more than the usual number of games are played, and here again the progress is remarkable. Much time has been devoted to nature study, illustrated by construction work, which is in many cases exceptionally good considering the little hands that made it. Fairy stories, patriotism, courage, kindness and gentleness have been illustrated in this way and also by freehand cutting, drawing and water-coloring.

Books were made of the children's work, illustrating the Thanksgiving, Christmas and Easter thoughts, and these were carried home. Some of the homes are decorated with the children's work.

The strike disturbances have made surprisingly little difference in the attendance, for even where the strikers were compelled to keep off company ground it was no uncommon sight to see the mothers bring the children to the picket line and pass them through to the school, thus showing their confidence in the kindergarten teacher and the company that made her work possible.

Crested Butte

Special reference should here be made to the new kindergarten opened June 1, 1904, at Crested Butte, for it has the distinction of being the youngest in the system, the largest in enrollment and the greatest in elevation, being a mile and a half above sea level.

A new kindergarten is also to be opened at Walsen mine Sept. 1, 1904, and the school house is being enlarged and moved to a more central location in order to accommodate the little ones.

Christmas in the Kindergartens

Although the strike was at its height at the holiday season it was not allowed to interfere with the happiness of the children. In keeping with the universal custom, the kindergartens made much of the joyous time and celebrated it with elaborate Christmas entertainments. The trees were decorated with bright and attractive ornaments of the children's own making, and fathers' and mothers' faces lit up as they received the simple gifts on which their own little ones' fingers had been busy for days beforehand.

Gifts for the little ones themselves were provided by the company in the form of a varied assortment of toys, so that each child received a substantial reminder of Santa Claus. The Colorado Supply Co., as usual, donated a generous supply of candy and oranges and in addition a box of fine French mixed candies for each teacher. The unburdening of the tree was preceded by simple exercises performed by the children, in several instances in conjunction with the public-school demonstrations.

Gold Medal for Kindergartens

While we have no kindergarten at Lime, Colo., there are many children of kindergarten age, and they were included this year in the Christmas remembrance. This seemed fitting as they had just dedicated a new schoolhouse at that place, and the tree and little gifts gave the children a pleasant introduction to their new building. About three hundred little ones were thus remembered in the various camps.

Teachers' Houses

The plan of setting apart separate houses for the use of the kindergarten teachers has amply justified itself, for not only are the teachers comfortably housed and sure of a permanent abode during the school year, but the houses have become headquarters and centers for social work. The furnishings of the teachers' rooms are thoroughly practical and sanitary and are intended to serve as a standard of taste from which housekeepers may realize how much may be accomplished with comparatively small expenditure. Teachers' houses are now fitted up in Berwind-Tabasco, Primero, Segundo, Engle, Rouse, Pictou and Crested Butte.

Teachers' Monthly Meetings

On the last Saturday of each month the kindergarten teachers have met regularly in Trinidad under the direction of their superintendent, Mrs. Margaret G. Grabill, for the purpose of conferring about their work and receiving instructions and suggestions.

At each conference some special line of work is taken up, demonstrated and discussed, and not only have the individual teachers been helped in this way but an esprit de corps has been developed that is of great value.

Pueblo State Fair

An exhibit of kindergarten work was made at the Colorado State Fair held in Pueblo in September, 1903, and the diploma to be awarded for the best work was given to our display.

Louisiana Purchase Exposition

A much more complete exhibit of kindergarten work was sent to St. Louis where it is attracting considerable attention because of its unique character and excellent workmanship. Whole mining camps, farmyards, houses and barns, gardens, windmills, kindergarten rooms, four- and five-roomed houses, each room furnished appropriately and all made by the little children, are among the features of the display.

Before the exhibit was sent to St. Louis it was displayed in the large show windows of the Colorado Supply Co. in Trinidad to the great delight of the passers-by. For a week or more there were groups of interested men and women constantly in front of the windows admiring the work and in many instances their delight was enhanced when they recognized the handicraft of their own children.

As will be seen in our illustrations the Colorado Fuel & Iron Co. received, as it richly deserved, a gold medal and a certificate in recognition of its free kindergartens in mining camps. For its kindergarten and the best industrial exhibit, it received another medal. A silver medal was granted for its method of housing employees in mining camps.

On our front cover will be seen how even the kindergarten children are being trained in first aid to the injured. We wish we could show you the pretty classrooms and the beautiful stages where these little "tots" are taught self-expression. We do not wonder at the enthusiasm of Doctor Corwin. Our readers would, we are sure, share it with him.

Anthracite Miners Good Patrons of Movies

The growth of the moving-picture business in the anthracite region of Pennsylvania shows a startling increase in the amount of money devoted to this form of entertainment. Five years ago there were nine motion-picture theaters in Wilkes-Barre with an aggregate seating capacity of about 1800. At the close of 1914 the aggregate seating capacity of the sixteen motion-picture theaters in Wilkes-Barre was over 10,000.

Of these theaters one represents an investment of $200,000, one an investment of $150,000 and a third an investment of $50,000, as compared with the $4000 or $5000 which was the average cost of the little theaters of five years ago. One of these theaters charges from 15c. to 20c. admission, one charges 10c. and the rest 5c. Most of them give performances from 10 in the morning until 11 at night, and prominent film men state that at the extremely moderate estimate of filling the theaters only once a day the aggregate daily receipts are $750, or over $32,000 a year.

There are four film exchanges in Wilkes-Barre, a city of 75,000 inhabitants, an unusual number for a place of this size, but it is in the center of the anthracite region, which is stated to have more moving-picture theaters per square mile and more seating capacity per capita than any other section of the United States except the big cities. Every little hamlet in the region now has two or three theaters.

The population of the anthracite counties, according to the latest census report, is 1,122,361 persons; so if Wilkes-Barre, with a population of 75,000, spends $32,000 a year on moving pictures, the total expenditure throughout the region is probably about $480,000. The anthracite mine workers, their wives and families number 822,960 persons, or 73 per cent. of this population. This means that at least a quarter of a million dollars of their wages are spent annually on moving pictures. The proportionate calculation makes it $350,000.

Discussion By Readers

Mining Laws, Legislation and Mine Regulations

Letter No. 32—In a general way, I am familiar with the mining laws of most of the coal-producing states and have followed the present discussion in Coal Age with intense interest. Many important suggestions have been made, the adoption of which would, I believe, result in a material advance toward the goal of safety in mines.

In most mining laws that I have studied, it seems to me that too much is left to the discretion of the mine inspector. In this respect, our law makers have seemingly failed to take into account the human factor, which is always involved when an enactment is made subservient to the judgment of an official. Such a law is, in my opinion, too loosely defined and provides a loophole for its frequent violation.

While the mine inspectors throughout the United States are unquestionably, as a body, well trained and conscientious in the performance of their duties—men endowed with as high ideals of public service as it is possible to expect, it must still be admitted that they are but human and fallible. Among the number, there are, as a matter of course, a few who are incompetent and others who lack judgment, while still others are prone to show partiality in their dealings. For this reason I believe mining standards should be clearly defined by laws that would specify in simple, definite terms the numerous requirements necessary to safety in mining operations. To arrive at a proper standardization in respect to mining, I would suggest the appointment of a board of experts to work under the direction of the Federal Bureau of Mines. The findings of such a board, properly appointed, would not be tinged with the intrigues of state politics.

The duties of the board would be to consider the conditions in the various coal fields of the country, and, after a careful study, to determine the requirements that will provide the greatest degree of safety under existing conditions. Their efforts should be to standardize the requirements in regard to conducting ventilating currents; the construction of stoppings and air bridges; the shooting of coal and the timbering of working places; the best and safest methods of lighting mines; the safeguarding of electric installations in mines; and the foolproofing of mining machines and all mechanical appliances. In fact, the board should endeavor to standardize all mining requirements, methods and construction, as far as these relate to safety.

When the findings of such a board have been submitted to and approved by the several state departments of mining, they should be made the subject of special enactment in each state, in order to bring the mines operated in that state under their requirements.

I know there is a deep-rooted prejudice against a standard way of doing many things in mining. It is argued that each separate case requires individual treatment. However, I believe most intelligent mining men will agree that it would be better to have standard methods and standard requirements that are suited to different conditions of mining and legalized by state enactments so as to wholly eliminate the human factor, which always results in the haphazard, disjointed and widely diversified systems that are now so prevalent in the different coal-mining states.

In closing, permit me to say that I believe that such a standardization as I have suggested would, to a marked degree, relieve the mine foreman from the embarrassment attending his present position, to which frequent reference has been made in this discussion. It would enable him to carry out, in good faith, the orders of both the superintendent and the inspector. It would bring into conformity the orders of a superintendent issued with an eye single to costs, and those of an inspector whose eye is blind to everything but safety.

Flat Top Engineer.

Crumpler, W. Va.

Letter No. 33—The West-Virginia mine-foreman law does not render coal operators in that state immune from liability, generally, for injury to miners resulting from a company's negligence or failure to install and maintain suitable and safe machinery, tools and appliances. This fact is emphasized in a decision just handed down by the West Virginia Supreme Court of Appeals, in the case of Crockett vs. Black Wolf Coal & Coke Co., 83 Southeastern Reporter, 987. The court holds that the immunity of a company is limited to the duties imposed upon the mine foreman by the expressed and implied terms of the law. Accordingly it was decided that the law could not avoid defendant's liability for death of a mine motorman, caused by his coming in contact with an improperly attached trolley wire.

After pointing out that the mine-foreman law should be strictly construed in favor of injured miners, inasmuch as it abridges a long established right to recover for negligent injuries, the court shows that there is no language in the law that is fairly subject to an interpretation that would place upon the official any statutory duty of inspection, oversight, or repair of mining machinery or appliances, such as wires and cars; although said official is bound to "keep a careful watch over the ventilating apparatus" and pumps. "Nowhere," says the court, "does the statute say that the mine foreman shall see that the miners or other employees are provided with safe or suitable tools and appliances."

The decision holds that the jury was warranted in finding that defendant was guilty of negligence in failing to discover and repair the defective condition of the trolley wire, which neglect resulted in the accident, although the defect had existed only 16 or 18 hours.

Under the statutes of Alabama, a miner is not deprived of the right to recover for an injury resulting from a fall of slate, merely because he knew of the defective condition of the roof before the accident occurred, unless it was his duty to prop the roof or it could be shown that some negligence on his part caused the roof to fall. The section of the mining law of that state which requires operators to provide props for use in working places does not absolve the operator from his duty to prop the roof, except where employees are specially directed to perform that duty. (Alabama Court of Appeals, Phillips vs. Lookout Fuel Co., 66 Southern Reporter 946.)

Other instances could be cited where mining laws could be improved so as to more clearly define the duties and obligations imposed.

A. L. H. Street,
Attorney at Law.

St. Paul, Minn.

Letter No. 34—I have followed with much interest the discussion, in Coal Age, of mining laws, and desire to call attention to a few points that I believe have been neglected in previous letters.

The first point is the advisability of making *refuge stations* in mines compulsory by law. In an article entitled "Safety First—the Slogan Cry," Coal Age, Vol. 3, p. 790, I advocated the enactment of a law requiring that refuge stations should be provided in all coal mines where the number of men employed underground exceeds 50; so that in case of an explosion of gas or a mine fire or any serious accident cutting off access to the surface, the workmen might find refuge in such chambers. In that article I tried to demonstrate the blessing such stations would have proved to many of our poor unfortunate brothers who have been entrapped and have lost their lives; but who would have been saved had such refuge chambers been provided in the mine. To prove this, I referred to numerous mining disasters that have occurred both in this country and in Europe, of which the records show that the victims lived, in some cases, several days before finally being overcome by the afterdamp.

I want to say, also, that the use of *naked lights* in mines generating gas should be prohibited by law. The lives that have been sacrificed on the altar of the naked light have been legion. In this list must be included the loss of life in mine fires that have been caused by the ignition of gas or combustible material stored in the mines, by the use of open lights. The accidental ignition of powder or detonating caps by sparks from open lights, which has so often resulted fatally, must be included in the same list. The large number of accidents from this cause should be sufficient testimony to warrant the enactment of a law prohibiting the use of naked lights in mines generating gas.

I am inclined to think that some form of electric light will provide the best means of illumination in coal mines. Electric lamps seem to be giving satisfaction to the companies who have installed them. When safety lamps are used, only a fully approved type of lamp should be adopted. Such lamps should be used in mines showing the least trace of gas, especially where fine dust is produced in greater or less quantity by the operation of the mine. In my opinion, only such types of lamps as are approved by the Bureau of Mines should be employed.

In this connection, I would draw attention, also, to the subject of *mixed lights* in mines. I believe the use of mixed lights should be wholly eliminated in coal mines. Many lives have been sacrificed, simply because the management of the mine permitted the use of naked lights in certain portions of the mine, while one or more sections of the same mine were operated exclusively on safety lamps. An accidental fall of roof or a careless or forgetful employee has, in many such cases, been the cause not only of his own death but that of his fellow workmen.

I wish, in closing, to refer to one other point; namely, the *life of certificates of competency*. In my opinion, all coal-mining officials should be examined at least every five years, until they reach the age of 50, when they might be exempt from further examination. I believe such assistance would be a great stimulus to the efficiency of mine foremen and firebosses, since they would have to keep posted and uptodate on all matters of importance in connection with their work. This would be necessary, as all examinations would naturally keep pace with the improvements and advance made in coal mining. I believe that such periodical examinations should not only be made compulsory by law, but should be advocated by all mining corporations on the ground that such a system would provide naturally for more intelligent and efficient service, and insure, to a greater degree, the safety of men and the security of the mine and property.

J. W. Powell,
General Contractor.

Windham, Mont.

⁂

Stopping Payroll Leaks

Some time ago, Coal Age invited a discussion by readers of the leaks that occur in coal-company accounts. The nature of mining accounts makes it impossible for the heads of operating departments to accurately check the various items of expenditure.

For example, the usual method of paying a contract miner is to have his account kept by an underboss and handed by him to the mine foreman, who in turn sends it to the colliery clerk and it is thus entered upon the payroll. The payroll is always most carefully checked, as to addition and extensions; but the correctness of the time turned in is seldom checked. The only check made at most collieries on a breast miner's account is the final check measurement of his breast when he has completed it, and if he should have a squeeze or any other common accident closing the place it cannot be measured.

There is no question but that the large majority of mine officials trusted with handling the payment of their employers' money are honest and would gladly welcome a check on their work. The check measurements made by the engineers when a place is completed do not begin to tell the complete story of the cost of the work measured. Those measurements show only the total distance driven. The many other items, which run quickly into high figures, are not included and cannot be, without considerably complicating the accounts, and increasing the labors and responsibilities of the mine foreman and his assistants. The nature of the numerous allowances of time, powder, etc., made for the constantly changing conditions that require the setting of timbers, sheet-ironing, driving headings, shooting rock, erecting batteries and platforms and other expenses is such that they go by without a check.

In order to stop the possibility of leaks, in the payment of contract miners, the only course open seems to be some method that will enlist the mining engineers as a vital part of the payroll force, in the way that they will check all items paid to other than company hands. It will of course be impossible to make such checking apply to every payroll at the time it is due; but leaks can be caught, and the dangerous act of a foreman in arranging a price unknown to his superiors, which might afterward return to plague both him and them, will be avoided.

One source of temptation to a payroll clerk inclined to be "crooked" is the fact that the paymaster is not always informed when a man leaves the service of the company at a colliery; and it is possible then for a man to work a portion of a month, at the colliery of a big company and, through the aid of the timekeeper be paid for the whole month. For instance Stiney Balone is an employee of No. 4 colliery and leaves after having worked, say ten days in the month. By connivance with such a one, a dishonest foreman, timekeeper, or payroll clerk may report him as still on the roll and the main office or the paymaster will not know his account should have been closed on the tenth.

Where a company operates one or more than one colliery a man should be compelled to show a record of his former connection with the company if he has any, and if not he should be compelled to at least state the time and place where he was last employed. A form should be furnished every man who transfers from the outside to the inside workings, or who comes from another company; and he should be required to fill out the same with his full name, as it appeared on the payroll of the company who employed him last, together with the date he quit his last place. The foreman or timekeeper should then date and turn this form in the same day, to the office, for entry on the payroll.

A vexing leak is often caused by the ease with which some fellows change their names and leave balances on the companies' books, for supply-house charges. The form just mentioned should be given by an employee when he seeks employment at other collieries of the same company, in the same locality. By requiring this form as the final act to secure employment at another colliery of the same or another firm, or in another department of an individual colliery, the possibility of an employee who is a drifter going from one job to another will be stopped. When a man is discharged he is usually sent to the colliery office and a statement of his time is given him. His record thus comes to the paymaster's notice and he closes the account. But it is the fellows who quit during the month and who, without getting their time statement, secure another job at the same colliery, that give the most trouble, because their names allow manipulation on the part of a timekeeper or clerk; and for these the suggested form would be most useful.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

The Heavy Hydrocarbon Gases—The heavy hydrocarbons occur in the coal measures as occluded gases, only to a limited extent. Of these, there are but two that are worthy of mention; they are

Olefiant gas, ethene or ethylene, (C_2H_4); sp gr., 0.978;

Ethane, (C_2H_6); sp. gr., 1.0366.

Both of these gases are colorless and odorless; they occur but to a limited extent in association with methane; and their chief importance lies in the fact that they each have a wider explosive range and a lower temperature of ignition than pure methane. The analyses of the gases exuded from coal rarely show any appreciable quantity of olefiant gas (ethene); but ethane (C_2H_6) occurs more frequently as an occluded gas. The following table gives the percentages by volume of the constituents of natural gases obtained from various coals, in different localities.

TABLE SHOWING THE COMPOSITION OF GAS EVOLVED FROM COALS AT 212 DEG. F., IN VACUO.

Locality	CH_4	N_2	CO_2	O_2	C_2H_6	Remarks
South Wales	....	62.78	36.42	0.80	...	Bituminous
South Wales	63.76	29.75	5.44	1.05	...	Bituminous
South Wales	87.30	7.33	5.04	0.33	...	Steam coal
South Wales	93.13	4.25	2.62	...	...	Anthracite
Lancashire	80.69	8.12	6.44	...	4.75	Cannel
Lancashire	77.19	5.96	9.05	...	7.80	Cannel
Westphalia	....	89.91	7.50	2.59	...	Gas coal
Westphalia	34.85	58.48	2.56	4.11	...	Gas coal

The following table gives the composition, by volume, of blower gas in different localities, which shows in a general way a higher percentage of methane, in comparison with that of nitrogen. This may be due, to a large extent, to the higher rate of transpiration of the methane, as compared with nitrogen, which tends to increase its percentage in blower gas over what actually exists in the pores of the coal:

TABLE GIVING COMPOSITION OF BLOWER GAS IN DIFFERENT LOCALITIES

Locality	CH_4	N_2	CO_2	O_2	CO	C_2H_4
Austria	88.9	10.8	1.0	0.3	...	...

Wilkes-Barre, Penn. ..	94.2	3.3	1.1	0.9	0.1	0.4

It is important to remember that the occluded gases of coal are not chemically combined with the constituents of the coal as shown by analysis, and do not form a part of the coal itself, although adding much to its inflammability and heat value.

The Coal Age Pocket Book

Occlusion of Gases—The occlusion of gases in coal or other solid substances is the result of the absorptive power of the substance for that particular gas. For example, platinum, palladium, gold and other metals, as well as coal (carbon), absorb varying quantities of hydrogen, nitrogen, oxygen, hydrocarbon and other gases.

The most common **examples of occlusion** are the absorption of hydrogen by platinum; and of methane, nitrogen, oxygen and carbon dioxide by coal and coal dust. The law that governs this absorption is unknown. The occluded gas is often held very strongly by the substance with which, however, it is not combined.

The occluded gases of coal seams **were probably produced** in the metamorphic processes that formed the coal; and their absorption (occlusion) in the solid formation may have resulted in the oxidation, to a limited extent, of the carbonaceous matter that was being transformed into coal. Such reactions, if taking place in the measures, together with the consolidation that accompanied the formation, would naturally give rise to the observed pressures of occluded gases.

The **pressure of occluded gases** in coal formations is very variable, depending not only on the conditions attending the occlusion; but to an even greater extent on the impermeability of the infolding strata, which has prevented the escape of the gases from the measures where they were formed.

Transpiration, Emission of Gases from Coal—The gases occluded in coal exude from its exposed surface in the same manner as perspiration exudes from the pores of the skin. The term "transpiration" relates to the motion of a gas through a capillary tube and thus describes the emission of gas from coal.

The **velocity of transpiration** is according to a different law from that governing the rate of the diffusion of gases. For the same gas, the rate of transpiration varies directly as its pressure or density, and inversely as the length of the tubes through which it must pass. The velocity of transpiration is independent of the material that forms the tube, but is affected by temperature, being less for a higher temperature, and vice versa.

TABLE GIVING THE RELATIVE VELOCITIES OF TRANSPIRATION OF MINE GASES (AIR = 1)

Gas	Relative Velocity	Gas	Relative Velocity
Hydrogen	2.066	Carbon dioxide	1.237
Olefiant gas	1.788	Carbon monoxide	1.034
Methane	1.639	Nitrogen	1.030
Hydrogen sulphide	1.458	Oxygen	0.903

The above table gives the relative rates or velocities with which the common mine gases transpire, referred to the rate for air as unity. The actual rate of emission of gas from coal, however, will depend chiefly on the pressure of the gas in the coal. Any sudden fall in barometric pressure is always accompanied with an increase in the emission of gas from the coal.

Inquiries of General Interest

Pumping by Compressed Air

I am in charge of a mine that has recently been flooded. The steam pump that we are using makes slow progress in draining the mine. As we have two air compressors that are at present idle and there is a 6-in. borehole that reaches from the surface to the lowest part of the mine, a depth of 180 ft., it occurred to me that we might employ the compressed-air method for unwatering the mine by pumping compressed air through a pipe to the bottom of this hole.

At present, the water stands 100 ft. deep in the hole. The borehole is 1600 ft. from where the air compressors are located. I would like to know the size of pipe necessary to convey the air from the air compressors to the bottom of the borehole, and the pressure that will be required at the compressor to transmit the air through the pipe and raise the water from the mine. I will be glad if you can give me any information that will help me in this matter.

JAMES KILKER.

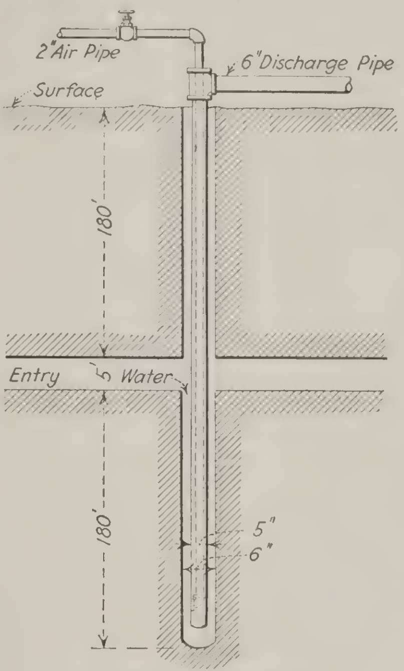
Jessup, Penn.

An article on this subject appeared in COAL AGE, Vol. 5, p. 121. In the same volume, p. 560, was described an improved system that combined pumping with compressed air and the air-lift feature, which could not be applied, however, in the present instance where the problem is one of draining a flooded mine.

Before answering this inquiry, we might suggest that the operation of an ordinary pump by compressed air has the special advantage that the pump can be operated equally well when it is completely submerged. When operating a submerged pump by compressed air, it is first necessary to drive the water out of the air cylinder, which will require an air pressure corresponding to the head of submergence; or (if the exhaust pipe is carried up the shaft) to the vertical distance of the exhaust discharge above the pump. When the air has been expelled from the air cylinder two cases are presented: 1. If the air cylinder exhausts under water, the air pressure must be equal to the entire head of discharge or the entire lift from the pump to the surface. 2. When the air is exhausted through a pipe extended above the level of the water in the shaft, the air pressure required to operate the pump will then be only equal to the head of discharge less the head of submergence, or the vertical height of the point of discharge at the surface above the level of the water in the shaft. This will increase, however, as the water level in the shaft is lowered.

Referring, now, to the case in hand where correspondent suggests the use of compressed air to form an air lift in a borehole 180 ft. deep, it may be stated that such an air lift has been found to work economically only when the head of submergence is practically 50 per cent. of the vertical distance from the surface to the bottom of the hole. Disregarding frictional resistances, the air pressure required is then equal to the head of submergence of the pipe in the hole. To start the flow of water in this column pipe, which is submerged to a depth of 100 ft. will require an air pressure of $100 \times 0.434 = 43.4$ lb. per sq.in. In the present case, however, after the flow is once started the air pressure is required to overcome a head of only $180 - 100 = 80$ ft. The working pressure is therefore $80 \times 0.434 = 34.72$ lb. per sq.in. at first, but increases as the pumping proceeds.

It must be observed that, as the water level in the shaft is lowered, the system will reach its limit of efficiency when the depth of water or the submergence of the pipe is one-half the depth of the shaft, or 90 ft. At this stage, the system will work with less and less efficiency until it ceases to operate. In order to apply the air-lift system effectively, in this case, therefore, it will be necessary to sink the borehole to a total depth of 360 ft., so that the submergence in pumping will never be less than 50 per cent. of the total depth. This will, of course, increase the air pressure required.



DRAINING A MINE BY AIR LIFT

Referring to the accompanying figure, a 5-in. pipe is shown dropped into a 6-in. hole, which has been sunk to a total depth of 360 ft., or double the distance from the surface to the coal seam. The effective working pressure for this depth is $180 \times 0.434 = 78$ lb. per sq.in. Assuming an initial pressure at the compressor plant of, say 85 lb. per sq.in., and using a 2-in. pipe to conduct the air to the borehole, and dropping the same sized pipe (2-in.) down the hole inside of the 5-in. pipe, will give a loss of pressure of 3 lb. per sq.in., which will make the terminal pressure $85 - 3 = 82$ lb. per sq.in. This pressure will be sufficient to overcome the friction and elevate the water to the surface, for the subsequent drainage of the mine under normal working conditions.

When starting the operation of unwatering the mine, in this case, the actual submergence of the pipe is $180 + 100 = 280$ ft. This will require a terminal pressure at the bottom of the hole of $280 \times 0.434 = 121.5$ lb. per sq.in. To obtain this terminal pressure, it will be necessary to maintain a pressure of, say 125 lb. per sq.in. at the beginning of the operation. As the water is lowered in the shaft, this pressure will gradually be reduced to 85 lb. per sq.in., as previously stated.

Examination Questions

Miscellaneous Questions

(Answered by Request)

Ques.—What are the general causes of mine fires, and what precautions should be taken to prevent them?

Ans.—The most frequent causes of mine fires are the spontaneous ignition of fine coal and slack mixed with the waste of the mine in abandoned and poorly ventilated places. Other frequent causes are the ignition of gas, either accumulated at the roof or in void places or issuing as feeders from the strata, the gas being ignited by the flame of shots in blasting the coal. Fires are also caused by the careless use of open lights in stables and oil shanties or other places where combustible material is stored. The short-circuiting of electric wires may cause a serious fire.

To prevent such occurrences strict regulations should be enforced in regard to throwing the fine coal and slack back in the waste, instead of loading it out of the mine. Greater care is needed in the inspection of the mine to detect the presence of accumulated gas and to reduce the dangers incident to blasting. Where conditions are particularly dangerous in this regard, every working place should be carefully inspected and competent shotfirers should be employed to charge and fire the holes. Strict regulations should also be enforced in regard to the storing of combustible matter in the mine and the use of open lights, the handling of explosives, etc. A thorough daily inspection should be made of all electric installations underground.

Ques.—What conditions would you take into consideration in reference to the work of removing pillars so as to recover the largest percentage of the seam possible, keeping in view safety and economy?

Ans.—In order to obtain the largest recovery of pillar coal, it is necessary to carefully consider the nature of the roof, floor and coal; the thickness, inclination and depth of the seam; the width of the pillars and length of time they have been standing; and, finally, the means to be employed in removing the pillars, whether this be accomplished by pick or machine. After a careful study of these conditions, a plan of extraction and system of timbering should be adopted that will provide the greatest safety to the workmen and the largest recovery of coal, with the smallest expenditure of time and money.

Ques.—What is the cause of the large number of accidents occurring in mines and what steps should be taken to avoid them?

Ans.—This a many-sided question, and the answer will be modified by the conditions existing in particular cases. In general, however, it may be stated that the chief cause of mining accidents is to be traced to the general disposition of mine workers to assume unnecessary risks and to postpone or neglect to take ordinary precautions for their own safety and that of their fellows. This disposition is largely the result of ignorance of mining conditions, the effect of which is not fully appreciated by men who have neglected to study the principles of mining and who depend too much on their experience as miners. The largest number of accidents in mines occur at the working face and are due to the fall of roof and coal, owing to insufficient timbering.

In order to avoid the occurrence of mine accidents, it is necessary, *first,* to enforce strictly all regulations that tend to insure the safety of the worker; *second,* to maintain a constant and thorough inspection of every working place in the mine; *third,* to encourage the study of mining principles, on the part of all mine workers.

Ques.—In working a dusty mine, where marsh gas is given off, what steps would you take to guard against accidents from explosions?

Ans.—Provide for the thorough ventilation of all working places in the mine, by maintaining an ample supply of air and conducting the same in separate splits throughout the entire mine in such a manner as to cause the air to sweep the coal face in all live workings and prevent the accumulation of gas in cavities in the roof or void places and abandoned workings. Old and abandoned workings should be carefully sealed off and closely watched. Abandoned places not thus sealed should be thoroughly ventilated. The entire mine should be carefully and thoroughly examined by competent firebosses not more than two or three hours before the men go to work, each shift. The mine should be worked exclusively with safety lamps, and no open lights should be permitted to be used, except by drivers working on the main intake airways. All roads and airways in the mine should be regularly and thoroughly cleaned and a proper system for spraying the roads and humidifying the mine air should be installed and maintained in good condition. Only permissible powder should be used in blasting the coal, and all holes should be inspected, charged and fired by competent shotfirers. No more than a specified number of men should be permitted to work on the same air current. All safety lamps used by the men should be owned by the company, and these should be thoroughly inspected and cleaned at the end of each shift.

Ques.—The water gage in a certain mine reads 2 in. when the velocity of the air current is 500 ft. per min. and the length of the air course is 4000 ft. What will be the water-gage reading in this mine when the air course has been extended to 8000 ft. and the velocity of the air current increased to 800 ft. per min.?

Ans.—Assuming a single air current in each case, the pressure or the water-gage reading will vary as the length of the air course and as the square of the velocity of the current. In other words, the water-gage ratio is equal to the product of the length ratio and the square of the velocity ratio. Therefore, calling the required water gage in the second case x,

$$\frac{x}{2} = \frac{8000}{4000}\left(\frac{800}{500}\right)^2 = \frac{2}{1}\left(\frac{8}{5}\right)^2$$

$$= \frac{2 \times 64}{25} = 5.12$$

and $x = 2 \times 5.12 = 10.24$ in.

Coal and Coke News

Washington, D. C.

The House of Representatives has just passed the sundry civil appropriation measure, which carries the provision for the annual expenses of the Bureau of Mines. The detail of the appropriations for the coming year is as follows:

For general expenses, including pay of the director and necessary assistants, clerks and other employees in the office at Washington, D. C., and in the field, to be expended under the direction of the Secretary of the Interior, $70,000;

For investigation as to the causes of mine explosions, methods of mining, especially in relation to the safety of miners, the appliances best adapted to prevent accidents, the possible improvement of conditions under which mining operations are carried on, the use of explosives and electricity, the prevention of accidents, and other inquiries and technologic investigations pertinent to the mining industry, $347,000;

For investigation of mineral fuels and unfinished mineral products belonging to or for the use of the United States, with a view to their most efficient mining, preparation, treatment, and use, including personal services in the bureau at Washington, D. C., not in excess of the number and total compensation of those so employed during the fiscal year 1913, $135,000;

For inquiries and scientific and technologic investigations concerning the mining, preparation, treatment, and utilization of ores and other mineral substances, with a view to improving health conditions and increasing safety, efficiency, economic development, and conserving resources through the prevention of waste in the mining, quarrying, metallurgical, and other mineral industries; to inquire into the economic conditions affecting these industries: Provided, That no part thereof may be used for investigation in behalf of any private party, nor shall any part thereof be used for work authorized or required by law to be done and that is being done by any other branch of the public service, $100,000;

Not exceeding 20 per cent. of the foregoing sum and not exceeding 10 per cent. of the sum for investigation as to causes of mine explosions may be used during the fiscal year 1916 for personal services in the District of Columbia; and for the fiscal year 1917, and annually thereafter, estimates shall be submitted specifically for all personal services required permanently and entirely in the Bureau of Mines at Washington, D. C., and previously paid from lump-sum or general appropriations;

For inquiries and investigations concerning the mining, preparation, treatment, and utilization of petroleum and natural gas, with a view to economic development, and conserving resources through the prevention of waste; to inquire into the economic conditions affecting the industry, $35,000;

For equipment and extension of mine rescue station at Birmingham, Alabama, $3000;

For repairs to mine rescue station at McAlester, Oklahoma, $500;

Toward dismantling and removal of the plant of the Pittsburgh Mining Experiment Station and installation in the new buildings in Pittsburgh constructed under the authority contained in section 26 of the public buildings act, approved Mar. 4, 1913, including the employment of necessary labor; machinery, appliances, materials and supplies, furniture and office equipment, cases for apparatus, shades, awnings, and all other articles made necessary by such removal to fully equip and furnish these new buildings for laboratory and office purposes, $57,300;

For one mine inspector for duty in Alaska, $3000;

For per diem, subject to such rules and regulations as the Secretary of the Interior may prescribe, in lieu of subsistence at a rate not exceeding $5 when absent on official business from his designated headquarters, and for actual necessary traveling expenses of said inspector, $2500;

For clerk to mine inspector of Alaska, $1500;

For technical and scientific books and publications and books of reference, $1500;

For purchase or lease of necessary land, where and under such conditions as the Secretary of the Interior may direct, for the headquarters of mine rescue cars and construction of necessary railway sidings on the same, $1000: Provided, That the Secretary of the Interior is authorized to accept any suitable land or lands that may be donated for said purpose:

Persons employed during the fiscal year 1916 in field work, outside of the District of Columbia, under the Bureau of Mines, may be detailed temporarily for service in Washington, D. C., for purposes of preparing results of their field work; all persons so detailed shall be paid in addition to their regular compensation only their actual traveling expenses or per diem in lieu of subsistence in going to and returning therefrom: Provided, That nothing herein shall prevent the payment to employees of the Bureau of Mines their necessary expenses or per diem, in lieu of subsistence while on temporary detail in Washington, D. C., for purposes only of consultation or investigations on behalf of the United States.

In all, Bureau of Mines, $757,300.

HARRISBURG, PENN.

The bill (No. 160), introduced on Feb. 8, by Senator Catlin, to put the miners in line for the benefits to be reaped from the proposed workmen's compensation act, was reported out of the mines and mining committee of the Senate on Feb. 9, and by unanimous consent passed first reading. This is the most rapid progress of a mining bill in the Senate in 30 years.

The Catlin measure marks the opening of the fight to secure general remedial legislation for the anthracite miners during the present session of the Legislature.

The bill calls for several important changes in the hard coal mine code of 1891. The suggested changes deal exclusively with the health and safety of the men employed in and about the mines. The miners' lobbyists here say that any operator who has the interest of the employees at stake cannot consistently oppose the bill. They affirm it will give the operators a splendid opportunity to let the public know whether their "Safety First" movement is sincere.

The bill also provides that before any one shall receive a mine foreman's certificate he must have had at least five years' practical experience in an anthracite mine of this Commonwealth as a miner cutting or blasting coal at the face. Several changes in the duties of a mine foreman are also suggested, and the method of hoisting and lowering men is also touched, and the duties of the hoisting engineer and the hours to be worked have been covered. It is also provided that no one shall blast coal or rock unless he possess a miner's certificate, and no machinery operated by steam, gasoline or oil using fire to generate its power shall be operated inside the mine.

Should the bill of Representative Ramsey repealing the anthracite coal tax pass the Legislature, the anthracite operators would probably be enriched by at least $6,000,000.

This bill merely cites the act of 1913 and adds "is hereby repealed." No provision is made for the return to the people of the money collected by the coal dealers. Just how this plan could be worked out in case the act should be repealed, or in case after the pending suit to test the constitutionality of the act it is decided to be unconstitutional, has never been suggested.

Members of the Legislature who have been looking for additional means of increasing state revenues, it is believed, will not favor the repeal of the anthracite tax; rather they favor the imposition of a similar tax on bituminous coal, oil and natural gas. Such a tax would find more popular favor than the proposed tax on real estate.

A general act including all of these natural resources as well as coal, it is said, could not be attacked as unconstitutional with the same plausibility as shown in the litigation over the anthracite coal tax recently heard in the Dauphin County Court. There it was claimed the tax was class legislation.

Governor Brumbaugh declared on Feb. 13, that he did not see any reason why the Rooney Act of 1913, placing the coal tax should be repealed.

"Why should it be repealed? There is every reason why it should not be repealed now that the question of the constitutionality of the act is in the courts" he said. "If the act is held unconstitutional there would be no need of a repeal because that would end it. The act ought to remain until the court has passed upon it. In my address I said that a reasonable tax could be placed on our great natural resources as they flow to the markets and that they should be made to bear their part of the burden. But this act is before the courts so why should it be repealed?"

PENNSYLVANIA

Anthracite

Pittston—An explosion of gas occurred Feb. 8 at the No. 9 Colliery, Pennsylvania Coal Co., resulting in the serious burning of three men. These men were putting up brattice when they ignited a pocket of gas in the Marcy vein near No. 3 Shaft. It is believed that all will recover.

Scranton—The Hyde Park and Brisbin collieries of the Delaware, Lackawanna & Western Coal Co. were recently ordered closed for 10 days during which time repairs will be made. The Hyde Park colliery employs 800 men, and the Brisbin 600 men. It has not yet been decided whether or not steel cages will be put in the shafts during the idle period.

Bituminous

Pittsburgh—The U. S. Bureau of Mines is coöperating with the City of Pittsburgh in an attempt to determine the causes of sewer explosions. Special methods and apparatus have been devised, and samples of sewer air are being tested.

The work is under the supervision of G. A. Burrell, chief gas chemist of the Bureau of Mines, and H. C. Boyd, chemist of the City of Pittsburgh.

Greensburg—The Donohoe Coke Co. and John P. Donohoe & Co., Ltd., are attempting to organize a temperance society among employees and get them to sign a total abstinence pledge for a period of one year. Only employees of the company 18 years of age or over are eligible, and an application for a charter for the Greenwald Temperance Society has been presented to the Common Pleas Court.

Uniontown—Receivers for the Tower Hill Coal & Coke Co., announced recently that Tower Hill No. 1 has been ordered fired up immediately, affording employment to over 300 men. The Republic Iron & Steel Co. at Martin has also started 240 additional ovens.

Connellsville—Orders have been issued by the H. C. Frick Coke Co. for firing 515 additional ovens, making a total of 855 for the past week, and 3355 for two weeks. Orders have also been issued for all plants to run five days per week. Production and shipments throughout the Connellsville region now average over 250,000 tons weekly. With the resumption of work at the coke plants, Mayor Marrietta has given orders to discontinue the bread line at the Connellsville City Hall. Every morning since the first of the year, some 20 to 40 persons have been fed free rolls, soup and hot coffee. It is believed that some have presumed upon the generosity of the municipality.

WEST VIRGINIA

Boomer—Mines at this place will shortly go on full time, as there has been a marked improvement in coal production on Cabin Creek.

Carlisle—Charged with violating the mine laws, William Pilkington, mine foreman, and Firebosses Romeo Campi and John H. Rowley were arrested recently at the instance of Earl Henry, chief of the Department of Mines. The specific charge against Pilkington is that in his official capacity he violated the provision of the statute requiring break-throughs at intervals of 80 ft. The firebosses are alleged to have been negligent in failing to place danger signals on the outside of the mine after discovering gas in the entry where the explosion took place.

Huntington—Coal is already being taken from the new mines of the Pursglove-Maher Coal Co., of Cleveland, Ohio, which began opening mines in Logan County following the strike in eastern Ohio, where the company was working several mines. It is expected that shipments will begin within 60 days, and that developments will be made upon a large scale.

Morgantown—The West Virginia Mining Institute through its newly elected president and vice-presidents is making a vigorous effort to increase the interest of all mining men of the state in its behalf. In their circular letter to this end the officers express themselves as desirous of increasing the membership to 1000 and as an inducement are offering the proceedings of the institute in five volumes from 1908 to 1912 inclusive at the extremely low price of $3 complete.

Charleston—Governor Hatfield is strongly advocating to his legislature which is now in session, the enactment of legislation concerning the conservation of the natural resources of the state. The Governor claims that 200,000 acres of valuable coal lands have been destroyed by prospectors for natural gas and oil, also that 500,000 cu.ft. of gas is going to waste every day.

VIRGINIA

Lynchburg—The Virginia-West Virginia Coal Co., of Charleston, W. Va., has filed suit in the Federal Court here for the possession of 146,000 acres of coal and timber land in Buchanan County, Va., the defendants being the Clinchfield Coal Co., the Big Sandy Fuel Co., the Ritter Lumber Co., the Virginia Mining & Mfg. Co., the Big Sandy & Cumberland Ry. Co., and the Dominion Coal Co. This is the fifth suit filed recently involving Buchanan County lands, and it is understood that others are to follow.

ALABAMA

Montgomery—The movement to take the state convicts from the lease system was started in the Legislature Feb. 13, when Representative Davis introduced a bill in the Lower House prohibiting the working of state and county convicts in any mine, turpentine camp, lumber mill or other private enterprise, and providing penalties for each conviction.

TENNESSEE

Jellico—A coöperative mine rescue station will be instituted at Jellico by the coal operators and the U. S. Bureau of Mines. Apparatus will be loaned from the Knoxville station of the Mine Bureau, and the men who work in the station will be remunerated under a law of the state allowing appropriations for mine rescue work. Operators will be reimbursed for their outlay in the same manner.

KENTUCKY

St. Charles—The Carbondale mines, two miles north of here, have resumed operations after a long shut-down, with 65 negroes and a few of the old employees. These were among the mines which were visited earlier in the winter by "Possum Hunters." On the first visit three white men and one white woman were injured and on the second the negroes were lined up and told to leave the country. One negro boy was killed.

OHIO

Salem—The New Waterford Mining Co., which was recently organized with a capital of $50,000 will soon start a shaft at the northern edge of New Waterford for the purpose of developing a large bed of coal. It is expected that 300 miners will be employed.

Columbus—Arrangements were made for an open hearing Feb. 17 on the bill of Senator Gallagher, pending in the Ohio legislature seeking to amend the Green antiscreen law in Ohio to permit miners and operators to agree upon a wage scale on either the mine-run or the screen basis. The bill was introduced at the instance of eastern Ohio operators, who believe that the passage of the amendment will end the strike which has been going on in that field for more than 10 months. It is said that operators in the Hocking Valley, Cambridge, Massillon and Jackson fields, where the wage agreement has been signed, will oppose the passage of the amendment.

Rendville—An early resumption of operations at the Sunday Creek Coal Co.'s mine No. 268, at this place, is reported to have been decided upon, and the men are anxious to go to work, as they have had only six weeks' work since April of last year.

INDIANA

Indianapolis—The shotfirers' bill which was killed in the Senate of the Legislature in 1913 was introduced again at the present session, and has passed the house without a dissenting vote. It provides that the mine operators shall employ and pay the shotfirers.

A bill has been introduced to establish a department of mining engineering at Purdue and Indiana Universities; also a bill to regulate the use of black powder in coal mines and providing penalties for misbranding black powder to be used in blasting.

Terre Haute—Over 300 miners recently went on strike at the Shirkie mine, one of the most active in the state, because of their contention that the contract required the laying of track in the middle of the room and that it was laid at the side.

Sullivan—The Chicago-Carlisle Coal Co.'s mine at Carlisle has been equipped with electric motors.

ILLINOIS

Belleville—There will be a hearing shortly at Springfield, Ill., before the Public Utilities Commission, on a petition presented by citizens of Belleville and operators in the Standard field, to reduce the freight rate on coal from certain mines in the 5th and 9th districts and within a certain radius of East St. Louis, from 32c. to 20c. per ton. This will doubtless stir up much trouble and confusion, and will likely cause a separation of the operating interests in the field. The intention in the beginning was to ask the Commission to put into effect a rate of 10c. per ton, a nominal switching rate, on coal moving off of what are known as the industrial roads; that is, roads owned and controlled by mining interests and used for the purpose of hauling coal only. Ten cents a ton, it is contended, will pay the transportation on the coal and will prohibit the operators from selling coal at 20c. below the cost of production and losing on the coal what they are enabled to make up on the transportation. It is likely that the Commission will not take any decided steps for some time until the matter has been thoroughly investigated.

Harrisburg—Orders to close for an indefinite time mines 14 and 15 of the O'Gara Coal Co. were recently received here. All tools have been removed. The only reason assigned for the shutdown is the poor market conditions. Over 700 men will be idle from these two mines.

Carterville—Wm. Bauman has filed a petition in bankruptcy with liabilities of $31,500, all unsecured, and assets of $150. Coal-mining ventures that proved failures were given as the cause. The creditors are banks that hold notes.

South Bartonville—An explosion occurred in the mine of the Collier Coal Co. on Feb. 10, resulting in the death of one man and in serious injury to at least one other. Sixty men were working on the night shift, but it is believed that practically all of these escaped uninjured.

FOREIGN NEWS

London, England—A strike of the Yorkshire coal miners which had been feared was avoided when the mine owners conceded the men's demand for an advance in wages until the end of the war. The dispute involved 50,000 men and arose over the interpretation of a minimum wage award.

Essen, Germany—It is reported that coal-mine operators have reached an agreement with the military authorities whereby the former are to be supplied with prisoners of war for the purpose of working the mines.

PERSONALS

Frank L. Speakman, of Wilmington, Del., has been appointed Trustee in Bankruptcy for the Elliott-Chapman Coal & Coke Co., a Delaware corporation doing business in Alabama.

John P. White, Frank J. Hayes, and William Green, president, vice-president, and secretary-treasurer of the United Mine Workers of America, were all recently reëlected for a term of two years.

J. W. Miller, formerly connected with the Central West Coal Co., has taken a position with the Columbus office of the Elk River Lumber & Coal Co. of which C. M. Anderson is Western sales manager.

James R. Caseley, who has been general manager of the Buffalo & Susquehanna Coal Co. for several years, was recently elected president and general manager of the firm as well as to a directorship.

Thomas Moses has been appointed general superintendent of the Bunsen mines as a successor to Clay Lynch, who resigned recently to become vice-president and general superintendent of the H. C. Frick Coke Co. at Pittsburgh.

Col. J. C. Maben, president, and W. H. Goadby, chairman of the board of directors of the Sloss-Sheffield Steel & Iron Co., both of New York, were recently in Birmingham making the semiannual inspection of the physical properties of the company.

Edward R. Clayton, formerly of Grafton, W. Va., and well known as an operator at Fairmount, W. Va., and also in the Eastern part of the country in the coal trade, has joined the Snead & Meguire Coal Co., at Louisville, Ky., as manager of sales.

James Hillhouse, former state mine inspector of Alabama, left Birmingham recently for Rochester, Minn., to undergo treatment by a specialist. Mr. Hillhouse's condition has been apparently fairly good and it is hoped that when he returns home, he will be free from suffering.

E. C. Mahan, of Knoxville, Tenn., treasurer and general manager of the Southern Coal & Coke Co. and of the Southern Mining Co., left recently for a vacation of a month in Florida with his wife and daughter who are there recuperating from serious attacks of typhoid fever.

Frank R. Clark, of the U. S. Geological Survey, has been assigned by the Federal bureau to work in the Cumberland plateau coal field of Tennessee and will begin his work of collecting samples at once, expecting to spend three months or more on the work. The samples will be analyzed at the U. S. Bureau of Mines at Pittsburgh.

J. M. Roan, chief mine inspector and safety superintendent of Ohio, has asked for an appropriation of $3000 to push his safety campaign in Ohio. His plan is to organize the state into districts for the purpose of demonstrating the use of the safety equipment of the rescue car which was purchased by the department last year. The appropriation is to be used to pay the railroads for transporting the car as all other work will be done by the deputy inspectors which are under state pay. He plans to visit all mining camps and show the use of the helmets and demonstrate first aid.

A. B. Saurman, for the past 12 years Pacific Coast manager for the Standard Underground Cable Co., has been appointed Southeastern manager of the company (succeeding the late T. E. Hughes) with headquarters in his native city, Philadelphia, Penn., and will return East in the early spring. He became associated with the company in Philadelphia in 1893 and after two and a half years in the construction department was transferred to the eastern sales department at New York City, leaving the position of assistant manager there in 1900, when he organized, and was manager of, the northeastern sales department with headquarters at Boston, until transferred to San Francisco as manager of the company's interests there in the fall of 1902. John P. Bell will succeed Mr. Saurman as Pacific Coast manager.

OBITUARY

Peter Klitch, 50 years old, outside superintendent of the new Locust Mountain Coal Co., Shenandoah, Penn., was caught in the machinery on Feb. 11, and instantly killed. He was one of the best known mining men of the region, a patentee of note and was formerly with the Lehigh Valley Coal Co. for 20 years. A widow and 10 children survive him.

William Dick, an independent mine owner of Colorado, was shot and killed by two highwaymen, while driving his automobile in the La Veta road, five miles west of Walsenburg, Colo., Feb. 13. Mr. Dick had $10,000 with him, $6500 of which was undiscovered by the highwaymen and left in the machine. The money was to pay off the miners of the Oak View mine. Mr. Dick was interested in many mining projects in Colorado and was president of the Pinon Supply Co. and of the Walsenburg Wholesale Mercantile Co. He leaves a wife and 8 children.

John G. Massie, aged 67, a pioneer coal operator in the southern Illinois field, recently died at St. Elizabeth's Hospital in Belleville, Ill. Until last December he was a resident of Chicago. He was a third descendant of Major Thomas Massie, a member of Gen. Washington's staff during the Revolutionary war. Mr. Massie has been credited with the discovery of the coal seams of Alabama previous to 1879.

Born near Logan Courthouse, Va., in 1847, he enlisted in the Union army at 18 and served throughout the war. He later studied civil engineering, and specialized in mine work. At the request of the British government in 1898 he went to Australia to demonstrate American methods of mine ventilation. He was one of the first to work out the third-entry ventilation system, and had invented and patented over 50 appliances for the mining industry. Besides a widow in Denver, and a brother in Parkersburg, W. Va., seven children survive him. Burial was in Belleville.

CONSTRUCTION NEWS

Barnesboro, Penn.—The Watkins Coal Co. will shortly begin the sinking of a shaft a short distance from Bakerton.

Pineville, Ky.—The Continental Coal Corporation will develop two additional mines on Straight Creek and is reported to have purchased the mines of the Big Hill Coal Co.

Dorchester, Va.—A. H. Hopkins and others have leased a tract of coal land at Fagan, Ky., which they plan to develop. It is the intention to secure a daily production of 1000 tons.

Pittsburgh, Penn.—D. T. Riffle has been awarded a contract to build a fireproof hoisting-engine house and substation for the Pittsburgh Coal Co. at Hill's Station. This contract involves $15,000 and calls for the completion of the work in 90 days.

Harlan, Ky.—Besides the one mile of railroad which will be built up Catron's Creek from the main line of the L. & N. to the operation which Judge Peyton Norville is to develop, there will be three or four miles of road built up Clover Fork and Yocum's Creek as soon as the weather settles. Judge Norville has leased 1056 acres from W. H. H. Smith and W. F. Hall.

Johnstown, Penn.—The Washeries of the Lackawanna Coal & Iron Co. at Wehrum, which were destroyed by fire some time ago, will not be rebuilt, but a heading will be driven to connect Mines No. 3 and 4. When completed the coal from both operations will be taken out of the shaft two miles from the town. No. 3 mine was abandoned some years ago, but a new tipple is being placed at its mouth and the old washer is being repaired.

Arden, Penn.—The Meadowlands Coal Co., whose large wooden tipple was burned during the month of December, has contracted for a new steel tipple and complete equipment. The tipple is to be built and erected by the Penn Bridge Co., and the Fairmount Mining Machinery Co. is to install the equipment complete consisting of a double set of chutes and screens, loading boom, empty-car haul, and ram for pushing the cars on and off of the cages.

Lexington, Ky.—The Himyar Coal Corporation, operating a mine recently opened on the Lexington & Eastern branch of the Louisville & Nashville Ry., at Himyar, Ky., is opening another mine on a tract leased from the Haly Coal Co. on the First Creek Branch of the Lexington & Eastern, now under construction, in Perry County, Ky., in the Hazard field. Louis Des Cognets, of Lexington, Ky., is president of the company and W. L. Carter, of Himyar, Ky., is general superintendent.

Chattanooga, Tenn.—Construction work is progressing rapidly at the plant of the Chattanooga Gas & Coal Products Co. on East End Ave. Three large tanks, one for water, one for coal tar and one for benzol, are rising rapidly, foundations are being laid for the gas reservoirs and the concrete foundations for the ovens are in advanced stages of construction. Some of the first machinery shipments have been received. It is said that probably the Durham Coal & Iron Co.'s entire output of coking coal will be utilized when the ovens are in full operation.

Clarksburg, W. Va.—The Link Belt Co. of Philadelphia has been awarded a contract for equipping the plant of the Marshall Coal Co. at Byron with a retarding conveyor system about 600 ft. in length, which will extend from a point near the pit mouth to the railroad car tracks at the foot of the hill. The contract for the frame and concrete work in connection with this equipment has been awarded to the Consolidation Construction Co. of Shinnston, which will begin work soon. The conveyor system when completed will have a maximum capacity of 2000 tons per day. Excavations and grading for the new equipment have already been completed.

NEW INCORPORATIONS

Woodsfield, Ohio—The Ohio River Western Coal Co. has reduced its capital stock from $3,000,000 to $150,000.

Chattanooga, Tenn.—The Old Virginia Coal Co. has been incorporated with a capital stock of $50,000 to develop coal mines.

Hopkinsville, Ky.—The Southern Coal Co. was recently incorporated with a capital stock of $50,000 for the purpose of developing coal mines.

Harlan, Ky.—The Harlan Gas Coal Co. has been organized and has leased the Harlan Town mines. The incorporators are W. W. Lewis, A. B. Cornett and J. L. Williams, of Harlan.

Cincinnati, Ohio—The E. R. Carter Coal Co. has been organized with a capital of $5000 for the purpose of operating mines and commissaries, and dealing in coal, land, timber and minerals. The incorporators are E. R. Carter, M. Geiger, F. E. Kunkel, Carl Lehmann, and C. B. Jolly.

Charleston, W. Va.—The Gauley Valley Coal & Coke Co. of Summersville was recently incorporated with a capital stock of $500,000. The incorporators are W. L. Camden, of Mountain Lake Park, Md., J. H. Nash, Jr., J. G. Bimting and C. L. Smith of Charleston, and W. G. Reddy of Summersville.

INDUSTRIAL NEWS

Torchlight, Ky.—The Eastern Kentucky Coal Co. has been working full time all winter on coal for domestic purposes, and has just closed a contract for Lake shipments that will keep the mines working full capacity all summer.

Pittsburgh, Penn.—The tow-boats "James Moren" and "Exporter," of the Monongahela River Consolidated Coal & Coke Co., left the Pittsburgh Harbor, Feb. 15, with 22 boats and 16 barges, containing a shipment of coal aggregating 680,000 bushels.

Stonega, Va.—The commissary of the Stonega Coal & Coke Co. recently burned with all its contents. For a time the whole town was threatened. The loss to the coal company is estimated at $75,000, a large part of which is covered by insurance.

Seacoal, Ky.—Seacoal will be the name of the town in Letcher County where the mines of the Southeast Kentucky Coal Co. will be located. Henry La Viers, general manager, is now on the grounds participating in the development work. This company is closely allied with the Northeast Coal Co., of Paintsville, Ky.

Newport News, Va.—A total of 886,435 tons of coal were dumped over the Hampton Roads coal piers at Lambert's Point, Sewall's Point, and Newport News, during the month of January. These figures show an increase of 54,578 tons over the preceding month of December, when dumpings amounted to 831,948 tons.

Scranton, Penn.—Anthracite shipments during January totaled 4,831,329 tons as compared with 5,280,644 tons for the corresponding month in 1914. The Lehigh Valley R.R. led with 954,072 tons. The Reading followed with 750,757 tons. The Delaware & Hudson ranked third with 623,947 tons, and the Jersey Central fourth with 608,296 tons.

Washington, D. C.—It has been learned from the Interstate Commerce Commission that a decision in the so-called anthracite coal case involving rates from anthracite coal districts in Pennsylvania to tidewater would not be settled before the Commission takes its summer recess. It is probable that the decision will not be rendered until some time this fall.

Knoxville, Tenn.—In order to prevent, or at least try to prevent ruinous competition, the Southern Appalachian Coal Operators' Association, comprising a large number of the operators in eastern Kentucky and Tennessee, is preparing to take up with the United States Department of Justice the question of the legality of entering into an arrangement to restrict the output of the mines.

London, England—Among the concessions to the German bankers, in return for the loan to Bulgaria, is the right to exploit the Pernik coal mine, the richest in Bulgaria. The fuel is lignite, possibly of Miocene Age, having about the following composition: Fixed carbon, 40 per cent.; volatile matter, 37 per cent.; ash, 7 per cent. of which 2 per cent. is sulphur. The moisture content is about 16 per cent. There are four beds, one of which is about 11 ft. thick.

Knoxville, Tenn.—The last spike in the Clinchfield Railway extension from Dante, Va., to Elkhorn City, Ky., was recently driven, just north of the Sandy Ridge tunnel, nearly 8000 ft. in length, by George L. Carter, who conceived the Clinchfield route. This road, connecting with the Chesapeake & Ohio at Elkhorn City, forms a direct line between the Ohio Valley and Central West to the South Atlantic States and opens up a rich coal section. Regular service will begin in the near future.

Bluefield, W. Va.—Successful tests have been made of the giant electric locomotives, weighing 270 tons each, and with sufficient power to move a 250-car train on the level, installed on the Elkhorn division of the Norfolk & Western. A pair of these locomotives, one at each end of the test train, moved a train of coal cars aggregating 4000 tons in weight, on a 2 per cent. grade. Tests in braking down the grade were also successful. The section electrified handles from 50,000 to 100,000 tons of coal a day.

Columbus, Ohio—Figures in support of the complaint that the railroads are charging higher rates for the transportation of Ohio coal than for West Virginia coal were submitted to Governor Willis recently by a committee representing the United Mine Workers of Ohio, which has united with Ohio operators to secure the passage of a bill to prevent such alleged discrimination. The figures submitted showed that West Virginia coal is being hauled across the state to Lake ports at 36.9c. per ton, while 75c. is being charged for hauling Ohio coal over the same route. The committee told the chief executive that the railroads charge on an average 103 per cent. more for hauling Ohio coal than for the West Virginia product.

St. Louis, Mo.—Notwithstanding the general business depression during the past fall and early winter, the Broderick & Bascom Rope Co., St. Louis, New York and Seattle, manufacturers of Yellow Strand Powersteel wire rope, arranged matters so that every man and boy on its pay rolls had work. The company decided it was best to employ all its force, even if only part time rather than to work one-half of the force full time. Last spring, the big St. Louis plant was running full force; at least 85 per cent. of its full time. Later in the year, it operated three-fourths time, but kept the entire day and night force. Finally, during part of October and all of November, it ran one-half time—still keeping all the men employed. During December, the plant operated full time, day and night—even though that meant piling up large stocks of wire rope. This resulted in no little expense, increasing stock several million pounds. The mayor of St. Louis and the president of the St. Louis Business Men's League, on Dec. 23, 1914, wrote to all St. Louis manufacturers, urging them to do just what this firm had voluntarily done for months—that is, keep all their employees working, even if only part time.

Coal Trade Reviews

General Review

Anthracite production still heavily curtailed and storage facilities of the companies choked full of coal. Bituminous buyers in control of the market and showing no anxiety regarding supplies. Preliminary forecasts on the Lake trade discouraging. No indications of any improvement in the Middle West.

As a result of the generally mild weather, and the generally curtailed consumption, the storage facilities of the large hard-coalers are choked up with coal, and operations are heavily curtailed. Circular prices are being obtained only on the very best grades, while discounts down to the full April schedule are already being noted. There are superabundant supplies in every direction so that the buyer is generally in control and becoming exceedingly critical as to quality. Old and conservative members of the trade regard the situation as the least favorable for this period of the year in their recollection. There are even rumors that some of the large companies are making concessions on the regular circulars.

The bituminous situation continues as discouraging as ever. With the exception of the movement on contracts, there has been practically nothing doing at all in the coal market, and with the textile and other mills working under heavily curtailed schedules, stocks will last considerably further into the season than usual. Still new high records are being noted on ocean freights, which is confusing the off-shore trade, and it is extremely difficult to interest steamship owners in coal. Buyers are showing no anxiety whatever regarding supplies, and the wide range in bids on recent large government contracts show how uneven the situation is.

The domestic demand in the Pittsburgh district continues fair, and a very slight improvement is noted in railroad orders which, if continued, will stimulate a greater activity all along the line. At the moment prices are still being cut, while buyers are showing no disposition to come into the market, and the situation is as irregular as ever. The outlook for the Lake trade is also discouraging; reports from the head of the Lakes indicate that large tonnages will be carried over, and so far it has not been possible to interest Lake buyers in the market.

The higher temperatures have caused a further slump in the Ohio market, many orders for delivery over the last part of the current month having been canceled. New buying has ceased almost completely, what little there is being generally irregular and confined to small orders. There is considerable distress coal on consignment which can only be moved by forced sales, usually at heavy sacrifices. Steam coals in the Southern market show a slight improvement, though prices continue irregular on all grades with the buyer in full control of the situation; as a result of the uniformly low prices prevailing throughout the past year, operators are anticipating considerable difficulty in renewing the old contracts.

Some of the high-grade operations in the Middle Western field have been forced to suspend operations for the first time this season. The railroads are taking far below their customary tonnage, and the persistent reports of a general industrial revival are contradicted with great positiveness by some of the best informed operators in Illinois and Indiana. Prices on the domestic grades are at the summer level, and the outlook is regarded as discouraging.

ATLANTIC SEABOARD

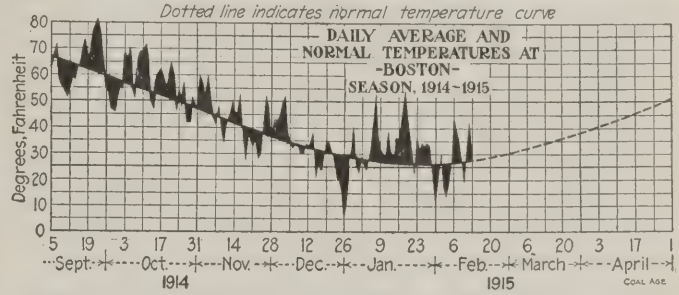
BOSTON

Pocahontas and New River situation makes no special progress. Buyers more disposed to wait. Georges Creek shippers make no move as yet on delivered prices. Pennsylvania grades in somewhat better demand. Anthracite dull.

Bituminous—The week has developed no buying of any consequence aside from the contracts placed earlier in the month and in January. As the latter are almost altogether in the same channels as last year there is practically a deadlock in the Hampton Roads coals in this market. The shippers with transportation under control have taken on about all the business that could be closed at an advance over last year but there are a great many consumers and dealers who now feel they can lose nothing by waiting. They are encouraged in this by those agencies that are dependent on boats in the open market.

The recent bids for supplying the Navy Yard at Portsmouth, N. H., show how uneven are current prices delivered. The bids ranged from $3.65 for New River to $4.15 on Georges Creek, a difference of 50c. on coals that are normally competitive. What contracts have lately been closed either alongside or on cars have been at a very small advance over last year.

The spot market at distributing points has eased off again. Prices are still near to $4 for small lots on cars. The demand for contract requirements is fairly strong. A few plants that would otherwise be forced into the market soon after Apr. 1 are accepting liberal shipments on 1914 arrangements.



There is nothing new on the Georges Creek grades. The shippers are still withholding any announcement of their attitude toward delivered prices. The largest interest in this field has a fleet of its own but is pursuing a waiting policy.

The better grades of Pennsylvania coals are being represented in every open competition. Several of the shippers are making a vigorous canvass of the territory both all-rail and at tide and it is hard to see how they can fail to increase their tonnage.

Water Freights continue at $1, but with plenty of bottoms offering. The number of sailing vessels chartered off-shore has, however, so reduced the amount of available tonnage that owners are in a very independent position. At the same time it is problematical whether there will be any advance from the present level, inquiry is so likely to drag the next three months.

Anthracite shows no relief from the dullness last reported. Individual coals are beginning to appear, notwithstanding the rates asked on barges from New York. Cargoes have even appeared from Philadelphia and, it is generally understood, at prices well down to the usual April circular. The curtailment at the mines is so rigid that spot orders for fresh-mined sizes like pea are accepted only subject to delay.

Wholesale prices on bituminous are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*..........	$0.90@1.50	$1.15@1.65	$1.67@1.77	
Philadelphia*.....	2.15@2.75	2.40@2.90	2.92@3.02	
New York*.......	2.45@3.05	2.70@3.20	3.22@3.32	
Baltimore*.......	....	....	2.85@2.95	
Hampton Roads*.	....	....	....	$2.70@2.75
Boston†..........	....	....	....	3.85@3.95
Providence†......	....	....	....	3.68@3.83

* F.o.b. †On cars.

NEW YORK

Embargoes cleared up and inquiries on new contracts are about normal. Prices unchanged. Superabundance of anthracite and the market heavy with prices irregular. Storage facilities crowded.

Bituminous—There is no change of any kind noticeable in the local situation, though perhaps the agencies are becoming more generally reconciled to existing conditions in the belief that they certainly cannot become any worse so that any change must be for the better. One encouraging factor is that the numerous embargoes recently in effect at South Amboy were all removed the early part of the week with the exception of about three. It is also noted that there is about the usual amount of inquiry on contract renewals and the agencies uniformly report that last year's prices have been obtained in every instance where contracts have been closed.

Production of one of the leading bituminous companies for the current month will be about 75%, that for the same month last year, and the output for January was about 60% of January, 1914. The Berwind-White Co. is again reported down to a three-day working schedule; there are rumors that this company has closed a large contract in Baltimore. The Consolidation Co. is said to be moving a large tonnage out of Baltimore which will presumably apply on the Italian business they recently closed.

Though there is practically no business being negotiated in the spot market with the exception of occasional forced sales of demurrage coal, the market is not quotably changed and we continue it as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—With the superabundance of supplies now at tidewater, buyers are becoming more critical as regards quality and frequent rejections are noted. Prices are generally more or less irregular, ranging all the way from the April to the full winter's circular. Because of the uncertain operations at the collieries, the agencies are experiencing some difficulty in meeting the demand for broken coal; the steam sizes are also occasionally reported in short supply, but the domestic grades are plentiful in all directions.

With the exception of possibly one or two favored companies, the storage facilities of all the large hard-coalers are choked up to their full capacity with coal and some of the oldest and conservative members of the local trade consider the situation as the worst for this period of the year in their experience. Mine operations are curtailed to from three to five days per week, and what little business appears in the spot market is being snapped up by the individuals at substantial discounts. Of the domestic grades, egg is probably the strongest while stove is the weakest, though curiously enough it is not being cut so liberally as some of the other sizes.

The New York hard-coal market is quotable as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	5.00@5.35	5.30	4.90@5.30
Stove	5.35	5.00@5.35	5.30	4.80@5.30
Chestnut	5.60	5.20@5.60	5.55	5.05@5.55
Pea	3.55	3.50@3.55	3.50	3.35@3.50
Buckwheat	2.80	2.70@2.80	2.50@2.75	2.35@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.80@2.25
Barley	1.80	1.70@1.80	1.75	1.45@1.75

BUFFALO

Some improvement in bituminous. Railroads buying more liberally. Iron orders increasing. Canadian tariff promises to affect business adversely. Anthracite quiet.

Bituminous—There is some report of better business. Dealers say that they get an occasional good day and they look for a further increase shortly. At the same time the volume of sales is not what it should be and it will have to increase considerably before the trade is satisfied. Some shippers report a better demand from the railroads. If this continues it will create a greater activity all along the line. It is generally believed that there will be an improvement before April.

So far nothing has been heard regarding new contracts, either pending or made. One large shipper says that he is trying to come within 5c. of last year's figures, but some of his competitors think he will have to accept something still lower.

Certain Pittsburgh bituminous leaders, who commonly announce a Buffalo price about this time are hesitating over the problem, probably not liking the idea of making a figure that is too low. Next month there will be regular city and other contracts to bid on and figures will have to be made. Canada is preparing to increase its tariffs in a general way and the move is expected to lessen the trade in that direction still further.

Quotations on bituminous remain dull on the basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack. Allegheny Valley sells at 25 to 30c. lower than Pittsburgh.

Anthracite—The trade is rather quiet, with further reports of inactivity, but shippers are apparently not much disturbed. In the Lake trade there is steady movement. One shipper has loaded more than 150,000 tons into vessels and others will begin loading soon, as most of them have coal that is not needed. There is no complaint of the local trade. The weather has been favorable to handling and the buying has been steady.

PHILADELPHIA

Unseasonable weather conditions continue to retard trade in anthracite. Dealers apparently well stocked. Bituminous retains its sluggish attitude, with no appreciable change.

Anthracite—The erratic weather is playing havoc with the anthracite trade. The production has been curtailed until it is now on about a fifty per cent. basis, and even with this restriction, there is always more or less coal carried over from one week's mining to another; this of course refers to certain sizes. Buckwheat seems to be in the best demand at the present time though broken is also being consumed in about normal quantities. Egg and stove are difficult to move and sales are being made at the April circular or even less, in some cases; in fact about all the domestic sizes are in this same condition. It is rumored that even some of the large individual operators are making substantial concessions. The dealers continue well intrenched in the matter of supplies, and they are making every effort to dispose of these, prior to the first of April but with poor success.

Prices at Tidewater rule about as follows:

	Circular	Individuals
Broken	$4.75	$4.50
Egg	5.00	4.80@4.90
Stove	5.00	5.00
Chestnut	5.25	5.10

Bituminous—There is nothing new in the bituminous situation. Prices and demand continue on a parity with last week. Contracting still goes on, but slowly, the manufacturers evincing a disposition to delay closing up definitely for their year's supply. Fairly good prices are being secured on contract, compared with current offerings; 90c. to $1 is still the rule for medium grades, with the better qualities 25 to 35c. higher.

OCEAN FREIGHTS

Rates still reaching to new high levels. Few coal charters being made.

The freight market is even higher than a week ago, owing to the increased demand for steamers for export grain and for Cuban sugar, both at advanced rates. The highest rate yet paid on export grain was to the West Coast of Italy, and Cuban sugar freights reached new high levels last week.

Under the circumstances it is extremely difficult to interest steamship owners in export coal, although we are chartering a few boats each week.

To	Rate	To	Rate
Havana	**$2.75**	Guantanamo	**$3.25**
Cardenas or Sagua	3.25@3.50	Demerara	**5.50**

W. W. Battie & Co.'s Coal Trade Freight Report.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Auchencrag	British	Baltimore or Virginia	River Plate	2539	$9.60
Singleton Palmer		Norfolk	Rio Janeiro	2357	
John B. Biemiller		Philadelphia	Cienfuegos	858	
Charles K. Schull		Atlantic Range	Porto Rico	827	
Florence Creadick		Norfolk	Key West	657	1.25
Badminton	British	Baltimore	Buenos Ayres	2438	
Allanton	British	Baltimore	Mediterranean	2775	
Claveresk	British	Newport News	Havana	2441	
Chas. A. Campbell		Norfolk	Boston	1493	1.00
Clacique		Atlantic Range	San Francisco	4543	7.50
Thor	Norwegian	Atlantic Range	San Francisco	2889	7.00
Stanley M. Seaman		Atlantic Range	Cienfuegos	953	2.80
Lizzie M. Parsons		Atlantic Range	Cienfuegos	571	
Wm. J. Quillen		Baltimore	Mayport	575	1.05

Note—Steamers are indicated by **bold face** type. all others being schooners.

BALTIMORE

Market stagnant except for contract business. Prices remain weak on soft coal. Warm weather hurts anthracite.

Rains, and temperatures ranging from 40 to 60 deg., have confronted the coal men most of the past week. Except for coal moving on contract obligations, there has been little or nothing doing. In the mining districts the reports are monotonously alike in that respect

Prices remain weak on bituminous coals. The better class of Pennsylvania line fuels were the only ones to show even a fair activity; prices on these grades ranged from $1.20 to $1.30, and good coals were obtainable at from $1 to $1.15, while low-grades were offering at 95 cents.

West Virginia gas-three-quarter was very dull, and what sales were made were at around 85c. Slack remained steady at about 60 to 65c., mainly for the reason that the production is very light. West Virginia and Western Maryland steam coals were offering at from 80 to 90c. outside of the specialized fuels that bring fancy figures at all times.

Export movement is fair. However, charter announcements the past weeek were not as numerous as in the week preceding. Closings included the following:

Steamships "Auchencraig," to the River Plate; "Allatnon," to a Mediterranean port; "Badminton," to Buenos Ayres, and schooner "Charles T. Schull," to Porto Rico.

HAMPTON ROADS

Some improvement in demand. Shipments foreign and coastwise showing some increase.

Dumpings over tidewater piers for the past week have shown some improvement. Large cargoes have gone to New England ports and there has also been some movement Coastwise to Jacksonville and Savannah. Export cargoes have also been fairly large. Schooner tonnage is still being pressed into use for the export trade, several large cargoes having gone to South American and West Indian ports during the week.

The accumulation of coal on the railroad yards is somewhat reduced and with the tonnage now due it will probably be cut down even lower. One of the largest loadings expected for the coming week is the U. S. Collier "Cyclops" which will take in the neighborhood of 13,000 tons cargo and bunkers combined. The number of bunker vessels loaded last week has shown up well. One of the most talked of vessels bunkering was the S.S. "Dacia," formerly under the German flag, but now under American registry.

Vessels clearing from Hampton Roads during the week ending Feb. 12 were as follows:

From Norfolk	To	From Newport News	To
Wagama	Buenos Aires	**Harald**	Bridgetown, Barbadoes
Posilipo	Genoa, Italy	**Antares**	Havana, Cuba
Jacob M. Haskell	Rio de Janeiro, Brazil	Alice B. Phillips	San Domingo, S. D.
Hope Sherwood	Hamilton, Bermuda	**Vinland**	Manzanillo, Cuba
Stephen	Para & Manaos, Brazil	**Leonatus**	Santiago, Cuba
Winderemere	Bridgetown, Barbadoes		
Fannie Palmer	Rio de Janeiro, Brazil		

Note.—Steamers are indicated by **bold face** type, all others being schooners.

OHIO VALLEY

PITTSBURGH

Demand practically unchanged. Mining operations at 55 to 60% of nominal capacity. Lake coal shipping interests show no disposition to buy for season.

Domestic demand for coal has continued fairly good, while there has been a barely perceptible increase in manufacturing demand, the latter almost wholly on regular contracts, so that there is very little demand for free coal and the market remains as irregular as ever. While the usual quotation given as representing the market is $1.15 for mine-run the price is more often cut than not. Mining operations for the district are at the rate of between 55 and 60% of capacity, when figured on a conservative basis. There is no doubt, however, that with an adequate supply of men and cars the district could turn out more than double the tonnage now being mined.

An outstanding feature of the situation, now that the middle of February has been passed, is the reserve exhibited by buyers of Lake coal. There is practically no business being done and operators are correspondingly depressed. The position of stocks in the northwest is presumably responsible for the apathy of the Lake shipping interests. It is understood that the stocks at Duluth and Superior on Dec. 1 were slightly in excess of six million tons and that at the rate they were reduced in December and January there would still be left over three million tons on May 1 at the opening of navigation.

We quote as the market, largely nominal: Slack, 90c.@$1; nut and slack, $1.05; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district.

COLUMBUS

Warmer weather of the past week had a bad influence on the trade. Domestic demand fell off and cancellations were numerous. Steam trade continues slow and the tone of the market is unfavorable.

One of the worst slumps of the winter has taken place in the local trade, due to higher temperatures. Buying on the part of retailers ceased almost completely and many orders for delivery the latter part of February were canceled. On the whole the market is now a weather proposition entirely and with sudden warm spells the slumps can be expected at any time. All branches of the industry suffered and operators are now looking anxiously for the opening of the Lake trade to relieve the softness in the market.

Retail stocks are apparently sufficient for the present; buying on the part of consumers is not steady and only small orders are booked. The fancy grades such as Pocahontas and West Virginia splints are in fair demand. Hocking lump is also moving fairly well. Retail prices are rather firm at former levels, but the expected advance has failed to materialize and all hopes for higher prices have been abandoned.

Anthracite is selling fairly well in central Ohio territory and prices are firm at the following levels: Chestnut, $8; egg, $7.75; grate, $7.50.

Steam business is slow all along the line. Manufacturing plants are only buying what they need for the present and are loath to accumulate stocks. Demurrage coal is being offered at very low figures. Quite a few contracts are expiring and some difficulty is experienced in renewing them. In general the steam trade is demoralized and little improvement is expected before the revival of the iron and steel business.

Pomeroy Bend district, which was flooded by high waters in the Ohio, has partially resumed and the output is estimated at 65% of normal. In the Hocking Valley, Crooksville and Jackson the output is below 50% normal.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.50	$1.50	.....
Inch and a quarter	1.35	1.40	$1.35
Three-quarter inch	1.30	1.30	1.30
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	0.60	0.65	0.55
Coarse slack	0.50	0.55	0.45

CLEVELAND

The coal market is extremely dull and barely holding to quotations. Retail trade very quiet because of spring-like weather.

Coal receipts over Sunday were in the neighborhood of 250 cars and only about 75 cars were carried over from the week before, yet there was general complaint that there was no market The week of Feb. 8, receipts were very light for this time of the year on account of mines being flooded by the heavy thaw but even with this the demand was no more than equal to receipts.

Of the 157 cars received by the Pennsylvania there were about 30 cars of three-quarter No. 8 coal from West Virginia on consignment; this has been selling at $1.80 to $1.85 a ton on track here or from 20 to 25c. below the nominal market. Slack holds to $1.65 to $1.70 for the better grades, merely because cutting prices would not increase the demand.

Natural gas, which is being produced in enormous quantities in northern Ohio, is cutting more deeply into the coal business than ever. The peak of the load on the Cleveland gas mains during January is reported to have been 150,000,000 cu.ft. a day, with an average of more than 100,000,000 ft. a day. It is estimated that 15,000 ft. of gas is equal to one ton of fine coal and 20,000 ft. to high-grade lump. These figures mean that gas replaced close to 5000 tons of coal a day in Cleveland. More manufacturing plants are using gas today than ever before, and though business is better the coal industry is not getting its full proportion of the improvement.

Some of the railroads are still using coal laid on the ground almost a year ago as a protection against a shortage following the suspension of mining Apr. 1, 1914. The consumption of this coal has also narrowed the market temporarily.

Conditions in Cleveland are as dull as would be expected in mid-summer when business is normal.

The market continues quotable as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8
Lump	$3.60	......	......	......	......
Lump, 6 in.	......	......	$2.35	......	......
Lump, 1½ in.	......	......	2.20	$1.95	......
Lump, 1¼ in.	......	$2.35	......	......	......
Lump, ¾ in.	......	2.25	2.10	1.90	$2.05
Egg	3.60	......	......	......	......
Egg, 6 in.	......	......	2.00	......	......
Mine run	2.60	2.15	1.90	1.85	1.95
Slack	......	1.80	1.75	1.70	1.75

CINCINNATI

A dragging market and a failure to limit production have thrown much distress coal on the market, very low prices resulting. Only a hand-to-mouth demand in evidence, due to the lateness of the season.

A characteristic early-spring situation prevails if the existing industrial depression be regarded as the normal thing. With the end of the winter rapidly approaching, buying is confined to the smallest possible quantities, to avoid carrying over any surplus. Notwithstanding this, heavy shipments are coming in on consignment, and eventually finding their way to the bargain counter. As low as 75c. for mine-run is reported for this distress coal, and possibly less has been accepted. If reports can be believed, no such concessions are made at the mines, although the normal price of $1 to $1.10 is by no means maintained.

TOLEDO

Trade continues quiet though indications are promising.

There is little activity in the trade and what business there is comes largely as the result of hard work. The domestic trade is slow and mild weather has accentuated the heaviness. Steam business is picking up very slowly and the railroads are not using anything like their usual quota of fuel.

COKE

CONNELLSVILLE

Market stagnant as to new transactions, but increased consumption by steel interests and furnaces already under contract.

The Connellsville coke market continues absolutely stagnant, there being no fresh demand from any quarter. Consumption by the producer-consumer class has increased very materially, as most of the steel works have been blowing in additional furnaces. Shipments on contracts are also increasing. The Youngstown Sheet & Tube Co. will blow in a third stack towards the close of the month, the coke to come on a contract already made for the year. The Alan Wood Iron & Steel Co., Philadelphia, is blowing in one of its furnaces this week, contracts having been made for the coke some time ago. We quote: Prompt furnce, $1.50@1.60; contract furnace, nominal, $1.75; prompt foundry $2@2.35; contract foundry, nominal, $2.20@2.30, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Feb. 6 at 256,358 tons, an increase of 13,750 tons, and shipments at 247,847 tons, an increase of 7607 tons. Until the middle of January the tonnages had been running about 210,000 tons a week.

Buffalo—There is report of a better movement of coke at Connellsville, but the increased orders do not appear to have come from this section. The iron trade has not improved to any extent. If the European orders continue to come they alone will do something for the trade. Quotations remain on the basis of $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

Columbus, Ohio—Some coke is selling and there appears to be a better demand than formerly.

St. Louis—The local foundry coke situation is extremely weak, with few inquiries.

Chicago—There is still fair buying in domestic coke, and prices are firm. Not much change is to be reported in furnace and foundry coke; some say that conditions are a little better for these grades, but the improvement has not made itself felt in prices. Prices are as follows: Byproduct, $4.60@4.95; Connellsville, $4.65@4.80; Wise County 72-hr. (select), $4.60@4.75; gas coke, $4@4.25.

THE STEEL INDUSTRY

The recent slight improvement well sustained and the trade is optimistic. Spectacular advance in galvanized pipe. Pig iron unchanged but looking up.

Tendencies in the next few weeks in finished-steel prices will have an important bearing on betterment in general. The creeping improvement in volume is being sustained, and in spite of the small part contributed by the railroads, and, in fact, because of it, the trade is optimistic of the future. It seems clear that the higher prices being asked for new orders of steel for the next few months will be strongly held.

The spectacular event has been the rise in prices of galvanized steel and iron pipe of $6 and $4 a ton, respectively, and in galvanized sheets of $5, because of the exceptionally high price of spelter, zinc blende in Missouri having reached a record price. The wage question in some sheet and tinplate plants is not yet settled, and meanwhile these mills are down, but with stocks on hand to take care of the demand for some time.

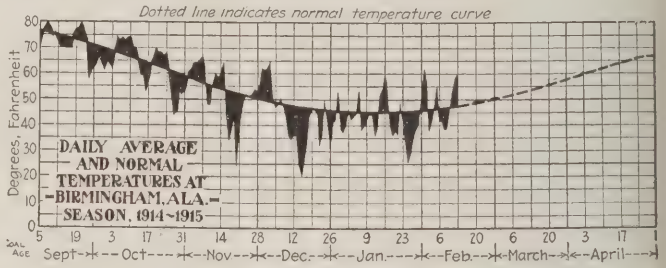
The pig-iron business has not enjoyed any large sales, but it is looking upward and not a little encouragement is taken among merchant furnaces in the decided improvement in machinery-building circles. The last few weeks has seen a growing demand for machinery independent of the larger buying attributable to the war account.—"The Iron Age."

SOUTHERN

BIRMINGHAM

Market on all grades quiet and heavy.

The market is quiet, with no change either way. The weather has turned much warmer, which will probably further curtail shipments of lump coal until the spring movement takes place. Blacksmith coal is normal, though the tonnage being moved may be slightly below normal.



LOUISVILLE

Warm weather curtails the domestic demand still further. Steam coals show some improvement but prices are irregular.

More abnormally warm weather has virtually suspended the domestic demand and accumulations are appearing at the mines and shipping points. The situation with the retailers has not improved and operators are dubious as to whether they can be induced to stock up again this spring.

Steam coals are in better demand though not improving rapidly. Prices are irregular on all grades, running from $1.50 on Eastern Kentucky block, down to almost the buyer's own figure. Egg coal is very hard to sell at from $1 to $1.25, while the best grades of nut and slack are bringing from 60 to 70c. and lower grades from 40 and 50c. down.

MIDDLE WESTERN

CHICAGO

Dullness prevails with weakness reflected everywhere. Adverse weather conditions continue. Screenings soft. Anthracite very quiet.

General market conditions show a further relapse due to the mild weather. Suspension of orders and cancellation of shipments have contributed toward a general demoralization. In steam coals there has been no recovery; screenings are softer, and the coarser sizes have seen but little demand, although some inquiries have been received for steam-coal contracts covering next season's requirements, mainly from industrial plants. The recent slump was so abrupt that operators have not yet been able to reduce production in a corresponding ratio.

Reports of an industrial revival have benefited the steam-coal trade, but some of the best informed operators in Indiana and Illinois state with great positiveness that they see no improvement as yet. It is the consensus of opinion that general demand is weak and prices below normal. The steel industries are working very slow and the railroads are not taking the tonnage usual at this time. Sales are being made on basis of summer prices. Local buying from city retail yards is very light.

The Franklin County operators are maintaining prices by coöperative efforts on the part of a majority of the prominent companies in the district.

The movement from the Indiana mines for the current month has been less than in previous years. Domestic coals are sagging and prices generally show no recovery.

The market for Eastern Kentucky coals has been listless, though operators from that section are showing more interest in this market.

Hocking grades are fairly firm, mainly because production has decreased. Some coal was sold this week due to the accrual of demurrage, and in such cases $1.35 was the minimum price.

Smokeless coals are not being bought to any extent. Most of the orders placed are at cut prices.

Splints are in bad shape, and all kinds of prices are being made.

The domestic demand for Springfield coals has been fair compared with other districts. Screenings are about the same as last week.

Anthracite sales are very slow, and few shipments are being made direct to this territory by the mines.

Prices are as follows:

	Franklin Co.	Springfield	Sullivan	Clinton	Carterville
Lump......	$1.40@1.75	$1.50	$1.40@1.60	$1.40@1.60	$1.50@1.75

ST. LOUIS

Summer prices quoted on domestic sizes and some of the high-grade operations have been forced to suspend. Outlook discouraging.

Summer prices were being quoted the past week on domestic sizes, and even with a dropping off of this business, the steam market also went down. Colder weather has stimulated the market to a very small extent, but it is not likely that prices will advance above the cost of production. For the first time this winter some of the better mines in the Williamson-Franklin County field have been obliged to suspend operations on account of no orders.

The washed market has weakened some, and every field has felt the results of the warm period. Anthracite is coming in very slowly, with little demand; for the first time in several months there has been a fairly good demand for smokeless, which was readily taken care of by diverting coal from other markets where there was a surplus. The local situation is not at all encouraging, unless something unexpected develops.

INDIANAPOLIS

Moderate weather follows the prolonged cold spell. Coal demand slackens and mines on about half-time. Operators wait anxiously for the spring revival.

Mining conditions in Indiana show little or no change. The moderating weather is against activity and the mines are making about three days a week. Operators are watching the industrial situation, but its improvement is so slow that it has not yet affected the coal situation. Prices continue unchanged and about on a level with those at the opening of the season. For a short period, advances of 10 to 20c. were obtainable at some of the mines but others seemed glad to be able to operate at the summer price schedule. The hope of the trade now lies in a betterment of factory conditions, with the end of winter. The chief constructive factor of the week has been the reopening of the rail mills at Gary, Ind., after three months' idleness, giving employment to 4500 men.

KANSAS CITY

Coal trade brisker, but prices remain steady.

Kansas City coal trade has experienced a seasonable activity the past few weeks, and retail dealers have disposed of much of the surplus accumulation but are not purchasing heavily due to the nearness of spring. The warm weather has not been seriously deterrent to the coal trade, since Kansas City expects some of the heaviest winter after these spells.

PRODUCTION AND TRANSPORTATION STATISTICS

NORFOLK & WESTERN RY.

The following is a statement of coal handled by the N. & W. Ry. during January and the past four months in short tons:

	October	November	December	January

FOREIGN MARKETS

ENGLAND

Situation much disturbed by difficulties due to the war. Prices are generally high and labor troubles are developing.

Feb. 5—The coal industry remains in a disturbed condition owing to a variety of causes, most of which are traceable to the war directly or indirectly. The signs of labor unrest which are now making their appearance in various directions are adding to the anxieties of the trade, and although it seems probable that the West Yorkshire dispute will be settled before the notices expire on Feb. 20, other questions are now under discussion and complaints are rife that the miners who remain at work are not doing their best to meet the exigencies of the situation. Generally speaking, the demand still exceeds the supply, with the result that prices are very high and still on the up-grade, except in some sections of the export trade where high freights and scarcity of tonnage depress the markets. More shipping seems to be available now, however, and coasting, if not foreign, rates are easier, so that the question of seaborne transport is not quite so acute as it was, but railway congestion is still unrelieved, the consequence being that some markets at a distance from the centers of production, such as London, are comparatively short of supplies.—"Iron and Coal Trades Review," London, England.

Feb. 5—Firmness is in evidence in all branches of the trade. New business is not active owing to the difficulty of arranging prompt supplies, sellers being heavily booked. The question of labor is becoming more serious. Quotations are approximately as follows:

Best Welsh steam.......	$4.92@5.04	Best Monmouthshires....	$4.38@4.44
Best seconds............	4.56@4.80	Seconds................	4.32@4.38
Seconds.................	4.50@4.62	Best Cardiff smalls......	3.60@3.72
Best dry coals..........	4.56@4.68	Cargo smalls...........	3.12@3.36

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering is on quiet lines owing to difficulty in arranging loading turns.

Gibraltar.........	$5.52	Naples..........	$7.32	Las Palmas......	$5.04

Coal Contracts Pending

Contracts listed in this department are authoritative in every respect except where the source of information is questionable, in which event it is noted. All contracts are listed promptly on receipt and only repeated when additional information becomes available or in the last issue previous to the day on which bids will be closed. Liberal remuneration will be paid for all legitimate notices of this kind sent in.

Contract No. 81—Philadelphia, Penn.—The bids on this contract (p. 275), which provides for furnishing and delivering 29,000 tons of bituminous coal to the floating plant employed in the Philadelphia Engineer District, were as follows:

Name of Bidder	Class 1	Class 2	Class 3	B.t.u.	Commercial Name
Empire Coal Mining Co.	$3.19	$2.68	$2.85	14,275	Somerset Smokeless
W. H. Bradford	3.02	2.60	2.85	14,400	Victor Smokeless
Sterling Coal Co.	3.27	2.83	2.98	14,600	Powelton
Dexter & Carpenter, Inc.	3.30	2.85	3.05	14,600	Lloydell So. Fork Semi-Bit.
Commercial Coal Mining Co.	3.12	2.70	2.85	14,500	"Star" Miller vein
Coale & Co.	3.12	2.70	2.85	14,500	Georges Creek Tyson
The Consolidation Coal Co., Inc.	3.13	2.63	2.78	14,150	Pine Hill
B. Nicoll & Co.	3.23	2.79	2.94	14,500	Tyson

Willard Bros.	4.10	....
T. H. Weaver & Co.	3.90	....

[1] For 6000 tons. [2] For 1200 tons. [3] For 5000 tons.

Archibald McNeil & Son Co., George's Creek coal, Portsmouth, $3.80; Key West, $4.90; New River coal, Portsmouth, $3.95; Key West, $5.07. Willett Martin Co., Portsmouth, Lincoln, Nantyglo, Penn., $3.63; Bethel, Holzapfel, Penn., $3.58; Beaver, Beaverdale, Penn., $3.63; Quemahoning, Ralphton, Penn., $3.58; George's Creek, Md., $3.73.

In most cases the bidders on this contract specified from which mines the coal was to be furnished. Address Paymaster-General of the Navy Samuel McGowan, Washington, D. C.

Contract No. 93—Jersey City, N. J.—Bids will be received until 10 a.m., Feb. 24, for furnishing and delivering 2500 gross tons of best quality pea coal at the power house (p. 318). Address, Clk. of the Bd., John C. Sweeney, Boulevard Commissioners, County Court House, Jersey City, N. J.

Contract No. 94—New York, N. Y.—Sealed bids will be received until 10:30 a.m., Feb. 24, for furnishing and delivering bituminous coal for fire companies in the Boroughs of Bronx and Queens. Security required is 30% of the total bid and delivery is to be made as directed before Dec. 31, 1915. Address Fire Comr. Robert Adamson, Municipal Bldg., New York.

Contract No. 95—Baltimore, Md.—Oppenheim & Oberndorf, Hanover and Fayette St., Baltimore, will be in the market during April for a supply of standard mine-run soft coal. This company consumes about 200 tons per month. Address P. W. Tucker, Baltimore, Md.

Contract No. 96—Farmington, Mo.—The Municipal Electric Light & Water Plant, Farmington, will be in the market during April for about 200 tons of 1½ to 2-in. screenings. The usual contract price is $1.90 f.o.b. railroad station, Farmington. Address Supt. C. M. Thomsen, Municipal Electric Light & Water Plant, Farmington.

Contract No. 97—Baltimore, Md.—The Merchants' & Miners' Transportation Co., Baltimore, will contract during April for an annual supply of about 240,000 tons of soft coal. Address Pur. Agt. and Gen. Mgr., W. P. Coria, Merchants' & Miners' Transportation Co., Baltimore.

Contract No. 98—New York, N. Y.—Sealed bids will be received until 10:30 a.m., Feb. 24, for furnishing and delivering anthracite coal as follows: No. 1—For the fire companies in the Borough of Queens, delivery to be completed before May 15, 1915; No. 2—for the fireboats, delivery to be completed before June 30, 1915; No. 3—for companies in Dist. No. 23, Borough of Brooklyn, delivery to be completed before June 30. In each case, the security required is 30% of the total bid. Address Fire Comr. Robert Adamson, Municipal Bldg., New York.

Contract No. 99—Baltimore, Md.—The Baltimore Bargain House, Baltimore and Liberty Sts., will be in the market about Apr. 1 for a supply of coal. This company commonly uses about 500 tons of Ralphton coal per month. Address Pur. Agt., G. E. Smith, Baltimore.

Contract No. 100—Galesburg, Ill.—The Galesburg Artificial Ice Co., Galesburg, will be in the market about Apr. 1 for 11,000 tons of 1¼-in. screenings, the usual contracting price being $1.50. Address W. R. Allensworth, Galesburg Artificial Ice Co., Galesburg, Ill.

Contract No. 101—Middletown, Conn.—The Connecticut Power Co., Middletown Division, will be in the market about Apr. 1 for 5000 tons of George's Creek Cumberland coal, the usual contract figure being $4.40 per ton. Address Mgr. P. N. Golden, Connecticut Power Co., Middletown, Conn.

Contract No. 102—Baltimore, Md.—Strouse & Bro., Lombard & Paca St., Baltimore, will be in the market about Apr. 1 for from 300 to 400 tons of coal per month. Address Pur. Agt., George Nopper, Baltimore, Md.

Contract No. 103—Ottawa Ont., Can.—Bids will be received until 4 p.m., Mar. 1, for furnishing a supply of steam coal for the departmental dredges. R. C. Desrochers is Secretary of the Department of Public Works, Ottawa. Address Dist. Engr. John Sweeney, Winnipeg, Man., Can.

Contract No. 104—Baltimore, Md.—Sharpe & Dohme, of this city, will be in the market about the first of April for a supply of standard mine-run coal. This company uses from 250 to 300 tons per month.

Contract No. 105—Somerville, Mass.—The Board of Education will be in the market about Apr. 1 for 4000 tons of Cumberland and anthracite coal. The contract is made on a test basis. Address the Commissioner of Public Buildings, City Hall, Somerville, Mass.

Contract No. 106—Knoxville, Iowa—The Marion County Electric Co., Knoxville, will be in the market about Apr. 1 for 6400 tons of Iowa steam screenings, the usual contract figure being $1.43 per ton. Address Marion County Electric Co., Knoxville, Iowa.

Contract No. 107—New York, N. Y.—The New York & Baltimore Transportation Co. purchase about 60,000 tons of soft coal per year. This contract will be let during April. Address Pur. Agt. B. R. Roome, Pier 10, East River, New York, N. Y.

Contract No. 108—Bay City, Mich.—The Bay City Electric Light Department will be in the market about Apr. 1 for 14,000 tons of slack coal, the usual contract price being $2 per ton. Address Pur. Agt. E. E. Prohazka, Bay City Electric Light Dept., Bay City, Mich.

Contract No. 109—Indianapolis, Ind.—The Interstate Public Service Co. will be in the market about Apr. 1 for 7800 tons of No. 4 mine-run Indiana coal, the usual contract price being $1.90 per ton, delivered. Address Supt. T. A. Elder, Interstate Public Service Co., 510 Board of Trade, Indianapolis, Ind.

Contract No. 110—Baltimore, Md.—The Maryland Biscuit Co., Baltimore, purchase about 1200 tons of bituminous coal per year. This company lets its contract during April. Address Pur. Agt. W. C. Scott, Maryland Biscuit Co., Baltimore, Md.

Contract No. 111—Watertown, N. Y.—The Board of Education will be in the market about Apr. 1 for 12,000 tons of best Scranton egg and stove coal. The usual contract price is $6.40 per ton. Address Supt. of Schools, Frank S. Elsdale, City Hall, Watertown.

Contract No. 112—Baltimore, Md.—The Coca-Cola Co. will award a contract during the month of April for a supply of good grade steam coal. This company consumes about 100 tons per month, and deliveries are made in carload lots every eight or ten days. Address Pur. Agt. William Martien, 3 Calvert St., Baltimore, Md.

Contract No. 113—New London, Wis.—The Municipal Electric Light & Water Works Plant, New London, will be in the market about Apr. 1 for about 1200 tons of thin vein Youghiogheny lump coal. The usual contract figure is $4.10, in bin. Address Supt. O. H. Pribnow, Municipal Electric Light & Water Works Plant, New London, Wis.

Contract No. 114—Baltimore, Md.—Wise Bros. will soon be in the market for a supply of standard grade mine-run coal, the present contract expiring in April. About 150 tons per month is generally used. Address Pur. Agt. and Supt., L. A. Hazzard, Wise Bros., Baltimore, Md.

Contract No. 115—Mount Pleasant, Iowa—The Municipal Electric Light & Water Works, Mount Pleasant, will be in the market about Apr. 1 for 2000 tons of Illinois egg coal, the usual contract figure being $2.70 per ton. Address Supt. T. W. McMillan, Municipal Electric Light & Water Works, Mount Pleasant, Iowa.

Contract No. 116—Baltimore, Md.—Stewart & Co., of this city, consume about 200 tons of Georges Creek coal per month. The present contract expires in April, and is awarded on a competitive basis. Bids are received by J. Middleton. Address Pur. Agt. Geo. R. Russell, Baltimore, Md.

Contract No. 117—Boston, Mass.—The Stone & Webster Co. will be in the market during April for 50,000 tons of New River and Pocahontas mine-run coal, deliveries to be made in proportionate amounts each month at Tidewater, Boston. Address R. E. Hamilton, 147 Milk St., Boston, Mass.

Contract No. 118—Baltimore, Md.—The Baltimore & Ohio Central Bldg. will be in the market about Apr. 1 for approximately 3000 tons of Somerset soft-grade coal. Address Pur. Agt. E. A. Foos, Baltimore & Ohio Central Bldg., Baltimore, Md.

Contract No. 119—New York, N. Y.—Bids will be received until 2 p.m., Feb. 26, for furnishing and delivering about 4,000,000 lb. of No. 2 buckwheat coal alongside of dock at the asphalt plant, 90th and 91st St., East River, Borough of Manhattan. The security required is 30% of the total bid, and a deposit of 1½% of the total amount must accompany each bid. The contract is to be completed before Dec. 31, 1915. Address Pres. Marcus M. Marks, 21st Floor, Municipal Bldg., New York.

Contract No. 120—Everett, Mass., and Providence, R. I.—The Stone & Webster Co. will be in the market during April for 79,500 tons of mine-run coal to be delivered as follows: 18,000 tons f.o.b. Everett, Mass.; 26,500 tons f.o.b. Providence, R. I., and 35,000 tons at Woonsocket. Address R. E. Hamilton, 147 Milk St., Boston, Mass.

Contract No. 121—Baltimore, Md.—The American Tobacco Co. purchases approximately 3000 tons of Orenda grade coal per year. The present contract expires in April. Address Pur. Agt. J. A. Powell, care of the American Tobacco Co., Baltimore, Md.

Hocking nut, pea and slack, New River & Ohio Coal Co., $1.35; Fletcher-Williams Coal Co., $1.19½; Victoria Coal Co., $1.29. West Virginia nut, pea and slack, New River & Ohio Coal Co., $1.39; Lorain Coal & Dock Co., $1.49; Victoria Coal Co., $1.54. Kentucky nut, pea and slack, Victoria Coal Co., $1.64.

380 TONS, delivered for other municipal departments, Hocking Valley Products Co., $2.35; Fletcher-Williams Coal Co., $2.30; M. A. Suydam & Co., $2.34; John Wilhelm, $2.30; The Franklin Builders Supply Co., $2.32.

Awards were as follows: Fletcher-Williams Coal Co., 12,000 tons for the Municipal Light Plant, Hocking nut, pea and slack coal at $1.20; 6000 tons for the water-works pumping station, Hocking nut, pea and slack at $1.19½; 380 tons for the city hall, city prison and other city departments, Hocking lump at $2.30. Victoria Coal Co., 2500 tons West Virginia mine-run at $1.54 for the garbage-disposal plant.

Contract No. 73—Washington, D. C.—This contract (p. 318), which provides for furnishing and delivering bituminous coal either at Washington, D. C., or at Alexandria, Va., has been awarded to W. A. Smoot & Co., Alexandria, Va., at $3.69 per gross ton. Address Lieut.-Col. J. P. Houston, Depot Quartermaster, Washington, D. C.

CONTRACT NOTES

A careful census recently taken of the steam plants in St. Louis that buy screenings in carload lots revealed the fact that the tonnage of this coal used now, in comparison with former years, is considerably lower. There is approximately 5300 tons of Standard screenings used for steam purposes in St. Louis per day, and about 1000 tons of Carterville screenings, in carload lots. One industry in St. Louis, the breweries, uses about 2000 tons of assorted screenings per day, delivered by wagons. This constitutes the bulk of the screenings moving into St. Louis, and represents about 8500 tons per day.

The New England Coal & Coke Co. has been recently awarded a contract by Stone & Webster for furnishing 79,500 tons of mine-run coal, deliveries to be made as follows: 18,000 tons to Everett, 26,500 tons to Providence and 35,000 tons to Woonsocket. Address R. E. Hamilton, 147 Milk St., Boston, Mass.

Barsteel Insurance

Means Hauling Coal "All Day Every Day"—

accomplished by the following features:

Barsteel Frame—Never been broken in service.
Commutating Pole Motors—Sparkless over wide range of loads and overloads.
Bronze Bearings with oil and waste lubrication. Last for years—and do not need an expert to replace.
Only mine locomotive on market with **Vauclain removable gib**—simplest device for Journal Box.
Hexagon Brass on main Journals.
Brake rigging supported at three points—two points close to Brake Shoes. Strongest and safest on market.
MCB Brake Shoe—recognized standard by all large railroads—strongest and simplest scheme on market.
Motor's spring suspended.
Separate axle caps—Oil and waste lubrication of axle bearings.
Separate Oil Channel for filling axle bearings.
Diagonally split Motor Field Frame.
Heavy Controllers with large copper contacts.
Only locomotive with **nickel alloy grid**-resistance.
D-21 Trolley—Combines simplicity with strength.

Barsteel Users are Boosters

Published Weekly by HILL PUBLISHING COMPANY
Tenth Avenue at Thirty-sixth Street, New York, N. Y.
JOHN A. HILL, Pres. ROB'T McKEAN, Sec'y.
Cable Address, "COAGE," N. Y.

Correspondence suitable for the columns of COAL AGE solicited and paid for. Name and address of correspondents must be given—not necessarily for publication. Subscription price $3 per year, in advance, for 52 numbers to any postoffice in the United States or possessions, and Mexico. $4 to Canada. $5 or its equivalent to any other foreign country.

Subscribers in Great Britain, Europe and the British Colonies in the Eastern Hemisphere may send their subscriptions to the London Office, 6 Bouverie St., London, E. C., England. Notice to change address should be written to the New York Office in every instance.

Advertising copy should reach New York Office by Thursday of week prior to date of issue. Entered as second class matter, October 14, 1911, at the Postoffice at New York, New York, under the Act of March 3, 1879.

VOLUME 7 FEBRUARY 27, 1915 NUMBER 9

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD—SUCCESS: *Page* 359

Attention is here called to a special "Success" number of Coal Age which will be issued Apr. 3. Readers are invited to contribute suitable articles for publication in this issue.

IDEAS AND SUGGESTIONS: *Pages* 360-361

An Opportunity and a Duty—The Case of the Man Who Quits—Don'ts for First-Aid-to-the-Injured Corps.

*EQUIPMENT AND OPERATION OF A NEW UTAH MINE: *Pages* 362-366

The mine is worked on the three-entry plan, the pit cars are weighed by an automatic recording machine, and railroad cars are weighed both before and after loading. Coal dust is burned as fuel under the boilers. W. W. Jones. COAL AGE, Vol. 7.

FATALITIES AT COAL MINES DURING 1914: *Pages* 366-367

Albert H. Fay. COAL AGE, Vol. 7.

*MOLOCH: *Page* 367

Poem by Berton Braley. COAL AGE, Vol. 7.

*A LONGWALL CONVEYOR AND LOADER FOR THIN SEAMS: *Pages* 368-369

A sectional coal conveyor and loader that is moved forward following the face. The results obtained by its use have been quite satisfactory, and the cost of production has been reduced. James Dickson. COAL AGE, Vol. 7.

THE GRIFFITH MINE PILLAR: *Page* 369

*WORKING WITH A NEW TYPE OF COAL CUTTER: *Pages* 370-371

Results obtained with a machine that cuts an 8-in. kerf in the bone parting of a 6-ft. seam of bituminous coal. The coal is obtained in better shape, that is, larger lumps, and the entire product is cleaner than before. Lighter shooting which results also insures a better top, thus improving safety and cost. John G. Bart. COAL AGE, Vol. 7.

COAL AND COKE NEWS: *Pages* 389-392

COAL TRADE REVIEWS: *Pages* 393-400

COAL CONTRACTS PENDING: *Page* 398

*A NEW MINER'S ELECTRIC LAMP: *Pages* 372-373

The new lamp of the General Electric Co. is guaranteed to burn more than 10 hours per charge after one year's service. It distributes light through an angle of 130 deg. COAL AGE, Vol. 7.

EXTRACTS FROM A SUPERINTENDENT'S DIARY: *Page* 373

EXPLOSION AT THE PROSPECT COLLIERY: *Page* 373

TWENTY MEN DROWNED IN A MINE NEAR NANAIMO, B. C.: *Page* 374

RECENT LEGAL DECISIONS: *Page* 374

*THE HAMPTON ROADS COALS—IV: *Pages* 375-377

This is the concluding article of the series. It takes up the Virginian district, with some interesting comments on the railway by that name. The probable future of the Hampton Roads coals is discussed, as is also the question of transportation to the foreign markets. F. R. Wadleigh. COAL AGE, Vol. 7.

THE LABOR SITUATION: *Pages* 378-379

Indications favor the initiation of the "open shop" in northeastern Ohio, after evictions have taken place. The antiscreen law is declared constitutional. A strike is developing in the Fairmont region. The legislature in West Virginia is asked to decree that all coal be weighed. Arkansas is now pacified. No more strike benefits will be paid in Colorado. COAL AGE, Vol. 7.

*A NEW MINE PUMP: *Page* 379

EDITORIALS: *Pages* 381-382

Confederating Our Mining Societies—Sobriety in Mining Camps—The Fee System.

DISCUSSION BY READERS: *Pages* 383-386

Recognition of Bravery. Letters Nos. 1 and 2—Mining Laws, Legislation and Mine Regulations. Letter No. 35—Safety Hints—Humidifying Mine Air.

STUDY COURSE IN COAL MINING: *Page* 386

Solution of Right Triangles.

INQUIRIES OF GENERAL INTEREST: *Page* 387

Purchase of Electric Power—Pick vs. Chain Machines.

EXAMINATION QUESTIONS WITH ANSWERS: *Page* 388

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

LAST SUNDAY NIGHT I was just finishing dinner in a hotel in Pittsburgh when the General Manager of a company, which operates eight large mines, happened along.

Naturally, I asked him how Coal Age was satisfying him and what he had to say about its value to the busy, progressive officials at the mine. His reply was interesting and I am going to quote it as nearly as I can remember it:—

"You bet I read your paper. Of course, the editorial part is invaluable to any coal mining man, but I want to tell you something you may not know or realize—and that is that the *advertising pages* are just as valuable to me as the editorials."

"How do you make that out?" I asked.

"Why, you see, I have eight mine superintendents under me, and those fellows seem to get all their ideas on where to buy new machinery or equipment from the advertisements. They say the argumentative copy and the different illustrations and drawings are so attractive that they naturally look in the ad pages each week and go through them from beginning to end as a sort of duty.

"Well, it got so that those boys were sending in requisitions to me for supplies I didn't know about, and I finally asked where they were getting their new hunches. When I heard it was from the ads in Coal Age, you can bet it didn't take me long to become a regular reader of that part of the paper. I can't let those superintendents be putting anything over on me."

▫ ▫ ▫

That's a true story of one case —and I know of a lot more.

The brains that modern manufacturers are putting into their printed salesmen—the advertisements—are pretty sure to suggest valuable ideas to those who read.

Are you an ad-student? If not, take an experimental course with this issue. *Begin* NOW.

COAL AGE

ONE OF THE HILL ENGINEERING WEEKLIES

Vol. 7 NEW YORK, FEBRUARY 27, 1915 No. 9

Success

The aim of all effort, in fact of all life, is the attainment of success. The common thief strives as hard to succeed in his evil avocation as the upright man who preaches the gospel. Every human thought bears a relation to success, and no single word in the English language has a broader appeal.

° ° °

IT IS FOR THIS REASON we propose to print a real "*Success Number*" of COAL AGE on April 3, and we want each and every one of our readers to cooperate with us in making this special issue the kind of a paper the subject implies.

We want it to be so interesting you will not lay it aside until you have finished reading it all; and, in addition, we intend to present in this particular issue more valuable educational coal-mining information than we have heretofore crowded into any three or four consecutive copies of this paper.

We want something from every reader, no matter whether the contribution is a long article, a few lines, a single thought, or only a suggestion. It makes no difference whether you are a miner, foreman, superintendent or president, whatever you send in will have close attention, and if published, you will be properly recompensed.

You say: I would like to help, but how can I do so? The answer is simple. Send us a description of the most successful thing you are familiar with at the mine where you work. It may be quite an elaborate machine, or it may be a simple contrivance. It may be the product of a great manufacturer, or it may be entirely homemade. It may be underground or on the surface. It may be a material object, or only a plan on paper.

It may be a system having to do with actual mine development, or it may be a night school devoted only to mental betterment. Whatever it is, if it is a success, and you can give facts to prove such is the case, let us have it.

Perhaps you are so busy that all you can send us is a suggestion. If that's the situation, we promise you we'll follow up your idea. Maybe you know a man who has accomplished a whole lot along mining lines, and whose life story would inspire others to bigger accomplishments. Tell us in confidence about him, or better still, prepare a short story of facts concerning him. And remember there are foremen and superintendents who are actually bigger successes than many mining presidents. Success is measured by what we overcome rather than how far we travel. It's easy to cover distance on a smooth level road.

Two brief announcements of this coming issue of COAL AGE have been made, and much to our surprise, a number of contributions have already been received. This early show of interest leads us to believe that, although the "*Success Number*" will be greatly enlarged, there may not be room for everything that comes in, so in fairness to all we will enter each contribution in the order of its receipt; those reaching us first will be given earliest attention, while the others left over—if suitable for publication—will be printed in subsequent issues.

DO YOU BELIEVE *it is wise to carefully improve all one's opportunities?* DID YOU EVER PROCLAIM *this brand of philosophy? Then practice what you preach, and* START PREPARATION OF YOUR "SUCCESS" ARTICLE TODAY. *If uncertain on any point, write us.*

Ideas and Suggestions

An Opportunity and a Duty

SYNOPSIS—Will the owners, operators and workers engaged in the coal-mining industry in Alabama help to eradicate the fee system which preys on the workmen, especially on the negro race?

It is not every day that opportunity and duty meet, or present themselves at the same time. Whenever they do a splendid chance is offered to do the thing, whatever it is, that duty impels.

It is suggested to us that such a condition exists at present in Alabama, where the legislature is in session and before which a bill will be presented providing for a constitutional amendment to eliminate the iniquitous fee system which for years has been an incubus to this state and its progress. The people have already expressed themselves as desiring this legislation. However it must be understood that it will not be a "cinch" to secure it on account of the opposition likely to develop from those so strongly entrenched in the system.

The "fee system" in Alabama, Tennessee and other Southern states provides in lieu of salaries that court officials such as judges, sheriffs, solicitors, court clerks, etc., be paid by a system of fees exacted from the unfortunates convicted of crime. In fact it is not necessary that persons be convicted—they need only be arrested (the fact that no bond has to be made by the party swearing out warrants of arrest makes this mighty easy) and put in jail to insure the sheriff and other officials at least $5.30 per head, regardless of whether they ever secure even a trial or conviction. In thousands of cases the fees mount up enormously and the officials paid under this system draw princely stipends. It has been said that the position of sheriff of Jefferson County in the heart of the coal-mining district of Alabama pays sometimes as much or more per year than the office of President.

Such a condition can mean but one thing. The poorer classes—the workers—pay the price of such a system.

The owners and operators of coal mines in Alabama are vitally interested in the eradication of such a plan of paying public officials. The scheme is successful for the officials who are paid in fees because they can make it so by increasing the number of arrests. It is destructive to the success of coal-mining operations, however, because it demoralizes labor.

The largest single class of labor in Alabama's coal mines is the negro. It is open knowledge that the beneficiaries of the present fee system fatten and grow rich at the expense of the negro and his employer. This is largely due to ignorance and a certain racial weakness of the negro for petty gambling. He is, therefore, the principal victim of the plan. Those familiar with mining operations in Alabama will recall many instances where the negroes have been ensnared into "crap games" on Sundays and holidays and then arrested in a bunch by the active deputies of the sheriff because of the fees that would follow. Both the workers and the operators had to pay for this kind of thing and are still doing it.

It is an open fact that some of Alabama's jails stay brimful of prisoners caught in the dragnet of the fee system. Hundreds of men who ought to be and want to be at work are kept there as the result of Sunday arrests, etc., until arrangements are completed whereby the resultant fees will accrue. It is also a well known fact that so flimsy and poor is the evidence in hundreds of these cases that they never get to trial. In Jefferson County alone several hundred such cases were recently nol-prossed because of insufficient evidence, etc.

Here is the opportunity and the duty of Alabama's citizens who are engaged in the mining industry from owner and operator down to the humblest worker in the ranks; that is to *do everything possible to secure the passage of a constitutional amendment doing away forever with the present fee system.*

It will be in line with the work that many of the coal concerns of the state are engaged in looking toward the betterment of working conditions and the improvement of living conditions. The elimination of the fee system will mean increased contentment and prosperity in the mining districts, and the part that those engaged in the industry plan and perform in bringing about this accomplishment will redound to the honor of every man who lends a hand.

Will Alabama's mining men do their plain duty? Let us hope they will.

⁂

The Case of the Man Who Quits

By M. D. Cooper*

SYNOPSIS—Coal companies might find it profitable to establish a system of investigation formed on the lines here suggested.

During recent years some companies have given considerable attention to the case of the man who is discharged. Individual inquiries and even bureaus of investigation have been organized to examine the causes of discharge and to assure each employee of just treatment. In this manner it has been found that the man discharged was not always at fault. In some cases the responsibility rested with a fellow employee, in others with the man's boss, and in still others the cause was beyond the control of any of the persons involved. The causes of discharge were discovered to be numerous and varied.

Regardless, however, of the nature of the cause, it stands to reason that a man deserves to be discharged only in those cases where he himself is proved to be at fault. Therefore, the positive identification of the person in the wrong, and the assurance that he only will be compelled to accept the consequences, is a matter of more than ordinary importance in maintaining the reputation of an employer.

---

*Ellsworth, Penn.

A movement of more recent origin concerns the man who of his own initiative quits his job. What is known of the causes of his going? Very little at many places. He comes and goes and generally but slight attention is paid to the cause, even though 80 or 90 per cent. of the men leaving a company's employ may belong to this class. An inquiry as to the reason for his voluntary leaving generally reveals one of the following reasons:

1. A better job elsewhere.
2. Dissatisfaction with the present job, the boss or living conditions.

This man's case may be taken up in each instance by getting the answers to three questions. What is his own reason for leaving? What is his boss' reason for his leaving? What does a disinterested investigation reveal as to the cause of his leaving? The answer to the third question may agree with one or both of the answers to the first two, or it may differ entirely from them. The third answer is of course the most difficult to obtain, but when accurately determined is the most valuable of the three. A card index record containing these three questions and their answers should be kept in the cases of those employees who leave of their own accord.

A Record of Each Individual Case

A record of this sort will cost money to establish and maintain. Is it worth it? What are its advantages? In the case of the man who leaves to get a better job, an investigation may reveal little of importance. He perhaps leaves in the friendliest spirit and with the good will of his boss and associates. On the other hand, his going may show up a weakness in organization or stagnation that needs remedying in the department in which he worked. It is, however, the man who leaves dissatisfied who will usually bear the greater amount of attention. Either he will be found to be a chronic "kicker" or else some basis for his dissatisfaction will be brought to light. If the latter proves to be the case, it is very much to the advantage of the management to know about it.

It seems reasonably certain that unsatisfactory conditions surrounding a job, or a mine, or a town are in the end more costly than the expense involved in removing them. Ordinarily, it is not a great loss to have a mediocre workman leave, but if, on leaving, he is able to air his dissatisfaction in descriptions of conditions that cannot be denied, he may easily succeed in keeping better workmen than himself away from the place he left. In other words, if men leave and their employer is indifferent as to the cause of their going, a mine or a town may get a bad name for no other reason than some slight cause of dissatisfaction that could be removed if proper effort was made to find out about it.

In office work alone, it is possible that in some plants enough time could be saved by reducing the number of changes and the expense involved in recording them to pay for the maintenance of this important service.

Where It Affects Production Costs

Of still greater consequence, however, is the question of production and costs. It is well known that new workmen must always be broken in, the time required for this training varying with the skill and experience of the men, but in any case their production during this period is always lower than it becomes after they are well established; consequently their unit costs are higher. Therefore, the greater the number of changes, the less the average production per man and the higher the costs of the plant as a whole. If then a study of the causes of men's leaving results in more faithful and longer-continued service per man, the cost of the investigation may be saved many times.

A well kept record of the cases of the men who quit is worth its cost because it tends to keep an employer alive to the value of maintaining a good name, because it saves unnecessary office work, and finally because it results in less waste of time and lower costs.

Have you ever gone into this matter? Do you know the proportion of men who leave your service on their own initiative as compared with the total number who leave for all causes? If you find that this group constitutes 80 or 90 per cent. of the whole number, you may discover that some simple act on your part will result in a more permanent body of workmen, increased output per man, and decreased costs.

◆

Don'ts for First-Aid-to-the-Injured Corps

1. Don't fail to attend your first-aid practice. It is for your benefit and that of your fellow workmen.
2. Don't touch a clean wound with dirty hands. You are sure to infect it and cause blood poison.
3. Don't forget that in the absence of a tourniquet pressure will stop hemorrhages.
4. Don't fail to handle a sprain the same as a fracture.
5. Don't explore a punctured wound.
6. Don't tie "granny" knots; they slip.
7. Don't forget arterial blood is bright red and spurts. Venous blood is dark.
8. Don't use tobacco or cobwebs on a wound of any kind for fear of infection.
9. Don't fail to slightly loosen tourniquets at end of one hour; if hemorrhage returns, retighten.
10. Don't retain the dangerous rubber and chain tourniquet longer than 20 min., endeavor to apply a safer tourniquet as quickly as possible.
11. Don't fail to stimulate and apply heat in a condition of shock.
12. Don't attempt to reduce a dislocation. Put parts at rest and send the patient to a doctor.
13. Don't apply a tourniquet too tightly; you may cause death to the part.
14. Don't forget to handle a patient with a fractured spine with the utmost care and gentleness for fear of injuring the cord.
15. Don't handle a simple fracture except with great care; you may make it a compound fracture.
16. Don't delay efforts to restore life.
17. Don't hurry in performing artificial respiration.
18. Don't give up hope of saving the patient's life—work.
19. Don't attempt to place a person suffering from shock in a standing or sitting position.

NOTE—From Susquehanna Coal Co.'s Book of Instructions to Employees.

Equipment and Operation of a New Utah Mine

By W. W. Jones*

SYNOPSIS—The mine is worked on the three-entry plan, the pit cars are weighed by an automatic recording machine, and railroad cars are weighed both before and after loading. Coal dust is burned as fuel under the boilers.

The Standard Coal Co.'s property is located in Carbon County, Utah, approximately six miles west of Helper. This property was developed by Messrs. L. F. Rains and F. A. Sweet, of Salt Lake City, prominent in business and financial circles as well as in coal- and metal-mine operations.

The company began construction work on July 10, 1913, when one mile of standard-gage railroad track was required to connect the tipple site to the branch of the Denver & Rio Grande R.R. to Helper.

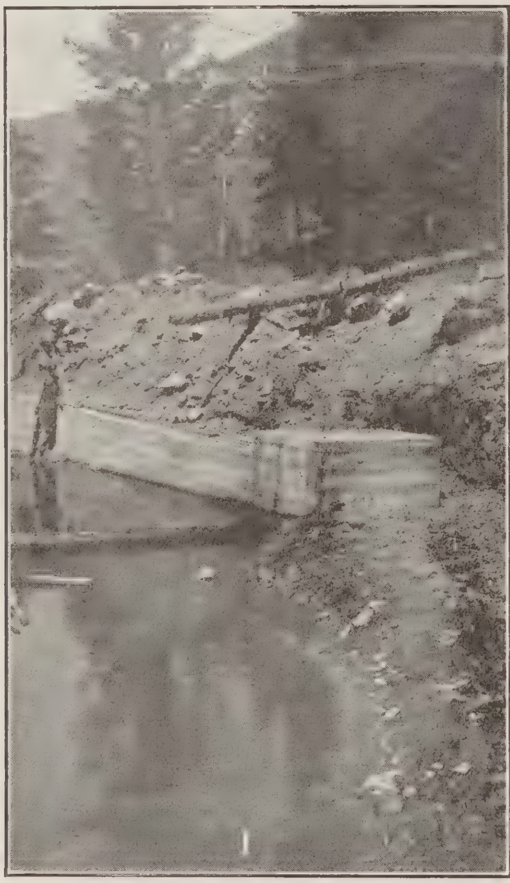
The railroad and tipple yards were completed on Sept. 15, 1913; in the meantime work on the double-track gravity tramway was well under way.

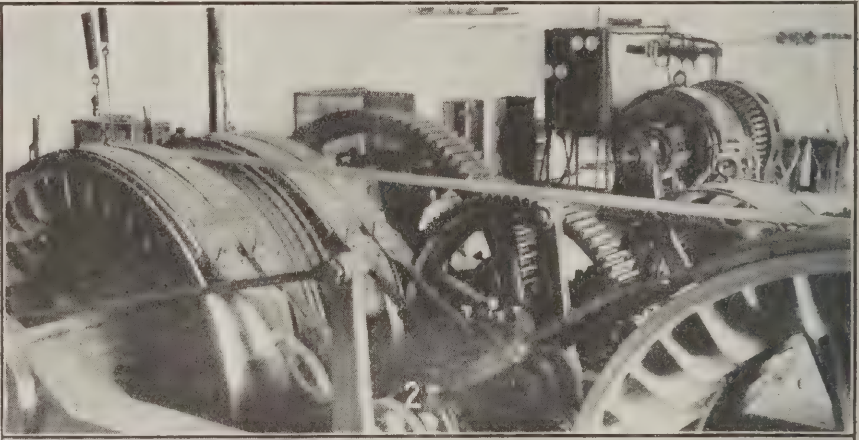
The reinforced-concrete retaining wall and tipple were completed on Nov. 3, 1913. Considerable inclement weather was encountered, but notwithstanding these difficulties the first trip of coal was lowered, dumped, screened and loaded into railroad cars on Feb. 10, 1914, just seven months after the first shovelful of earth was turned.

The company is now operating with a capacity over the tipple of 1000 tons, this record having been established on Oct. 28, 1914.

The equipment is modern, uptodate, efficient and economical in operation. The construction is permanent and solid, requiring the minimum of maintenance.

The main features of interest are the geology, mine, electric haulage, gravity double-track tram and hoist, automatic mine-car weighing machine, rotary dump, reciprocating screens, rescreening plant, box-car loaders, dust-blower system, the power-house equipment, the reinforced-concrete retaining wall and tipple and the water system.





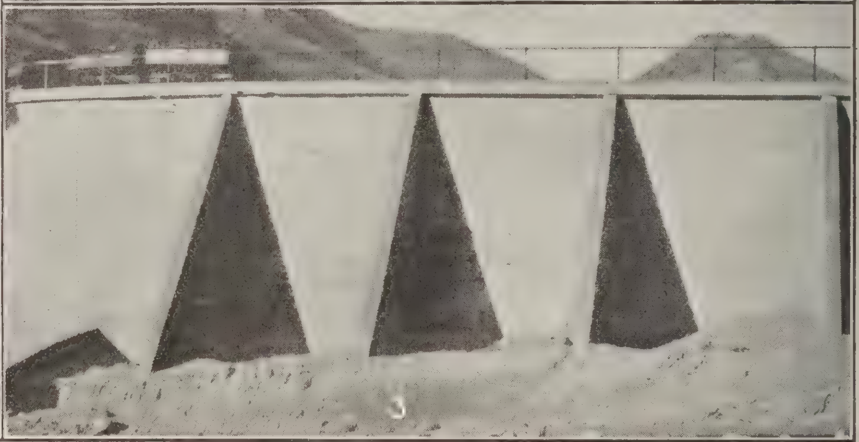


Fig. 1. Intake for One Source of Water-Supply. Fig. 2. Inside of Hoist House, Showing Engine. Fig. 3. Concrete Buttresses on Wing Wall, 30 Ft. High

The coal measures at this point dip 7¼ per cent. to the northeast. There are three workable seams, all having sandstone roofs and floors. The No. 3 bed is the same measure, although with slightly different characteristics, as the Castle Gate seam, and is the one being worked. This bed varies in thickness from 10 to 15 ft., having a parting 4 ft. 2 in. from the floor.

The coal has a pronounced cleavage in parallel and in perpendicular planes about 18 in. apart. This makes it easy to mine and gives a large percentage of lump. The coal is black and lustrous; it ignites easily and burns freely, giving a clean gray ash devoid of clinker. According to statements made by customers and as shown by steam tests, it has a high calorific value.

---

*Chief engineer, Standard Coal Co., Standardville, Utah.

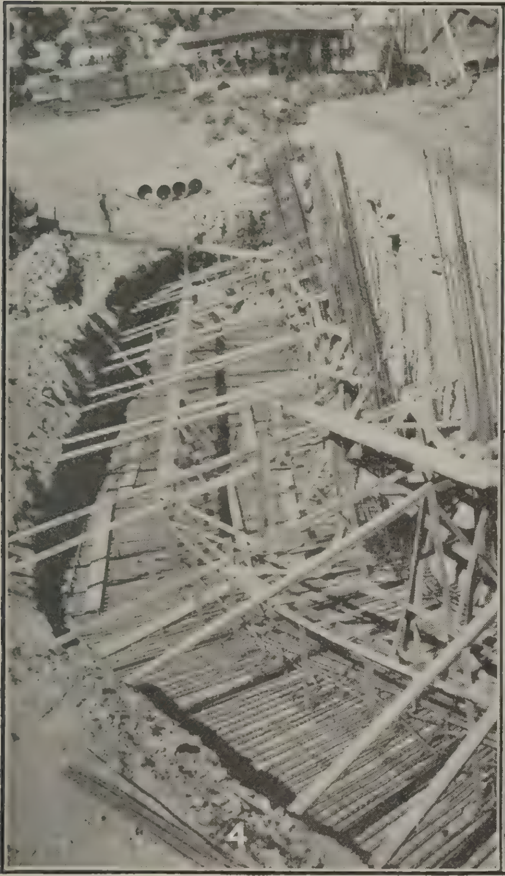
THE THREE-ENTRY SYSTEM IS EMPLOYED

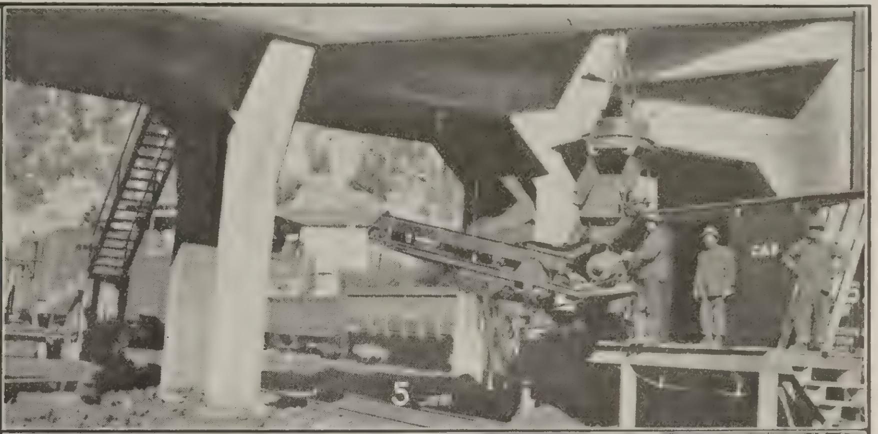
The mine is developed on the three-entry system, two haulage roads being driven, one either side of the return-air course. This system has many advantages. Separate splits of air are more easily furnished to the butt entries and reduce the chance of an explosion in one portion of the mine being communicated to the rest. The size of the entries may also be reduced without increasing the mine resistance to such a degree as is the case when the double-entry system is used.

The main entries are run on a 3½ per cent. grade against the loads. The butt entries are on a grade of approximately 4 per cent., one side of the mine in favor of the loads and the other side against them. The main entries are on 75-ft. centers; butt entries on 50-ft. centers between air courses. Rooms off the butt entries are on 72-ft. centers.

The mine fan is an 8-ft. Sullivan reversible-hood machine, of 250,000 cu.ft. per min. capacity. It is driven by a 50-hp., 2300-volt polyphase induction motor through a variable-speed drive of the disk-and-roller type.

The main entries are whitewashed. This is an added factor of safety, in that it provides reflecting surfaces for light and makes dust collections on the ribs easily detected so they may be removed.





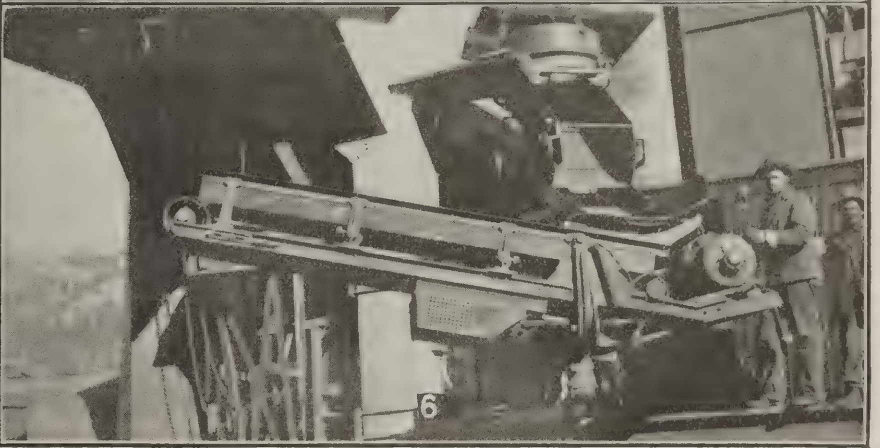


FIG. 4. FOOTING FOR RETAINING WALL, SHOWING STEEL REINFORCING IN PLACE. FIG. 5. BOX-CAR LOADER FOR EGG AND STOVE COAL. FIG. 6. A CLOSER VIEW OF THE MANIERRE LOADER

The main- and butt-entry haulage roads are laid with 40-lb. standard A. S. C. E. rail, all joints having 10-in. twin-cable fishplate bonds, of the channel-pin type. All room turnouts are of standard 40-lb. rail, switches and frogs.

The locomotives are three in number; two are 7½-ton Baldwin-Westinghouse bar-steel frame gathering-reel type, with one 15-ton haulage machine.

These locomotives are giving excellent service with but little attention or repairs. They operate on a 250-volt overhead trolley system. All of the butt-entry trolley circuits are connected to the main-haulage circuits through automatic switches.

The main-haulage circuits are sectionalized by all-metal under-run switches. All of the haulage roads are illuminated by 40-watt tungsten lamps operated on 110-volt a.c. independent circuits.

The hoist house is located directly over the portal to the mine, the floor and main entrance being of reinforced-concrete construction. In the building are located the hoist and a 200-kw. synchronous motor-generator set, which converts the 2300-volt alternating current to 250-volt direct current for trolley service in the mine. Directly in line with the tramway and over the portal of the mine is the double-drum hoisting engine, with axles mounted in a horizontal plane. The friction for holding the rope during an unbalanced pull is obtained by three wraps around each drum.

Four sets of brake bands, two for each drum, control the speed of hoisting. In case of equal loads on each end of the cable, the hoist can be driven through a friction band

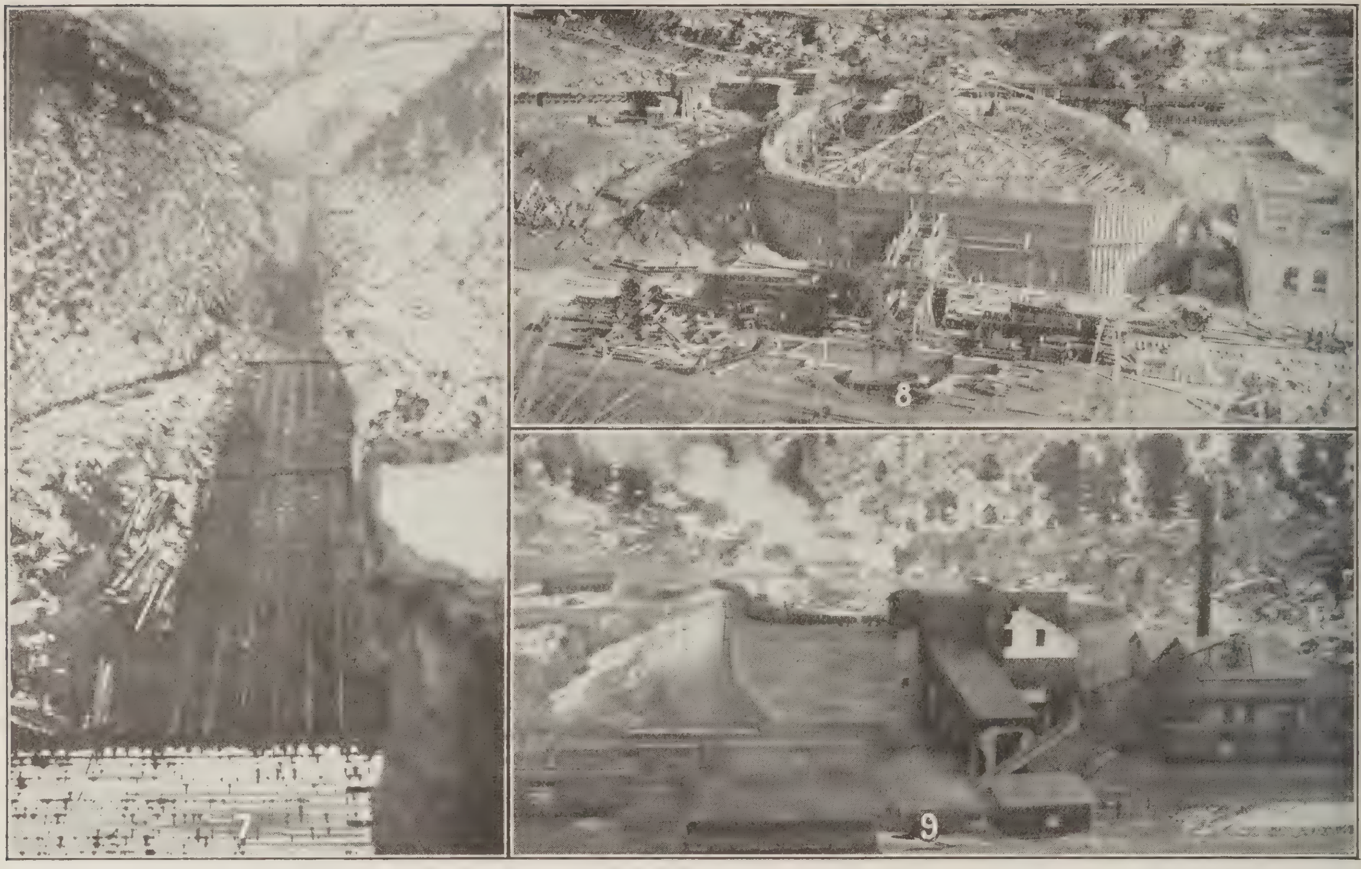

Fig. 7. Looking down the Tramline from above the Hoist House. Center Track Is Used for Empty Cars Only. Fig. 8. Showing Method of Setting Forms and Bracing. The Forms in the Foreground Are Designed to Support the Reciprocating Screens. Fig. 9. General View of Surface Plant, Showing Power House and Tipple. This View Shows Results of Proper Firing with American Stokers and Forced Draft

clutch and gears by a 150-hp. 2300-volt variable-speed polyphase induction motor. Under normal conditions the hoisting is done by gravity. The loads going down the incline to the tipple pull the empties up to the mine. The hoisting engine was built by the Denver Engineering Works.

The greatest obstacle overcome in the construction work was the building of the 4300-ft. double-track tramline. A straight road with one break in grade from a 12.4 per cent. to a 7.1 per cent. inclination connects the mine to the tipple. Large cliffs 60 to 100 ft. high were torn down to fill the cañon and build the grade.

The excavation at the lower end of the line was made by a steam shovel. The upper end was mostly solid rock and was blasted and hauled away by teams to make the fills. Approximately 100,000 cu.yd. of material was removed in construction of the grade. The roadbed is 18 ft. wide with side slopes of 1½ to 1. The tracks are of 40-lb. standard-section rails laid on a 42-in. gage. The tramway rope is 4500 ft. long and 1⅛ in. in diameter, made of the best materials obtainable. It was furnished by the Leschens & Sons Co.

Manganese steel rollers with Hyatt spiral-roller bearings are set in the center of each of the tracks to support the rope. These rollers were furnished by the Silver Bros. Iron Works and the American Manganese Steel Co.

The rope and tramway were designed for 16-car trips to travel the distance from the mine to the tipple in 4 min. At present 12- to 14-car trips are run in approximately 6 min. The ultimate capacity of the incline is 500 tons per hour. At the upper end there are three tracks, the center one for incoming empty trips and the outside tracks for loaded trips. All of the switches on the tramway are automatic and require no attention during operation.

The Weighing and Dumping Apparatus

When the cars are detached from the rope on the tipple bridge they pass over an automatic recording Streeter-Amet weighing machine which accurately weighs them, thus eliminating the necessity of a weighman and checkweighman.

As the cars leave the scales they run into a rotary dump. In this is incorporated the theory of rolling the coal out of the car rather than dropping it. The dump is driven by a constant-speed, 7½-hp., 220-volt polyphase induction motor. The receiving bins are circular and set close to the car as it is dumped, thus insuring a minimum of breakage to the coal. The feed table under this dump is run by a 15-hp. induction motor.

The reciprocating screens are of special design, having an extreme width of 8 ft., making an excellent screening area. They are driven by a 50-hp., 2300-volt induction motor. These screens are in two units, the first set having a double deck and the second a single deck. The second set is used for California lump only.

All of the coal-separating machinery was furnished by the Link-Belt Co. The rotary dump and the coal-separating machinery are inclosed in a structural steel housing furnished by the American Bridge Co.

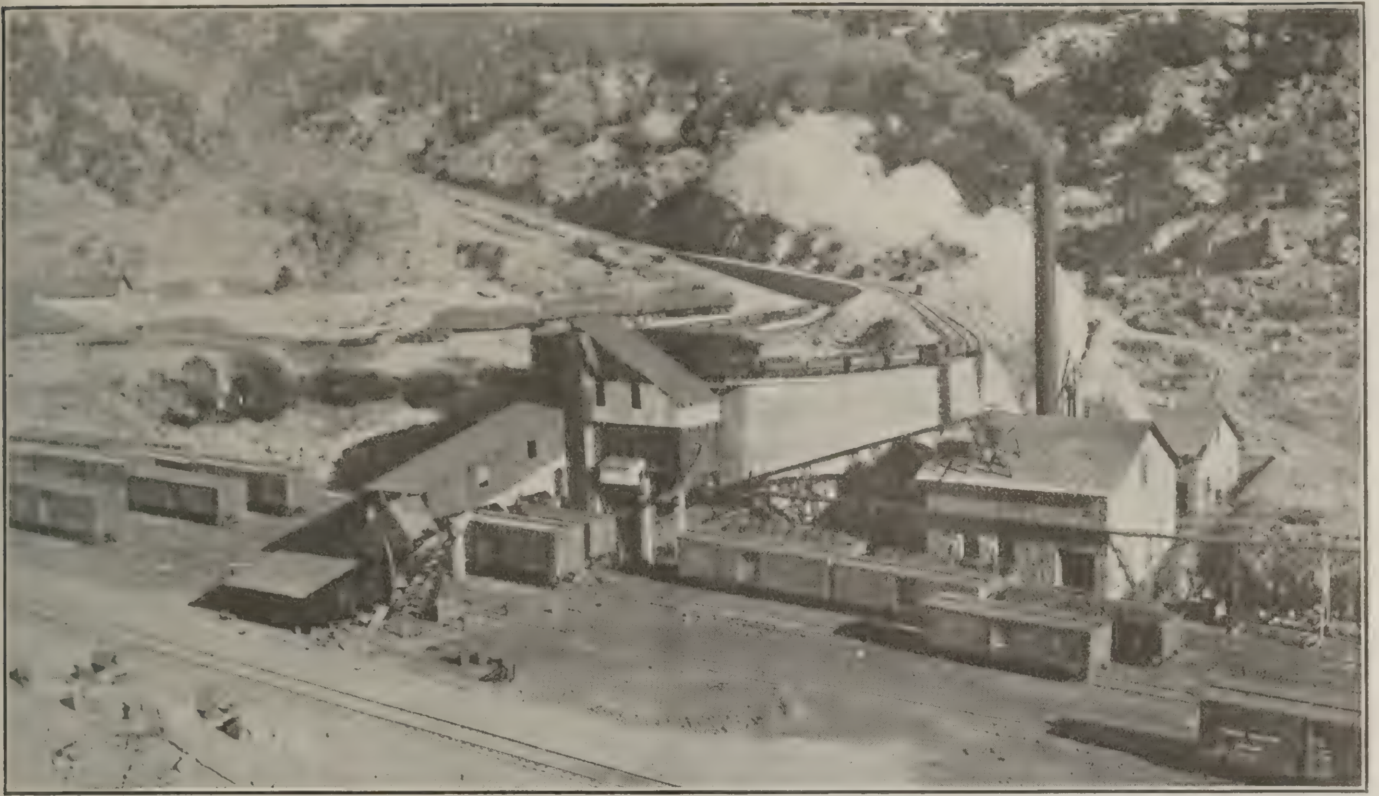

Fig. 10. In This View We May See the Results of Improper Firing and Running Noncondensing. The Pipe Line Running to Top of Boiler House Is for Blowing Dust From Rescreening Plant to Bunkers above Boilers

The slack coal from the upper deck of screens is collected in a hopper with the chute leading to an 18-in. elevator, which takes the coal to a rotary screen. The elevator is driven by a 20-hp. induction motor.

The revolving screen, which is likewise driven by a 7½-hp. induction motor, is set over an 80-ton steel dust bin. The screened slack from the rotary screen is stored in a steel bin of 50 tons' capacity.

The box-car loader for lump coal or run-of-mine takes any size of the ordinary railroad car and tips it to such a slope from the horizontal that the coal will readily roll down and fill up the end of the car. As the end of the car fills, the loader tilts back until it is horizontal; then slowly, as the car fills, it reaches the maximum inclination in the opposite direction when the car is loaded. This loader gives excellent service in that it does not break the large lumps of coal.

The tilting device is driven through a Morse silent chain by a 75-hp., 2300-volt, phase-wound induction motor. The auxiliary device for operating the clutches that hold the car on the loader is driven by a 20-hp., phase-wound, 220-volt motor. After the car is tilted on end it is held in that position by an air brake. The air is furnished by a 1-hp. motor-driven air compressor. The loader was furnished by the Ottumwa Box Car Loader Co.

The egg and stove coal is loaded by a Manierre box-car loader. This is a belt conveyor mounted on two arms hinged from a supporting column of the tipple. It is moved easily by hand as all the pivots are ball bearing. This loader is driven by a 10-hp., 220-volt, phase-wound motor; the belt is 24 in. wide, with a capacity of six tons per minute, and travels at the rate of 100 ft. per min.

Coal Dust Is Burned as Fuel

In the dust bin is a screw conveyor driven by a 5-hp., 220-volt induction motor through a Reeves variable-speed transmission. This conveyor ends in a 16-in. galvanized iron pipe through which air is traveling at the rate of 8000 ft. per min. This air current is produced by a 53-in. Sirocco pressure blower, driven by a 125-hp., 2300-volt induction motor. The blower handles approximately 13 cu.ft. of air per pound of coal, or about 25 tons per hour. The portion of the dust required for firing the boilers is conveyed by an auxiliary pipe line to a dust collector, over the steel coal bunkers, where the velocity is so reduced that the coal falls through the bottom and is carried by chutes to the bunkers. The blower was furnished by the Utah Engineering Co.

The boiler plant consists of two 200-hp. Stirling water-tube boilers fired by two American stokers to each boiler. Steam is carried at 150 lb. gage pressure. The building is of native sandstone, 34x40 ft. and 22 ft. high, with a corrugated sheet-iron roof supported on steel trusses and channel purlins.

Forced draft for the stokers is supplied by a steam-engine-driven fan, which also drives the stokers. As the steam varies in pressure the engine automatically changes its speed as required.

The ash pit is underneath the boilers, where a small car is provided to receive the ashes. This car runs on a ½ per cent. down grade to the ash dump.

Power is generated by a 2300-volt, 375-kv.-a. Westinghouse turbo-alternator. The turbine is of the impulse type, having only one set of blades. A barometric condenser has just been installed which gives 22 in. of vacuum, which corresponds closely to the altitude at this place. The circulating water for the condenser is forced through eight special spray-cooling nozzles by a 30-hp. direct-connected centrifugal pump and falls into a concrete pond, whence it again flows by gravity to the condenser.

A two-panel switchboard with all of the necessary instruments controls the distribution of power. All of the switches are operated by remote mechanical control and are mounted on the wall together with all of the instrument transformers.

Westinghouse electrolytic lightning arresters take care of all of the disturbances from the elements. The entire electrical equipment was furnished by the Westinghouse Electric & Manufacturing Co. through its Salt Lake representatives.

The water for sprinkling the mine is conducted by gravity through four miles of pipe line and stored in a 50,000-gal. wood-stave tank, situated 120 ft. above the portal of the mine. The entire mine is piped so that water is available for sprinkling and drinking purposes in each of the rooms and entries.

Water for the town and for the operation of the power house is supplied from springs 3½ miles up the cañon. The springs are all concreted in, so that the water has little chance of being contaminated. There are three sets of pipe lines from the three springs to the town, thus affording a constant supply.

Fig. 11. Spray Nozzles in Cooling Pond

The upper spring is 124 ft. above the storage tank at the mine and gives a static pressure of 285 lb. at the town if desired. The two lower springs will produce a pressure of 170 lb. at the town. The two pipe lines from the lower springs are connected to a 50,000-gal. wood-stave tank situated so as to give a pressure of 70 lb. for the town hydrants. In the complete system there are over 11½ miles of pipe. All of these systems are interconnected through valves that can be used for emergency.

Tipple and Yards

The reinforced-concrete retaining wall, which is a part of the tipple structure, is 480 ft. long. In plan it is pear-shaped, with a height varying from 10 to 46 ft. The maximum height is next to the tipple structure.

The wall is 19 in. thick at the base and 10 in. at the top and is set on reinforced-concrete footings. On the outside the wall has a batter of ½ in. to the foot. Throughout its length there are reinforced-concrete buttresses spaced approximately every 12 ft., the spacing depending on the height of the wall. The steel was furnished by Ryersons & Sons Co., of Chicago. Lyman & Samuels, of Salt Lake City, contracted the erecting of the forms and placing of the steel and concrete under the direction of D. H. Blossom, of Salt Lake City. The proportion in the aggregate was: 1 part cement, 2½ parts sand, 2½ parts gravel.

The tipple yards and railroad yards leading to them were excavated by a steam shovel and construction train. They are approximately 1000 ft. long by 150 ft. wide on a 2 per cent. grade. All of the rails are standard 75-lb. set on 8-in. tie-plated ties.

The empty cars are taken past the tipple on a passing track and are stored in the upper part of the yards above the scales. The storage capacity accommodates 40 cars at present. From these storage tracks the empty cars pass over a Fairbanks-Morse 150-ton full-suspension concrete-and-steel-set scales, where they are weighed and then distributed onto the four tracks leading to the tipple. Between the scales and the tipple there is storage space for 18 cars, together with one car under the chutes on each of the tracks.

As the cars are loaded they are dropped by gravity over a similar set of scales below the tipple and reweighed, then dropped onto two makeup tracks ready for the train. Below the tipple there is storage for 19 loads and on the makeup tracks there is storage for 29 cars.

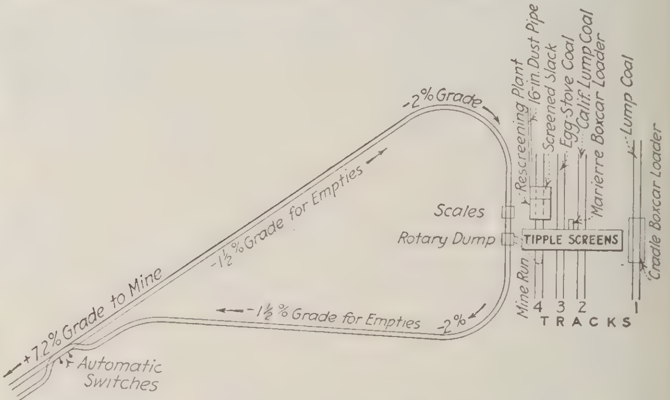

Fig. 12. Plan Showing General Layout of the Surface Plant

At present all of the employees are living in tents. There are an office building, a meat market, store and hotel, all of metal lath and pebble-dash construction. The meat market is equipped with a 10-ton refrigerating plant driven by a 15-hp. induction motor.

A mine-rescue and first-aid corps is organized and provided with a full equipment of first-aid supplies.

⁂

Fatalities at Coal Mines during 1914

By Albert H. Fay*

It is gratifying to note that the fatalities in coal mines in the United States in 1914 were 334 less than during the preceding year, the total fatalities being 2451 as compared with 2785 for 1913.

The principal causes of accidents showing a material decrease are: Coal-dust explosions, 96 per cent.; haulage, 11 per cent.; and falls of roof and pillar coal, 10.6 per cent. The net decrease in underground fatalities was 365, or 14 per cent. This is equivalent to one life every day during the year.

---

*Mining engineer of the U. S. Bureau of Mines.

There were 331 fatalities due to gas explosions as compared with 91 in 1913, making a net increase of 240. Of the total gas-explosion fatalities, 261 were due to four serious explosions. There were slight increases in accidents due to explosions and electricity.

There was also a net increase of 26 fatalities in shaft accidents, or 42 per cent.; while on the surface, the net increase was five, or about 3 per cent. The net decrease for the year for both underground and surface accidents at coal mines as compared with 1913 was 12 per cent.

Fatalities per Thousand Employed

The exact figures for the number of men employed are not yet available, but taking the estimates as furnished by the inspectors for part of the states and using the same number of men as employed in 1913 for the other states, gives an estimated total number of employees for the year of 742,868 as compared with 747,644 in 1913.

The fatality rate, therefore, becomes 3.30 per 1000 men employed in 1914 as compared with 3.73 in 1913. Excluding 1912, when the rate was 3.27 per 1000 men employed, the 1914 rate of 3.30 per 1000 is lower than any year since 1903.

Greater Reduction in Loss of Life Than in Tonnage

While there was a reduction of 12 per cent. in the number of fatalities, there was also a reduction of 10.5 per cent. in the production of coal. The United States Geological Survey estimates the production for 1914 as 510,000,000 short tons as compared with 570,048,125 tons for 1913. The fatality rate per 1,000,000 tons of coal produced in 1913 was 4.89 and in 1914, 4.81. With the exception of 1912, when this rate was 4.41, the 1914 rate is the lowest yet recorded for the United States. The amount of coal produced per fatality in 1914 was 208,078 short tons, which with the exception of 1912 is the largest on record. The production per fatality in 1913 was 204,685 tons, which compares with 226,469 tons in 1912 and 144,325 tons in 1907.

There were 316 lives lost in disasters in which more than five men were killed at one time as compared with 464 in 1913, a net reduction of 148, or 32 per cent., in this class of accidents.

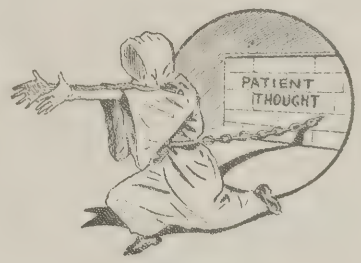
It is not possible to attribute these lower rates to any one particular influence. They may, however, be assigned in part to any one of the following agencies or to a combination of all of them: Closer and more careful inspection by the state inspectors; better enforcement of laws and regulations by the operators; a realization of the dangers attendant upon the miner in his daily work and his efforts to reduce accidents due to the educational campaign conducted in his behalf; the extended use of safety lamps in doubtful mines; the use of permissible explosives; humidifying dusty mines; first-aid and rescue training which saves lives that might otherwise be lost by reason of injuries received; the enactment of industrial-accident compensation laws; and last but not least the spirit of coöperation on the part of all concerned.

I AM *a Menace to Them All.*

Moloch

Written Expressly for
COAL AGE

By Berton Braley



WOULD *Bring My Power All to Naught.*

I AM Death's helper, for I slay
My thousands ruthlessly each day,
And all along my trail you find
Those I have crippled and made blind,
And children wailing piteously
Who starve and want because of me.

THE miner with his pick and drill
Who does his work with easy skill,
The trapper at his swinging door
Who whistles as he does his chore,
The old and young, the great and small
I am a menace to them all.

MY boast it is to kill or mar
Almost as many men as war,
And wise men know me and beware
But fools defy me and declare
They have no fear of such as I
And so they go their ways—and die!

IN mine and breaker, hoist and shop,
I reap my monstrous human crop,
And thus to meet that sacrifice
Mankind must pay a fearful price;
And yet a little patient thought
Would bring my power all to naught.

MAN *makes me—he can end me, too, and end the evil that I do,*
The pain—the sorrow—the distress, for lo, my name is CARELESSNESS!

Longwall Conveyor and Loader for Thin Seams

By James Dickson*

SYNOPSIS—A sectional coal conveyor and loader that is moved forward following the face. The results obtained by its use have been quite satisfactory and the cost of production has been reduced.

In reference to inquiry by John Harvey concerning "Loading Coal by Machinery at the Face" (Coal Age, Dec. 5, p. 920), I venture to give a brief description of a longwall conveyor and loader that is suitable for thin coal beds.

This conveyor is easily fitted up, is simple in operation and gives good results, both in the matter of output and in keeping down expenses.

It was first tried in a seam where the coal varied in thickness from 20 to 24 in., both roof and floor being of shale, which was generally fairly hard. The bed was worked on the longwall system, with roadways at 30-ft. centers, 3 ft. of rock being taken out in the branch roads, and from 4 ft. to 5 ft. in the main roads, to make sufficient height for the cars and horses. Packwalls were built along both sides of the roads with the rock, but there was generally a surplus of the material which had to be loaded out and sent to the surface, or else used for stowing purposes in some other part of the mine.

The cost of working the thin coal, together with the expense due to the large amount of rock-work necessary to make and maintain the roadways, became so great that the management was compelled to look for some other system that would give better results; and, as usual, necessity was called upon to mother still another invention, as follows:

The section first tried had 11 places on a straight face fully 300 ft. long, the main road being in the center. This main road, and those on the extreme right and left of the section, were the only ones kept in use after the conveyor was installed. The end roads were carried on as before, but in the main road all the necessary rock to make the required height was removed from the floor, this being taken up for about 10 ft. of width, or sufficient to permit double track being laid to the face. The two end roads were connected to the main road by two diagonal passages, as shown in Fig. 1, these end roads serving only as airways and ropeways and also as emergency exits in case of a cave taking place along the face.

The Construction of the Conveyor

The conveyor itself was built in 6-ft. sections, each section being of ¼-in. plate, 6 ft. long and 3 ft. wide, having on the edge nearest the gob a 9-in. side, and on that nearest the coal no side at all. Each section was mounted on two T-irons, which strengthened it, and also served as skids. The sections were coupled closely together, the junction being underneath the plates and only one center coupling being used.

When fitted together ready for use, the whole conveyor should be just a few feet less than half the total length of the face, the section at each end being carefully rounded off, so as to clear any obstruction that it may come against.

The timbering must be done systematically and kept in a straight line, in order that a clear passageway may be left through which the conveyor may pass. The posts were set about 4 ft. apart, as this was found to leave ample room for the conveyor to pass easily.

The roof support was augmented by two rows of hardwood cogs between the conveyor and the gob. These were generally built on a small pile of loose dirt to facilitate their withdrawal, as all this cog timber was recovered and used many times over. As soon as the conveyor was moved closer to the face, a new row of cogs was built, and the row farthest back taken out and the roof permitted to cave. The miners were each given about 20 ft. of face to work on, the fireboss measuring the distance and keeping a chalk line on the roof so that each man had to do his share, or his part of the wall tended to fall behind.

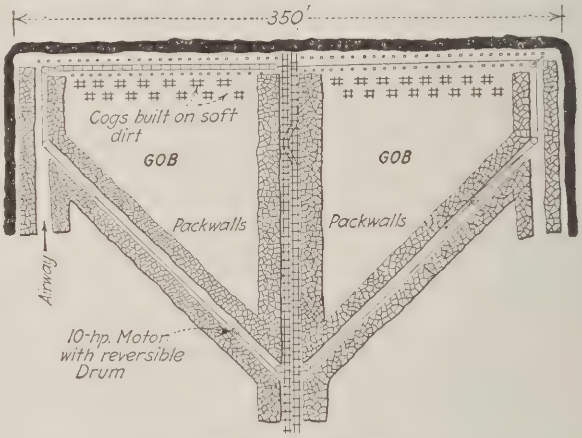


Fig. 1. Plan Showing General Scheme of Development

When in actual operation, the conveyor was drawn up until one end was close to the wheel on the end road, and the miners on that side of the section were given 3 min. in which to load their coal. Each section of the conveyor carries easily from 300 lb. to 500 lb., so that if there are 20 sections, or thereabouts, there will be from 3 to 4 tons on the conveyor. When ready to move, the man in charge signals the motorman to go ahead (see motors, drum and rope connections, Fig. 1).

The tracks on the main road are laid right up to the coal, so that a light trestle bridge is built across the tracks to carry the conveyor, the cars to be loaded standing under this trestle. When the first section of the conveyor reaches the part of the trestle immediately over the empty cars, the man in charge drops a small sheet of iron onto the bedplate of the conveyor, and this sheet being set at an angle of 45 deg. to the line of travel, the coal on coming against it is pushed over the side of the conveyor into the waiting cars—a car on each track being loaded alternately, so that while loading on one track the cars on the other are being changed.

---

*Vancouver-Nanaimo Mining Co., Nanaimo, B. C.

The speed of the conveyor is low, in order to give sufficient time to change the cars, and also to keep down any excessive noise. Three minutes is allowed for the conveyor to travel from one side to the other, so that the speed is about 50 ft. per min. The switches on the main road require to be kept as close as possible to the face, in order that no time be lost in changing the cars.

As shown above, the conveyor can easily and safely make a trip in 6 min., discharging in that time, say 4 tons of coal, or at the rate of 320 tons per day of 8 hr. The capacity of the conveyor, of course, is changeable with the height available, and at 2 ft. 8 in., as stated in the query, there is plenty of room for variations to suit any individual case. The miners can be paid by the day, by the yard of advance or by the ton on the total output. The last method, in my opinion, is the best.

The timber and any surplus rock left after building the packwalls can be taken to any desired place along the face, this being done by the afternoon or night shift.

Supposing that in the case under discussion the actual output was ¾ of the output calculated above, or 240 tons, this would be equivalent to a daily advance of about 8 ft. on a 350-ft. face, so that the conveyor would require moving ahead almost every night. This moving is done by four men in two hours if the timbering near the face has been put up to suit the conveyor. This is a point that requires constant attention from the fireboss or man in charge.

THE CONVEYOR MAY BE EASILY MOVED

The actual changing is simple, the conveyor being drawn to one end of the run and the haulage rope detached from the end nearest the main road. The wheel at the corner of the section is advanced to its new position and the end of the rope carried down the new line on which the conveyor is to run. The conveyor is then guided easily into its new position, there being sufficient flexibility in the couplings to take the slight curve involved the other end being then changed.

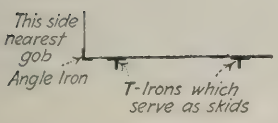

FIG. 2. AN ENLARGED SECTION OF THE CONVEYOR

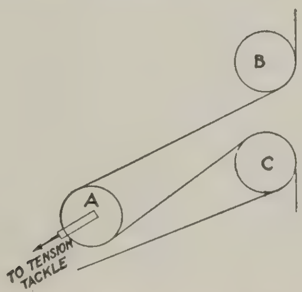

FIG. 3. PLAN FOR EXTENDING THE HAULAGE ROPE

Fig. 2 shows an enlarged section of the conveyor, and Fig. 3 an enlarged plan of the system for extending the haulage rope when the conveyor is moved forward, the rope from wheel *B* going to the conveyor, while that from wheel *C* goes to the motor. Wheel *A* is an idler held in tension by block and tackle, there being enough rope between it and the other two to serve for several weeks without splicing any new rope onto it.

The result of this conveyor was an increased output, the number of roadways was reduced from 11 to 3, with a corresponding decrease in expense, the handling of the cars was concentrated, requiring fewer pushers and drivers, and the roof was much better due to the rapid advance of the face. Above all, that which was sought was gained, namely, cheaper coal.

I may say that this system works equally well whether the coal is hand- or machine-mined.

I trust this may prove of interest to readers of your paper, and hope to see other systems of coal conveying described therein.

The Griffith Mine Pillar

William Griffith, of Scranton, Penn., some time ago patented a mine pillar made by the shooting down of "top" rock. This was described in our issue of Jan. 20, 1912, under the title, "Permanent Roof Sustention." Recently he has suggested another form of support, which has been tested at the laboratory of the Delaware, Lackawanna & Western R.R. Co. at Scranton. It has also been tested at Pittsburgh, at the testing plant of the Bureaus of Mines and of Standards.

At present, Mr. Griffith has not revealed precisely the character of the pillars, but it may be said that they are formed mainly of concrete reinforced in a peculiar manner with wood. The wood should be creosoted and the pillar coated with cement placed in position by the cement gun. They all contain rock as blasted roughly from the roof. The experiments are said to show that, after 30 days has been allowed for the cement to set, the Griffith pillar will settle only 3 per cent. when loaded with 80 to 90 times as much weight as a timber-and-rock cog of the same size undergoing a similar settlement. From 25 to 40 times as much weight is needed to reduce the vertical height of a Griffith pillar 5 per cent. as to settle a timber-and-wood cog by that percentage. Even when the settlement reaches 10 per cent., the Griffith pillar is still found 15 to 20 times as strong as the old timber-and-rock cog. Nor, according to report, does it crumble to dust, as does concrete, when tested to the limit. Its failure is slow and would give time and abundant warning to men to escape in case of such failure. Moreover, when tested to its limit it is found twice or three times as strong and three times as elastic as a concrete pillar.

Placed in a 4-ft. coal seam, a pillar 4 ft. square with timbers 4 in. square would support 100 ft. of overburden for an area 21 ft. square. Spaced 20 ft. apart such pillars would support the roof with only 5 in. of permissible settlement, provided the floor was sufficiently unyielding. The pillars will support 224 tons to the square foot of cross-sectional area.

Among the persons present at the test were: Alex Bryden, consulting engineer of the Pennsylvania Coal Co.; S. D. Dimmick, superintendent, Peoples Coal Co.; Eli T. Conner, consulting engineer; Geo. Engle, mining engineer, Temple Coal Co.; H. J. Force, engineer of tests, of the Delaware, Lackawanna & Western R.R. Co., coal-mining department; Arthur Long, engineer, Scranton Mine Cave Bureau and William Schunk, Scranton city engineer.

* * *

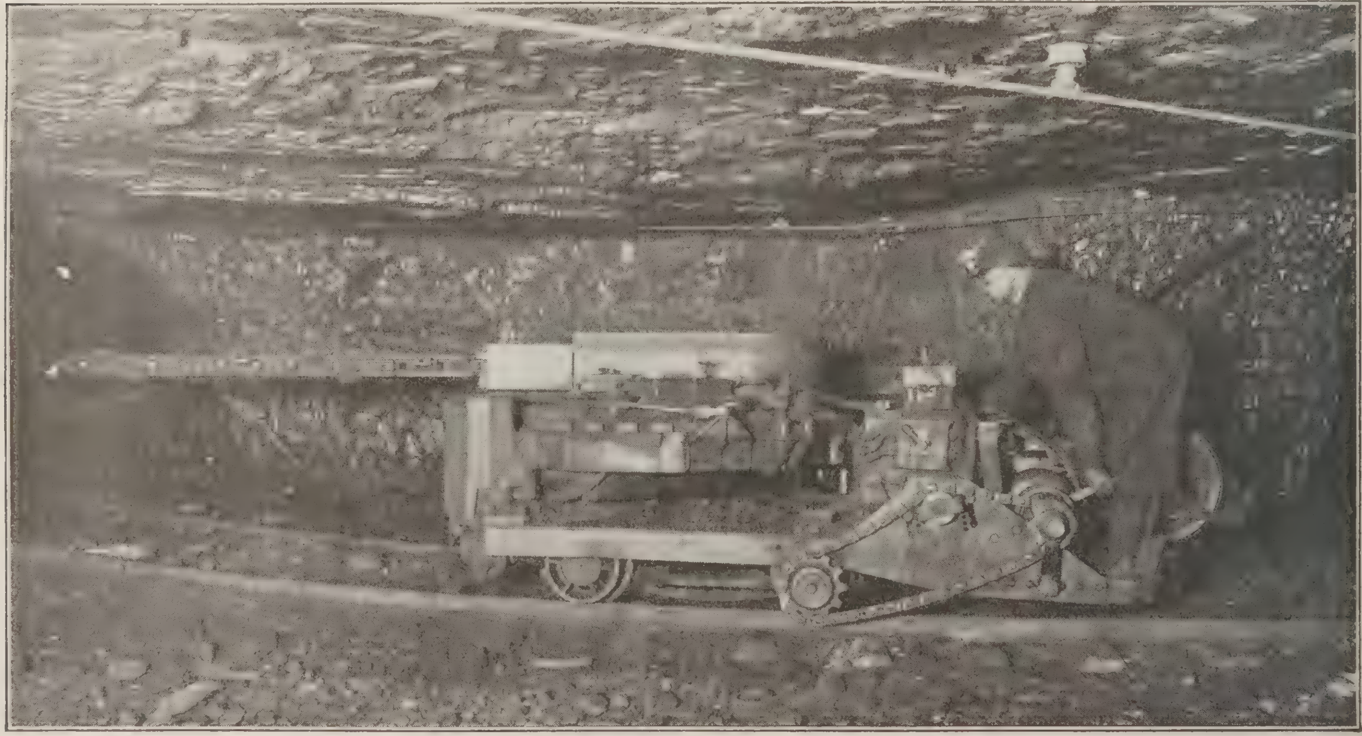
The Current-Carrying Capacity of an Electric Conductor is limited both by the allowable temperature rise and the allowable drop of potential. The potential difference required to transmit a given electric current through a conductor will vary directly as the resistance of the conductor, and, inversely, as its cross-sectional area. The diameter of conductors used for long-distance transmission is usually determined by the drop of potential allowable rather than other electrical considerations.

Working with a New Type of Coal Cutter

By John G. Bart*

SYNOPSIS—Results obtained with a machine that cuts an 8-in. kerf in the bone parting of a 6-ft. seam of bituminous coal. The coal is obtained in better shape, that is, larger lumps, and the entire product is cleaner than before. Lighter shooting, which results, also insures a better top, thus improving safety and cost.

Because of numerous requests from men in the coal-mining industry for information relative to the use of a new type of mining machine which has been in operation under my supervision for a period of about six months, and for coal men in general who are interested in progressive methods of mining, this article is presented. I particularly invite comment and discussion of the subject.



Transporting the Cutter to Another Room

The mining machine in question has been given locally the name of "bony machine," on account of the fact that the original purpose of the machine was to cut a kerf in the bone coal which occurs in the Twin Freeport seam, thereby eliminating the loading of this bone coal with the clean coal. This bone forms a stratum varying in thickness from 5 in. to 7 in. and occurs approximately 3 ft. from the bottom. The good coal above the bone varies in thickness from 2 ft. to 4 ft., making the total thickness of the seam from 5 ft. 6 in. to 7 ft.

The system of mining in use is the room-and-pillar panel system, each panel consisting of 22 rooms on 40-ft. centers driven to a depth of 250 ft. The mine is equipped throughout with electrical machinery, including gathering locomotives and electrical chain machines. The type of mining machine in regular use is the shortwall or continuous cutting machine which undercuts the coal to a depth of 6 ft. with a 5-in. kerf in the bottom part of the seam. This cut leaves several inches of good coal at the bottom, which is done to avoid the possibility of cutting in the fireclay, and thereby depreciating the value of the coal. Under this system it is extremely difficult to regulate the thickness of bottom coal left by the machine; this coal, however, is entirely lost, thereby decreasing the percentage of recovery from the seam.

The Bone Parting Raises Difficulties

With reference to the shooting of the coal after it is undercut at the bottom, it will be readily understood by mining men that the 5 in. to 7 in. of bone coal makes it extremely difficult to shoot without the use of excessive amounts of powder. The system of shooting consists of placing one hole 6 in. above the bone coal in the center of the working place to break down the center. After cleaning up this shot, a shot is placed in each corner, bringing down the bone coal and the clean coal, thoroughly mixed and difficult to separate. This results in some of the bone coal being loaded with the clean coal, and in narrow work the hard shooting practically pulverizes the coal.

Consideration of these points, and some others which will be mentioned later, led me to investigate a mining machine for cutting a kerf in the bone coal, which resulted in a trial installation of the machine known as the "Arcwall" or turret machine, and which, as before stated, is known locally as the "bony machine." This machine is shown in the accompanying photographs, also on the front cover, and consists essentially of a motor-propelled truck on which is mounted a turret capable of being raised and lowered by power. In this turret is a mounted revolving cutter-bar measuring 10 ft. from center of drive sprocket to center of idler sprocket.

---

*General superintendent, Bessemer Coal & Coke Co., Russellton, Penn.

The machine was originally installed in entry work with a maximum depth of undercut of 7 ft. and a kerf of 5 in. The entries are driven from 10 to 12 ft. in width.

How the Coal Was Shot

The plan employed in shooting the coal after the initial cut was to place a shot in either the right- or left-hand corner of the top coal, which resulted in breaking it down at the back of the cut and required pick work to bring it down at the front of the cut. After loading this out, the second shot was placed in the opposite corner, and this shot having a loose end gave a large proportion of lump coal. After the top coal was loaded, the third shot was placed in either the right- or left-hand corner of the bottom coal, and the coal from this shot was loaded out before shooting the fourth and last hole in the opposite corner of the bottom coal. This last shot gave an excellent grade of lump coal.

The first experimental work with the machine led to a consideration of cutting a wider kerf and it was decided to change from a 5-in. kerf to an 8-in. kerf for the following reasons:

1. The bone coal that was left on either the top coal or the bottom coal made it more difficult to shoot the tight shot.
2. The 5-in. kerf was not wide enough to permit the proper bringing down of the top coal with a 7-ft. undercut.
3. The bone coal remaining after the 5-in. kerf mixed with the coal and required cleaning.

In adopting the 8-in. kerf, we practically eliminated the above mentioned troubles, as this kerf left practically no bone coal and the wide kerf was an additional advantage in bringing down the top coal. It eliminated also the trouble mentioned above, with the tight shot in the top coal, by bringing down the front of the cut.

Quality of Coal Is Improved

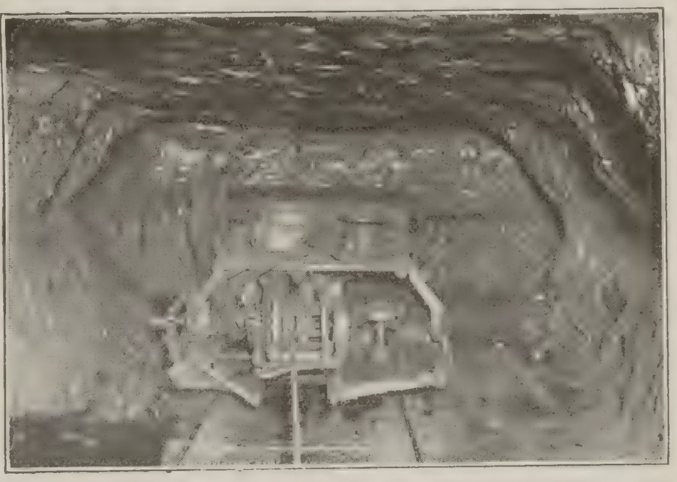
The important point which I wish to emphasize is the quality of the coal produced by cutting out any foreign matter which may exist in a seam 5 ft. or more in thickness. This is true not only because the impurities are eliminated, but also because of the better grade of lump resulting from shooting the coal in two benches with four shots, in comparison with shooting the full thickness of the seam with three shots. Another advantage of this method concerns both the safety and cost of mining in that the light shooting required for the top coal has no effect on the roof.

For the benefit of those wanting to know the character of the results obtained with this machine during the regular operation of same, the following points are brought out: The "bony" cutter requires less manual labor than the shortwall type of machine, as the former runs directly to its working position on a track laid with steel rails and steel ties and is almost immediately in position for making the sumping cut, which is made by pulling the machine to the place by a wire rope anchored in the face. This operation requires from 4 to 5 minutes.

Operation of the Machine

The wire rope is then removed from the anchor and attached to a lug on the machine for the purpose of revolving the turret, and two jack pipes are placed against the ribs as shown in the front-cover photograph. The machine is then ready to make the cut across the face, which requires from 10 to 12 min. When the cut has reached the required width, the turret is locked in position and the machine is pulled back on the rails by the self-propelling mechanism and is ready to move to another working place.

The power required during the operation of the "bony machine" at no time exceeds the power required for operating the shortwall type of machine when cutting in clean coal. It is evident that the time required between the finishing of one place and being ready to sump in another place is considerably less with the "bony machine," on account of its being integral with the truck and requiring no loading and unloading.



Sumping the Machine

With reference to repairs on machines, my experience up to the present time based on a comparison of the mechanism of many cutters would indicate that the cost of maintenance will be considerably less than the shortwall and breast types of machine.

*

A Good Hoisting Record

The New Staunton Coal Co.'s mine at Livingston, Ill., produced 102,115.15 tons of coal during December, 1914, working 22.4 eight-hour days, making an average of 4538 tons per day. For the month of January, 1915, it did equally as well, making an average of 4537 tons daily. From July 1, 1914, to Jan. 31, 1915, it averaged 4515 tons per day. The largest output for one day was on Nov. 4, 1914, when 4826 tons were hoisted, making 1658 hoists, or an average of 10 tons per min.

Buy It Now

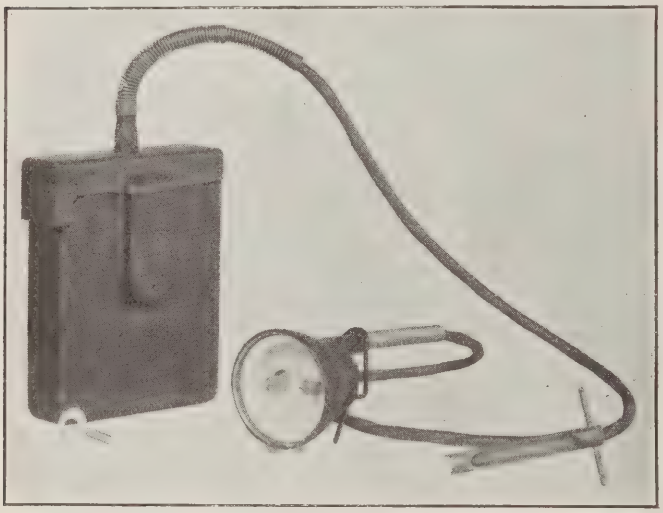
Get now what you need in the spring and help pass prosperity along. Don't buy what you don't need, but buy now what you do need. It will put thousands of idle men at work who are suffering this winter.

A New Miners' Electric Lamp

SYNOPSIS—The new lamp of the General Electric Co. is guaranteed to burn more than 10 hours per charge after one year's service. It distributes light through an angle of 130 degrees. It weighs only 3¾ pounds.

The General Electric Co. is offering a new miners' electric lamp that is safe to use, of strong construction yet light in weight, simple in design, foolproof, efficient in operation and of ample guaranteed capacity. The outfit consists essentially of a lead-plate battery, carried on the belt; a ¾-cp. Mazda lamp with a suitable reflector held in a steel shell carried on the cap. A strong, serviceable cable connects the battery and the lamp.

That an electric lamp would be safe to use in coal mines has long been recognized, because it could be made so that it would not ignite inflammable gases and would produce a uniform light regardless of atmospheric conditions. While the carbon-filament lamp represented the best available electric illuminant, such a miners' lamp was not possible because of the relative inefficiency of the lamp; for storage batteries of the required capacity could not be designed within permissible weight and dimension limits. The perfection of the efficient Mazda lamp in miniature sizes by the General Electric Co. and the development of small, efficient, light-weight storage batteries have resulted in the design of this type of miners' electric lamp.



New General Electric Miners' Lamp

The prime feature of this lamp is that it has been made thoroughly safe to use. By adequate insulation of the entire circuit, placing all the terminals and contacts inside of locked and sealed steel cases and providing automatic means for extinguishing instantly the glow of the filament, should breakage of the lamp bulb expose it to the air, this lamp, built of high-grade materials, has been made both safe and rugged.

Lamp Will Burn 12 Hours

The outfit complete weighs but 3¾ lb., of which 3½ lb. are carried on the belt and 4 oz. on the cap. The battery is rated at 7.2 amp.-hr. Normally it will light the lamp 12 hr. per charge and can be relied on to furnish light at least 10¾ hr. per charge at the end of one year's service. The ¾-cp. Mazda lamp operates at 1.9 volts and the reflector distributes the light evenly through a solid angle of about 130 deg.

The battery is nonspilling and the terminals are not subject to acid corrosion. The case is of medium-hard rubber. Exide plates are used. The battery box measures 6¼ in. high by 5 in. wide by 2 in. thick overall. It is made of drawn sheet steel, electrically welded, including the two side straps for the miner's belt. After welding, the box is lead plated and painted with acid-proof paint. The cover is drawn steel, hinged at one end and fitted with a substantial lock at the other end. The terminal contact block is riveted to the inside of the cover. Connection to the battery terminals is made by strong spring contacts, arranged to close the circuit when the cover is shut. The cable entrance bushing is watertight and clamps the cable firmly to prevent strain on the terminals.

Some Details of Construction

The lamp bulb, reflector and terminal contact block are incased in a light, strong, drawn-steel shell, which is copper oxidized, enameled and provided with a hook for attaching to the miner's cap. The entrance bushing leads the cable through the back of the shell where it is reinforced by a steel plate. On the terminal contact block, which is waterproof and screwed to the protecting shell, are mounted suitable terminals for cable connections and the spring contacts which hold the lamp bulb. The contacts are nickel plated. The reflector is of drawn steel, white porcelain enameled. A rubber gasket between this and the glass renders the case waterproof. The glass is held by a phosphor-bronze retaining ring, which has its ends looped and flattened to extend through slots in the rim of the case for a seal wire if desired.

The Mazda lamp bulb has its filament inserted and connected with a base contact in the usual manner, and at the tip of the bulb is a duplicate contact to which the filament is connected by a fine copper wire along the outside of the glass. The bulb is held at the focal point between the contact springs, which maintain it constantly under stress, so that, in case of a blow otherwise only sufficient to chip or partly break the bulb, it will be completely shattered by the springs and will drop clear of the contacts. Sufficient space is provided between the reflector and glass cover to keep broken lamp parts from short-circuiting the spring contacts. This prevents the possibility of ignition even if the cap lamp is seriously damaged amid explosive gases.

The Cable Has Been Carefully Designed

The cable consists of two braided-strand, rubber-covered conductors, each having a steel piano wire at the center. These are twisted together and then heavily rubber covered, making the cable strong, well insulated and not liable to kink. The ends are protected from wear and damage by flexible steel armor. To meet practice analogous to that of flame lamps, this electric lamp is designed to be supplied to miners from the lamp house. The outfits are to be assembled and locked with the lamps burning when delivered, and are to be returned to the lamp house in the same condition at the end of the shift. No care or attention whatever is required from the miners.

Direct current only should be used for charging. In some instances mercury-arc-rectifier or motor-generator sets may be required to change alternating current into suitable direct current. Small sets adapted for this purpose can be supplied readily. Racks arranged for charging batteries conveniently in quantities are also offered.

⁂

Extracts from a Superintendent's Diary

There are two possible ways of keeping in touch with the affairs of the world. One is to travel extensively and the other is to associate with people who *have* traveled extensively. I have been able to travel but little; however, because of the fact that widely traveled men are continually called into our camp on business, I have been able to satisfy my desire to keep tab on what is going on in the world to an extent that often astonishes my acquaintances, who have come to think of me as a man almost buried from civilization.

This week, for example, I have been constantly thrown with four men who are experts in four different lines of work, and owing to their reputations in their respective fields, they have received calls from all the corners of the earth and have been to some of them many times.

One is a designing engineer for a coal-washing equipment company, one a consulting engineer in private practice, specializing on valuation reports for boards of directors, one a field superintendent for a company operating diamond drills and one an expert on byproduct coke ovens.

They were strangers to one another and their arrival in our camp simultaneously, on business connected with their professions, was purely accidental, but because of the isolated location of our camp and the fact that all of them had to make my office their headquarters, we were all soon on most intimate terms.

If any one of these men had come alone I would have gained much information (two men can not be thrown together in isolated surroundings without unbridling), but the four together comparing experiences and discussing viewpoints kept me in the clouds most of the time.

It is extremely doubtful if four more interesting men could be found than those who have just left our camp. They have, in times past, been sent to all parts of the globe in search of all sorts of information by all kinds of people. Sometimes their employers have been rascals trying to get the best of honest associates, and at other times their reports have been desired by worthy men searching for evidence to make possible the ousting of rascals.

Because their own actions must be always kept above suspicion, they have learned the importance of inquiring closely into the motives of all who would employ them. As a result they have become most excellent judges of men and have acquired a vast amount of information covering the possibilities of companies now organized and others that hope some day to complete an organization.

The reports which they are employed to furnish are not always concerned with technical details alone but often most fully cover market conditions and possibilities, railroad and transportation facilities, tariff influences, labor conditions, etc. It naturally follows that these men have become so familiar with the people and governments of the civilized and uncivilized countries of the globe, that they comment on a newspaper item about China or Alaska for example very much as I might discuss a happening in my own country.

I feel very sure, however, that such men are hard to draw out when thrown with a crowd, especially if there are any professional men present; so in recalling the pleasure I have derived from this and many similar appointments with mining experts, I am inclined to hold that life in a mining community has many very delightful advantages after all.

⁂

Explosion at the Prospect Colliery

An explosion occurred on Feb. 18 at the Oakwood Shaft of the Prospect Colliery operated by the Lehigh Valley Coal Co. near Wilkes-Barre, Penn. It caused the death of 13 men and boys.

The scene of the explosion was a chamber off the gangway just east of the foot of No. 10 slope which is driven in the Red Ash vein and connects with the various levels.

It is believed that behind the coal breast was a large body of gas under heavy pressure contained in the crevices of a piece of faulted coal. This breast had been weakened by a blast and was broken down suddenly by the gas pressure. The escaping gas was lighted by an open lamp of a laborer who, with the miner, was driving the chamber.

The miner after firing the shot waited the proper length of time for the coal to fall and then entered the chamber and tested the roof, examining the face for gas with a safety lamp. He found the face free from gas and sent his laborer in to load the coal. This man used a naked light. Shortly after he went to work, the face, weakened by the blast, gave way before the gas pressure. The coal runs quite freely, and the thin shell was thus easily blown out.

On the gangway, a group of men and driver boys, runners, and nippers had seated themselves for lunch. The explosion swept down on them without warning and almost all of them were roasted alive. About thirty men were employed in the section in which the explosion occurred. Only those miners and laborers were injured who were working adjacent to that chamber where the gas was ignited.

Had it not been the lunch hour, the loss of life would not have been so great, for there would not have been so many on the gangway. Instead of an accident of ordinary size the chance presence of the men in the roadway made it a disaster of larger proportions than has occurred in a Lehigh Valley Coal Co. mine for a long time. It was the more pathetic that all the victims except two were less than 22 years old.

The report of the explosion could be heard on the surface. It tore down pillars, brattices and other development timber and in many cases caused heavy falls of roof. The work of rescue was immediately started, General Manager F. M. Chase ordering first-aid and rescue corps from Dorrance, Henry, and the Pittston Division Collieries to the scene.

A bad fire broke out in the gangway and was not subdued until after 72 hours of hard work.

Twenty Men Drowned in Mine near Nanaimo, B. C.

A sudden incursion of water from the old Southfield colliery into South Wellington Mine No. 1 of the Pacific Coast Coal Co. formerly known as the Fiddick colliery, at 11:30 a.m. on Feb. 9, resulted in the death of 20 men, including the mine manager, Joseph Foy.

According to the president, J. H. Tonkin, the company believed the workings were hundreds of feet away from the water, and the intention was to leave everywhere a 100-ft. pillar. It is said that the idea prevailed that, at the point where the incursion happened, the pillar was 450 ft. thick whereas 50 ft. was thought to be ample for safety.

David Nillerst, a fireboss, was indirectly the cause of the accident. He fired the shot releasing the water which poured into the workings and drowned 17 men. Joseph Foy, William Anderson and Thomas Watson were later victims, the two last mentioned having escaped from the flood.

Foy, on his way to the accident, met Thomas Watson and three other men and asked them to go with him to see if anything could be done. There was a counterslope or parallel airway and he hoped that some men could be rescued by that roadway.

THE MANAGER AND TWO OTHER MEN RISK AND LOSE THEIR LIVES

The *Daily Colonist* of Victoria says:

> Foy, with Watson and the others following, proceeded to a point in the counterslope where there was an air regulator. Debouching on the counterslope at this point was a slant to the main slope, and in this crosscut was a stopping. It was the washing out of this stopping which caused the death of Foy and Watson.
>
> On the low side of the regulator was a drop of 3½ ft., and, when Foy clambered through the opening and dropped to the floor, he was up to his waist in water. The jar of the jump extinguished his lamp, and he asked the men on the high side of the regulator for one of theirs. His companions lighted his wick and at the same time Tom Watson climbed through the regulator and into the water.
>
> It is said that at this time Foy could hear the shouts of victims down the counterslope, and this explains the willingness of the men to follow him. But they did not know the danger to which they were exposed, for the water had backed up the main slope well above the slant and was bringing a severe burden to bear on the stopping by which it was blocked. Just as Watson scrambled through the regulator the stopping broke down and the wave of water engulfed Watson and Foy, who could not climb back through the opening.
>
> Another man who risked and lost his life for others was William Anderson. He was working in No. 3 level, where the flood occurred, but succeeded in reaching the main slope. Then he remembered that his brother-in-law, Robert Millar, had been working down the slope lower than No. 3 level, and he thought he would at least try to warn him and the other men working in that section. He handed his coat to his partner, Gourlay, and started down the slope. Part way down he came across a boy tending a winch, and told him to run for his life. The boy reached safety, but Anderson continued on to his death.

WERE THE DRILLHOLES OMITTED?

It will be a long time before the responsibility for the accident will be determined. Meanwhile, of course, there will be much interest in the question whether the drillholes were kept ahead of the work as required under the Coal Mines Regulation Act. Unfortunately a severe cave-in has occurred under a stream which carries the water from Becks Lake, and much water has poured into the workings. The stream will be diverted, at once, but the damage is now largely done and the dewatering of the mine will be no small task.

The families of the deceased miners will receive $1500 each as compensation. Seventy-eight other mine workers were in danger of being engulfed in the flood, but they managed to escape.

The Nanaimo district inspector, John Newton, is in charge, in the absence of Thomas Graham, the chief inspector, who is at Fernie, Crowsnest pass, inquiring into the cause of the explosion at Coal Creek colliery on Jan. 2, in which the district inspector lost his life.

SOME ACCOUNT OF THE MINE

The mine at which the accident occurred is at South Wellington, four miles south of Nanaimo on the Esquimalt & Nanaimo Ry. The mining of coal was commenced in 1907 by the South Wellington Coal Mines Co., Ltd., on what were then known as the Fiddick and Richardson estates.

The coal seam, the old "South Wellington" coal, a continuation of the "Douglas" coal at Nanaimo, was developed by three slopes, the larger of the three being 13 ft. wide and the two others, parallel with it, being 10 ft. in width. The seam was from 6 to 16 ft. thick and the coal was of good quality. The room-and-pillar method of working was adopted, though, where the coal was thin, longwall was attempted.

The mine was apparently conducted with some regard for safety, for two 2-hr. Draeger helmets and one of one half-hour capacity were provided. There were four oxygen tanks and a pulmotor kept on hand. Monobel powder and electric batteries were used exclusively in the firing of shots.

However, it may be that the simple precaution of drilling ahead of the work was overlooked. Sometimes expensive equipment can be obtained where items appearing on the daily cost sheet are cut off in the interests of economy though they are equally necessary for safe operation.

Recent Legal Decisions

Contract Which Need Not Be in Writing—The statute which provides that an agreement to pay the debt of a third person shall not be enforceable unless reduced to writing and signed thereby, does not apply to a promise to pay for coal delivered to a third person, where the seller refused to make delivery in the absence of such promise, which, in the circumstances, must be deemed to be an original and not a collateral obligation. (Texas Court of Civil Appeals; Timpson vs. Roach, Stansell & Crane; 170 Southwestern Reporter, 863.)

Negligence Must Be Direct Cause of Accident—A miner injured through sudden movement of a cage, through which he was passing at the bottom of a shaft, cannot recover damages against the employing operator on the theory that the latter violated statutory requirements concerning signaling devices, if it appears that the accident resulted from the miner's own violation of orders which required him to use a passageway around the shaft, instead of passing through the cage. (Colorado Supreme Court; Colorado Capitol Coal Mining Co. vs. Chatfield; 143 Pacific Reporter, 1095.)

Rights Under Coal-Mining Contract—An agreement by a land owner that an operator may continue to remove coal at a royalty of 25c. per ton mined creates the relation of lessor and lessee, and not a sale of the coal in place. A clause in a lease providing for payment of coal mined in accordance with the lessee's "usual condition and practice" does not prevent the lessor from recovering royalties on coal passing through a ⅝-in. mesh, although the lessee has been in the habit of appropriating such coal without payment therefor, if such practice was not known to the lessor. (Pennsylvania Supreme Court; Girard Trust Co. vs. Delaware & Hudson Co.; 92 Atlantic Reporter, 129.)

The Hampton Roads Coals--IV

By F. R. Wadleigh*

SYNOPSIS—This is the concluding article of this series. This installment takes up the Virginian district, with some interesting comments on the railway by that name. The probable future of the Hampton Roads coals is discussed, as is also the question of transportation to the foreign markets.

The Virginian Ry. is one of the best equipped coal-handling roads in the world. It was built by the late H. H. Rogers, for the purpose of developing the coal fields of West Virginia, and constructed with the sole idea of handling freight at a minimum cost. No expense was spared to build the road according to the most approved standards of railroad construction and equipment, so as to make it possible to handle the heaviest trains with one locomotive.

The road was opened for through traffic on Apr. 1, 1909. It extends from Deepwater, W. Va., where it connects with the Chesapeake & Ohio Ry., to Norfolk, Va., a distance of 436 miles. The tidewater terminals and coal pier are at Sewalls Point, on Hampton Roads.

Shipments of coal over the Virginian in 1913 amounted to 4,555,331 tons, of which 3,283,677 tons, or 72 per cent., were dumped over the Sewalls Point pier, the balance going to the inland Eastern trade. The road has, as yet, no Western outlet. Nearly all of this coal was from the New River field, as there are at present only two operating mines in the Kanawha beds, and about 75 per cent. of their output is used as locomotive fuel.

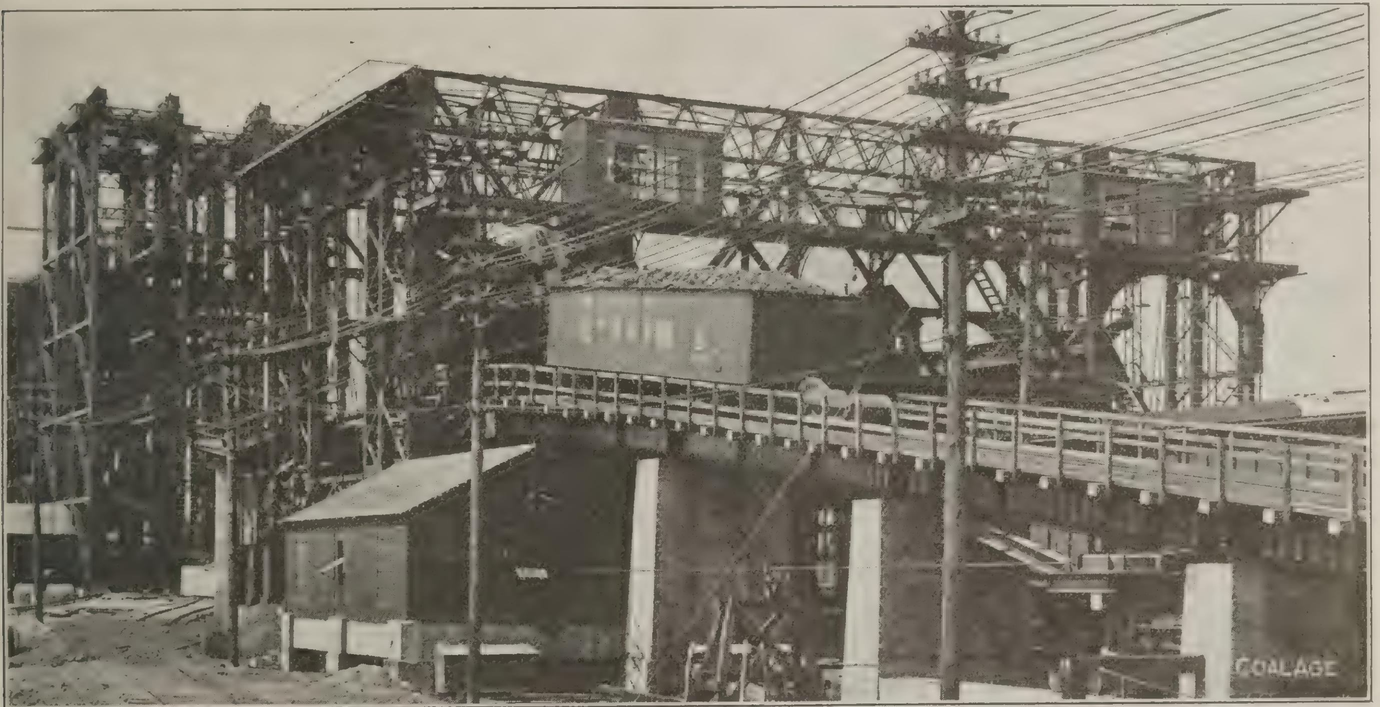
The average distance from the mines to tidewater is 388 miles, and the maximum distance, 427 miles. The freight rate on all coal shipped to tidewater is $1.40 per gross ton.

For handling its coal traffic, the Virginian has 108 locomotives, 250 cars of 80,000-lb. capacity and 5450 of 100,000-lb. capacity.

There are 58 mines on this road, all but three being in the New River beds, Sewell and Beckley, one in the Pocahontas and two in the No. 2 Gas and Eagle beds of the Kanawha measures.

Virginian Ry. District

About 37 per cent. of the total shipments of New River coal are handled over the Virginian Ry., and as noted elsewhere, some of the mines in this district are also served by the Chesapeake & Ohio Ry. Of the New River coal dumped over the Hampton Roads piers, 51 per cent. moved over the Virginian in 1913.



Shore-End View of the New Pier of the N. & W., Showing Duplicate Car Dumpers and Elevators

The two mines in the Eagle and No. 2 Gas beds of the Kanawha field also ship to Hampton Roads. One of these mines is operating in the No. 2 Gas bed alone, where the coal is of excellent quality, especially as a locomotive fuel. Analyses of this coal are given in the accompanying table:

ANALYSES OF VIRGINIAN RY. DISTRICT COALS

	No. 1	No. 2	No. 3	—As Received—	
Moisture...	Dry	Dry	0.85	4.60	Dry

---

*Consulting engineer, 426 Real Estate Trust Bldg., Philadelphia.

The other mine is working both the Eagle and No. 2 Gas beds, loading both over the same tipple. It produces an excellent steam coal, most of which goes to Hampton Roads, for shipment to New England and for bunkers.

The receiving yards of the Virginian Ry. have a capacity of some 2500 cars, and in addition to this there is a pier yard for both loads and empties.

The coal pier of the Virginian Ry. at Sewalls Point has made some remarkable records in loading ships. It was the first cargo pier on the Atlantic Coast to be equipped with car dumpers, and its operation has been very successful. The pier is 1045 ft. long from bulkhead to outer end and 70 ft. above low water; the slips on each side are 140 and 300 ft. wide, with 30 ft. of water alongside. Each side has 31 coal pockets and adjustable chutes.

The rated capacity of the pier is 1500 tons per hour, but 1721 tons per hour have been loaded.

An example of the rate of loading at this pier is as follows: Steamship "Melrose" arrived at 12:25 p.m.; commenced loading 12:35; loading completed and vessel ready for sailing at 5:35; cargo, 7238 tons; bunkers, 238 tons.

Mines and Mining Methods

The systems of mining and preparing coal are practically the same in all of the fields shipping to Hampton Roads, and the following brief outline will cover the subject.

In all of the coal fields tributary to Hampton Roads, most of the mines are opened by drifts, the shaft and slope operations comparing as follows:

	Shafts	Slopes
Pocahontas	7	7
Thacker and Kenova	1	0
Clinch Valley	0	0
New River	18	5
Kanawha	..	..

The depth of the shafts runs from 675 ft. at Parral in the New River field down to 100 ft. in the Pocahontas.

The mining methods used are all based on the room-and-pillar system. Great improvements have been made of late years in the efficient working of the mines, especially by the larger companies, as shown by the increase in the percentage of coal recovered and in the output per man employed.

Screening and Sizing—Probably 75 per cent. of the mines in all the districts considered have some provisions for screening their coal, either for making sizes for domestic use, taking slack out of run-of-mine coal for sale or for coking. The usual sizes are:

Run-of-mine	Standard 35 to 40 lump
Lump	Over 3-in. screens
Egg	Through 3-in. over $1\frac{1}{2}$-in. screens
Nut	Through $1\frac{1}{2}$-in. over $\frac{3}{4}$-in. screens
Nut and slack	All through $1\frac{1}{2}$-in. screens
Slack	All through 1-in. or $\frac{3}{4}$-in. screens

Practically none of the lump, egg and nut sizes are shipped to Hampton Roads from either the Pocahontas or New River fields, all coal of this kind going inland East or West, for domestic use. There is, however, quite a large tonnage of nut and slack coal shipped to New England for steam making.

Cleaning the Coal—There are five washeries in the Pocahontas field and none in the New River; all of the Hampton Roads coal is cleaned by hand, by the same general methods, as follows: In the mine, by the miner; in the railroad car, as it is being loaded; on picking belts and conveyors.

There are usually some more or less efficient provisions to avoid breakage, but there is much room for improvement. Some of the newer tipples are equipped with conveyor loading booms that can be lowered into the railroad car, avoiding the usual drop from the chute and screens.

The Future of the Hampton Roads Coals

The following table will show the varieties of uses to which Hampton Roads coals are adapted:

Use	Best Coal to Use
Stationary steam plants	Pocahontas, New River, all others
General, hand-fired	Pocahontas, New River, all others
Where minimum smoke is desired	Pocahontas and New River
Stoker-fired steam plants	All coals
Locomotives	All coals
Steamships	Pocahontas, New River and lower volatile
Gas making, illuminating	Kanawha gas, Kentucky gas
Gas making, producers	New River, Kanawha splint and gas
Furnaces, heating and melting	New River, Thacker, Kanawha gas and splint coals
Coke making, byproduct ovens	Kanawha gas and mixtures, Eagle bed coals
Smithing and forging	Pocahontas, New River
Domestic, grates and furnaces	Pocahontas, New River, Thacker, Kanawha cannels and splints

Domestic Markets—The shipment of coals from Hampton Roads to the coastwise markets will continue to grow under normal and existing conditions, with the increase in manufactures and other lines of business using coal. It is not likely that the present balance of shipments as between these coals and those from Baltimore and Philadelphia will be altered, unless unforeseen changes take place.

The only disturbing factor in sight will be the new coal-shipping facilities at Charleston, S. C., to be completed during the current year. Just what effect these piers will have is rather hard to determine at present. The coals will all be comparatively high volatile, from 31 to 33 per cent., and not as high in heat value as Pocahontas or New River, but they are excellent locomotive coals and good steam fuels. How much Hampton Roads coal they will displace depends largely on the f.o.b. Charleston price. The freight from the mines to Charleston has been definitely fixed at $1.40 per gross ton, while the actual mining cost is not to exceed 90c. per net ton.

The placing of these coals, however, will probably affect the Philadelphia and Baltimore coals more adversely than those from Hampton Roads, especially in the South Atlantic and Gulf trades. It is not likely that they will be shipped in any quantity to the New England markets, as the distance from Charleston to Boston is 35 per cent. greater than from Hampton Roads, not to mention the dangers of the Diamond Shoals or Cape Hatteras. In addition to this, they are not of the quality most used in New England.

Foreign Markets—For some weeks after the beginning of the war, all exports of coal from Great Britain and Australia were prohibited. Now that this embargo has been lifted, the British coal agencies are making energetic efforts to supply their South American and Italian trade. It is true that all Admiralty British coals are withdrawn, but there are others almost as good, and but little Admiralty coal went to these markets even in normal times.

As it stands now, Italy and the South American countries are in great need of coal, but this emergency has found us unprepared; we are dependent on foreign bottoms to handle the coal and our coal agencies are willing to sell only for cash. We must have the necessary banking facilities in foreign countries if we are to do business with them, a fact that we do not seem to have accepted until lately.

The coals from Hampton Roads will undoubtedly experience a large increase in foreign buying, but after the present war is over, will we be able to hold this new business? If England still maintains command of the seas, our own ships will be put out of business, unless our present navigation laws are changed, as it costs over 50 per cent. more to operate under our flag than the British. Under our laws, all officers of the United States ships must be citizens and our ships must have three navigating officers in addition to the captain, while the English only require two; our vessels must have a 25 per cent. larger crew, and our wage scale is much higher.

A United States 4500-gross-ton ship costs per month, in wages, $1700, while a British 6000-ton ship costs $850 per month. Our system of measurement of cargo space and classification often operates against our ship owners as compared with the British measurement. We will, therefore, after the war is over, either have to lose business, operate at a loss, change our navigation laws or sail our ships under foreign flags. [Since writing these notes, the President has suspended the operation of a part of our navigation laws.]

The distances (nautical miles) from Hampton Roads (Newport News), Baltimore, Philadelphia, Charleston, S. C., and New Orleans to various coaling ports of the world, also time of voyage from Hampton Roads at nine knots' speed *via* Panama Canal to Pacific ports, are given in the accompanying table.

From To	Hampton Roads	Baltimore	Philadelphia	Charleston	New Orleans	Time from Hampton Roads, Days	Hr.
Aberdeen	3,248	3,372	3,216	3,528	5,078	13	25

Before the war began, the Hampton Roads coal exports were showing a steady increase, with excellent prospects for the future, partly based on the opening of the Panama Canal. These coals were being quoted daily in foreign markets, a number of contracts for them had been made and some of the larger companies had established their own agents in foreign countries. In brief, the outlook was extremely promising and may be made more so, if the shippers take advantage of present conditions, do not raise prices and supply coal properly prepared.

The proposed legislation under which the Government proposes to buy and operate merchant ships will open the doors for a large-sized political job and will not aid our export trade. We do not need large transatlantic liners or ships of that class; what is required is tramp ships—cargo boats that can be operated economically, using 30 to 40 tons of coal a day, which are adaptable for bulk cargoes, grain and coal, and not passengers and package freight.

SUPPLEMENTARY NOTES

Domestic Markets—Since writing the above, the unexpected and unexampled rise in ocean freights and demand for ships in the overseas trade has somewhat changed the conditions in the coastwise markets.

A number of coastwise collieries and schooners have been withdrawn from their usual trade and chartered for ocean voyages. This has had the effect of raising rates on coastwise business, Hampton Roads to Boston, from 65c. per ton, Oct. 1, 1914, to $1.10 today, with prospects of $1.25 being reached.

Such high-water rates should undoubtedly increase the all-rail shipments to New England as well as to southern ports. The near approach of the contract season will cause the buyers in these markets to figure closely on the comparative costs and quality of the Pennsylvania and Hampton Roads coals.

Foreign Markets—As written several weeks ago, the statements made above as to our export trade were justified by conditions, but today these conditions are altogether different.

Our exports from Hampton Roads have fallen off considerably, due to the high ocean freights and because the usual difference in rates as between British ports and our own has not been maintained, making the delivered price of Hampton Roads coals higher than even the best grades of British coals at foreign ports.

There seems no immediate prospect of any lowering of ocean freights; they are higher now than they have been in the world's recent history. For instance, in 1863 freight on coal from Cardiff to Genoa was $5.35, a point never reached since, until today: now it is $7.53.

⁂

It is more economical to run the boilers above their rating 100 or even 200 per cent. than to carry banked fires under stand-by boilers. The drop of efficiency is small for such excess steam generation above rating as that indicated.—Bromley in "Power."

The Labor Situation

SYNOPSIS—Indications favor the initiation of the "open shop" in northeastern Ohio, after evictions have taken place. The anti-screen law is declared constitutional. A strike is developing in the Fairmont region. The legislature in West Virginia is asked to decree that all coal be weighed. Arkansas is now pacified. No more strike benefits will be paid in Colorado.

At a meeting of the eastern Ohio operators held in Cleveland on Feb. 16, they decided to open the mines in that district on an "open-shop" basis. This decision was only made after the joint committee of operators and miners and the federal investigators had failed to provide for arbitration.

The details of the plan were left to a special committee which was named for that purpose. Agencies representing strike-breakers and mine guards have been conferring with operators and have been in Cleveland for some time. It is believed that trouble will result from the attempt to operate, but the operators are firm in their stand that they start their mines. They feel they are fully justified in so doing because of the inconsistent position which the representatives of the miners hold relative to the wage scale.

The announcement comes from the Coshocton field that the operators will not attempt to operate the mines on the "open-shop" basis. The workings in that district have been idle since Apr. 1, 1914.

Report of Commission to Be Pigeonholed

Word comes from Washington, D. C., that the report of the Federal investigators will not be made public for some time. D. J. Keefe, of the investigators, stated that it would be rather "voluminous."

The committee named to go to Washington to confer with Secretary of Labor Wilson consists of George M. Jones of Toledo, S. H. Robbins of Cleveland, and R. L. Wildermuth of Columbus. This committee went to the national capital to inform the labor secretary that the operators had exhausted every means of settling the strike, and the operators expect to resume mining on the "open-shop" basis.

The first serious outbreak occurred at Bellaire, last week, where Industrial Workers of the World were most active last summer. A mob of about 200 striking miners seized three men employed at the West Wheeling mine and led them through the streets bearing placards "I am a scab." The mob marched its prisoners to Bridgeport. The arms of the three men were tied with ropes and they were surrounded by a strong guard

After a demonstration in Bridgeport, the mob started back to Bellaire, permitting two of the men to escape. Arriving at Bellaire the sheriff rescued the remaining man, who had been pretty badly beaten. Work at the West Wheeling mine was resumed the following morning under protection from the sheriff.

The Sunday Creek Co. Contract

Mine 256 of the Sunday Creek Co. started operation in the Hocking Valley field recently at a scale which if duplicated in eastern Ohio would give the men 38.57c. per ton on the run-of-mine basis. The company agreed to pay the recognized rate of 47c. per ton for the lump coal and proposed to estimate the slack coal at 26.59 per cent. of the lump and to pay for it at the same rate. But the proportion of slack coal made according to the determination of the commission was 28 per cent. of the whole coal.

If 72 per cent. of the coal is lump, the amount of lump coal in a ton will be 1440 lb. If 26.59 per cent. is allowed for slack nearly 383 lb. will be added. Thus the miner will be allowed 1823 lb. for a ton of coal, for which he will receive at 47c. almost 42.84c., which is 6.8c. less than last year's scale.

In eastern Ohio only 64 per cent. of the coal is lump or 1280 lb. per ton. Adding 26.59 per cent. for slack, the miners would receive an additional 340 lb. A ton would therefore weigh only 1620 lb., which at 47c. would give the miner 38.57c. per ton. If the statement is correct, it is clear that the Sunday Creek Co. has jockeyed itself into an extremely favorable contract.

New Freight Rates Are Proposed

The miners in West Virginia are arguing the passage of a bill establishing a maximum freight rate on intrastate coal traffic. The schedule is to be as follows: 125 to 175 miles, $0.75 per ton; 175 to 300 miles, $0.80 per ton, and 300 miles or more, $0.85. They hope in this way to compete in Ohio at least with the coal mined in West Virginia and Tennessee, for it is claimed that intrastate rates are higher than interstate rates to some places.

Operators are divided on the measure. Some claim it is introduced only to becloud the situation. Other operators and the miners favor the measure. At a conference with Governor Willis, Feb. 17, the miners were represented by President John Moore, Secretary G. W. Savage, former Representative Percy Tetlow and Judge G. B. Okey, while John H. Winders, of the Sunday Creek Co., headed a delegation of operators.

This matter was brought up a year ago by Senator Dolliver, who showed that the rate on Ohio coal from Nelsonville to the Toledo docks was $0.80, while West Virginia coal was hauled from Armitage, 12 miles farther from Toledo than Nelsonville, at $0.40 per ton. Cars were assembled by the carrier at Nelsonville, while at Armitage the train was already made up. These rates apply only to Lake coal, the rate from Nelsonville to Toledo proper being $1 per ton. It is a question whether the General Assembly or the Interstate Commerce Commission should act.

Evicting Northeastern Ohio Miners

The Glen's Run Coal Co. is now endeavoring to secure evictions of its idle men. Its case against Leonard Snell, of Rush Run, was tried before the justice of the peace and a jury on Feb. 16, and resulted in a verdict for the coal company, giving it possession of its property. Five other cases are pending, but as jury trials are demanded the progress of law is slow.

On Feb. 23, the Supreme Court affirmed the decision of the Federal district court of northern Ohio holding the mine-run or anti-screen law of Ohio constitutional.

The Fairmont Strike

The continued references to the rates of mining in Ohio appearing in the daily press of West Virginia has apparently started a strike of no small dimensions. This outburst appears to have surprised the union leaders, who do not feel financially able at this time to back strikes in more than one region. However, the strike has arisen, and they are but little disposed to frown on what under normal conditions they would encourage. Coming after a long period of short-time operation, the men are not in a position financially to put up a long contest.

Apparently the trouble crystallized with the Jamison Coal & Coke Co. at its Farmington mines. This concern had hitherto supplied its miners with free powder. An order was issued requiring them to supply their own. The miners claimed that this was the equivalent of a reduction of 4c. per car loaded, and a strike followed. On Feb. 20 there was a severe riot at Farmington and a fight between C. D. Conaway, the sheriff, assisted by 12 deputies and the striking miners. W. R. Riggs, a constable, was alighting from his buggy when the horse became frightened at the revolver shots and ran away, dragging Briggs, whose foot was entangled in the reins. He was found unconscious and was hurried to the Cook Hospital at Fairmont, W. Va. He is believed to be dying from internal injuries and a fractured skull.

The riot started when the sheriff tried to arrest striking miners on a charge of throwing stones at workmen. Two were arrested and were about to be taken to jail by Deputy Sheriff George Straight, when a score of striking miners surrounded the officer and his quarry and demanded that he release his prisoners. The men arrested escaped, and also all those who had interfered with the sheriff's officer. Twenty-five men were immediately sworn in, but the rioters by that time had dispersed to the woods. The sheriff of Marion County appealed on Feb. 22 to Governor Hatfield, asking him to send militia to quell the disturbances at Farmington. Meantime there has been no further exhibition of disorder.

The Ronda and Dry Branch mining dispute still continues. In violation of their agreement the men remain on strike. The operators' commissioner, however, has discussed the issue with the representative of the miners, though he would have been justified in refusing, seeing that the miners should work while the case is under arbitration. The men expect to submit the matter to John P. White, president of the United Mine Workers of America.

Coal by Weight or Measure

On Feb. 9 the Mines and Mining Committee of the West Virginia House of Representatives and Senate held a hearing at Charleston, W. Va., relative to a bill providing that the miner must be paid by weight and not by measure.

Senator Sam B. Montgomery, who is legal representative of the United Mine Workers of America, argued for the bill, urging that the first cost to a small mine for scales would be only $250, while a large mine could buy a self-recording scale for $500. In all, he figured that $146,250 would fit up the coal industry in West Virginia with scales.

He stated that cars at any one mine varied in size and that the amount loaded into them depended on the height to which they were rounded on top. The argument that in good times the miners took advantage of this fact by loading their cars barely to the level of the end gates did not, he declared, make the condition morally sound, and it was equally wrong for operators to bring pressure to bear on their men to have the cars loaded above the rated capacity.

As coal is sold invariably by weight, he could not see why miners should not be paid in the same way. He argued that the weight of coal per cubic yard was not uniform and that the miner should be compensated for the burden of the material handled and not for its bulk. He also declared that as operators could increase the size of a car and keep the rate uniform, it furnished a species of improper competition from which operators and miners in West Virginia alike suffered. He asserted that cars usually held more than their rating would indicate. The state law requires the operator to mark in plain numerals the amount of coal each car will hold. This law, he said, was almost invariably violated.

The Reply of the Operators

The operators were represented by George W. Williams, of Beckley, who declared that the proposed law was unconstitutional, citing in support of his contention the mining laws of Colorado, Kentucky, Indiana, Ohio, Illinois, Pennsylvania and West Virginia and decisions of the Supreme Court of West Virginia and of the United States. It would interfere with freedom of contract and would be class legislation unless it also applied to the farmer who would under similar provisions be obliged to sell fruit, grain, hay, eggs, milk and other products by the pound, instead of by more convenient and adaptable methods.

An operator, D. T. Evans, declared that the use of scales had been a constant source of trouble between the miners and the men, and that he had never had so little dispute and discontent as when the coal at his mines was paid for by car and not by weight. The operators declare that the introduction of scales and the hiring of weighmen would add considerably to the cost of mining at a time when the industry is suffering from the expenses resulting from the Workmen's Compensation bill.

About 80 men employed at the Opperman Coal Co.'s mine at Blair, Logan County, W. Va., went on strike Feb. 16. The men allege that the operators sublet the work to contractors.

Troops Withdrawn in Arkansas

All the troops sent into Arkansas by Secretary of War Garrison on Nov. 6, 1913, were withdrawn on Feb. 12, as it was believed their services were no longer needed. There had been no trouble in the Prairie Creek district, which they were guarding, at any time after their arrival, and Maj. N. M. McClure, believing that the disorder was at an end and that the civil authorities could control the disturbing element, urged that the squadron be withdrawn.

The Colorado "Strikers"

The State of Colorado is having much trouble in finding work for the former strikers and their adherents in the mining districts. The companies do not have work for all these trouble makers, and many of them are starving. It is proposed that work be found for them on the public roads and that the convicts who are now working at these utilities be sent back to prison.

It was announced that no strike benefits would be paid after Feb. 20 in the Colorado strike district. While some help may be extended to the needy, no regular weekly strike pay will be dispensed hereafter.

Conciliation in the Anthracite Region

The report of the Anthracite Board of Conciliation for the year beginning Apr. 1, 1912, and ending Mar. 31, 1913, now in press, shows that the establishment of local grievance committees at the collieries of the anthracite region of Pennsylvania by the agreement of May 20, 1912, has been productive of much trouble and many misunderstandings. The number of grievances that the full board was obliged to hear was nearly double that of the previous three years together.

It has been the policy of the members of the board to use all their influence to have difficulties settled without resort to formal argument, and many additional grievances have been settled by them in their respective districts since May, 1912, without the necessity for the action of the entire board. So numerous have these been that the total number of grievances since that time to date exceeds the whole number brought before the board in the previous nine years of its existence.

Operators Sustained in 14 and Miners in Nine Instances

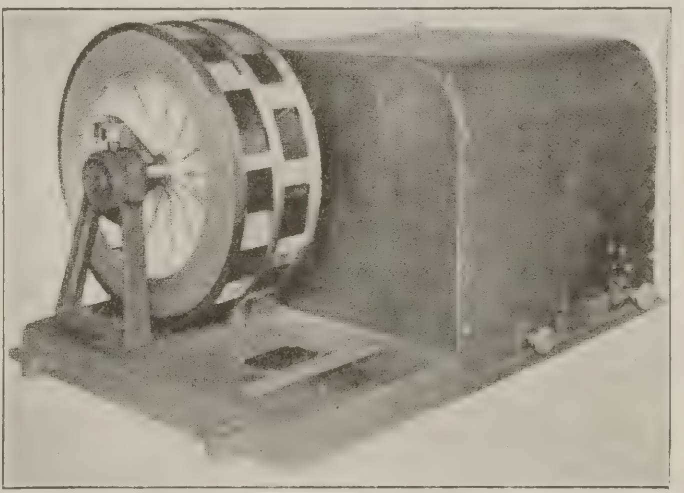
Several of the 46 cases recorded in the present volume of the board's proceedings contained two or more items for decision, so that the total number of grievances aggregates 61. Of these, 26 were withdrawn, the operators were sustained in 14, the mine workers were sustained in nine, in six cases no further action was necessary after the hearings, five were compromised and one item of one case is still pending before the board. It should be explained that many grievances are settled by a compromise of the parties, by failure to appear before the board or by the complainant quitting the employ of the company.

Twelve of the grievances presented to the board were brought by the operators, generally on account of the activities of the local grievance committees, which, it is claimed, devote much of their time to seeking causes for small local strikes. In four of these the operators were sustained, and eight were either adjusted by the parties and withdrawn, or withdrawn without prejudice.

The board consists of three representatives of the mine workers and three representatives of the operators. Its members hear the testimony, discuss the cases among themselves, and, if possible, decide them by a majority vote. In case of a tie vote an umpire is called in. The board was established by the Roosevelt Strike Commission in the spring of 1903 and has done efficient work in maintaining peace in the anthracite coal region ever since that time.

The Denver Siren

The Denver Siren, built by the Hendrie & Bolthoff Mfg. & Supply Co., of Denver, Colo., is of interest to coal-mining people. It is a motor-driven electric, fire or accident alarm, which may be operated from the telephone central's desk or any other convenient point. The rotor is made of aluminum and mounted on Hess-Bright ball bearings. The stator, which is mounted outside of the rotor, is of bronze. These two parts do not touch but operate in close proximity to each other.



The Siren with Boxed-In Motor

The Siren gives best results when driven by a three-phase induction motor. When the switch is closed, the pitch rises rapidly from the lowest audible sound or that produced by about 16 vibrations per second, to the sound made by 700 vibrations per second, which is approximately high C, two octaves above middle C.

By alternately closing and opening the switch, the pitch of the Siren can be changed between these limits. The sound emitted is extremely penetrating and can readily be heard for four or five miles. For best results, the Siren should be placed upon a building or tower, with no higher structure closer than about 200 ft. To prevent the instrument from becoming choked with snow or ice, a roof may be placed over it. This also tends to deflect and project in a horizontal direction that volume of the sound which would otherwise travel skyward, increasing by this much the efficiency of the instrument.

⁂

A New Mine Pump

In order to attain its maximum efficiency, a mine pump should be rigid, simple, durable and accessible. It should be strong and rugged in design to successfully resist over a long period of time the severe and rough handling which it is certain to receive in the mines. For the same reason, it should be built of as few parts as possible, each of these being abundantly heavy to do the work required of it. At the same time, since space is at a premium in underground operations, the unit should be as compact as possible.

On account of the small amount of skilled care which such a machine receives, it should be as simple in construction as possible, no more parts entering into its construction than are absolutely necessary.

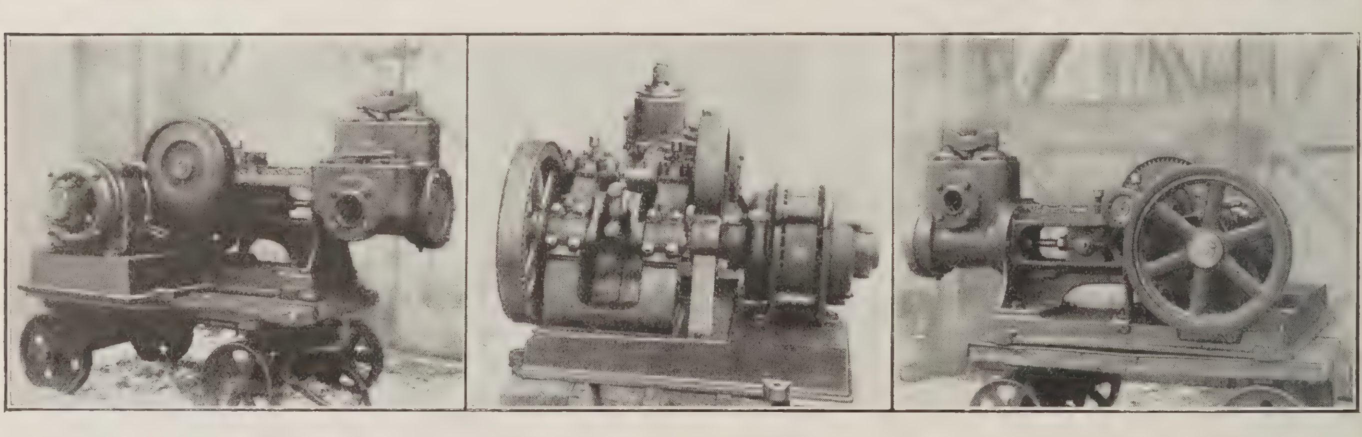
The accompanying illustrations show a mine pump designed and recently placed on the market by the J. C. Stine Co., of Tyrone, Penn. This pump has been planned with the especial purpose of meeting the severe conditions encountered in mine service and embodies many novel and interesting features. The water end of the pump may be made either of anti-acid bronze or a close-grained cast cylinder equipped with an anti-acid renewable bronze lining. This lining is so built that it may be turned six times, thus assuring the maximum possible wear of this part. All the small parts, including the valve seats, stuffing boxes, valve stems, nuts, piston and piston rods which come in contact with the mine water are composed of acid-resisting bronze. The frame is of the box type and heavy. The connecting-rod is of the marine type with a solid bushed wristpin bearing and an adjustable crankpin bearing. This rod is cast solid and the babbitt cast and expanded in place. The cap is then cut off and provision thus made for adjustment. The crank shaft is of cast steel and is made abundantly strong. The gears are all cut.

As will be noticed in the illustration, the jackshaft gear has an unusually heavy rim. This acts as a flywheel. Since the stress on the crankpin is unequal, the stabilizing effect of this wheel tends to relieve the motor or the otherwise unavoidable surges of current as the crankshaft alternately requires a small amount and a maximum of power.

The valve disks, four in number, are of rubber backed with bronze. As may be seen in the illustration, the removal of only two nuts gives access to all four of the valves. This is an important consideration under certain conditions.

The pump is so constructed throughout that no water can possibly get to any of the studs or nuts holding the various parts together. Corrosion and consequent weakening of these parts is therefore reduced to the least possible amount.

This pump is the result of much painstaking care and years of experience in manufacturing apparatus for use solely in mining. Before it was placed on the market, also, it was given a thorough tryout under working conditions. It is built with a bore of 5 in., and a stroke of 6 in., the suction is 3 in. and the discharge 2½ in. It operates at 60 to 80 r.p.m., and the capacity is from 60 to 80 gal. per min. It is small enough to be mounted on a truck traveling upon the regular mine track. This truck is so constructed that the pump may be either retained thereon for temporary work, or the four wheels may be dismounted, the truck body forming the permanent foundation for the machine.



Three Views of the Pump, Showing Accessibility of the Valves and the Heavy Rim on the Gear Wheel

One of these pumps delivering 84 gal. per min. under a total head of 54 ft. in operating continuously for 513 hr. consumed 651 kw.-hr. of electrical energy. This shows an efficiency of over 67 per cent.

⁂

Decrease in Anthracite

There was a decrease of 449,315 tons in the shipments of anthracite in January last, as compared with January, 1914. The consumption, small even for such a mild January, bears out the theory of the operators that householders are economizing coal and keeping only one stove lit where they formerly kept two or three.

Total shipments last month were 4,831,329 tons, as compared with 5,280,644 tons in January, 1914, according to the Bureau of Anthracite Coal Statistics, which now includes the tonnage of the Lehigh & New England R.R. The amount of coal on hand at Tidewater shipping ports increased from 669,833 tons on Dec. 31 to 798,125 tons on Jan. 31.

Editorials

Confederating Our Mining Societies

We received a letter this week from an engineer in central Pennsylvania who wanted to join one of the mining societies and desired to know enough about their activities so that he could make a good choice between them. It is perhaps not hard to answer his letter, but when we sent him a complete reply we could but feel that he would think that there were so many societies in the field that it was best not to join any of them.

There is no reason why all the various coal-mining institutes in West Virginia, Illinois, Pennsylvania, Tennessee, Alabama and the Rocky Mountain states should not be amalgamated into a strong organization, national in scope and of such commanding influence that everyone would desire to join the confederation.

There is no opposition existing between these various institutes. They have no relation to business. A Pennsylvanian or a West Virginian attending any of these gatherings would find his welcome warm and friendly and hear nothing of the competition between the fields, with which we are so much impressed elsewhere.

Moreover, we do not believe that anybody desires to keep the institutions apart. Several people living in one district with their interest purely local belong to other institutes in order to get the benefit of the proceedings and for the pleasure and broadening effect of visiting in other fields. Those thus affiliated with several institutes have never failed to receive a welcome wherever they went, which was perhaps conceded to them as much because of their personal excellence, as because they were members of other organizations.

If any believe that there is friction existing let them consider that meeting together in a technical convention and sitting at the same banquet board will help to change that deplorable difference of viewpoint and bring harmony out of dissension.

Some organization should make the necessary move, and which institute makes the attempt is a matter of no concern. It is unfortunate that no one association was strong enough when the others were started to make the leaders of the industry in other states extend that parent society's work instead of starting independent bodies.

And turning from the technical coal-mining field to that of safety, it would seem that the American Mine Safety Association is so large and comprehensive that no rival local organization would be started. Yet recently one was founded in Alabama which was entirely independent of the larger body though duplicating its work.

Some time ago, a local branch of the American Mine-Safety Association was about to be opened at Franklin Furnace, N. J., within territory in which there is a local branch of the National Safety Council. It was then asked why the American Mine-Safety Association does not affiliate with that body having broader aims. Perhaps that amalgamation might be advantageous, but it is surely not well to have a dozen independent mine-safety organizations in separate expensive existence all over the country, and so insignificant in many cases as to make no appeal to the imaginations and pocketbooks of the members.

Certainly the shifting membership of local institutes as compared with the permanence and strength of national bodies warns, or should warn the "home-rule" element that the local organization always has a precarious hold on existence, owing to the lukewarm support of its following.

We would be pleased to have suggestions concerning this matter from Coal Age readers.

Sobriety in Mining Villages

There is no avoiding the conclusion that total abstinence is coming. It is not merely practical politics; it is now practical business. Just as soon as we look at it from that point, the very dregs will fall from the liquor bottle.

Mining is behind the transportation industry in this matter. For years the railroads have discriminated against drinking men, while even those coal companies which kept saloons off their property feared to be equally stringent. As a result, they gained but little from excluding the drinking places. If they had shut out drinking men, they would have gained in the character of their employees, in their output per man, in the safety of their mines, in the respectability of their villages and would have received the approval of the public.

To gain or retain a few worthless men, some companies have allowed their whole force to be debauched and have injured their own reputations, for the man who drinks heavily saves nothing, condemns his company, his working place, his home and invariably declares, usually with truth, that he has not seen a dollar for years. It is the part of folly to permit saloons to be built on the company's property, and it is even more a folly not to carry the campaign to its natural conclusion and prohibit the employment of every man who drinks to excess, if not also of all those who imbibe in moderation.

We do not believe that the companies would have had trouble from strikes had such drastic action been taken, for no one really respects a drunkard, or even grants the right of a man to his whisky. We are glad to see that the Delaware, Lackawanna & Western R.R. Coal-Mining Department has warned its foremen, driver bosses and others in authority against entering saloons.

In a short while, a few of the old operating heads in the industry who still retain the liking for a nip of whisky will go the way of all flesh and then it will be ruled out with an iron hand. After all, the foreigner is not so much bent on his liquor as we think. Across the water he can't afford to convert himself into a swill-wagon and he will not miss his beer and whisky as much as we apprehend, except perhaps at weddings and funerals.

At the recent meeting the American Institute of Mining Engineers, J. Parke Channing told of a mine in Russia which lost 60 per cent. of its men when the war broke out. Slowly the force was increased, until it had 50 per cent. of the normal number of employees. But meantime vodka had been prohibited, and that depleted force of men actually produced 30 per cent. more tonnage than the full crew of men had done before the war broke out.

The men who were working four days a week asked to be put on piece-work and to be allowed to put out product seven days a week. Later they decided that such continuous work was not desirable, and they cut the working days to six. They showed, however, very clearly that it is not so important to have many men as to have them all sober.

Charles W. Goodale, of the Anaconda Copper Mining Co., then discussed the effect which martial law and the closing of the saloons in Butte had on the accident rate at the mines of the company. On Sept. 1, 1914, all the saloons in Butte were closed for ten days. They were then opened, but only from 8 a.m. till 7 p.m. During the balance of the month, the saloons were open from 7 a.m. till 10 p.m. only.

As a result, in September only 4.21 accidents occurred per 10,000 shifts. In the August before, the rate was 11.25, and in the October after, 7.58. The rate in July was 6.22 and in November 6.07. The appearances are—though this is merely our idea—that the great loss in August was due to the drinking, consequent on the strenuous events preceding the proclamation of martial law. In any event, with excitement still almost at its height, the accident rate was lowest in September, because, concurrently, the chance to secure liquor was restricted. Probably the result would have been even better had the liquor been wholly cut off.

The Workmen's Compensation Bill is going to make some wonderful changes in the attitude of employers to the genial habit of imbibing liquor. We do not anticipate as large an improvement will arise from temperance as in Russia or perhaps even in Butte, but we do expect the change will be most perceptibly for the better.

Miners and other men whether employers or employees too often drink to excess. But we do not blame the action of a number of union men in bitterly resenting the aspersions on their sobriety said to have been made by a Delaware, Lackawanna & Western R.R. official, if the statements they quote are truly reported. But we do admire the protesting union men because in the resolutions passed they say we "do not uphold anyone going to work in an intoxicated condition." Let them make their stand even stronger, and we will applaud their declaration even more loudly.

The Fee System

The abuse of the fee system among negroes in Alabama, to which reference is made in our Ideas and Suggestions, is not confined to men of color or to citizens of that state. It exists in a degree throughout the whole country. We well remember how the constable and justice of the peace in a little mining village in Pennsylvania used to look upon the "foreign drunks" as legitimate picking. The Americans were passed over and the aliens chosen.

Order was none too well maintained because the arrests were made not to enforce order but to levy a tribute on those whose political influence would not weigh when the vote was taken. The foreign-born who did not know how to vote could be depended on to cast their ballots for all in one party regardless of the way in which some of the lesser nominees had victimized them in the recent past. And the foreigners, having no votes, had in the eyes of the minions of the law no rights deserving of respect.

Had the constable and justice been temperance advocates we might have sympathized with them in their efforts to arrest drinking men, but the justice himself liked his liquor only too well. The campaign in Pennsylvania as in Alabama was animated by a desire simply to corral the easiest, least resisting quarry.

Judge H. B. Abernethy of Birmingham has asserted his right to try cases where certain misdemeanors are committed. Particularly, he has had haled before him the negroes who have been arrested for shooting crap. This change does not directly help the negro, but it diverts the fines to public funds and discourages the activity of the exploiters of the fee system.

Judge Abernethy at a recent trial vigorously expressed his indignation saying:

> If the officers were half as diligent in running down actual criminals as they are in arresting petty offenders, there would be less crime in the city and county. The practice of rounding up negroes Saturday night for the purpose of making fees is one of the most pernicious practices in the county and imposes great hardships on a class that is practically helpless so far as the courts are concerned.
>
> In the case cited above, the solicitor agreed to nol-pros the case on the payment of the fine and costs. The law fixes the fine at $10, which in my opinion, is entirely too much for a first offender. The fine, however, is insignificant compared with the costs involved. Just think of it, $37.55 costs for a case involving nothing more than a petty offense against public morals.
>
> In nine cases out of ten, the negroes so convicted have to work out the sentence and costs on the county roads, all to the benefit of the fee-system office-holder. There is no fee attached to the court of common pleas. Judge Hickman and myself are on a salary as are both of our clerks. All the fees collected, which are very small, go into the county treasury.
>
> I propose to try all cases of this character that come before me and if the law would permit, for the first offense, I would impose a more nominal fine, but for the chronic offender, I would give the limit.

It seems that not only in Alabama but in several states north, south, east and west, a more reasonable system should prevail. A number of legislators in Alabama have been elected on the strength of their opposition to the fee system, and though there will undoubtedly be a strong lobby in favor of the spoils, the advocates of a more scientific system will probably win their fight.

To show that the fee system is a form of spoliation, it is only necessary to quote the fees received by the sheriffs of New York County—men whose names are hardly known to the citizens of the city which they are supposed to serve. These men also receive salaries of $12,000 per year. Nicholas J. Hayes (1906-1907) received in fees $70,193.91, Thomas F. Foley (1908-1909) made $92,594.84 and John S. Shea (1910-1911) $95,623.91. To Julius Harburger (1912-1913) fell no less than $98,769.24 of fees. Max S. Griffenhagen made more than $71,000 last year. The total amount of fees retained by sheriffs in New York County from 1906 to 1914, inclusive—9 years—was $408,324.44.

Discussion By Readers

Recognition of Bravery

Letter No. 1—I have seen no replies to the invitation extended in Coal Age, Jan. 16, p. 109, asking for suggestions recommending the adoption of some feasible and practical method of properly rewarding miners who risk their lives in performing deeds of heroism. Although I am not directly connected with the coal-mining industry, I am associated with it enough to be deeply interested in this question, and beg to offer a few words on the subject.

Deeds of heroism in and about a coal mine are, as a rule, given little consideration and quickly forgotten, because it is generally assumed that such acts are a part of a miner's calling and he is expected to face all dangers without a thought for his own personal safety. The fact has been proven many times that the miner himself does not know such a word as "falter" or "hesitate" when called to sacrifice his own safety, or when there is a service to be done for others in danger. In time of trouble or danger, the self-interest of a true miner disappears and he faces death as bravely as does the soldier on the field of battle.

The question of making adequate recognition of exceptional courage exhibited by the miner in times of peril, presents two aspects in working out a practical plan of operation. First, let us ask, would it be advisable to set a standard of *degrees of courage*, or would it be better to bring all worthy acts under one general classification? Second, Should the reward be entirely honorary in all instances, or conditioned to suit the rescuer's own physical condition when that is permanently impaired?

Many of our larger cities have honor rolls of brave firemen and policemen. In the city of Chicago, today there are two separate funds maintained for the recognition and commendation of heroic work. One of these is called the "Lambert Tree Fund" and is so named in honor of its founder, Mr. Tree. The other is supported by the self-styled "World's greatest newspaper," the Chicago *Tribune*. Each year medals are awarded and recognition bestowed on deserving ones, who are selected by a board of judges, acting for each of these funds. In making their recommendations the board of judges considers three grades of classification; namely, commendation, honorable mention and honorable mention with recommendation for a medal.

Coal Age is certainly to be commended for having taken the first step in an effort to extend the warm hand of friendly recognition to the brave men who face danger and death for their imperiled fellows in the dark recesses of coal mines. Without doubt the suggestion will receive the hearty support and coöperation of the larger coal-mining companies and men of the coal industry, who appreciate and understand what individual volunteered bravery means in and about the mines. No vast sum is required to accomplish the desired result, and I firmly believe the idea will be well received and liberally supported by everyone in the coal-mining fraternity. Let an authoritative and permanent record at least be made of the many brave rescues that have been already made, and thereby perpetuate heroic deeds in coal mining.

Bykem.

Joliet, Ill.

Letter No. 2—In the foreword that appeared in Coal Age, Jan. 16, p. 109, a suggestion was made in regard to providing in a suitable manner for the recognition of the acts of bravery and heroism so often displayed, not only in mine-rescue work but in the humble performance of the daily duties of miners and all mine workers.

I want to say that I consider your suggestion in this regard a most worthy one. I believe that such recognition would go far toward increasing the efficiency of rescue work, by stimulating the desire on the part of mine workers to render every aid in their power in an emergency or at times of danger to fellow employees.

Following your suggestion, which I regard as a timely one, I have taken some steps to obtain an expression of opinion in regard to the form such recognition of brave acts and heroism on the part of mine workers should take. I would like to ask if we understand that the columns of Coal Age are available for the frank and full discussion of this subject by its readers, and the free expression of their opinions in regard to the same.

Such a discussion would undoubtedly develop many good ideas and eventually make known the best course to be pursued in such an important and worthy undertaking, in order to bring about the greatest good to the industry. I believe this could be handled to advantage in a way similar to the question "Who Gets the Promotion?" which recently appeared in Coal Age and attracted such wide interest and attention.

I. R. Packard, vice-president,
Harper Coal & Coke Co.

Bates, Ark.

[It is the desire of Coal Age to obtain a full and frank expression of opinion from all its readers who are interested in this important matter. We hope, thereby, to work out eventually a plan that will make suitable recognition of heroism and bravery in mining work. The purpose should be to stimulate in the minds of *all* a generous disregard of personal safety in times of danger, whenever there is a reasonable expectation of aiding and rescuing others.

Such recognition should not be regarded in the light of a *reward* for action that is incumbent on every fellow workman. To the right-minded, the faithful performance of duty is its own reward. Few who are willing to risk their own life in an effort that bids fair to save another's would consider accepting a reward for their deed. Deeds of heroism are too costly to be purchased.

We hope for a discussion of this question that will bring splendid results, and Coal Age invites all its readers who are interested to lend their aid to this end.—Editor.]

Mining Laws, Legislation and Mine Regulations

Letter No. 35—In connection with the dangers attending the operation of mines in the same territory with oil and gas wells, mentioned by D. W. S. Coal Age, Jan. 30, p. 216, I thought it would be of interest to give a brief summary of the Ohio law, which is headed "Relating to Oil and Gas Wells Through Coal Measures" (Mining Laws of Ohio, 1914, pp. 107-112) and reads as follows:

> Sec. 973. Any person, firm or corporation causing to be drilled any well for oil or gas, or elevator well, or any test well within the limits of any coal-producing county of this state must give notice, in writing, of such fact to the chief inspector of mines, stating the location of the land upon which such well is to be drilled.

The law further requires that the parties shall make or cause to be made an accurate map, on a scale of 1 in. to 400 ft., showing the location and number of wells, property lines, township, section and quarter section in which the well is located, together with measurements from the section and quarter-section lines. The map must be accompanied with the sworn statement of the person, firm or corporation making the same and must be kept on file in the office of the state mining department and be open for inspection by the public at all reasonable hours. The owner or surveyor shall retain the original map, but a blueprint copy must be furnished the chief inspector of mines and another copy filed with the recorder of the county where the well is located, within 60 days after commencing to drill. If the drilling is continued a complete blueprint copy of the map must be filed at the end of each year. The law continues:

> No oil or gas well shall be drilled nearer than 300 ft. to any opening to a mine, used as a means of ingress or egress for the persons employed therein, nor nearer than 100 ft. to any building or inflammable structure connected therewith and actually used as a part of the operating equipment of said mine.
>
> In the event that a well being drilled for oil or gas penetrates the excavations of any mine, it must be cased with casing of approximately the same diameter as the diameter of the hole, the hole to be drilled 30 ft. or to solid slate or rock and not less than 10 ft. below the floor of such mine; and the casing shall be placed in the following manner: One string of casing shall be placed at a point above the roof of said mine so as to shut off all of the surface water and then the hole drilled through said mine and another string of casing put in, and the bottom of the second string of casing or the one passing through said mine shall not be nearer than 10 ft. nor more than 30 ft. from the floor of the mine where it passes through the same.

When abandoning an oil or gas well that has penetrated a mine from which the mineable coal has not all been removed the law provides that:

> * * * The person, firm or corporation owning said well shall leave in said well the casing passing through said mine from a point not less than 10 ft. nor more than 30 ft. below the floor of said mine and extending above the roof of said mine 5 ft.; and a seasoned wooden plug or iron ball shall be driven to a point 40 ft. below the floor of the mine. * * *

The hole must then be filled with cement to the top of this casing and, after driving another iron ball or seasoned plug, cement must be again filled into the hole to a depth of not less than 20 ft.

If the oil or gas well to be abandoned has penetrated *two or more* workable seams of coal a seasoned wooden plug or iron ball must be driven to a point 30 ft. below the lowest workable seam of coal, and the hole filled with cement to a point 20 ft. above the upper seam, when another wooden plug or iron ball must be driven and the hole filled with cement for a distance of 20 ft. more.

The law concludes:

> When any oil or gas well is to be abandoned, the person, firm or corporation having drilled or operated such well shall notify the chief inspector of mines, at least 10 days in advance, so that he may direct one of his district inspectors to be present at the time of abandonment.

It will be seen from the above quotations that not only are owners of property required to give written notice of wells to be drilled or abandoned, but they must also make and file an accurate map showing the exact location of the wells on the property and file copies of the same with the state inspector of mines and the recorder of the county; and when drilling is continued a yearly report must be made showing the number and location of each well drilled.

Referring now to Mr. Weigle's suggestion that the mine foreman should be a state official, Coal Age, Feb. 13, p. 302, in my opinion, there are many objections to such a procedure. Without discussing the legal difficulties that might be encountered but which could be easily overcome if it were desired, I will simply state my objections, which are as follows:

1. I believe the control of a mine foreman placed in charge of a mine should rest, in part at least, with the company or owner of the mine and not with the state, whose interest in the operation of the mine relates to safety alone.

2. I do not believe the state should dictate or control the selection of a mine foreman to be placed in charge of a mine that it does not own or operate.

3. State control might lead to term service, which would be a disadvantage in the operation of a mine.

These objections are made in full recognition of the dual capacity of a mine foreman, who must act both as safety inspector and coal producer.

There are, however, other duties devolving on the foreman that have no relation to *safety of operation*. For example, in order to maintain the output of the mine at its full capacity, the foreman must plan its future development. In these plans, as well as in the details of operation, *economy of production* is an essential factor; and the foreman in charge must be a man who understands the details of the work, the ordering of needed supplies and the economical management of men, in order to give satisfaction to the operating company or owner.

In all these respects, the state has no concern. The state already employs the mine inspector to look after the safe operation of the mine and to see that the law is obeyed. In my opinion, the selection of the mine foreman and his control should be wholly in the hands of the operator or owner of the mine.

Assuming for a moment, however, that the mine foreman is or should be a state official, we are confronted at once with difficulties relating to his appointment. There is, already, much diversity of opinion in respect to the manner of selection of mine inspectors; and the question arises, "Would the mine foreman, as a state officer, be *appointed* by the governor or *elected?*" In any case, it would be difficult to secure a man who would be satisfactory to the company or the mine owner. There is material difference in the policies of different companies and mine operators, which would still further increase the difficulty.

There is no question but that the examination and certification of mine foremen as to their capabilities tend to greater competency in the operation of mines as well as provide a greater degree of safety. From among such certified men, the operator or company can best select the man suited to their needs. In making this selection, an important consideration is the familiarity of the candidate with the conditions existing in the particular mine of which he may have charge. Any selection for this office, by the state, could not satisfactorily determine this qualification.

Mr. Weigle suggests further that the removal of a mine foreman should only be possible after he had been given a fair trial by "an executive board composed of at least two district mine inspectors and one member of the operating company." This suggestion virtually takes from the operator all power to dismiss a mine foreman from his employ, since the majority vote of the board would be in line with the state's interest. In other words, the owner or operator of the mine would be prevented from removing a mine foreman, which they might desire to do for economical reasons; but would be forced to operate under conditions that were not economical. Again, on such a plan, a mine foreman with the support of the inspectors could safely oppose the plans and wishes of the operating company who would be powerless to discharge a man simply for poor management or uneconomical methods. He would be forced to see his cost-sheet eat up his reserve.

However, it hardly seems fair to criticise this suggestion without offering a substitute. The method that appeals to me most strongly is to hold the operator responsible for any failure to enforce the mining law in the operation of the mine when it appears that he is rightly to blame and to impose a heavy penalty for such failure. The orders of the mine inspector might be written in duplicate—one being given to the foreman in charge and the other to the operator. It might be further provided that any order given to a mine foreman that is plainly in conflict with the mining law should be made in writing and duly signed by the superintendent or operator. Such written order would shift the responsibility from the shoulders of the foreman to the responsibile party or parties, in case any action resulted therefrom. In the absence of such a written order, the mine foreman would be regarded as responsible for any violation of the law in matters in his charge. By this means, responsibility would be placed where it rightly belonged, and neither operator nor foreman could shift the blame, but every man would shoulder his own load and suffer for his own act.

GEORGE N. LANTZ.

New Straitsville, Ohio.

Safety Hints

There appeared in COAL AGE, Oct. 24, p. 676, an editorial entitled "Safety Hints." After stating what railroads were doing along this line, by means of committees appointed in each operating department, the belief was expressed that a similar system could be put in operation, with good results, at coal mines.

I am not opposed either to safety committees in mining or to the posting of danger signals in and about coal mines as a precautionary means of impressing the idea of safety on all mine workers. However, I greatly fear that the multiplicity of these signs, giving warning of unsafe places or conditions, may engender in the minds of many mine workers the idea that all unsafe places are properly marked and guarded, and that less care and precaution are needed on their part in protecting themselves in their own working places or where such danger signals do not appear.

In other words, too much reliance may be placed on the work of the safety committee or the mine foreman or fireboss, and too little care taken by the miner for his own safety. The habit of risking danger and postponing the doing of things that should be attended to at once has cost many a miner the loss of his life. Safety committees and mine foremen cannot be expected to be always on hand when danger is present; and the responsibility for his own safety must rest on the individual worker in the mine.

I have long felt that the best safety rule and method that can be adopted in coal mining is, *Train and discipline every mine worker to detect dangerous conditions and to know how to avoid or escape them.* It is important to impress strongly on the mind the danger of delay or of assuming unnecessary risks. I have observed, and statistics will generally show, that the percentage of accidents occurring in mines where danger signals are displayed almost everywhere is as high or higher than in mines where this system is not carried to such an excess, other conditions of course being similar. It will be generally granted that the percentage of accidents, under like conditions, will be less in proportion as miners have been trained to care for themselves by observing every precaution for safety, however insignificant the need of such precaution may appear.

The idea has gained some prevalence among miners that the mine foreman knows much more about mining than even good miners do themselves. It need not be stated that this is true only where the mine foreman is a good practical miner himself and a man of broad experience. Even in that case, however, the mine foreman should not be expected to be as well acquainted with the conditions in a working place as the miner who works there continually.

Another idea that has gained some prevalence is that long experience as a miner renders him immune from accident. Whatever his experience, the exercise of *precaution and constant vigilance* on the part of a miner is absolutely necessary for his safety; and experience of the proper sort should make this fact certain. Long experience will not keep a loose piece of slate from falling on a miner who neglects to keep away from under it and to set the necessary timber for its support. Long experience will not prevent a man from being run over by a trip of cars when he travels on a haulage road, in disobedience to orders. Long experience will not prevent a miner from being burned when he walks into gas with an open light. Indeed, *long experience will teach men the need of precaution and obedience to the rules and regulations of the mine.*

JOHN ROSE,
District Mine Inspector.

Dayton, Tenn.

Humidifying Mine Air

Letter No. 2—I was much interested in the inquiry of Miner, COAL AGE, Jan. 2, p. 29, and have read also the suggestions of Geo. Morris, to the effect that sufficient exhaust steam should be introduced into the intake current to produce a relative humidity of 93 per cent. in the live workings when the outside temperature is at or near the freezing point, COAL AGE, Jan. 16, p. 135.

The subject of humidifying the mine air has interested me greatly during the past few years, since the explosibility of coal dust has been so clearly demonstrated by many fatal occurrences. In this connection, it has been my good fortune to have had the opportunity of inspecting many devices and methods designed for the purpose of maintaining the degree of humidity in the mine air at or near the dew point so that the tendency will be for the air current to *deposit* rather than to *absorb* moisture in its passage through the mine.

The appliances inspected have included many types of apparatus, from the most elaborate systems for the injection of watery vapor into preheated air, to the more simple application of deliquescent chemical compounds to the haulage roads and intake airways. While many of these methods have given beneficial results more especially in the smaller mines, they have demonstrated to my mind that any apparatus that will produce and maintain a desirable percentage of moisture in the live workings of a mine, at all seasons, would be precluded by the necessary expense for the installation and upkeep of the system.

In this connection, I thought the following description of a device that is both simple and inexpensive and that has, in a number of observed instances, been entirely efficacious would be of interest. I would say, however, that this apparatus is designed for a mine operated on the blowing system of ventilation; and, since it must be installed on the intake, its adoption presupposes that the mine haulage is performed on the return airway. The description is as follows:

The device consists of a radiator composed of a series of 2-in. pipes hung from the roof in horizontal layers 10 in. apart. The first layer is suspended from the roof, while each layer below is hung from the one above it. The length of the radiator pipes will depend somewhat on the volume of air in circulation. For an air volume of 60,000 cu.ft. per min., a radiator 50 ft. long will suffice, while a 90-ft. radiator would probably be required for an air volume of 100,000 cu.ft. per min. The steam is introduced into the top layer of pipes, and, after passing successively through each of the lower layers, is discharged from the layer next to the floor, at the inby end.

By the operation of this device, the air current is heated to a temperature sufficient to enable it to absorb and carry into the mine all of the water in the exhaust steam, which is as much as can be asked or desired of any apparatus or device. The radiator is located a few hundred feet from the bottom of the intake shaft, slope or drift mouth.

FLAT TOP ENGINEER.

————, W. Va.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Example—Given the two sides of a right triangle to find the hypotenuse: Thus, altitude, a = 300 ft.; base, b = 400 ft.; to find the hypotenuse c and the other two angles A and B.

Solution—There are two methods to employ, which are as follows:

First Method—Substituting the given values in the formula previously given and transposed to give the value of c,

$$c = \sqrt{a^2 + b^2} = \sqrt{300^2 + 400^2} = \sqrt{250{,}000} = 500 \textit{ ft.}$$

For the two unknown angles,

$$Sin\ A = \frac{a}{c} = \frac{300}{500} = 0.6; \quad \text{and } A = 36° 52'$$

then, $$B = 90° 00' - 36° 52' = 53° 08'$$

Second Method—The angles may be first found, after which the hypotenuse is found by the law of sines or the law of cosines. There are two ways of finding the angles A and B, in this case:

1. By the law of circular functions:

$$Tan\ A = \frac{a}{b} = \frac{300}{400} = 0.75; \quad \text{and } A = 36° 52'$$

or $$Tan\ B = \frac{b}{a} = \frac{400}{300} = 1.333; \quad \text{and } B = 53° 08'$$

2. By the law of tangents:

$$Tan\ \tfrac{1}{2}(B - A) = \frac{b - a}{b + a} = \frac{400 - 300}{400 + 300} = \frac{100}{700} = 0.1429, \textit{ nearly}$$

$$\tfrac{1}{2}(B - A) = 8° 08'$$

Then, since for the half-sum of these angles, ½ (B + A) = ½ (90°) = 45°

$$B = 45° 00' + 8° 08' = 53° 08'$$

and $$A = 45° 00' - 8° 08' = 36° 52'$$

To find the hypotenuse, now, apply either the law of sines or of cosines, as follows:

Law of sines, $$c = \frac{a}{sin\ A} = \frac{300}{0.6} = 500 \textit{ ft.}; \quad \text{or} \quad \frac{b}{sin\ B} = \frac{400}{0.8} = 500 \textit{ ft.}$$

Law of cosines, $$c = \frac{a}{cos\ B} = \frac{300}{0.6} = 500 \textit{ ft.}; \quad \text{or} \quad \frac{b}{cos\ A} = \frac{400}{0.8} = 500 \textit{ ft.}$$

Example—Again, taking the same triangle, and given one side and either angle; thus, given a = 300 ft. and A = 36° 52′, to solve the triangle.

Solution—Whether the given angle is adjacent or opposite to the given side the same method of solution can always be applied, since the other angle is 90 deg. less the given angle.

$$B = 90° 00' - 36° 52' = 53° 08'$$

$$b = a\ tan B = 300 \times 1.333 = 400 \textit{ ft.}$$

$$c = \frac{a}{cos\ B}; \text{ or } \frac{b}{sin\ B}; \text{ or } \frac{b}{cos\ A}; \text{ or } \frac{a}{sin\ A}, \textit{ as before.}$$

The Coal Age Pocket Book

Example—Again, taking the same triangle as above, and given c = 500 ft. and A = 36° 52′, to solve the triangle.

Solution—The other angle, found as above, is B = 53° 08′

Altitude, $a = c\ sin\ A = 500 \times 0.6 = 300 \textit{ ft.}$

Base, $b = c\ cos\ A = 500 \times 0.8 = 400 \textit{ ft.}$

Or, since in any right triangle, sin A = cos B; and sin B = cos A,

Altitude, $a = c\ cos\ B = 500 \times 0.6 = 300 \textit{ ft.}$

Base, $b = c\ sin\ B = 500 \times 0.8 = 400 \textit{ ft.}$

Formulas for Use of Logarithms—When using logarithms, in the solution of triangles, it is desirable to have a formula that avoids as much as possible the addition and subtraction of terms. This is possible in Case 4, where the three sides only are given. For example, denote the half sum of the three sides by S; or say S = ½ (a + b + c) and we obtain

$$Sin\ \tfrac{1}{2}\ A = \sqrt{\frac{(S - b)(S - c)}{bc}} \qquad (1)$$

$$Cos\ \tfrac{1}{2}\ A = \sqrt{\frac{S\,(S - a)}{bc}} \qquad (2)$$

$$Tan\ \tfrac{1}{2}\ A = \sqrt{\frac{(S - b)(S - c)}{S\,(S - a)}} \qquad (3)$$

The letters in these formulas, as previously stated, can all be changed correspondinly, as will appear in the following solution of the example in Case 4.

Example—Given the three sides of a triangle, as follows: a = 300 ft., b = 500 ft. and c = 700 ft.; to find the angles A, B and C.

Solution—Using the formula for the sine of the half angle, since S = ½ (300 + 500 + 700) = 750; S — b = 750 — 500 = 250; and S — c = 750 — 700 = 50; we have

$$Sin\ \tfrac{1}{2}\ A = \sqrt{\frac{250 \times 50}{500 \times 700}} = \sqrt{0.03571} = 0.1889$$

$$\tfrac{1}{2}\ A = 10° 53\tfrac{1}{2}'; \ A = 21° 47'$$

Again, since S — a = 750 — 300 = 450,

$$Sin\ \tfrac{1}{2}\ B = \sqrt{\frac{450 \times 50}{300 \times 700}} = \sqrt{0.10714} = 0.3273$$

$$\tfrac{1}{2}\ B = 19° 06\tfrac{1}{2}'; \ B = 38° 13'$$

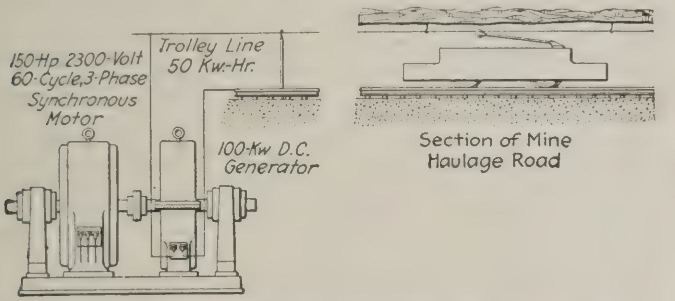
It is well to remember that Formula 3, above, giving the value of the tangent will yield generally closer results for angles between, say 10 deg. and 60 deg. Below 10 deg., there is little practical difference between the sine and the tangent; and above about 60 or 70 deg., the value of the tangent becomes less and less definite.

Also, Formula 2 for the cosine should be used in preference to Formula 1 for the sine, for all angles between 45 and 90 deg. **For angles less than 45 deg. Formula 1 or 3 is preferable.**

Inquiries of General Interest

Purchase of Electric Power

At a mine purchasing electric power for the operation of its haulage motors and coal-cutting machines at the face, a 100-kw., direct-current generator is direct-connected to a 150-hp., 2300-volt, 60-cycle, three-phase synchronous motor, as illustrated in the accompanying diagram. If the generator delivers 50 kw. to the power line extending into the mine, for 10 hr., how many kilowatt-hours will the alternating-current motor take from the mains in that time?



150-Hp 2300-Volt 60-Cycle, 3-Phase Synchronous Motor
Trolley Line 50 Kw-Hr.
100-Kw D.C. Generator
Section of Mine Haulage Road

Diagram Showing Arrangement of Motor and Generator Supplying Power to the Mine

ELECTRICIAN.

Handley, W. Va.

According to the above statement, the generator delivers 50 × 10 = 500 kw.-hr. to the trolley line. Then, assuming an efficiency of 90 per cent. for the generator and 90 per cent. for the motor, the latter takes from the mains, in the same time, $500 \div (0.90 \times 0.90) = 617.28$ kw.-hr. The combined efficiency of the generator and motor, in this case, is 81 per cent.

⁂

Pick vs. Chain Machines

I am desirous of ascertaining in what parts of this country mining machines of the pick type are most largely used. Available statistics do not mention the type of machines used. Kindly state, also, whether the increased use of the chain type of coal-cutters is due to the fact that they use electric power or is it due to any general preference on the part of miners for chain machines? What objections, if any, have been made to the use of pick machines, in the mining of coal? I shall appreciate any information you can offer on the subject.

CHAS. O. PALMER.

Cleveland, Ohio.

In regard to the use of these machines, respectively, it may be stated, in a general way, that pick machines are employed most largely in sections of Illinois, Indiana and Pennsylvania; but it is worthy of note that, at the present time, the records of these three states show a greater increase in the use of chain machines for cutting coal than any other state or district, except eastern Kentucky and West Virginia, which stand first in point of increase. Pick machines, however, never had much popularity in eastern Kentucky and West Virginia, for the reason that the chain machine of the side-cutting type was available for use at the time when the extensive development of the West Virginia field began.

The increasing use of the chain type of coal-cutter is due chiefly to three causes or conditions: 1. Chain machines are operated by electricity; and as electric power is now being so largely introduced into mines for the purpose of haulage, the adoption of the chain machine requires but one power installation for coal cutting and haulage.

2. It cannot be denied that there is a general preference for the chain type of machine, owing to its greater speed of cutting. The early type of chain cutter was a breast machine, which could make but one cut at a time and was little better, if as good as the pick machine. The introduction of the side-cutting, chain machine, however, made it possible to undercut an entire breast in a single operation, without withdrawing the cutter-bar from the coal. This greatly increased the speed of cutting coal with the chain type of machine; and, in this respect, made it superior to the pick machine.

3. The side-cutting machine, of which the "Ironclad" is a good representative, is much more flexible and easy to handle than the old breast type of chain cutter and is adapted to a much larger range of conditions.

It may be stated that a chain breast machine, under favorable conditions of roof and floor, will cut about twice as much coal as a pick machine, in the same time. The recorded results of coal cutting show that an "Ironclad," continuous coal-cutting chain machine cuts double the quantity of coal previously cut by a breast machine having the same length of cutter-bar, in the same time. An important feature of the "Ironclad" is that it permits the use of a considerable length of cutter-bar. Bars 10 ft. 4 in. long are in successful use in a number of mines today, while the present capacity for depth of cut of the pick machine does not exceed 5½ or 6 ft.

Correspondent will find much information on machine mining, including the number of each type of machine in use for a number of years, in the annual report, U. S. G. S. for 1913, by E. W. Parker, p. 759. In this connection, we would draw attention to an interesting paper entitled "Some Recent Developments in Electric Coal Mining Machines," by S. B. King. This paper was read at the New York meeting of the American Institute of Mining Engineers, February, 1914. It gives an interesting chart or diagram showing the total number of coal-mining machines in use; percentage of coal mined by machine; compressed-air pick machines; electric machines and all types in use; and continuous-cutting, electric machines to 1914. Copies of the paper can be obtained from the secretary of the institute.

Examination Questions

West Virginia Mine Foremen's and Firebosses' Examination

(*Selected Questions*)

Ques.—What are the chief points to be considered in establishing and maintaining substantial and reliable ventilation in coal mines? Should the circulation of air in mines be made continuous and not during the day only?

Ans.—The ventilating equipment of a mine should be such as to provide an ample supply of air throughout the mine at all times. If the mine is particularly gaseous, it is well to provide a duplicate fan for alternate or emergency use. Careful attention should be given to the question of whether the mine should be ventilated on the exhaust or the blowing system, which will depend on the conditions in the mine. The mine should be divided into separate ventilation districts, each district being supplied with its own air split taken from the main-intake current and returned directly to the main-return airway. By the use of regulators, the air should be distributed between the several districts according to their respective needs.

In general, the air should be conducted at once to the face or inby end of each district and returned from that point along the working faces to the mouth of the district where it joins the main return. It is important to hang canvas on the entries and at the mouth of each room so as to force the air current to travel the working faces. In many cases, it will be necessary to erect temporary brattices at the faces of the rooms as these are advanced beyond the last breakthrough in order to cause the air to sweep the working face in each chamber.

The circulation in a mine should be continuous, day and night, in order to make sure that there will be no accumulation of gas in cavities or void or abandoned places, for lack of a sufficient circulation of air during the night or on idle days. It may be possible, under certain conditions, to reduce the ventilation by running the fan at a lower speed during such time; but this should only be done after a careful inspection to ascertain the effect of such reduced ventilation on the condition of every place in the mine.

Ques.—How would you reduce accidents from falls of roof and slate at working faces? How would you prevent accidents from mine cars? Is it necessary for a miner to examine his working place after firing shots; and, if so, why?

Ans.—Accidents from falls of roof and coal at the face can only be properly guarded against by a thorough and constant inspection of the working faces throughout the mine while the men are at work and by seeing that a plentiful supply of needed timbers and cap pieces is kept on hand. It is also necessary to impress on every miner the absolute need of taking every precaution for his own safety and the danger incurred by taking unnecessary risks, or delaying the setting of timber for the support of the roof, until after loading out the coal.

To prevent accidents from the movement of cars in a mine, the track and rolling stock should be kept in good condition and constantly oiled and inspected. Separate traveling ways should be provided where it is necessary for men to walk in and out of the mine. It is a good rule to permit no one to travel on the main haulage roads of the mine, except those whose duties require them to do so. Where it is necessary to use a haulage road for travel, there should be provided a sufficient clearance on at least one side of the track to enable men to pass cars in safety. If this is impracticable, refuge holes should be provided at short intervals along the roadway, and these should be whitewashed and kept free of all obstructions. On gathering hauls, drivers should work together following each other; and in no case should they be permitted to alternate, one coming out after another goes in. Doors should not be placed at the foot of a grade. Where necessary to sprag cars in descending a grade, ample room should be left at the side of the road for the safe performance of the work. Cars should never be left standing on a haulage road and when standing on a siding should be properly blocked or spragged to prevent their running out or being knocked out onto the main track. Safety blocks should be placed at the head of all inclines used as haulage roads.

After firing a shot, a miner should never return to the face until sufficient time has elapsed for the air current to carry away the smoke and gases produced by the explosion. Where there is danger of gas feeders being ignited by the flame of a shot, suitable provision should be made for the inspection of the working faces by competent persons within a short time after the shots have been fired. The neglect to do this has frequently been the cause of disastrous mine fires.

Ques.—What tools should a miner have to properly timber his place?

Ans.—A miner should always have an ax, saw and sledge for use in timbering his working place.

Ques.—What means are necessary to properly conduct the air current to the faces of the workings? What are the advantages to be obtained by dividing the air current into separate splits? Should mine fans be built reversible?

Ans.—Canvas should be hung at the mouth of each room to prevent the short-circuiting of the air at that point. As the face is advanced beyond the last breakthrough, it is often necessary to erect a line of brattice from the outby corner of the last breakthrough and extend this to a short distance from the coal face so as to conduct the air to that point.

Splitting the air current provides a larger quantity of air in circulation by the same power. The ventilation in the mine is under better control, as the quantity of air in each district is proportioned to the need therein. Better air is supplied to the working face, and the smoke and gases in each district are conveyed directly out of the mine without passing through other districts.

Mine fans should be built reversible at all gaseous mines. At such mines occasion is liable to arise when the reversing of the air will be necessary.

Coal and Coke News

Harrisburg, Penn.

To the surprise of everybody, members of the Senate clashed bitterly on Feb. 16 over the Catlin Mine Code (160) when it reached the third reading in the Senate. A motion by Senator Thompson of Beaver to have the bill placed on the postponed calendar brought a strong objection from Senator Catlin and for a few minutes the chamber was thrown into the greatest excitement since the opening of the Legislature. The Thompson motion was carried by a vote of 24 to 15.

As far as the final success of the bill goes, the coal operators' victory it is thought means nothing. The bill is on the calendar and may be called up any time by Senator Catlin for a vote. There seems to be a strong feeling that the code will eventually secure the constitutional 26 votes, for many who voted for the Thompson motion did so on the usual "senatorial courtesy" ground rather than with the scheme of delay.

The Catlin bill has smashed all records and precedence for quick action in the usually slow and deliberate Senate. The bill was only introduced recently, and this argument was used by the operators' agents in canvassing the Senate for the purpose of having the bill recommitted to the committee for a chance to give the vested interests time to consider the measure, which is radical. They failed to induce the Senate to move to recommit and had to be satisfied with the postponed calendar.

Fourteen sections of the anthracite law are modified by Senator Catlin's bill. One of the sections of the present law is amended giving the operators of mines the right of free selection of foremen. This breaks up the practice of coal companies going behind the mine foremen when an accident occurs. By this amendment coal companies will hire employees and not mine foremen, or at least the companies will be held responsible for their foremen. The Supreme Court has held on repeated occasions that the operator is not to blame for the neglect of duty of a mine foreman. Unless the bill goes through, the miners claim, no workmen's compensation act will affect the anthracite miners.

It is stated, that the United States Bureau of Mines is behind one of the amendments.

It has been agreed that a hearing on the Catlin bill be given the operators and miners on Tuesday, Mar. 2. at 2:30.

Would Compel All-Steel Cages

Representative Dawson is the author of a bill introduced in the House to eliminate wooden cages in mine shafts where men are raised and lowered. It would substitute for the wooden cages all-steel cages, with wooden plank floors and would make it a misdemeanor for mine foremen, etc., to use any other construction, in the anthracite region.

The Dawson bill is the result of the agitation for greater safety that started at the time 13 men were killed when the bottom of the mine carriage at the Diamond Shaft in Scranton suddenly and mysteriously dropped away.

Mr. Dawson is a mine operator himself, and is manager of the Clearview Coal Co. in North Scranton, and has the distinction of being the first and only superintendent to anticipate the law in this respect.

A bill to regulate the use of lamps in bituminous mines was introduced on Feb. 15, by Representative Myers. The bill makes it unlawful to use any lamp in a bituminous mine, other than a portable electric mine cap lamp of the style or type approved by the Federal Bureau of Mines. An ordinary gas testing lamp known as a safety lamp may be used as directed by the chief of the Department of Mines of Pennsylvania, only for the purpose of examining working places and for testing the gaseous conditions of air currents in the mine.

The portable electric mine cap lamp may be used only when they comply with the standard of requirements as stated in the bill.

The bill provides for a fine of $25 for failure to comply on first offense, $100 for second and a jail sentence of one year or both on third offense.

Certified Miners in the Bituminous Field

Senator Burke has introduced a bill to provide for the examination and prohibit the employment of incompetent persons as miners and providing penalties for the violation of same in bituminous mines.

The Burke bill provides that no person shall be employed as a miner in any bituminous mine in the state until he shall have first obtained a miners certificate of competency and qualification, from a "miners examining board" of some county of the state. Provided that any miner actually employed when the act becomes effective who has been employed as a miner at least two years in the mines shall be entitled to a certificate permitting him to work as a practical miner. The bill also provides that any certified miner may have one uncertified person working with him and under his direction for the purpose of learning the business of mining and for the purpose of obtaining a certificate in conformity with the provisions of the act. It also states that in cases where a miner holds a certificate and has two or more sons who do not hold certificates they shall have the right to work with him if he so desires.

Senator Croft has introduced a bill relating to the manufacture, keeping, storage and transportation of explosives and providing for any violation of the act.

Representative Powell, has introduced a bill in the House providing for an increase in pay for the several boards for the examining of candidates for Mine Inspector.

Representative Evans has introduced a bill regulating the sale of liquors, etc., making it unlawful for any saloon to be open between the hours of 11 p.m. and 8 a.m., the primary object of which is to compel saloon keepers to close while miners are on their way to work, and stop all night carousing, which is in line with the movement started by many of the anthracite operators.

Representative Kitts has introduced a bill to compel employers to publicly advertise in newspapers or by posters or otherwise if they have a strike or lockout on their hands when soliciting employees.

Representative C. J. Roney, chairman of the Ways and Means Committee, and sponsor of the anthracite coal tax, is discussing a proposition to place coal companies under the control of the Public Service Commission on the ground that they are purveyors of a utility. Just what will be done about it is not known but it is thought that a bill will be prepared and shown to the Governor.

Amendment of the act imposing a tax of 2½ per cent. ad valorem on anthracite is likely to be made by the present Legislature, and not repealed as asked for by the Ramsey bill. It is thought by amending the act, it will restore the measure to the form in which it was drawn by Attorney General Brown, who was counsel for the commission to consider and report upon a revision of the corporation and revenue laws.

The bill as drawn by Attorney General Brown was amended on its passage through the house. No amendment has as yet been suggested which will relieve the consumer of coal from the tax burdens.

That the Corporation and Revenue Commission in framing the bill realized that the burden of taxation would fall ultimately on the consumer is revealed by this clause in its report: "We (Pennsylvania) have a monopoly on anthracite coal, and it must be taken from us by those who consume it. Bituminous coal is produced in many other states, and a tax upon it would not be passed on to the consumer. The price would be regulated still by competition with other states where no such tax is laid, and would be in effect, merely an increase of the tax on land."

Mr. Ramsey declares that his sole reason for seeking to annul the tonnage tax is that the coal companies have made an asset of the tax, and are extracting from the people of the state 25 cents for every 6 cents of tax imposed.

Mr. Roney states that the study of coal prices is coordinate with the proposition which Mr. Ramsey has put before the Ways and Means Committee, and that he will look into the charters of several of the coal companies before taking any definite steps.

PENNSLYVANIA

Anthracite

Wilkes-Barre—An explosion of gas in the Prospect Colliery of the Lehigh Valley Coal Co. occurred on Feb. 17, resulting in the death of 12 persons. At last report two others were in a serious condition at the City Hospital, while one was unaccounted for.

Shamokin—Frederick Dornsife and other prospectors on Feb. 18 discovered a 12-ft. bed of anthracite near Dornsife. For several months prospecting for coal has been conducted in this region, which is primarily an agricultural center.

Scranton—Although the state and most of the large coal operators in the anthracite mining region are devoting much time and money to the education of mine workers, the Y. M. C. A. of Scranton has not stopped offering facilities to the ambitious who wish to study to advance themselves. The mine foremen's class in this institution is 12 years old and there are now 11 men in the class and 25 in the preparatory class leading up to the course.

Lansford—Two steam shovels are now in operation in the swamp between Lansford and Coaldale in removing the huge culm banks.

Bituminous

Republic—On Feb. 19, the Tower-Hill Connellsville Coke Co. landed another large contract for coke and ordered that 200 additional ovens be fired at once. There are already 130 ovens in operation and those ordered fired will increase the force of workmen more than 200 men. No. 2 plant which has more than 300 ovens will probably be fired shortly.

Butler—On account of increased orders and general stimulation in the coal trade, a number of additional trains have been placed in commission on the Bessemer & Lake Erie R.R., with prospects that additional trains will be ordered before long. Greater activity in the mills in the Pittsburgh district is making necessary an earlier than usual start in ore traffic and a number of train crews which have been idle for months have been ordered to report for duty. It is thought that by the first of March hauling of coal and ore on the Bessemer will require the services of a large number of additional crews. On Feb. 18, officials of the road stated that they are preparing for one of the biggest coal and ore carrying seasons in the history of the road.

West Brownsville—An unsuccessful attempt was recently made to fire the coal tipple of the Lilley Coal & Coke Co. a short distance from West Brownsville Junction. This is the second attempt made within four months to burn the tipple, and officials of the company are seeking the incendiary.

Star Junction—The Washington Coal & Coke Co. recently issued orders for the firing of 100 ovens at the Star Junction plant. When these are in operation, 700 ovens out of a total of 1000 will be working; 50 additional ovens are to be fired at an early date.

Connellsville—Orders were issued by the H. C. Frick Coke Co. for firing 418 additional coke ovens on Feb. 22. These ovens are at plants in Fayette and Westmoreland Counties, and make a total of 3773 since the increased production began somewhat over two weeks ago. W. J. Rainey has also placed 50 ovens in operation at the Royal Works. This makes 350 active ovens out of 375. Conditions at all plants of this company are now approaching normal.

Altoona—Ten miners were killed and 51 injured in the 10th Pennsylvania District during 1914, according to the report of Mine Inspector Joseph Williams. In the district there were 51 mines, and 4,386,738 tons of coal were produced by 7000 men and boys.

WEST VIRGINIA

Charleston—Romeo Campi and John H. Riley, firebosses at the Carlisle Mine of the New River Coal Co. were fined $50 each recently when tried before Justice Samuel Jasper on the charge of negligence in connection with the recent explosion which cost 21 lives. The firebosses' certificates and also that of foreman Pilkington who was in charge of the mine at the time, were revoked by the State Department of Mines.

Newburg—The mines of the Virginia & Maryland Coal Co. have been closed as the result of a disagreement over wages between the miners and the officials of the company. About 75 per cent. of the miners are idle as the result of this strike.

Grafton—Over 900 miners employed by the Jamison Coal Co. went on strike Feb. 18 in the Farmington-Barracksville region following a disagreement over a new wage scale.

Huntington—Representatives of the State Fish and Game Commission are prosecuting a case against four officers of the United States Coal & Oil Co. on the charge of pumping mine water into the Guyan River and thus destroying the fish. The maximum fine for a violation of this kind is $100.

Montgomery—All the Minden Mines are now in operation, the last one having resumed recently. Full time is now promised for an indefinite period.

KENTUCKY

Lothair—The Kentucky Jewel Coal Co. has increased its shipments from 800 to 1200 tons daily, and has employed a goodly number of extra men. It plans other increases by May 1.

Hazard—The Himyar Coal Co. here announces an increase in the coal tonnage from 600 to 1000 tons daily beginning Mar. 1, and the opening of an additional mine.

Madisonville—Coal business is reported as picking up and the mines at Coiltown, this county, have resumed operations with 100 miners, after a shut-down of three months. Reports from the surrounding section are to the effect that similar resumptions are in order.

Central City—Several hundred miners in the employ of the Central Coal & Iron Co. were thrown out of work when the mines of the company were closed down on Feb. 20 for an indefinite period. S. J. Gish, president of the company and of the McHenry Coal Co., said that his companies were seeking an agreement with the United Mine Workers of America whereby any differences that may arise hereafter may be submitted to arbitration.

Henderson—Local business men are very much interested in reports that the deal by which the Deep Water Coal Co. would acquire title to the greater part of the mineral land in this section of Kentucky is to be concluded in the next few weeks. It is understood that the abstracts and titles involved have been completed and proven and that H. F. Allen, president of the Deep Water Co., is now in the East where he is finishing up arrangements to finance the project. The deal would involve millions of dollars and be of much benefit to Henderson and Webster counties where most of the land lies.

Pikeville—Coal operators, the Chesapeake & Ohio R.R. and others are behind a movement looking toward the establishment of a modern hospital here. The new institution will be incorporated and will have $5000 capital. L. L. Stone, president of the Pikeville Light & Power Co., makes the announcement.

Straight Creek—The Continental Coal Corporation is to develop two new mines on Straight Creek and will remove its tipple and power plant to the new location, constructing 3000 ft. of railroad spur at a cost of $12,000 to tap the advanced work at the old mine. The company's daily output is 1000 tons and its holdings 1000 acres. F. B. Martin is president and W. L. Moss, vice-president and manager.

Whitesburg—Representative land owners, miners and lumbermen in eastern Kentucky are to assemble in Ashland, Ky., early in March to take steps looking toward conservation of the timber of this section, especially in Letcher, Knott, Perry and Pike counties, which are frequently ravaged by forest fires.

OHIO

Athens—Three of the mines of the Sunday Creek Co., located at Rendville and Jobs, have resumed operation after a long idleness. This tends to relieve the distress among the miners of that section. Word has been received in Columbus that no more donations are needed there.

Steubenville—Suit has been brought against the Blyth Coal Co., by John Blyth asking judgment for $42,000 and that a receiver be appointed for the mining property at Brilliant. This judgment was asked on a mortgage, Blyth alleging that the defendant had neglected to take any steps to preserve the property, which is being damaged by sulphur water.

St. Clairsville—The Purseglove-Maher Coal Co. has begun the shipment of machinery from the Belmont County mines to the corporation's new works in Logan County, W. Va. It is said that the firm will abandon its mines in this section because of strike troubles.

INDIANA

Petersburg—A St. Louis syndicate has leased 640 acres of coal land in the Sugar Ridge neighborhood, south of here, and, it is announced, will begin surface mining in the spring. Tests are said to have shown beds of superior coal 8 to 10 ft. thick at a depth of 28 ft. The landowners are to receive $75 an acre, the operators permitting them to remove improvements.

Sullivan—The Union mine has suspended operations, due to the depressed condition of the industry. The Rainbow mine at Caledonia closed some time ago for similar reasons.

Indianapolis—The progress of the attempted coal legislation of the Indiana Assembly now in session is as follows: The shotfirers bill, aiming to make the operators pay the cost, passed the house and is resting in the senate, with the chances agINst it. The bill for state ownership of certain mines in order to supply with coal state institutions is resting in committee, from which it may be slow of exit. The bill for codification of the mining laws of the state passed the senate and is in the house. It has its friends there. The bill to prevent strip mining has not yet been reported out of the committee to which it was referred. It may not be during the busy remaining two weeks of the session.

Brazil—The Kokomo mine, near here, which was allowed to fill with water, is being pumped out, so that it may be inspected for prospective purchasers. Owners of the mine have 1300 acres of good coal land adjoining. Plymouth No. 1 mine belonging to the Coal Bluff Mining Co. has closed down indefinitely and the electrical machinery has been removed. This puts out of employment about 300 men, most of them residents of Brazil, the center of the block coal district. The Crawford Coal Co. which recently added two new mines to its properties has scarcely had opportunity to operate them. It stands ready to put on 200 miners when the trade demands it. The Otter Creek Coal Co. has been one of the fortunates, having operated almost all season at nearly full time.

ILLINOIS

Odin—The Local Union of the Mine Workers has started a coöperative movement and equipped a grocery and supply store. It is stated that these men have succeeded in bringing about a substantial reduction in the cost of living.

Bryant—The opening of another coal mine between Bryant and Lewistown is in prospect, on land leased by John Long. Prospect drillings will begin at once.

Millstadt—The stripping operations at the High Prairie Coal Mining property near here are going on rapidly and it is figured that by July 1 this stripping proposition will have a daily output of 1500 tons.

Belleville—Operators in the Fifth and Ninth Districts of Illinois are trying to devise means whereby they can eliminate the destructive competition that has existed in the past in these fields and yet come within the law in the marketing of their coals. It is proposed to sell the output of all the mines on different roads to one producer or jobber in St. Louis on a contract basis. This would mean about 10 distributing companies but this arrangement will probably never be consummated. In the opinion of outsiders, who are impartial to the local situation, the only solution of the problem will be the bringing under one head of all the mining operations in the two districts with the allowance of a switching charge to the railroads entering East St. Louis which control their own mining properties. Destructive competition will always exist until the industrial railroad proposition is taken care of. This one feature alone prevented the formation of a syndicate, during the past summer, to take over all the mines in the Fifth and Ninth Districts.

Sparta—Serious trouble confronts the miners' organization at this point on account of miners from several of the idle mines insisting that the miners divide with them the working time at the mine of the Illinois Fuel Co. here. This mine runs three and four days a week and the regular miners insist upon working their full time. The tonnage of some of these local mines was removed to Percy and Willisville by the operating company, with the result that nearly one half of the mining population of Sparta is nearing a crisis.

Winkle—On orders supposed to have been issued by the State Board of the United Mine Workers, the mine here has been closed down for an indefinite period of time. This is one of the largest coöperative pits in the southern Illinois field and investigation developed the fact that the miners were receiving 38c. a ton and often less for mining coal off the solid where the regular scale is about 60c. to 62c. Competition against this wage was impossible by operators paying the full scale to their miners and men, it is understood, who worked in operator's mines, that could not compete against the coöperative pit, declared their intention of seceding from the union unless the coöperative mines were closed. There is much ill feeling on both sides in union circles.

MISSOURI

Rich Hill—Five miners were killed by a mine explosion at the workings at the Atlas Coal Mining Co. near here Feb. 18. These men had just entered the drift to begin work when the explosion occurred. No one else was in the mine at the time.

COLORADO

Denver—Payment of strike benefits to union miners in Colorado will shortly cease according to an announcement by John McLellan, president of District 16, United Mine Workers of America. The organization will continue to supply the necessities of life to the most needy ex-strikers, but payment will not be in the form of regular strike benefits. Strike benefits which have been paid since April 1910 have reached a total of approximately $4,000,000.

WASHINGTON

White Salmon—White Salmon and Bingham are excited over the discovery of a coal bed. C. A. Rogers while drilling a well on the property of John Tamms at Bingham struck this coal measure. Options are being taken on the property in the vicinity.

PERSONALS

F. S. Peabody was recently elected chairman of the board of the Pennsylvania Coal & Supply Co. B. E. Schrage was elected treasurer.

Neil Robinson has been appointed receiver for the La-Follette Iron Co., of La Follette, Tenn. Mr. Robinson is also receiver for the La Follette Coal, Iron & Railway Co. of the same place.

James Mitchell, of London, head of Sperling & Co., promoters of the Alabama Power Co. and a party of financiers are expected to make a tour of inspection of the company property shortly.

Louis H. Smith, who has been connected with the Spring Valley Coal Co. for a number of years, was recently made General Manager of the firm to fill a vacancy made by the death of S. M. Dalzell.

George H. Meuller, assistant sales manager of the Jeffrey Manufacturing Co., has been made manager of the New York office of the company. He became affiliated with the Chicago office of the company in 1906.

Charles Cohenour, receiver for the Maple-Gallia Coal Co., is negotiating privately for the sale of the properties of the company, consisting of two mines at Nelsonville and Clarion, Ohio. The attempt to sell the properties at auction at the court house in Columbus failed because of lack of bids. Receiver Cohenour will likely ask the court to fix a minimum price at which they can be sold at private sale.

OBITUARY

Richard Fell, aged 69, retired mine operator in Shelby and Winston counties, Alabama, died recently. He came to Birmingham from Charleston, S. C., and operated mines in this state up to a few years ago, retiring on account of health.

Peter Dawson, a well known colliery operator with a mine at Stewartsville, west of Bellaire, Ohio, recently succumbed to heart failure in the city of Wheeling, being found dead on the street by a motorman. He is survived by a wife, two sons and one daughter.

Michael J. Finnegan, for 25 years secretary of the Central Coal & Iron Co., with offices at Louisville and mines at Central City, Ky., died at his home in Louisville, on Feb. 18, after a week's illuess of pneumonia. His wife, five sons and two daughters survive him.

William S. Thiesing, of Covington, Ky., 25 years old, a traveling expert electrician for the Goodman Manufacturing Co., Chicago, was recently killed in the mine of the Woolley Coal Co., at Paxton, Ind. He had just ended a trip of inspection of the motors in the mine, recently installed by his company and was crossing the tracks in one of the entries on his way to the cage, when he was struck by a string of cars making a running switch.

CONSTRUCTION NEWS

Athens, Ohio—The laying of track by the Hocking-Sunday Creek Traction Co. from Nelsonville to Athens has progressed to a point where the city of Athens has been reached. The line will tap a rich coal field.

Whitesburg, Ky.—The South East Coal Co. as a public improvement will build several miles of roads around the new plant near Kono, Ky., in the Boone's Fork coal fields. The grade work is to start at once.

Marion, Ill.—The Illinois Central has built an extension from its Johnson City branch to the mines of the Big Muddy Fuel Co. near here, enabling that property to get it's coal into the West and Southwest.

Huntington, W. Va.—Workmen in the employ of the Lorain Coal & Dock Co. are now pushing work on the company's recently acquired field at Craneco, on Buffalo Creek. It is hoped that the work of mining will start by spring.

Herrin, Ill.—An extension of 3½ miles is now under way by the Illinois Central leading to Mine B of the Chicago-Carterville Coal Co., on the Franklin County line. At the present time the only connection with this mine is that of the Burlington.

Washington, D. C.—The appropriation of $350,000 for the Bureau of Mines Building at Pittsburgh was assured when the Senate on Feb. 20 passed the Sundry Civil Appropriation Bill. As soon as the President has signed this bill and the supervising architect of the treasury approves the plan, the work of construction will be expedited.

Paducah, Ky.—It is announced that on Mar. 1 the West Kentucky Coal Co. will begin construction of 27 coal barges for its own use at its Mechanicsburg plant. A contract let to the Langstaff-Orm Co. calls for 1,300,000 ft. of Oregon fir to be used in the barges which will be of the standard type used by the Pittsburgh Coal Co., 135 ft. in length, 26 ft. wide and 8 ft. in depth.

Edwardsville, Ill.—According to present expectations, work on the washer to be erected by the Mount Olive & Staunton Coal Co. will be begun in a few days. When completed this washer will handle coal from the Edwardsville, Staunton, and Mount Olive mines of the company. All are located on the main line or spurs of the Litchfield & Madison road, which passes close by the washer.

Pittsburgh, Penn.—The Pittsburgh, Chartiers & Youghiogheny Coal Co., which is controlled by B. S. Hammil, general manager of the Meadow Lands Coal Co. at Pittsburgh, has contracted with the Fairmont Mining Machinery Co. for a cable retarding conveyor about 600 ft. long and tipple equipment to be installed at Thornburg, Penn., on the Pittsburgh, Chartiers & Youghiogheny R.R., Thornburg being a suburb of Pittsburgh.

Steubenville, Ohio—According to an unconfirmed rumor, the Carnegie Steel Co. is contemplating the construction of a number of coke ovens at its Mingo mill. It is also rumored that the company has for a long time been seeking to cut down the heavy cost of transportation on its coke supply, and has at last conceived a plan which if carried out will reduce this expense. It is believed that the coke ovens will be erected on the company's property on the river front, south of the present works.

NEW INCORPORATIONS

Lexington, Ky.—Under amended articles of incorporation, the Kentucky Union Co. reduces its capital stock from $500,000 to $450,000. This company owns a number of coal and timber properties in the eastern portion of the state.

Dover, Del.—The Hillville Coal Mining Co. of Irwin, Penn., was recently chartered to acquire and develop coal mines. The capital stock is $50,000 and the incorporators are J. T. Davis, of Irwin, Penn., W. W. Kiehl, of Knoxville, Penn., A. W. Williams, of Fredell, Penn.

Charleston, W. Va.—The Catherine Coal Co. of Gilmer, was recently granted a charter. This firm has a capital stock of $20,000 and the incorporators are W. J. Colbern, of Burnsville, T. M. Bennett, of Glenville, J. B. Bolden, R. G. Walsh, and B. B. Truslow, of Charleston.

Terre Haute, Ind.—The Indiana Coal, Coke and Gas Co. was recently organized with a capital stock of $10,000. The purpose of the company is to operate coal mines, oil and gas wells, clay and other mineral deposits. The directors are Paul M. Bogart, Samuel D. Royse, M. E. Bradley, Leon Stern, W. J. Gillespie, John Duncan, and Ora D. Davis.

Marpleton, W. Va.—The Marpleton Coal Co. was recently chartered. It will have its chief works in Webster and Braxton Counties of W. Va., and is capitalized at $200,000. The incorporators are Theodore Switzer, of Plymouth, Penn., Joseph Bittenbender, Fred Bittenbender, Theodor Bittenbender, also of Plymouth, Penn., and L. O. Knipp, of Philadelphia.

INDUSTRIAL NEWS

Birmingham, Ala.—Fire did considerable damage recently to the infirmary of the Tennessee Coal, Iron & Railroad Co. at Ensley. The roof and second floor were burned, but the patients were removed to the first floor and were not hurt.

Kenton, Ohio—In an effort to break up a gang of coal thieves, Big Four R.R. police recently placed nine men and boys under arrest. The police claimed that thefts of many tons of coal at a time had been made, the fuel being sold.

South Bethlehem, Penn.—The second battery of 106 coke ovens, which are part of the 424 ovens being built at the Lehigh coke plant, were charged for the first time Feb. 19. The first battery of 106 ovens was put in operation about a week before.

Pittsburgh, Penn.—The Pittsburgh Coal Co. has authorized the sale of 11,530 acres of coal land to the Monongahela Consolidated Coal & Coke Co. for approximately $9,343,300. It is expected that the transfer and payment will be completed before July 1 next.

Baltimore, Md.—As the result of a wage dispute approximately 1000 miners went out on strike last week in Marion and Preston counties of West Virginia. Strikes are not of particular interest to the trade just now, because it is more of a question of disposal of product than one of getting coal to meet obligations.

Wellsville, N. Y.—The Kerr Turbine Co. announces the appointment of John S. Huey, 418 Hibernia Bank Bldg., New Orleans, La., as its district sales agent for the states of Louisiana and southern Mississippi. Mr. Huey was formerly connected with the Allis-Chalmers Co. and more recently with Woodward Wright & Co.

St. Louis, Mo.—At the engineering department of Washington University, the Smoke Abatement Committee of the Civic League is running tests on all kinds of fuel to determine which is best adapted to make St. Louis a smokeless city. All grades of bituminous, anthracite and smokeless coals as well as coke and briquettes are included in the list of tests.

Jeffersonville, Ind.—The Monongahela River Consolidated Coal and Coke Co. has reestablished its landing on this side of the Ohio River and is storing coal in barges a little above the city. The equipment had been moved to the Louisville side to let the high water scour out the harbor on this side, where the dead water due to the dam below the city tends to cause the harbor to silt up.

St. Louis, Mo.—According to the statistics compiled by the Merchants Exchange during the year 1914, there was received in St. Louis 8,051,088 tons of coal in 1914 against 8,925,579 tons in 1913 and 9,220,555 in 1912. The anthracite tonnage in 1914 was 174,694 tons. The anthracite for 1913 was 274,423 tons, showing a loss for 1914 of approximately 100,000 tons. Of the coal carrying roads, the Illinois Central led with a tonnage of 1,513,210 tons.

Toronto, Canada—The Canadian Freight Association, acting for the railways, has made application to the Canadian Board of Railway Commissioners for permission to make a general advance in freight rates—the proposed increase of coal freight charges is 10c. per ton. A similar application in November was refused. Coal companies are preparing to offer a strong opposition to the proposal, which it is understood will come before the Commission on Mar. 1.

Spokane, Wash.—Thousands of dollars are being poured from the Inland Empire into the Crows Nest district of British Columbia for coal which can be brought across the line for about 35c. a ton less than it can be hauled from Roslyn, on account of an alleged discrimination in rates, according to John Ryezek, manager of the Roslyn-Cascade Coal Co. The ultimate result it is alleged is that American miners are not getting as much money as they would if the rates were adjusted. The railroads are getting less for the haul from Canada, and the money goes to the Canadian miners.

Pittsburgh, Penn.—Coke requirements under contracts already closed are increasing somewhat. The Youngstown Sheet & Tube Co. will shortly blow in a third of its four stacks, taking a correspondingly larger tonnage on its two contracts made in December. The Allen Wood, Iron & Steel Co., of Philadelphia, is blowing in one of its two furnaces, to take coke on a contract made in November. The Buffalo Union Furnace Co. is blowing in an additional furnace, the coke being already contracted for. Nearly all the steel works are increasing their operations and shipping more coke from their own ovens.

Coal Trade Reviews

General Review

Anthracite steam sizes moderately active but domestic grades completely demoralized. Bituminous markets still crowded with coal. Interest centering on new contracts. Current business continues under heavy pressure.

Hopes of any improvement in the anthracite market during the balance of the season have been definitely abandoned by even the most optimistic, and the agencies are concentrating their efforts on cleaning up the surpluses now on hand, before the April discount goes into effect. As a result of the exceedingly light call for the prepared grades, and consequent restricted operations at the collieries, the output of steam sizes is falling somewhat behind consumption, and there is a moderate activity in this branch. On the domestic grades the situation has seldom been worse. Reductions down to the full April circular are obtainable without any difficulty, while large accumulations are reported, and dealers are buying only when accumulated requisitions amount a full car.

The opening of negotiations on new contracts is creating some activity in bituminous circles, though the current business continues as dull and flat as ever. The movement out of the Virginia terminals has been somewhat larger than usual, but there is evidence of a large accumulation, and the outlook for anything like a generally active market is negative. Shippers and agencies are canvassing aggressively for business, and purchasers are exceedingly slow in responding; prices are reasonably well maintained on the better grades, but the poor qualities are subject to heavy cuts, and especially so when it becomes necessary to free cars on demurrage.

In the Pittsburgh district the situation on new contracts is still indeterminate, though the general opinion indicates a concession on last year's figures. Some of the more optimistic agencies appear to be withdrawing from the contract market for the time being in anticipation of better conditions later in the season. On current business the market is almost at a standstill, with mining operations at about half capacity. The heavy drain of the European war upon Canada, involving expenditures already aggregating one hundred million dollars, together with the casualty lists which are now beginning to come in, have created a distinctly adverse sentiment in that direction, which is plainly observable in the fuel consumption.

Steam business in Ohio is down to an irreducible minimum, and though it is generally agreed that there must be more cold weather before the winter is over, the domestic trade continues exceedingly weak, dealers being loath to place additional orders and cancellations becoming more and more frequent. What little interest there is in the market is confined entirely to negotiations on requirements for the new coal year. Current production is at a low point, but in spite of this there is considerable demurrage coal reported in different directions.

Operations in the Middle Western field have been restricted down to about half capacity, with many mines shut down completely; in spite of this curtailment new record low prices are noted and the situation is becoming most distressing. The mild weather has completely paralyzed the domestic trade, while the West Virginia product is bringing unbelievably low prices in this market. The situation shows no improvement in any direction.

ATLANTIC SEABOARD

BOSTON

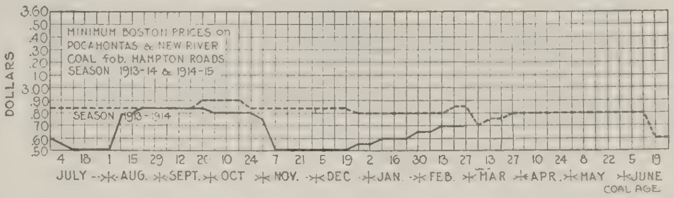
Only a few contracts under consideration. No developments in market for either Georges Creek or the Pennsylvania grades. Anthracite now waiting for spring orders.

Bituminous—There is almost no news to report on Pocahontas and New River. Receipts here are still restricted by the lack of orders, although in scattered instances there is still an impetus to contract demand due to old prices expiring Apr. 1. This latter is not general, however, although later there may be a wider development of it. Spot inquiry is very light, and accumulations continue large at the Virginia terminals. The prospect for anything like an active market for a long time to come is rather poor.

The bids to furnish 12,000 tons to the Boston Navy Yard by May 1 were opened early in the week and disclosed a new low price on a standard Pocahontas coal. The proposals ranged from $3.49@3.88 delivered alongside, the lowest bid apparently being figured at $2.85 f.o.b. Norfolk, plus a 64c. water freight, not including insurance. If prices like this continue to be named the outlook is not hopeful for remunerative figures later.

For inland delivery there is only a mild demand; $3.85@3.90, on cars, Boston, is still the basis for contract, with spot sales averaging 5@10c. higher.

All the Southern shippers are actively canvassing for business but buyers are slow responding; there is a general feeling that prices will settle down by May or June and there are only a few contracts now under consideration. The amount of transportation offering lately has helped to encourage buyers in their attitude.



Georges Creek shippers are still confining themselves to present obligations. With them there is also a dearth of spot business and there is an ample supply of coal at all the distributing and loading points. Delivered prices for the year beginning Apr. 1 have not so far been named, for these interests like others are waiting to see how the coastwise freight situation develops.

There is some current business on the Pennsylvania grades in anthracite transportation but mostly in cases where buyers are postponing a decision on yearly contracts; the demand therefore is only of the hand-to-mouth kind. Prices are being reasonably well maintained on the better Somerset and Cambria grades, but there are reports of heavy discounts in order to free cars on demurrage at the loading piers. The cheaper grades are having only a very light business.

Water Freights remain at $1, Hampton Roads to Boston, although there is an ample supply of tonnage for what trade there is. There have been rumors of rates less than $1, but so far they have not been verified. Occasional charters are still being made to South American ports, and at uniformly high rates; $960 was recently paid on a prompt steamer from Hampton Roads to Buenos Aires.

Anthracite is still extremely dull. The mines are all under heavy restrictions and in some cases orders for special lots have to wait until coal is mined. The mild weather is enabling retailers to continue on present stocks without replenishing.

Quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.50	$1.15@1.65	$1.67@1.77	
Philadelphia*	2.15@2.75	2.40@2.90	2.92@3.02	
New York*	2.45@3.05	2.70@3.20	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.70@2.75
Boston†	....	....	....	3.85@3.95
Providence†	....	....	....	3.68@3.83

* F.o.b †On cars.

NEW YORK

Bituminous continues dull and heavy with agencies concentrating their efforts on new contracts. Anthracite dealers pushing hard to clean up their stocks before the April discount becomes effective.

Bituminous—There is little change in the local situation. The weather conditions, which have so seriously affected the anthracite trade, have also had their effect on the bituminous market; in consequence of the warm weather, manufacturers have not been called upon to heat their plants.

Railroads are not hauling as much freight, and the consumption is also lessened in that direction.

While there is no new business of importance to report, there have been a number of inquiries from consumers down East, due to the high water freights on Southern fuels, but up to this time little coal has moved in that direction. Most of the larger companies are making strenuous efforts to renew contracts on last year's basis, and in a number of cases have been successful. There is a disposition on the part of some consumers, however, to withhold signatures until later in the season when they expect to be able to drive better bargains.

The demand for bunker coal continues fair, and would probably be larger if more vessels were available for the export trade offering. Stocks at Tidewater are large and practically no sales of spot coal are being made; prices, however, continue on the same basis as previously quoted, excepting in cases where it has been necessary to sacrifice coal in order to save demurrage, and we continue the market as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The trade continues abnormally dull. Warm weather has not been conducive to buying nor has it increased the consumption. Dealers throughout the country are now worrying for fear they may have to carry over stocks purchased on the high circular. The only shortages of coal are on the sizes used for manufacturing gas and steam.

Broken coal is the most active and slightly short. Egg is easier than it was a week or two ago with prices at the circular and a little below. Stove and chestnut sizes are in plentiful supply and ranging all the way from the April to the winter circular, the companies holding firm to the winter schedule. In pea coal, there is no large demand nor are prices reduced so far as can be learned. All sizes of steam coals are short of requirements but not to an extent that warrants any high price. Without colder weather there will likely be little or no change in the market situation until April.

Quotations are as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	4.85@5.35	5.30	4.80@5.30
Stove	5.35	4.85@5.35	5 30	4.80@5.30
Chestnut	5.60	5.10@5.60	5.55	5.05@5.55
Pea	3.55	3.40@3.55	3.50	3.30@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.35@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.90@2.25
Barley	1.80	1.70@1.80	1.75	1.30@1.75

BUFFALO

Slackness in Canadian markets has an adverse effect. Prices on new contracts indeterminate. Mine operations curtailed. Anthracite dull.

Bituminous—As the contract season approaches, the shippers are at a loss what to ask; they cannot see how they can do business at lower prices and yet the consumer often refuses to close unless they can secure a reduction of 10 to 15c. a ton. A larger number of shippers than usual will stay out of the contract trade for the present, though they have small hopes of getting their prices later on.

The extreme slackness of the Canadian trade still tells on Buffalo shippers. It is plain that Canada is not going to have any surplus money for coal and the manufacturers do not show any increased activity. Canada has already spent $100,000,000 on the war, which is intensified by reports beginning to come in of casualties in the field. There is some report of new cutting of prices, but that is to be expected where it takes a good salesman to maintain a fair tonnage. Reports from the mining districts are not favorable to improvement. The mines run about half time and where most of the coal has to be sold in the open market it is no easy matter to do even that.

Bituminous prices are still at the bottom, being quoted at $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with slack doing better than sizes. Allegheny Valley prices are 25c. below Pittsburgh.

Anthracite—The trade is called dull, but there is generally a good volume of business. Some of the smaller towns are cutting prices and making matters much worse than they otherwise would be, but there is no report of this in Buffalo. Western movements are not fast and it looks as if there would be more left on the Upper-Lake docks than was at first expected. A good amount of extra sizes are going into Lake vessels for shipments in the spring at the shipper's option; so far 18 cargoes have been loaded.

The winter loading has proved expensive to the insurance, as some of the bottoms were punctured in low water and two have been unloaded. It is expected that this loading will be kept up till the Lakes open. The vessel owners are likely to hold the cargoes here as long as the shippers will permit because Lake commerce is so dull.

PHILADELPHIA

No improvement in anthracite and open weather reduces demand. Dealers placing few orders and bituminous still lacks tone.

Anthracite—The season is so far advanced that dealers, in most cases, feel that if they dispose of the coal now on hand, they will have accomplished all that can be expected. Orders for new supplies have practically ceased. Dealers hesitate to take on a full car load of coal, fearing they will not be able to dispose of it, and it is only when the accumulated requisitions approximate a full car that they place an order.

The individual operators, and it is rumored some of the large companies, are shading prices to a considerable extent. Pea coal is quoted as low as $2 and egg and nut at the April circular or thereabouts. It is understood that there are large accumulations of stove size at Tidewater, but this will only be temporary; there is no size in more active demand in the early spring months than stove, and this year is likely to be no exception.

Dealers are already talking April prices, and salesmen find hard work in getting an order at the current circular. Buckwheat and rice situation is the only bright spot in the market, offerings being well taken care of, and circular prices maintained.

Tidewater prices rule about as follows:

	Circular	Individuals
Broken	$4.75	$4.50
Egg	5.00	4.80@4.90
Stove	5.00	4.90@5.00
Chestnut	5.25	4.90@5.00

Bituminous—In some quarters better call for certain brands is noted, but as a whole, the market remains without feature. Contracting still continues, with the same indifferent attitude on the part of the purchasing agents. Prices are on a parity with last week, and the inducement of a slight cut appears to offer little incentive to buying.

BALTIMORE

Operators busy on new contracts. On lower grade coals there is a possibility of reduced prices. Anthracite sales drop off.

The trade is devoting its attention almost exclusively to arranging new contracts. In some cases there is a disposition to renew at practically the same figures as obtained last year, but in others there is a strong inclination to hold out for lower prices. It seems entirely likely, from the present outlook, that contracts for some of the lower grade fuels will be made at slightly less rates than obtained last spring.

Warm weather is causing the anthracite trade to fall off. Except for isolated calls the trade has settled down to that period of waiting that always preceeds the regular contracting season and the time when the householders put in orders to take advantage of the lowest prices of the twelve months.

Export business is moving along at a brisk pace, and the prospects for late February and early March loading are excellent. The following charters were announced here this week: Italian steamer "St. Fillans," Naples; British steamer "Bedeburn," Italy; British steamer "Allanton," Sardinia; British steamer "Iddlesleigh," Italy; American schooner "Mary E. Palmer," Rio Janeiro; Norwegian steamer "Port Antonio," Guantanamo; American schooner "Stanley M. Seaman," Cienfuegos; American schooner "Lizzie M. Parsons," Cienfuegos, and American schooner "Charles T. Schull," Porto Rico.

HAMPTON ROADS

Movement for the week shows up well. Government loads both collier and barge tonnage. Demand improving somewhat and there is a brighter outlook for the February tonnage.

The dumpings from Hampton Roads piers for the week have shown up well considering existing conditions. In addition to shipments coastwise and foreign the government loadings have helped considerably to swell the week's movement, the U. S. Collier "Cyclops" alone taking 11,800 tons. Export cargoes have gone to Cristobal, Georgetown, Rio de Janeiro, Port of Spain and Havana. Of the coal exported Cristobal has taken the greatest percentage, three large cargoes having been consigned there.

The demand has improved somewhat on both the high volatile and New River and Pocahontas and there have also been some spot sales of prepared coal. With the coal already dumped and the amount of vessel tonnage due, the outlook for the month of February is perhaps somewhat better than was anticipated at the beginning.

Hampton Roads shippers were awarded a government contract for the delivery of 12,000 tons Navy Standard coal to Boston and about 1000 tons to Port Royal. The complete list of bidders and awards on this deal will be found under Contract No. 125 on p. 400.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Mary E. Palmer		Norfolk	Rio Janeiro	1377	
Mount Hope		Philadelphia	Key West	989	
Edwin R. Hunt		Philadelphia	Porto Rico	1005	
Ruth E. Merrill		Baltimore	Boston	2309	
Port Antonio	Norwegian	Baltimore	Guantanamo	717	
Rob Roy		Baltimore	Mayport	684	
A. M. Carlisle		Philadelphia	Charleston	302	
Mantanza (bark)		Philadelphia	Cadiz	929	$6.75
Wm. E. Downes		Virginia	San Juan, P.R.,	639	2.40

Note—Steamers are indicated by **bold face** type, all others being schooners.

OCEAN FREIGHTS

Further advances and coal charters are even more difficult to negotiate.

The general freight market remains firm at the high levels reached last week, except to West Indian ports, which rates have advanced slightly, and it is very difficult to interest steamship owners in export coal due to the great demand for steamers for other trades.

We chartered several boats during the past week, and would suggest your communicating directly with us if you desire any steamers for export coal.

To	Rate	To	Rate
Havana	**$3.00**	Guantanamo	**$3.75**
Cardenas or Sagua	**3.75**	Demerara	5.50@6.00
Cienfuegos	**3.50**	Bermuda	3.75@4.25
Port of Spain, Trinidad	**3.50**	Vera Cruz	**3.50**
St. Lucia	**3.50**	Tampico	**3.50**
St. Thomas	**3.50**	Rio	**9.60**
Barbados	**3.50**	Montevideo, Buenos Aires or La Plata	**9.00**
Kingston	3.50@3.75	Mediterranean	**11.40**
Curacao	**3.25**	Valparaiso	**7.20**
Santiago	**3.75**		

Note—Rates noted in **bold face** type are only approximate.
W. W. Battie & Co.'s Coal Trade Freight Report.

OHIO VALLEY

PITTSBURGH

Mild weather and decreased demand. Mining continued at about 55% capacity, and more free coal than ever, with somewhat deeper price cutting.

The weather has been remarkably mild and the retail coal trade is almost at a standstill. Variations in domestic coal demand on account of temperature are particularly wide in a natural gas district like this because in many dwellings the rooms are heated normally with gas, this being supplemented, in cold weather only, by a coal-fired furnace. There has been no further increase in demand from railroads or manufacturers, but the consumption remains heavier than in December.

Mining operations being at the rate of about 55% of capacity there is more free coal than ever and prices remain quite irregular, odd lots occasionally going at a dollar or less for mine-run. There is still no interest being taken in Lake coal and it is generally accepted that prospects for the Lake trade are poor. Operators who two months ago thought they would not be satisfied to make contracts at $1.15 for mine-run would now probably be glad to accept that figure. We quote asking prices for best grades, usually shaded for prompt, unchanged as follows: Slack, 90c.@$1; nut and slack, $1.05; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district.

TORONTO, CAN.

New tariff on bituminous now in effect. Anthracite quiet and demand easier.

The market is quiet and featureless with a lessened demand for anthracite. Last week the new tariff went into effect, increasing the duty on bituminous 7½%, the rate on anthracite remaining unchanged. So far the increase has had little effect on prices. Quotations are as follows: Retail anthracite, egg, stove and nut, $8; grate, $7.75; pea, $6.75; bituminous steam, $5.25; screenings, $4.25@4.50; domestic lump $6; cannel, $7.50; wholesale f.o.b. cars three-quarter lump $3.78; screenings, $3.

COLUMBUS

The long continued warm weather has had a distinctly adverse effect upon the domestic trade. Slowness characterizes the entire business and there is little hope for revival before the stocking-up period.

The domestic trade in Ohio has been rather weak during the past week, due to the continued high temperatures. It is believed that there will still be some cold weather before spring, but dealers are loath to increase their stocks at this time and cancellations have been frequent. In some cases where orders were not canceled, they have been held up indefinitely and will only be effective in case of a long cold snap.

Retail prices are still rather firm as dealers are not inclined to cut when there is practically no demand. Pocahontas and West Virginia splints are still favorites among the domestic consumers although there is quite a sprinkling of orders for Hocking.

Steam business is practically dead; manufacturing is quiet and requisitions for steam consumption are decreasing rather than increasing. Railroad fuel business is fairly active as they are taking a larger tonnage. In other lines there is no disposition to accumulate stocks and many of the users are content to buy in the open market so that the work of renewing steam contracts is most difficult. The demand for the small sizes is still rather strong because of the small amount of lump being produced.

Some attention is now being given to the Lake trade although it is still too early to predict as to the volume which will be required in the Northwest. A small amount of coal has already been loaded on vessels.

Production in Ohio fields is at a very low point. The Hocking Valley is estimated as producing about 30% of normal and the same figures are reported in the Jackson and Cambridge districts. In the Massillon field the output is about 40% and the Pomeroy Bend about 50% of the average.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.45	$1.50	.....
Inch and a quarter	1.30	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	0.60	0.65	0.55
Coarse slack	0.50	0.55	0.45

CLEVELAND

Spring weather keeps the market stationary. Consignment coal a drug on the market. Considerable anthracite being loaded on Lake vessels at Buffalo.

Retail trade is much below normal and dealers are neither ordering new coal nor moving stocks on hand. The weather is so warm that domestic fuel for the large consumers, such as apartment houses and blocks, is barely moving. The weather is also having its effect on the steam trade as factories use a large amount of additional fuel in cold weather to warm the shops.

The smaller sales have not resulted in a material change of prices, but have kept the brokers and operators active to avoid car service. Brokers have been asked to aid in cleaning up coal on track, but the larger agencies have had all the coal they could handle without taking on more. Consignment coal is a drug on the market; this is largely three-quarter, and the coarse coal market is much depressed. Last fall the gas well drillers were the principal consumers of surplus coarse coal, but of the 80 to 100 rigs that were at work at that time, more than 75% are now idle or working in territory where they can get gas. Slack sells at $1.65 to $1.70 with West Virginia three-quarter at $1.80 on track here.

Anthracite—Buffalo anthracite shippers are taking all the vessel tonnage available for coal. As fast as ships unload grain they are chartered, the coal shippers paying the expense of moving the vessels to the docks. The contracts also call for delivery of the coal not earlier than one month from the date navigation opens, Apr. 15, or as soon thereafter as ice moves out of the harbor. The coal shippers do not need the coal at the Upper Lakes until late in the summer and the steamship business has not shown any indication of opening early; for this reason owners will not charter until they know they can hold the boats in port until down cargoes can be procured.

The market continues quotable as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8

CINCINNATI

Some contract business closed. Prompt market dull and operators are restricting production.

With generally mild weather the feeling is growing that there is little use to look for any more winter business, and attention is now devoted to the beginning of the spring season. The movement of prepared sizes for the domestic trade is extremely slow, dealers buying only for immediate needs, and many of them having coal to carry over. A very slight improvement in the local steam market is noted, but not enough to create any marked stimulation to business.

The logical course of restricting production is being followed by some operators. There is still some little distress coal available and buyers are consequently holding off in hopes of picking up bargains. Even the smokeless producers have been affected by this, prices having broken somewhat as compared to the usually steady market for Pocahontas. Reports of possible trouble in several of the West Virginia districts this spring are expected to have a stimulating effect on the market.

LOUISVILLE

Prices ease off still further and now range at less than summer figures. Additional restrictions in working schedules.

Prices are even lower than the usual summer schedule and such contracts as are being renewed are ranging from 10 to 15c. below the previous figures. Operations are on a dwindling basis also, western Kentucky being the first to feel the slump.

Asking prices, which are purely nominal, range from $1.50 to $1.60 for block, though sales are being made as low as $1.25; lump is offered at $1.30 to $1.40; round at from $1.25 down, while nut and slack top prices are from 50 to 65c., with very little demand for the lower grades; these prices are f.o.b. mines. The operators usually keep going as long as they can realize cost of production but when that fails the mines are closed down.

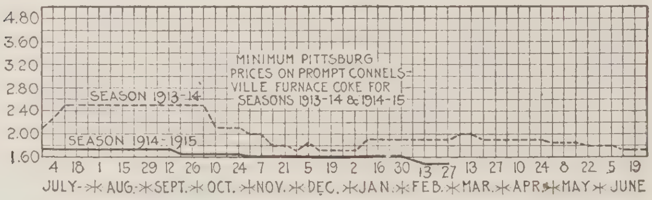
COKE

CONNELLSVILLE

Coke market stagnant and contract coke available at lower prices than under recently made contracts. Production and shipments substantially unchanged.

The coke market continues stagnant. The furnaces in operation seem to be well provided with coke and no additional furnaces are going into blast that would need to buy. Prices are not well developed as there is no inquiry but it is certain that purchases could be made for delivery to July 1 at least at a lower level than when contracts were being made two or three months ago. We quote: Prompt furnace, $1.50@1.55; contract furnace, first half, $1.65; year, $1.75; prompt foundry, $2@2.35; contract foundry, nominal, $2.20@2.30, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Feb. 13 at 250,855 tons, a decrease of 5503 tons, and shipments at 249,543 tons, an increase of 1696 tons.



Buffalo—There is still report of a better movement of coke at the oven centers and it must be that someone is making more iron that formerly. Whether this really means the beginning of a return to iron activity remains to be seen, but as a rule the shippers do not look for it yet. They say that the showing is more accidental than otherwise. There is no increase in the prices of coke, best 72-hr. Connellsville foundry selling for $4.25 and stock coke at $3.30.

Chicago—The demand for furnace and foundry coke is slow with prices irregular. There is some increased buying of domestic coke, but in general the expected improvement has not materialized. Prices are as follows: Byproduct, $4.75@4.95; Connellsville, $4.65@4.80; Wise County 72-hr. (select), $4.50@4.75; gas coke, $4.10@4.25; furnace, $4.50@4.65.

THE STEEL INDUSTRY

Steel mills maintain their increased schedules, but the outlook is still indeterminate. Railroad buying continues unsatisfactory.

February is enjoying a heavier daily percentage of specification on contracts than did January, a condition reflected in the higher rate of operations of the steel mills, and March will be materially helped by the fruition of contracts of quite some volume on which figuring has been going on this month. There are numerous negative influences which tend to chill the enthusiasm for the immediate future, but confidence in continued steady, if slight, improvement persists. Nothing has happened to shed light on how well March advances for finished steel will be held, but it is to be remembered that the bulk of the normal consumption is under contract and will not be pressing the market.

The Carnegie Steel Co. is operating at 65% of capacity, the American Sheet & Tin Plate Co. at 95% of capacity, with independent tin-plate makers ranging from 75 to nearly 100%, and the plate mills of the United States Steel Corporation at Homestead are turning out over 75% of their capacity, largely for pipe work taken a short time ago by the National Tube Co.

While railroads are still slow in deciding on bridge work and car builders have inquiry now for not more than 2400 cars, both freight and passenger, to encourage them, some rail purchases are to be noted, including 8000 tons for the Soo Line, 6000 tons for the Southern and 5000 tons for the Baltimore & Ohio. It is estimated that 15,000 tons of girder rails have been sold in the last two or three weeks. China is asking for 9000 tons of rails.—"The Iron Age."

MIDDLE WESTERN

ST. LOUIS

Quotations off to new record low levels. Many mines shut down. Conditions fail to show improvement in any direction.

The local coal market is in a most distressing condition; what was supposed to be the bottom of the market a few weeks ago was eclipsed during the past week when it came to low prices. In some instances Carterville coal got down to $1.10 for egg and $1.15 for lump, while nut went at $1, screenings at from 60c. to 70c. and mine-run was plentiful at 90c. Many mines in the field shut down rather than put their coal on the market at these figures and there was even some question as to whether coal could be marketed at these prices, in view of the large over-production coal that went on demurrage at many points.

In the Standard field 2-in. lump went down to 90c. with screenings at 50c. and 6-in. lump at $1.10 to $1.15. With very little chance of much colder weather there is little hope for any good prices on domestic sizes; this means that with any demand at all for steam coal, these prices will advance rapidly from now on. However, the business depression is not bettering in this section, despite rumors to the contrary and a lot of boosting both privately and publicly. A local ice plant contracted for Mt. Olive 2-in. screenings during the past week for 50c. a ton at the mines, this coal taking a 57½c. freight rate. The contract price on this grade of coal during the past year was from 62½c. to 65c. at the mines.

There is a small movement of anthracite coming in and a very small tonnage of smokeless.

CHICAGO

Apathy dominates the market with prices declining. Illinois and Indiana coarse coals weak. Smokeless situation depressed. Steam coals soft.

The market is decidedly weak and uncertain for all grades. This is due mainly to the continuance of warmer weather and the inability of producers to curtail their production in conformity with the demand, or perhaps the unwillingness of some shippers to restrain the forwarding of consignment coal. Retailers' stocks are more than ample for current needs, and they are not inclined to increase them; a number of them already have stocks which will be carried over until late next summer at the present rate of absorption. The contract period is now approaching, but retailers show no inclination to obligate themselves on future business because of the bitter experience during the past season.

Steam coals for manufacturing and industrial plants show no betterment. Some districts report slight improvement in the demand for screenings, but on the whole any considerable increase is not discernible. Indiana and Illinois mines are operating approximately one-half time, and curtailment of tonnage does not seem to help quotations.

Franklin and Williamson County operators issued a new circular this week reducing the price on lump, egg and No. 1 nut to $1.50. There is an immense quantity of the smaller sizes on hand unsold, with little business offered.

The domestic demand from the Indiana mines is nil, and what little coal they are producing is for steam purposes. Three important producing mines have been permanently abandoned during the past three weeks, two of which have been operating for ten years past. The steam coal prices are unchanged, but with a weakening tendency.

In the Springfield district, the domestic demand is very light, and prices for steam coals remain about the same; railroads are taking their minimum contract requirements from this section.

An increasingly wide variation in prices is noted on eastern Kentucky grades, and the idea seems to be to sell the coal at most any figure in order to dispose of it.

Hocking shipments to this territory have been curtailed and prices are improved as a result; most sales are around $1.35 to $1.50.

Splint coals are a drug on the market at prices ranging from 35c. to 50c. below the normal level.

As an indication of the shattering of prices in smokeless coals, a representative of one of the prominent shippers recently offered 50 cars of smokeless mine-run at a price of 70c. and found but few takers. There has been a decided slump in the demand for smokeless coal, and spot sales are made at almost unbelievable prices.

Prevailing quotations are as follows:

	Franklin Co.	Springfield	Sullivan	Clinton	Carterville

INDIANAPOLIS

Weather against an active coal trade. Mines on half time. Screenings not plentiful and price has stiffened. The block coal field reports a poor season.

The weather has been almost spring-like, cutting down the demand for all kinds of coal, particularly domestic lump. About the only hope for betterment is a larger demand for steam grades from factories and this is slow to materialize. Mines are on half-time. Those in the block field report that the winter season now closing has been about as poor as any in the history of the district; only a few of the mines have had a steady run and then only for short periods. The medium-size mines of the state have been the chief sufferers. There have been no changes in prices, either at the mines or retail yards, and the trade has given up hope of any advance the remainder of the season. Owing to the lessened production of other grades, slack is getting scarce and some companies announce sales at a premium.

KANSAS CITY

Retailers are buying little and market is sluggish. Mild weather continues.

A slackening of trade was felt among the retail dealers during the last week because of the mild weather, but the first sign of lower temperatures is expected to cause a rush from buyers whose supplies become depleted at this season of the year. The retail yards have enough tonnage on hand to care for present needs, which makes trade slow for the wholesale men.

PRODUCTION AND TRANSPORTATION STATISTICS

THE COAL CAR SITUATION

After having discontinued the publication of car surpluses and shortages since Nov. 1, 1914, the American Railway Association has once more resumed issuing these statements although in a somewhat abbreviated form. The initial report shows the situation on Feb. 1, covering 159 railroads as compared with 192 railroads on the date of the last statement. The gross surplus of idle coal and gondola cars on Feb. 1, of the current year, was 133,200 and the shortage 201.

IMPORTS AND EXPORTS

The following is a comparative statement of imports and exports of the United States for December, 1913-14, and for the twelve months ending December, 1912-13-14, in long tons:

	Twelve Months			December	
Imports from:	1912	1913	1914	1913	1914

FOREIGN MARKETS

ENGLAND

Markets in the most acute condition in the history of the country. Inadequate car supply the main trouble.

London, Feb. 12—There is little doubt that the coal industry as a whole has fallen into a state of chaos without precedent in its history perhaps. The conditions prevailing during the Boer War and the last great strike were by no means so bad as those of today, and it has been a blessing to the house coal trade that the winter has been of the mildest character so far. As it is, the demands for coal of all descriptions and in all directions is much in excess of the available supply. Transport difficulties are accountable for more than half the trouble, but it is impossible to get anyone connected with the railways to admit any such contention. Nevertheless, we have well authenticated cases of wagons taking a couple of months to perform the double journey from the colliery to destination and back. That this has been quite unavoidable owing to transport of troops and war stores of all descriptions does not alter the fact, and with the general public clamoring for the Government to regulate the price of coal and works of all descriptions at their wits' end to get in adequate supplies, it is only bare justice to the whole trade that the actual facts should be made known.—"The Iron & Coal Trades Review."

Feb. 12—There is a strong demand for all classes of coal for March loading. Prices show a further advance and are approximately as follows:

Best Welsh steam.......	$5.28@5.40	Best Monmouthshires....	$4.74@4.80
Best seconds...........	4.92@5.16	Seconds..............	4.56@4.68
Seconds...............	4.86@4.98	Best Cardiff smalls.....	4.08@4.20
Best dry coals..........	4.80@5.04	Cargo smalls..........	3.60@3.84

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport both net, exclusive of wharfage.

Freights—Owing to difficulty in arranging loading turns chartering is slow. Rates are approximately as follows:

Gibraltar.........	$4.80	Naples	$7.68	Las Palmas......	$5.16
Malta............	....	Venice, Ancona...	10.20	St. Vincent.......	5.52
Marseilles........	5.79	Alexandria.......	7.20	Rio Janeiro......	6.72
Algiers...........	5.40	Port Said........	7.20	Monte Video.....	5.76
Genoa...........	7.68			River Plate......	6.00

Note—These quotations are based on an exchange rate of one shilling equals 24 cents.

Coal Contracts Pending

Contracts listed in this department are authoritative in every respect except where the source of information is questionable, in which event it is noted. All contracts are listed promptly on receipt and only repeated when additional information becomes available or in the last issue previous to the day on which bids will be closed. Liberal remuneration will be paid for all legitimate notices of this kind sent in.

No. 67—Schenectady, N. Y.—The local city government will be in the market for about 4730 tons of anthracite stove and egg coal, Mar. 1 (p. 275). The contract is usually closed at about $6.50 per ton. Address Board of Contract and Supply, Franklin St., Schenectady, N. Y.

No. 75—Ottawa, Can.—The Canadian Department of Public Works has asked for tenders until Mar. 1 for supply of best quality steam coal to be delivered in quantities, and at places specified (p. 275). Address Secy. R. C. Desrochers, Department of Public Works, Ottawa, Can.

No. 77—Rochester, Ind.—The Rochester Electric Light, Heat & Power Co. at this point will be in the market for 7000 tons of Indiana mine-run coal on Mar. 1 (p. 275). The contract is to run over one year and it is usually closed at $2.10 per ton. Address Rochester Electric Light, Heat & Power Co., Rochester, Ind.

No. 78—Detroit, Mich.—The Municipal Electric Light Plant will be in the market for 1800 tons of Youghiogheny dock-run coal on Mar. 1 (p. 275). This coal laid down at Detroit usually costs $5 per ton and deliveries are to be made over the next year. Address City Clk. E. J. Bestick, Detroit, Mich.

No. 85—Baltimore, Md.—Henry Sonneborn & Co., Pratt and Paca St., Baltimore, will be in the market about Mar. 1 for 3500 to 4000 tons of standard mine-run coal (p. 318). Address Pur. Agt. A. Mainzer, Baltimore, Md.

No. 86—Hinsdale, Ill.—The Municipal Electric Light Plant, at this place, will be in the market about the first of next month for 4000 tons of screenings (p. 318). The approximate cost is 90c. per ton at the mine and Purity coal is commonly used. The contract is let on a competitive basis. Address Mgr. H. H. Bristol, Municipal Electric Light Plant, Hinsdale, Ill.

No. 87—New York, N. Y.—The bids on this contract (p. 318), which provides for furnishing and delivering anthracite and semibituminous coal, were as follows, per gross ton:

	Semibituminous			Buckwheat No. 3			Pea	
Name of Bidder	600[1]	75[2]	150[3]	2300[1]	425[2]	850[3]	1200[4]	500[5]

C. D. Norton Co..	2.98	...	...	1.88	...	...	3.74	3.74
Penn Fuel Co....	3.25	...	...	2.20	...	...	4.05	4.05

[1] Delivery at Harts Island. [2] Delivery at city prison, Manhattan. [3] Delivery at city prison, Brooklyn. [4] Delivery at penitentiary on Blackwells Island. [5] Delivery at workhouse, Blackwells Island.

Address Comr. Katherine Bement Davis, Department of Correction, Municipal Bldg., New York.

No. 92—Kennebunk, Maine—The electric light department at this place will be in the market about Mar. 1 for 375 long tons of Georges Creek coal (p. 318). The usual contracting figure is about $5 per ton. The award is made on a competitive basis. Address Supt. I. H. Wells, Electric Light Dept., Kennebunk, Maine.

No. 103—Ottawa, Ont., Can.—Bids will be received until 4 p.m., Mar. 1, for furnishing a supply of steam coal for the departmental dredges (p. 356). R. C. Desrochers is Secretary of the Department of Public Works, Ottawa. Address Dist. Engr. John Sweeney, Winnipeg, Man., Can.

No. 117—Boston, Mass.—This contract (p. 357) will be closed during March instead of April as previously announced; deliveries are to be in proportionate amounts each month at Tidewater, Hampton Roads, Va. Address R. E. Hamilton, 147 Milk St., Boston, Mass.

No. 122—St. John, N. B., Can.—Sealed tenders will be received until 4 p.m., Mar. 1, for furnishing coal for the Departmental Dredges for Nova Scotia and New Brunswick (p. 357). Address Supt. of Dredges J. K. Blenkinsop, Dept. of Public Works, St. John, N. B., Can.

No. 136—Sandusky, Ohio—Sealed bids will be received by the city government until noon, Mar. 1, for furnishing about 3000 tons of bituminous mine-run coal (p. 357). Address Dir. of Pub. Ser. John J. Molter, Sandusky, Ohio.

No. 137—Ellensburg, Wash.—Bids will be received up to 8 a.m., Mar. 1, for furnishing steam coal for Kittitas County at the following places: Heating plant at county jail, at Shoskins and Holmes Spur and at such places in Ellensburg as required (p. 357). Delivery is to be made in carload lots. Address County Audr. W. G. Damerow, Ellensburg, Wash.

No. 142—Poughkeepsie, N. Y.—Bids will be received until 10 a.m., Mar. 2, for furnishing one year's supply of anthracite coal for the Hudson River State Hospital. Specifications may be obtained on application (p. 358). Address the Purchasing Committee, Capitol Bldg., Albany, N. Y.

No. 143—Buffalo, N. Y.—Bids will be received until Mar. 3 for furnishing the annual supply of anthracite and bituminous coal for the schools and other public buildings of the city (p. 358). Deliveries are to be made in such quantities and at such times as specified. Each bid must be accompanied by a check for 10% of the total bid, and bonds for 50% will be required. Address Comr. Francis G. Ward, Dept. of Public Works, Buffalo, N. Y.

No. 150—Boston, Mass.—The United States Post Office and Sub Treasury Building here, will receive bids until Apr. 1 for furnishing coal during the fiscal year ended June 30, 1916. Bids are requested on 1800 tons of anthracite screenings and 1300 tons of bituminous mine-run coal. Deliveries are to be as required. Address, Custodian Wm. F. Murray, United States Post Office and Sub Treasury Building, Boston, Mass.

No. 151—Baltimore, Md.—The Baltimore American consumes about 800 tons of soft coal per year. The present contract expires during April. Address Mgr. J. W. Stoddard, The Baltimore American, Baltimore, Md.

No. 152—Forestdale, R. I.—The Forestdale Mfg. Co. will be in the market for approximately 4000 tons of bituminous coal about Apr. 1. Address Pur. Agt. A. Grove, Forestdale Mfg. Co., Forestdale, R. I.

No. 153—West Upton, Mass.—William Knowlton & Sons will soon place a contract for 1500 tons of bituminous coal, deliveries to commence about Apr. 1. Address Pur. Agt. George W. Knowlton, Jr., William Knowlton & Sons, West Upton, Mass.

No. 154—Stamford, Conn.—The Stamford Gas & Electric Co. will be in the market about Apr. 1, for 5000 tons of gas coal. Address Pur. Agt. R. Crawford, Stamford Gas & Electric Co., Stamford, Conn.

No. 155—Boston, Mass.—Williams & Bangs, at this place, will soon be in the market for about 15,000 tons of bituminous and anthracite coal for use in various buildings in the city. Deliveries are to be as required.. Address, Daniel F. Carew, 18 Tremont St., Boston, Mass.

No. 156—Baltimore, Md.—The Baltimore Sun consumes about 700 tons of soft mine-run coal annually, the present contract expiring in April. Address Pur. Agt. Miss M. B. Koller, The Baltimore Sun, Baltimore, Md.

No. 157—Detroit, Mich.—Sealed proposals will be received up to 2 p.m., Mar. 9, by the Board of Water Commissioners for furnishing 25,000 tons of bituminous mine-run coal. The Board reserves the right to order, before Aug. 15, 2000 additional tons at the contract price. Each bid must be accompanied by a certified check of $500. Address Secy. H. A. Gilmartin, Board of Water Commissioners, Detroit, Mich.

No. 158—Newark, N. J.—Bids will be received until Mar. 3 by the Board of Chosen Freeholders for furnishing a supply of coal from Mar. 15, 1915, to Sept. 16, 1915. Address Clk. of the Board of Chosen Freeholders, Newark, N. J.

No. 159—West Fitchburg, Mass.—The Fitchburg Paper Co. at this place will contract for 1800 tons of bituminous coal, deliveries to commence about Apr. 1. Address Pur. Agt. G. R. Wallace, Fitchburg Paper Co., West Fitchburg, Mass.

No. 160—Baltimore, Md.—The Riddlemoser Bldg., Baltimore, uses from 450 to 525 tons of soft mine-run coal per year, the present contract expiring in April. Address Pur. Agt. Bagby & Baer, Room 818 Fidelity Bldg., Baltimore, Md.

No. 161—Pawtucket, R. I.—The Greene & Daniels Mfg. Co. will be in the market for about 5000 tons of bituminous coal on Apr. 1. Address Pur. Agt. A. C. Dexter, Greene & Daniels Mfg. Co., Pawtucket, R. I.

No. 162—Shelton, Conn.—The Adams Mfg. Co., at this place, will be in the market about Apr. 1 for 3500 tons of bituminous coal. Address Pur. Agt. R. F. Adams, Adams Mfg. Co., 106 Grand St., New York, N. Y.

No. 163—Boston, Mass.—The Quincy Cold Storage & Warehouse Co., at this place, are in the market for 15,000 to 20,000 tons of bituminous mine-run coal. Deliveries are to begin Apr. 1 and to be as required, but chiefly during the summer period. It is said that the company have nearly closed their contracts already. Address, Treas. & Mgr. Geo. H. Stoddard. 133 Commercial St., Boston, Mass.

No. 164—Detroit, Mich.—Sealed proposals will be received until 2 p.m., Mar. 9, by the Board of Water Commissioners for furnishing about 700 tons of bituminous and 40 tons of anthracite coal to be delivered at the storage yard, emergency station and office of the Board of Water Commissioners. Address Secy. H. A. Gilmartin, Board of Water Commissioners, Detroit, Mich.

No. 165—Stamford, Conn.—Beck & Co. will contract for 2500 tons of bituminous coal about Apr. 7. Address Pur. Agt. George F. Leeming, 206 West 29th St., New York, N. Y.

No. 166—Concord, N. H.—The Board of Education at this place will be in the market on Apr. 1 for about 1000 tons of anthracite coal. The coal is bought from local dealers, the call for bids being advertised and the customary price is $6.80 per ton. Address Finance Com., Bd. of Education, Concord, N. H.

No. 167—Exeter, N. H.—The Exeter Mfg. Co. at this place will be in the market on Apr 1. for 3000 tons of bituminous coal, deliveries to be made over the next year. For full particulars address Pur. Agt. Chester A. Hatch, Exeter Mfg. Co., Exeter, N. H.

No. 168—Bridgeport, Conn.—The Burns & Bassick Co. will be in the market about Apr. 1 for 1100 tons of bituminous coal. Address Pur. Agt. W. F. Burns, Burns & Bassick Co., Bridgeport, Conn.

No. 169—Athol, Mass.—The Athol Gas & Electric Co. will be in the market Apr. 1 for about 1700 tons of bituminous coal. Address Pur. Agt. P. B. Webber, Athol Gas & Electric Co., Athol, Mass.

No. 170—Pontiac, Mich.—Bids will be received until 1:30 p.m., Mar. 11, for furnishing the Pontiac State Hospital with a supply of coal for one year commencing May 1, 1915. The approximate quantities are 7500 tons of free-burning three-quarter lump bituminous coal and about 500 tons of anthracite coal (250 tons grate, 250 tons stove, and 30 tons chestnut). Prices must be f.o.b. hospital, and bidders must specify location of mine. Address Steward E. H. Halsey, Pontiac State Hospital, Pontiac, Mich.

No. 171—Bridgeport, Conn.—The Salts Textile Mfg. Co. will be in the market about Apr. 1 for 10,000 tons of bituminous coal. Address Pur. Agt. C. F. Steod, Salts Textile Mfg. Co., Bridgeport, Conn.

No. 172—Boston, Mass.—The Boston & Maine R.R. Co. will soon be in the market for about 1,750,000 tons of bituminous coal. Address Pur. Agt. H. A. Fabian, Boston & Maine R.R. Co., Boston, Mass.

No. 173—Indianola, Iowa—The local city government will be in the market for 2500 tons of steam and mine-run coal on Apr. 1. The coal is bought on a competitive basis, the prices ranging from $1.70 to $2.10. Address Supt. G. G. Litzenburg, Indianola, Iowa.

No. 174—Bridgeport, Conn.—The Union Typewriter Co. contracts for about 2000 tons of bituminous coal about Apr. 1. Address Pur. Agt. F. H. Willard, Union Typewriter Co., Bridgeport, Conn.

No. 175—Medfield, Mass.—The Medfield State Asylum will be in the market for 6000 tons of bituminous coal, about Apr. 1. Address Pur. Agt. F. H. Gross, Medfield State Asylum, Medfield, Mass.

No. 176—St. Joseph, Mich.—The municipal government here will be in the market on Apr. 1 for both anthracite and bituminous coal. From 800 to 1000 tons of mine-run bituminous will be required for the water department and the customary price for this grade is $3.45 f.o.b. From 500 to 800 tons will also be required for the light department, the usual price on which is $5.85. Address the St. Joseph Water Dept. and Supt. F. A. Bunks of the Light Dept., St. Joseph, Mich.

No. 177—Gillespie, Ill.—The light and power department at this place will be in the market for 3000 tons of screenings on about Apr. 1. The customary price ranges about 75c. at the mines and the business is negotiated on a competitive basis. Address, Southern Illinois Light & Power Co., Gillespie, Illinois.

No. 178—Southbridge, Mass.—The Southbridge Printing Co. will contract about Apr. 1 for 12,000 tons of bituminous coal. Address Pur. Agt. Frank Hastley, Treasurer, Southbridge Printing Co., Southbridge, Mass.

No. 179—Boston, Mass.—Williams & Bangs will soon be in the market for about 15,000 tons of bituminous and anthracite coal, to be delivered as required. Address Daniel F. Carew, 18 Tremont St., Boston, Mass.

No. 180—Walpole, Mass.—The Walpole Rubber Co. will contract about Apr. 1 for 8000 tons of anthracite and bituminous coal. Address Pur. Agt. A. J. Baldwin, Walpole Rubber Co., Walpole, Mass.

No. 181—Bridgeport, Conn.—The Canfield Rubber Co. at this place will contract about Apr. 1 for 1800 tons of bituminous coal. Address Pur. Agt. C. F. Holcomb, Canfield Rubber Co., Bridgeport, Conn.

No. 182—Niagara Falls, N. Y.—The local school board will be in the market on Apr. 1 for about 1700 tons of semi-anthracite coal. This business is usually done on contract with the summer delivery at $4.80 per ton and winter delivery $5.30 per ton. Address the Board of Education, Portage Road, Niagara Falls, N. Y.

No. 183—Shawano, Wis.—The city water and light plant at this place will be in the market for 2000 tons of bituminous coal, contract for which will be made on Apr. 1. This business is usually done on a competitive basis, the customary price ranging around $3.90, delivered. Address Supt. Paul E. Papsaw, City Water & Light Plant, Shawano, Wis.

No. 184—Providence, R. I.—The Gorham Mfg. Co. at this place will contract about Apr. 1 for 5000 tons of bituminous coal. Address Pur. Agt. C. E. Fairbanks, Gorham Mfg. Co., Providence, R. I.

No. 185—Danbury, Conn.—E. A. Malloy & Sons, Inc., will be in the market about Apr. 1, for 3000 tons of bituminous coal. Address Pur. Agt. H. B. Malloy, E. A. Malloy & Sons, Inc., Danbury, Conn.

No. 186—Natick, Mass.—The Natick Gas Light Co.. at this place, will contract about Apr. 1 for 1700 tons of gas coal. Address Pur. Agt. R. W. Harwood, Treas., Natick Gas Light Co., Natick, Mass.

No. 187—Wolfeboro, N. H.—The local electric light department will be in the market for approximately 300 tons of Georges Creek coal on Apr. 1. The customary price is $5.60, f.o.b. station. Address Supt. H. L. Miles, Wolfeboro, N. H.

No. 188—Sturgeon Bay, Wis.—The local utility commission will be in the market for about 4000 tons of coal, contract for which will be made during either March or April. Youghiogheny three-quarter coal is ordinarily used, and the price is about $3 per ton. Address Supt. James E. Johnson, Sturgeon Bay Utility Commission, Sturgeon Bay, Wis.

No. 189—Bristol, Conn.—The Bristol & Plainsville Ry. Co. will be in the market about Apr. 1 for 8000 tons of anthracite coal. Address Pur. Agt. E. Cockings, Bristol & Plainsville Ry. Co., Bristol, Conn.

No. 190—Hyde Park, Mass.—The B. F. Sturtevant Co. will be in the market for about 7000 tons of bituminous coal, deliveries to commence about Apr. 1. Address Pur. Agt. H. P. Orrok, B. F. Sturtevant Co., Hyde Park, Mass.

No. 191—Metropolis, Ill.—The local water and light department will be in the market during March or April for about 2700 tons of 2-in. screenings. This business is usually closed at about $1.60 per ton. Address Frederic N. Cover, C. E., City of Metropolis Water & Light Dept., Metropolis, Ill.

No. 192—Rockville Center N. Y.—The local city government will be in the market for about 2500 tons of bituminous coal during the latter part of March. This business is customarily done at $3.53 per ton. Address Village Clk. George S. Utter, Rockville Center, N. Y.

No. 193—Hartford, Conn.—The Pratt & Cady Co. at this place will contract for 2700 tons of anthracite coal about Apr. 1. Address Pur. Agt. John S. Camp, Pratt & Cady Co., Hartford, Conn.

No. 194—New York, N. Y.—The Atlantic, Gulf & Pacific Co. will be in the market on Apr. 1 for approximately 30,000 tons of bituminous coal. The deliveries are to be made wherever the company may be doing work. Address Pur. Agt. H. E. Shaver, Park Row Bldg., New York, N. Y.

No. 195—Holyoke, Mass.—The Valley Paper Co., Holyoke, will be in the market about Apr. 1 for 4000 tons of bituminous coal. Address Pur. Agt. Chas. B. Prescott, Treasurer of the Valley Paper Co., Holyoke, Mass.

No. 196—St. Johnsburg, Vt.—The E. & T. Fairbanks Co. of this place will be in the market for 3000 tons of anthracite and bituminous coal on Apr. 1. Address Pur. Agt. C. H. Horton, E. & T. Fairbanks Co., St. Johnsburg, Vt.

No. 197—Newport, N. H.—Dexter Richards & Sons Co. of this place will be in the market on Apr. 1 for 2500 tons of soft coal. Deliveries to be made over the next year. Address Pur. Agt. F. W. Brown, Dexter Richards & Sons Co., Newport, N. H.

No. 198—Lawrence, Mass.—The Champion International Co., at this place, will contract about Apr. 1 for 20,000 tons of bituminous coal. Address Pur. Agt. G. F. Russell, Pres., Champion International Co., Lawrence, Mass.

No. 199—Albany, N. Y.—Sealed proposals will be received until 10 a.m., Mar. 2, for furnishing and delivering 457,419,000 lb. of coal to the various state hospitals. Address Purchasing Committee for New York State Hospitals, Room 138, Capitol, Albany, N. Y.

No. 200—Topsham, Me.—The Pejepscot Paper Co. at this place will contract for 25,000 tons of soft coal for delivery over the next year, beginning Apr. 1. Address Treas. W. W. Nearing, Topsham, Me.

No. 201—New Britain, Conn.—North & Judd Mfg. Co. at this place will be in the market for 5000 tons of bituminous coal on Apr. 1. Address Pur. Agt. F. W. Holmes, New Britain, Conn.

No. 202—Portland, Me.—The Portland Iron & Steel Co. will be in the market for about 15,000 tons of gas coal on Apr. 1. Deliveries to be made over the next year. Address Pur. Agt. R. W. Boutwill, Portland Iron & Steel Co., Portland, Me.

No. 203—Revere, Mass.—The National Fire Proofing Co., at this place, will be in the market about Apr. 1 for 7500 tons of bituminous coal. Address Pur. Agt., National Fire Proofing Co., John Hancock Bldg., Boston, Mass.

No. 204—New York, N. Y.—The Boston & Albany R.R. Co. will be in the market about Apr. 1 for 700,000 tons of bituminous coal. Address Gen. Pur. Agt. F. H. Green, Grand Central Station, New York, N. Y.

No. 205—Norristown, Penn.—The local Board of Education will be in the market during the month of April for 165 tons of anthracite, egg and stove coal each, 225 tons of pea, and 150 tons of bituminous coal. Customary prices are: Egg, $6.05; stove, $6.35; pea, $4.70; bituminous, $3.50. Bids are received through the secretary of the board. Address Sec. Harry W. Akins, 717 DeKalb St., Norristown, Penn.

No. 206—Woonsocket, R. I.—The local school board will be in the market some time during April for about 1000 tons of the best Lehigh and Scranton coal. Tenders are usually invited by letter from the local dealers, and the contract awarded to the lowest bidder. Address Chn. of Com. on Supplies, T. Guerin, care of Alsace Worsted Co., Woonsocket, R. I.

No. 207—Concord, N. H.—The United Gas Improvement Co. at this place will be in the market for 1000 tons of anthracite coal, delivery to be made over the next year beginning Apr. 1. Address Pur. Agt. J. A. Pearson, United Gas Improvement Co., Philadelphia, Penn.

No. 208—St. Peter, Minn.—The local electric-light company will be in the market Apr. 1 for between 1200 and 1400 tons of Wilmington egg coal. The customary price is about $4.65 delivered. Address Supt. F. N. Wilson, St. Peter Electric Light & Water Works, St. Peter, Minn.

No. 209—Huntingburg, Ind.—The local electric-light department will be in the market for 2065 tons of coal on Apr. 1. The customary price on this business is about $1.45, and a soft grade of coal from southern Indiana is generally used. Address F. G. Kattishburg, care of Huntingburg Electric Light Co., Huntingburg, Ind.

No. 210—Lawrence, Mass.—The Geo. C. Kunhardt Co. will be in the market about Apr. 1 for 5000 tons of bituminous coal. Address Pur. Agt. A. P. Thompson, Lawrence, Mass.

No. 211—St. Albans, Vt.—The Central Vermont Ry. Co. will be in the market for 190,000 tons of anthracite and bituminous coal on Apr. 1. Address Pur. Agt. J. B. Laurie, St. Albans, Vt.

No. 212—Hartford, Conn.—The Hartford Rubber Works will be in the market about Apr. 1, for 10,000 tons of anthracite and bituminous coal. Address Pur. Agt. C. A. Emerson, 42 Broadway, New York, N. Y.

No. 213—Great Works, Me.—The Penobscot Chemical Fibre Co. at this place will be in the market for 20,000 tons of bituminous coal on Apr. 1, delivery to be made over the next year. Address Pur. Agt. E. H. Clapp, Penobscot Chemical Fibre Co., Great Works, Me.

CONTRACTS AWARDED

No. 84—New York, N. Y.—This contract (pp. 318 and 356) has been awarded to Meyer-Denker-Sinram Co., 910 East Fifth St., New York, N. Y., at $6.75 per ton. Address Contract Clk. B. Lamb, Room 1034, Dept. of Public Charities, Municipal Bldg., New York.

No. 89—Washington, D. C.—The awards on this contract (pp. 318 and 356), which provides for furnishing and transporting coal for the Navy, under bids opened Feb. 10, were as follows:

Castner, Curran & Bullitt, for furnishing and delivering 8000 tons coal at Portsmouth, N. H., $3.65 per ton.

Crowell & Thurlow, for transporting 12,000 tons of coal from Hampton Roads to Portsmouth, N. H., at $1.05 per ton.

Pocahontas Fuel Co., for furnishing and delivering 5000 tons at Key West, Fla., $5 per ton.

Pendleton Bros. for transporting 1500 tons from Philadelphia to Key West, Fla., $2.25.

Address Paymaster-General of the Navy Samuel McGowan, Washington, D. C.

No. 90—New York, N. Y.—This contract (p. 318), which provides for furnishing about 350 gross tons of anthracite coal, has been awarded to Burns Bros., at $613. The only other bid submitted was from the Jurgen-Rathjen Co., at $626. Address Chn. of the Comn., Alrick H. Man, Board of Trustees, Hunter College, Dept. of Education, Park Ave. and 59th St., New York.

No. 91—Jackson, Ohio—This contract (p. 318), which provides for furnishing coal to the electric-light plant for a period of 11 months, has been awarded to Hollberg & Law, for No. 2 mine-run coal at $1.60 per ton, and No. 2 nut and slack coal at 90c. per ton. Address Dir. of Pub. Ser. R. L. Lamb, Jackson, Ohio.

No. 120—Everett, Mass., and Providence, R. I.—The Stone & Webster Co. has placed this contract (p. 357) with the New England Coal & Coke Co. The contract involves 79,500 tons of mine-run coal, to be delivered as follows: 18,000 tons to Everett, Mass.; 26,500 tons Providence, R. I., and 35,000 tons at Pawtucket, R. I. Address R. E. Hamilton, 147 Milk St., Boston, Mass.

No. 121—Baltimore, Md.—This contract (p. 357), of the American Tobacco Co. has been closed though terms are not available. The contract calls for 5000 tons of Orenda grade coal, instead of 3000, as stated in a previous issue. Address Pur. Agt. J. A. Powell, American Tobacco Co., Baltimore, Md.

No. 125—Washington, D. C.—Bids on this contract (p. 357), which provides for furnishing 12,000 tons of Navy Standard coal for delivery at Boston, Mass., and 1000 tons at Port Royal, S. C., were as follows:

Bidder	Boston	Port Royal
American Coal Exporting Co.	...	$4.09
Edward M. Alden Co.	$3.85	4.55
William C. Atwater	3.65	3.45*
C. G. Blake Co.	3.88	4.24
Chesapeake & Ohio Coal Agency	3.60	...
Chesapeake & Ohio Coal & Coke Co.	3.70	4.45
Castner, Curran & Bullitt	3.49*	...
Darrow Mann Co.	3.77	...
H. H. Hartwell	3.75	...
Maryland Coal & Coke Co.	3.70	3.61
Archibald McNeil & Sons Co.	3.73	4.48
Northern Coal Co.	3.78	...
New England Coal & Coke Co.	3.80	...
Pocahontas Fuel Co.	3.70	4.00
C. H. Sprague & Son	3.78	...
Smokeless Fuel Co.	...	4.11
Willett-Martin Co.	3.73	...
Willard Bros.	3.78	...
J. H. Weaver & Co.	3.45	...
West Virginia Coal Co.	3.85	4.10

*Awards: 12,000 tons for Boston to Castner, Curran & Bullitt, at $3.49; 1000 tons for Port Royal to William C. Atwater, at $3.45.

Address Paymaster-General of the Navy Samuel McGowan, Washington, D. C.

No. 141—Boston, Mass.—This contract (p. 358), which calls for 50,000 tons of New River Pocahontas mine-run coal, to be delivered at Tidewater in equal monthly proportions, has been placed with the New England Coal & Coke Co. Address R. E. Hamilton, 147 Milk St., Boston, Mass.

NOTES

The Commissioners of Foster County, North Dakota, have awarded a contract for furnishing coal for the Court House at Carrington, N. D., to Edward Callahan, local agent for the Dickinson Lignite Coal Co.

Department of the Interior—Bureau of Mines Permissible Portable Electric Mine Lamps

THOMAS A. EDISON never asks the public to pay for *his* experiments. After he announced the invention of the lightest, strongest and most durable storage battery ever conceived, he worked on it for *eight years* before he placed it on the market. For five years the battery *that received his approval* has remained practically unchanged and today operates over one-third of all the electric trucks and delivery wagons in the country, mining locomotives, industrial trucks and tractors, and is found in every service where sturdiness and reliability are essential.

After exhaustive tests as to ruggedness, cleanliness, safety, illuminating value and *maintained capacity*

The Edison Electric Safety Mine Lamp

has received Mr. Edison's personal approval.

The Edison Mine Lamp has received the highest approvals of Mining, Electrical and Safety Engineering Authorities.

The **Rathenau Gold Medal** is placed at the disposal of the American Museum of Safety by the Allgemeine Electricitaets Gesellschaft of Berlin, to be awarded annually for the best device or process in the electrical industry for safeguarding industrial life and health. The first award of the Rathenau Medal was to the Edison Electric Safety Mine Lamp.

The **Grand Prize** of the First International Exposition of Safety and Sanitation was awarded to the Edison Electric Safety Mine Lamp.

The **First Approval** for Electric Mine Lamps under the Present Government Code for safety, practicability and efficiency in general service has been awarded the Edison Electric Safety Mine Lamp by the United States Bureau of Mines. *So far it is the only electric safety mine lamp to receive this approval, under the provisions of Schedule 6A.*

⚒ ⚒ ⚒

The Edison is the first practical approved Electric Safety Mine Lamp and it is sold guaranteed that the storage battery will be capable of developing its full rated capacity at the end of four years.

Barsteel Insurance

Means Hauling Coal "All Day Every Day"—

accomplished by the following features:

Barsteel Frame—Never been broken in service.
Commutating Pole Motors—Sparkless over wide range of loads and overloads.
Bronze Bearings with oil and waste lubrication. Last for years—and do not need an expert to replace.
Only mine locomotive on market with **Vauclain removable gib**—simplest device for Journal Box.
Hexagon Brass on main Journals.
Brake rigging supported at three points—two points close to Brake Shoes. Strongest and safest on market.
MCB Brake Shoe—recognized standard by all large railroads—strongest and simplest scheme on market.
Motor's spring suspended.
Separate axle caps—Oil and waste lubrication of axle bearings.
Separate Oil Channel for filling axle bearings.
Diagonally split Motor Field Frame.
Heavy Controllers with large copper contacts.
Only locomotive with **nickel alloy grid**-resistance.
D-21 Trolley—Combines simplicity with strength.

Advertising copy should reach New York Office by Thursday of week prior to date of issue. Entered as second class matter, October 14, 1911, at the Postoffice at New York, New York, under the Act of March 3, 1879.

VOLUME 7 MARCH 6, 1915 NUMBER 10

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD—SELECTING THE RIGHT HOIST: *Page* 401
It is here suggested that mutual benefit would result from hoist buyers and builders getting closer together on the details of proposed new installations. A satisfactory product in the way of hoisting machinery can only come from such a close coöperation. COAL AGE, Vol. 7.

*ELECTRIC SHAFT HOISTS INSTALLED BY THE LEHIGH COAL & NAVIGATION CO.: *Pages* 402-406
After a careful test of a steam mine hoist, it was decided that if the manufacturer's guarantees could be realized, electric hoisting would be a paying proposition. An electric hoist built to exacting specifications was accordingly installed. This machine has proved entirely satisfactory from every standpoint. R. E. Hobart. COAL AGE, Vol. 7.

*DETERMINATION OF THE WEIGHT OF MINE LOCOMOTIVES: *Page* 407-409
The material composing the tread of the driver, as well as the grades traversed and load handled, have a considerable bearing on the necessary weight of a mine locomotive. The speed of acceleration and retardation may also be important considerations. Graham Bright. COAL AGE, Vol. 7.

*AN IMPROVED TYPE OF TWO-SPEED HOISTING AND HAULAGE ENGINE: *Page* 410
J. E. Werner. COAL AGE, Vol 7.

EXTRACTS FROM A SUPERINTENDENT'S DIARY: *Pages* 410-411

MINING FATALITIES IN WEST VIRGINIA SHOW DECREASE: *Page* 411

*A NEW HOISTING ENGINE: *Page* 411
COAL AGE, Vol. 7.

*GASOLINE MINE HAULAGE AS COMPARED WITH MULE HAULAGE: *Pages* 412-413
Comparison of costs of coal transportation with mules and with a gasoline locomotive showed a difference in favor of the mechanical haulage of 19.17c. per ton mile. The yearly saving effected is estimated as $3372, while the output was materially increased. COAL AGE, Vol. 7.

*ECONOMY IN MINE HAULAGE: *Pages* 413-414
Although horses and mules have in the past been used to a considerable extent for transporting coal underground, their place is now being taken by locomotives. Storage-battery machines in this service reduce the costs of coal moving about three-fifths. R. S. Richards. COAL AGE, Vol. 7.

THE LABOR SITUATION: *Page* 414
The northeastern Ohio situation shows no change. A strike in Fayette County, the Jamison strike in Marion County and the trouble at Ronda and Dry Branch focus attention on West Virginia. A strike in Kentucky shows signs of coming to a speedy end. COAL AGE, Vol. 7.

*ELECTRIC GATHERING LOCOMOTIVES: *Pages* 415-418
In most modern mines, the gathering locomotive has replaced the mule for haulage purposes. Aside from economy considerations, the gathering locomotive is a physical necessity if large outputs are to be handled. Old mines can be equipped with such locomotives as well as newer operations. E. C. De Wolfe. COAL AGE, Vol. 7.

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

A LOCAL "Buy It Now" crusade, which recently originated in one of our Western states, is fast developing into a big national movement.

It is a big thing for all of us, but big only in proportion to the manner in which we use it. Too long have we had the notion that trading is mere selling. We must not put all the burden on the manufacturer.

As we have said before, what makes dull times is the tendency to throttle the purchasing department at the cry of hard times. We have passed through a crisis, but this is another year and already there are indications for a big year in the U. S. A. for 1915.

This "Buy It Now" movement has already established itself firmly in seven states and the movement is only begun.

"*Associated Advertising*" tells us that the Department of Agriculture, and the Department of Commerce at Washington have been asked to further the move. Every railroad president in the country has been asked to cooperate and an appeal has been made to the governors of several states.

Fine!—But are you doing *your* part?

The readers of this paper represent an army of buyers—the *maximum* buying capacity of this big field of coal mining. And it rests with you whether or not this "Buy It Now" slogan is to be the forerunner of a big and prosperous year for all.

Read the ads—The manufacturer of coal mine equipment is making his appeal in this paper for commercial security and commercial growth.

It's your move.

COAL AGE

Vol. 7 NEW YORK, MARCH 6, 1915 No. 10

Selecting the Right Hoist

By L. F. Mitten

A resume of the progress made in the art of coal hoisting is unnecessary in view of the treatment given this subject by the various technical journals. A glimpse into the future, however, as indicated by recent developments, reveals that the trend of the times foreshadows improvements along definite lines.

* * *

So far as the engineer is concerned, it is possible to build a hoist that is faultless. Economic considerations however may demand a modification of the theorist's idealistic tendencies. In no branch of constructive industry is the statement that "engineering is the science of compromise" more thoroughly exemplified than in hoist building, and the design of a hoisting machine which gives the highest measure of success is obviously the one which results from a close coöperation between hoist buyer and hoist builder. Each is in possession of certain facts and experience which only in combination with those of the other yield a maximum of satisfactory results.

The manufacturer's experience, accumulated through much building, and his records of many installations and the results which they have achieved in operation enable him to propose preliminary plans which are certain to lean toward the correct ultimate design.

The buyer, on the other hand, knows precisely the physical condition of his property, the output which the machine must elevate or haul, the time in which this tonnage must be moved a certain distance, and the maximum amount which he can afford to pay for this transportation without exceeding a predetermined gross operating expense.

Clearly, then, a careful consideration of the necessities of *both* interested parties will reveal the weaknesses, the shortcomings and misfits in the builder's original plans, while in like manner the user's ideas and premises may possibly show need of extensive alteration and revision.

It should not be deemed sufficient for a buyer to ask competitive bids on a hoist meeting specifications formulated by himself. Nor can he hope to realize the highest value of his purchase when he arbitrarily places the business with the lowest bidder. How can the buyer know that his specifications will secure him the very best equipment, mechanically and financially, that a certain appropriation can buy?

In such a case he has only his own knowledge gleaned from a limited experience upon which to rely. He foregoes the benefit of the hard experience acquired by the managers of other properties more or less remote—experience which in all likelihood would cause a modification of his specifications and give him ultimately a better equipment. This experience, wide and comprehensive, properly filed and digested, is in possession of the hoist builder who will gladly give him its full benefit in the course of coöperative consultations.

Hoist buyers are now much less prone than formerly to wire: "Quote price No. A263Z, catalog page 71, 500 volts d.c. at once." They are beginning to realize that the only advantage in this method of buying lies in a quicker delivery—perhaps—while among its manifold disadvantages is almost certain inefficiency, which in the end means expensive hoist performance.

The more recent procedure in hoist buying is rather along the lines described in the article on page 402, where the duty required of the machine was first definitely specified and the 23 limitations or safeguards of performance agreed upon.

Coöperation between builder and buyer here begets a thoroughly satisfactory product. Utmost economy is realized under the specified conditions, a minimum of weight is secured through a judicious distribution of metal, least current or coal consumption is attained because of carefully planned proportions and ratios. The haulage cost per ton of coal is low since the machine admirably meets the demands made upon it. A maximum output is possible, since every contingency has been regarded as a certainty and provision therefor embodied in the design.

Hoist buyers and builders are getting together. It is more than possible that the future may disclose a more universal recognition of the advantages that accrue through their closer coöperation.

Electric Shaft Hoists Installed by the Lehigh Coal & Navigation Co.

By R. E. Hobart*

SYNOPSIS—After a careful test of a steam mine hoist it was decided that if the manufacturer's guarantees could be realized electric hoisting would be a paying proposition. An electric hoist built to exacting specifications was accordingly installed. This machine has proved entirely satisfactory from every standpoint.

The advantages inherent to power produced in large quantities at or adjacent to coal mines have been readily conceded. The cost of thus manufacturing energy should be extremely low, and mining regions as a rule usually use large quantities of power.

General View of Surface Plant at No. 11 Shaft

The vital question to the Lehigh Coal & Navigation Co. was whether or not it would pay to purchase power, or to continue in the time-honored custom of the generation of steam and its utilization at individual boiler plants.

This company owns and operates a number of anthracite mines throughout the Panther Creek Valley, situated in Carbon and Schuylkill Counties, Pennsylvania. The gross output for the year 1914 was 4,240,777 tons. To produce this amount of coal required the consumption of 494,481 tons of fuel in the company's various boiler houses. This large consumption of boiler fuel is the result of a poor load factor per individual boiler plant, and, due to the extent of the operations, a central boiler plant and pipe-line transmisison would be out of the question.

As the Lehigh Coal & Navigation Co. was contemplating the development of a number of new operations, and the modernizing of some of its old plants, it decided to investigate the savings claimed for the use of electricity. The steam and power consumption of the majority of the individual operations in and around the mines could be easily determined. The question, however, of the power used by large hoisting engines was one on which no reliable information could be found. The opinion of various engineers differed to such an extent that it was decided to conduct a test under actual operating conditions at one of the collieries.

In order to do this, the coal hoist at No. 10 shaft was selected for the test. This engine is a first-motion 30x60-in. piston-valve machine, of the most modern type and comparatively new. The boiler plant from which this hoist received its power is of 4800 hp. capacity, carrying 125 lb. steam pressure. The hoist is located approximately 600 ft. from the boiler plant and is fed by a 10-in. steam line protected with magnesia pipe covering.

To prepare for this test the company had two batteries of boilers, aggregating 1200 hp., cut off from the main boiler plant. Steam auxiliaries, such as feed-water pump, blowers, etc., were fed by the boilers in the test and their consumption charged against the hoist.

A barrel weighing device was installed to accurately weigh the consumption of water. The fuel, No. 3 buckwheat, was weighed in the ordinary manner for boiler trials. All the usual precautions in connection with such tests were taken, and the company feels that the results obtained were fair indications of the operating conditions at its various collieries.

---

*Master mechanic, Lehigh Coal & Navigation Co., Lansford, Penn.

Throughout the test a careful record was kept of the consumption of fuel during the working and idle time. The hoist was not operated between the hours of 5:30 p.m. and 6:30 a.m. The actual working time was 64 hr. and idle time 104 hr., for the week.

During the week 1705 trips were made from a depth of 581 ft., and the total coal consumed was 228,025 lb., of which 108,075 lb. were used in idle time, and the remainder during working hours.

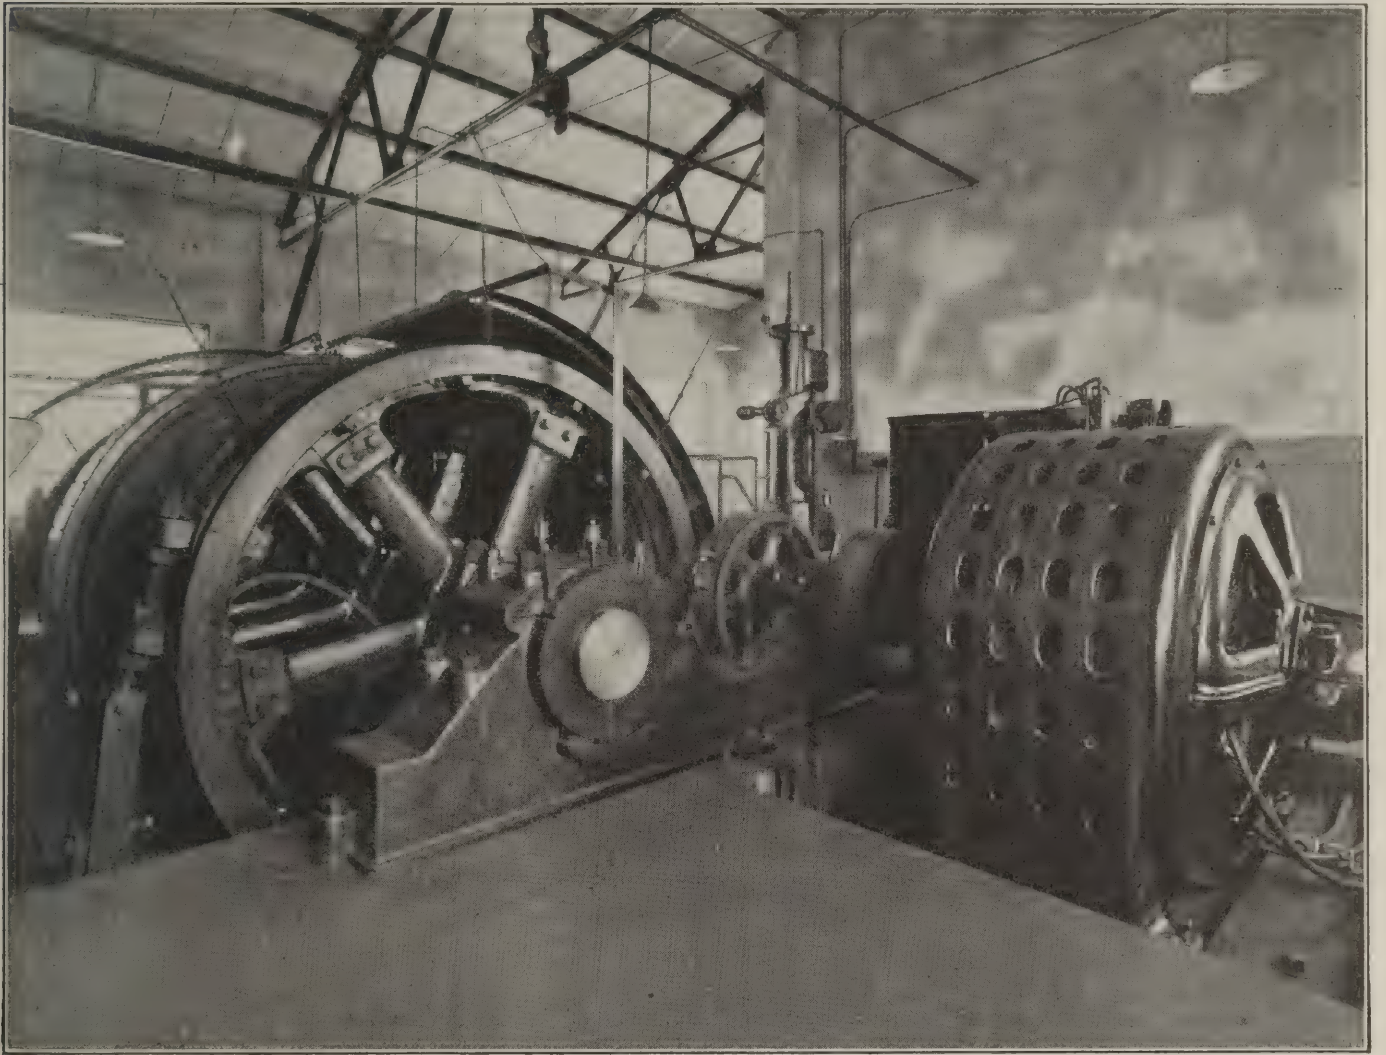
Electric Hoisting Would Pay if Guarantees Could Be Realized

From the results obtained the Lehigh Coal & Navigation Co. felt that electric power for hoisting purposes would be a paying proposition, if the guarantees made by the electrical engineers could be lived up to.

For local reasons it was decided to electrify the old No. 4 plant. This necessitated the electrification of No. 5 shaft hoist, as it was operated by steam from No. 4 boiler house, which will eventually be abandoned. The company also decided to use electricity for operating the hoist at the new No. 11 shaft.

As soon as this decision was reached and a definite cycle of operation determined, the question was turned over to the various electric companies and hoist manufacturers, and alternative proposals called for on three methods of electric hoisting; namely, the slipring induction motor with single-geared reduction, the direct-current hoist motor with synchronous motor-generator set and generator field control and, finally, the Ilgner system.

Specifications were received covering these three methods of hoisting, and after careful consideration, it was decided that the induction motor with single-geared reduction was best suited to meet the conditions.

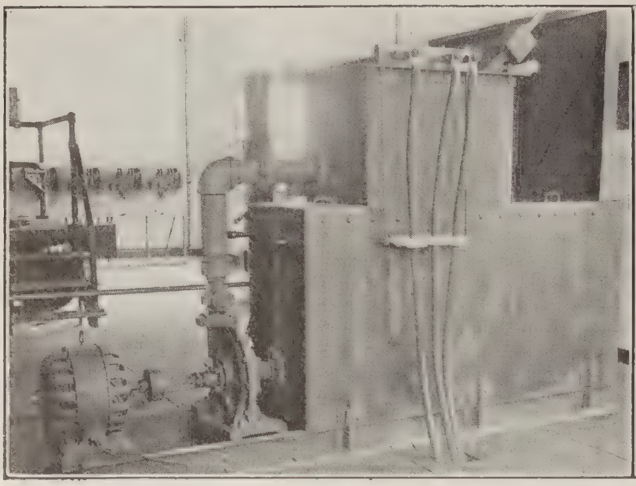


Hoisting Equipment at No. 5 Shaft

The duty to be met by this hoist is as follows: Depth of shaft, 486 ft.; weight of coal per trip, 11,500 lb.; weight of cage, 11,000 lb.; weight of empty car, 5500 lb.; diameter of rope, 1½ in.; rest between hoists, 15 sec.; cars per hour, 80.

The specifications called for a motor of sufficient size to operate the hoist unbalanced if necessary, the motor to be designed of sufficient capacity to meet this condition without injury. This required a 750-hp., 300-r.p.m. slipring induction motor of particularly rugged construction operating on a 2200-volt, three-phase, 25-cycle circuit.

The selection of the proper size of motor to meet the service was comparatively easy, but the choice of the



Liquid Rheostat at No. 11 Shaft

No. 5 Shaft Hoist House

proper control to meet all the varied conditions of hoisting was a subject that required considerable thought.

It was realized by the engineers of the Lehigh Coal & Navigation Co. that no time or money should be spared to make the control of the contemplated electric hoist as perfect as it was possible to build.

The 23 Necessary Requirements

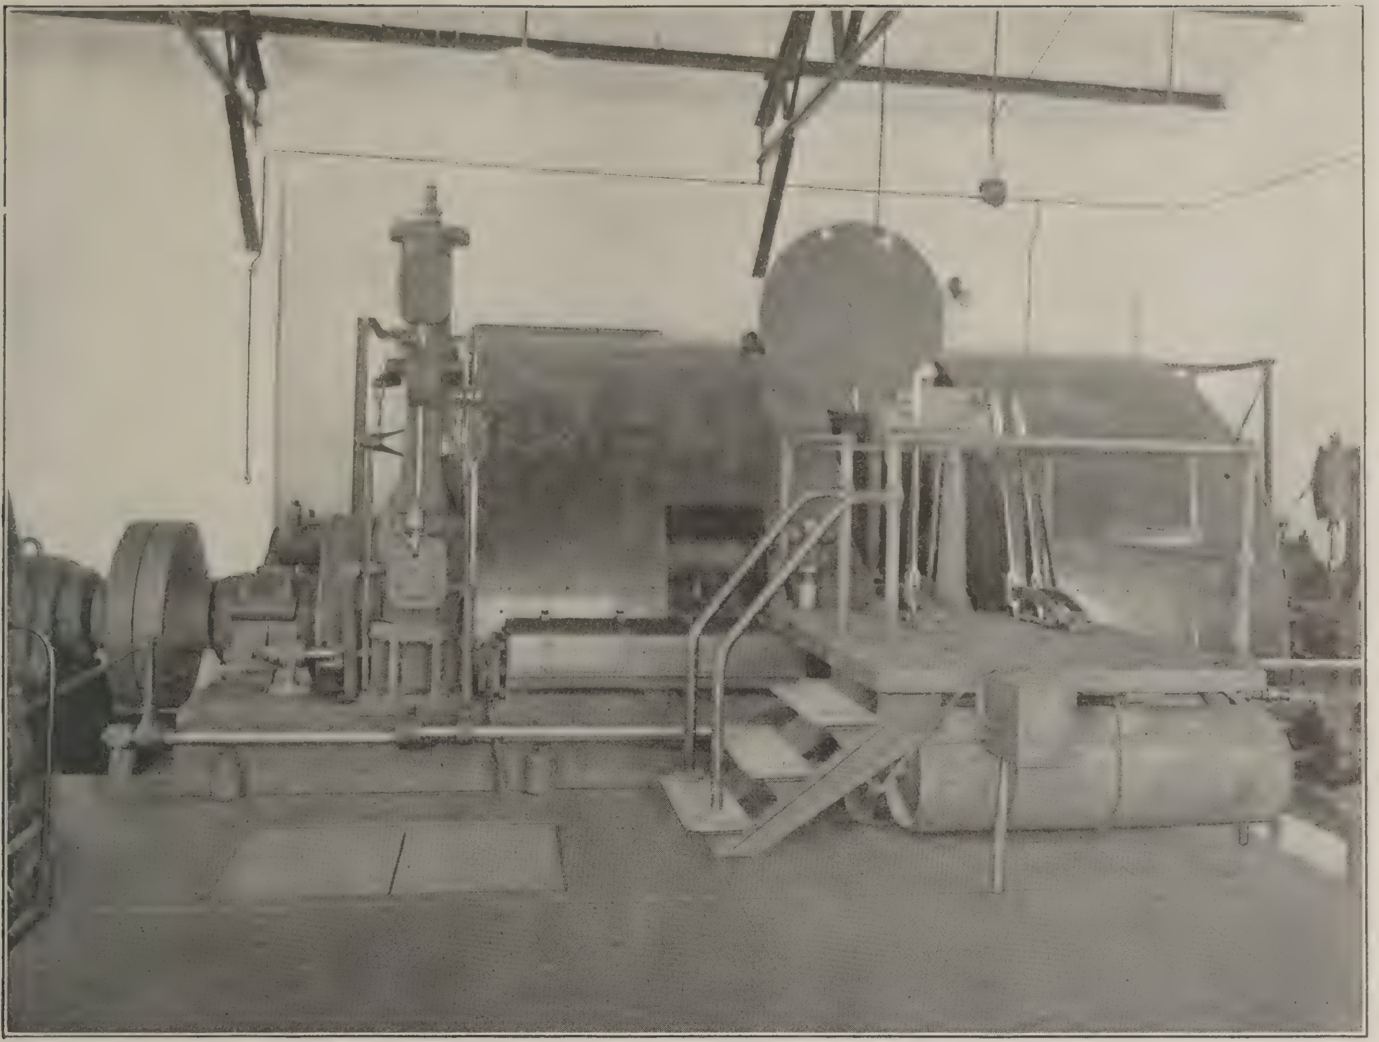
The company therefore insisted that the following 23 features should be embodied in the control of this hoist:

1. Hoist must not over-travel in either direction.
2. It must be impossible for the operator to start the hoist in wrong direction at either limit of travel.
3. Hoist must not back away due to failure of power or overload.
4. Protection must be provided against overspeed, due to any cause whatever in any position of travel.
5. Emergency brake must set and power be interrupted if operator fails to retard hoist approaching landings. This performance to be graduated and the braking effect must be adjustable to meet conditions.
6. Hoist must not start if upon return of power operator has carelessly left lever in "on" position.
7. If control circuits become grounded hoist must stop.
8. If operator fails to keep power brake in proper adjustment, emergency brakes must set and power must be interrupted, and remain so until operator has readjusted brake.
9. Hoist must be brought to rest and brake applied on loose drum before clutch can be disengaged.
10. It must be impossible to release brake on loose drum while clutch is disengaged.
11. A pawl must be provided, interlocking with clutch engine lock, this pawl to engage with loose drum before clutch can be released.
12. Inability to operate hoist unless clutch is full "in" and locked.
13. Air reservoir must not be drained due to emergency stopping of hoist.
14. There must be no delay in operation of hoist due to emergency stopping.
15. It must not be necessary for operator to call assistance in case of emergency stop, over-travel, or otherwise.
16. For operating hoist a multiplicity of levers must be avoided; two will be allowed, *i.e.,* brake and control.
17. Hoist operator must not be endangered by flying levers in emergency stopping of hoist.
18. No safety features can be dependent on the will of the operator.
19. A switch must be provided on operator's platform for an emergency stop if necessary.
20. Travel limits and speed ranges must be easily adjustable.
21. Current input to and acceleration of hoist motor must be governed automatically.
22. Hoist must start from rest gradually without excessive jerk and come to rest smoothly, and must be under control of the operator at all times.
23. The speed of the hoist must be varied by cutting the resistance into or out of the rotor circuit. The rheostat must be of the liquid type and of ample capacity to meet all operative conditions.

New Fireproof Hoist House Erected by L. C. & N. Co., Lansford, Penn.

From information the company had acquired on the use of oil-immersed contactors, it was decided that the hoist should be equipped with an air-break primary reversing switch.

In connection with the hoist proper it was necessary to provide a loose drum. It is a well known fact that numerous accidents have occurred while changing levels, due to either poor brakes or the failure of the engineer to place the cage on the landing fans while changing levels, and in view of this fact, the specifications for this hoist called for an interlocking device between the clutch engine and the pawl on the loose drum. This makes it impossible for the loose drum to move when clutch is released.



View of Hoisting Installation at L. C. & N. Co.'s No. 11 Shaft

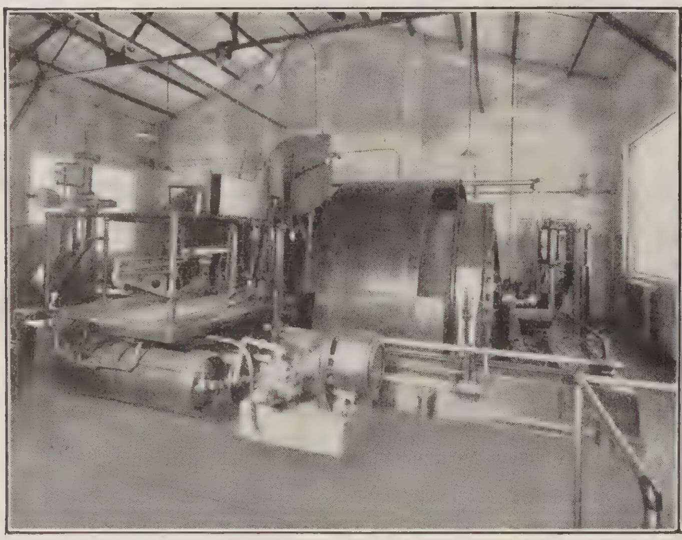
Another View of the Hoist at No. 11 Shaft

The hoist being of the single-reduction geared type, it was decided to equip it with cut-steel Wuest herringbone gears.

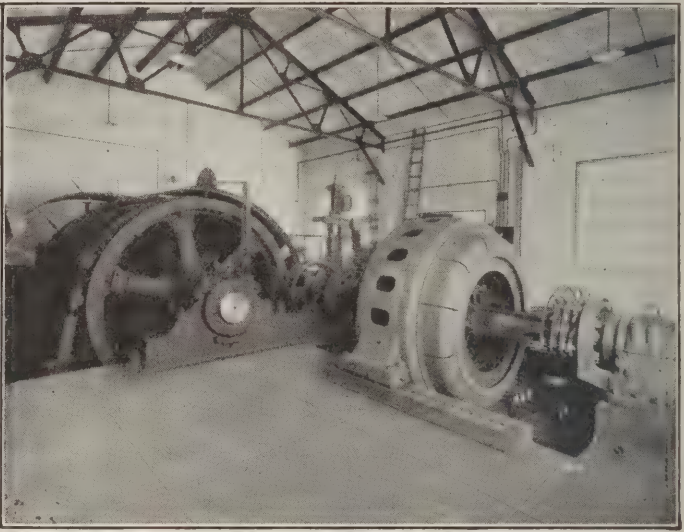
A brake on the pinion shaft was specified, this brake to work in connection with the main service brake, which was to be gravity actuated and power released. This auxiliary brake was so designed, however, that it would be impossible for it to take the full braking effort in the event of brake shoes wearing unevenly.

An auxiliary hand brake was furnished for use in case of emergency and a flexible coupling was provided of the Baehr type for connecting the motor with the pinion shaft.

Under these specifications the contract was awarded to the Vulcan Iron Works, Wilkes-Barre, Penn., and the General Electric Co., the Vulcan Iron Works furnishing the hoist proper with special control features, and the General Electric Co. the electrical equipment.



No. 5 Shaft Hoist



No. 11 Shaft Hoist

This hoist was delivered and placed in operation on Nov. 9, 1914.

The Change of Hoists Was Made in Two Days

It might be interesting to note that the old steam hoist which had been used for this operation was situated between the new electric hoist and the shaft. On Saturday afternoon, Nov. 7, 1914, on the completion of the day's work, it was decided to change from the steam to the electric hoist. To do this it was necessary to completely dismantle the 28x60-in. hoisting engine and remove not only this machine from its foundation, but the house also, as it was directly in line with the ropes to the new hoist. This was accomplished and the new hoist placed in service at 7 o'clock Monday morning, Nov. 9, 1914.

Due to the inexperience of the operators in handling the new equipment, the output on Monday was slightly curtailed, but since that time the hoist has fulfilled all expectations, and up to the present has operated without any delay.

The control features as outlined in the specifications to the builders have been met in every particular. As it has been the practice of the company to keep an actual account of coal and rock hoisted, but not the miscellaneous trips, such as inspections, men, timber, etc., the number of these miscellaneous trips can only be estimated; however, these extra trips average about 75 per day, which for the 23 days this hoist worked in November, 1914, would be 1725 trips. The number of cars of coal and rock hoisted, which were accurately counted, was 7704, making a total number of 9429 trips. The total input to the hoist was 37,500 kw.-hr., which would make an average per trip for the month of November, 1914, of 3.9 kw.-hr.

This result is most gratifying to the company when it is considered that to operate a hoisting engine for this duty would necessitate a boiler capacity of approximately 800 hp. This boiler would require at least three firemen and three ashmen every 24 hr., and under operating conditions for this region, the labor cost for firemen would be $167.76, and for ashmen, $135, making a total of $302.76 per month. This figure of course does not include fuel, boiler maintenance and repairs, nor depreciation on the boiler plant.

In addition to this installation a duplicate hoist was ordered for No. 11 shaft, the specifications being identical with the No. 5 hoist. This hoist with control features was built by the Vulcan Iron Works, and the electric equipment was furnished by the Westinghouse Electric & Manufacturing Co. The hoist has been installed and tested and will be put in service shortly.

⁂

Anthracite Output Small

February was a second successive month of low anthracite production on account of the continued high temperature, which was about 6 deg. above the normal daily average for the month. As February was also a warm month of low output last year, it is probable that the amount of coal mined last month was approximately equal to that of February a year ago. The Bureau of Anthracite Coal Statistics reported shipments of 4,121,451 tons in February, 1914.

A period of heavy water has added to the expense of operating the mines, and as the warm weather has decreased the consumption of anthracite, the hard-coal industry suffers both ways. The quantity of water that must be pumped and hoisted out of the anthracite mines of Pennsylvania has increased nearly 10 per cent. in the last decade.

Determination of the Weight of Mine Locomotives

By Graham Bright*

SYNOPSIS—The material composing the tread of the driver as well as the grades traversed and load handled have a considerable bearing on the necessary weight of a mine locomotive. The speed of acceleration and retardation may also be important considerations.

The weight of a mine locomotive is determined by a somewhat different set of conditions than its equipment, and the object of this article is to present some simple rules and formulæ so that a person with a fair knowledge of mining conditions can readily determine the proper locomotive to use to meet a certain set of circumstances.

The determination of the weight of a mine locomotive is a comparatively simple matter, and depends upon the loads to be handled, the frictional resistance of the cars, the length, value and direction of the grades, the rate of acceleration, the kind of wheels used, the size of the rails, the wheel base of the locomotive, and the height of the drawbar.

Where possible an actual test should be made in order to determine the average frictional resistance of the cars. This test can be made by pulling a car at a constant speed on a level track or on a track of a known grade and measuring the pull by means of a spring balance. Another method which will give the approximate friction is to find a grade down which a car will coast slowly at a constant speed without tending to increase or decrease its velocity. If this grade is say 1 per cent. then the frictional resistance of the car would be 1 per cent. of 2000 or 20 lb. per ton.

When the frictional resistance of the cars is not given it should be assumed at 30 lb. per ton unless they are newly equipped with roller bearings of an approved make. Roller bearings when installed and looked after properly, will no doubt give frictional resistance ranging from 15 to 20 lb. per ton. The writer, however, tested a number of roller bearings about three years ago which had been neglected and not properly lubricated. In this case the average resistance of several cars was 36 lb. per ton.

Friction Greater When Pushing Than When Pulling

On account of the short wheel base of a mine car the friction may be considerably higher when pushed than when pulled. When a string of cars are pushed they are liable to wobble more or less, and considerable binding of the flanges against the rails may take place. When the cars are pulled they are stretched out straight and but little wobbling will take place. The frictional resistance of new cars will largely depend upon the type of bearing, while for the old cars it will be decidedly influenced by the manner in which the bearings are kept up.

The locomotive resistances will range from 12 to 20 lb. per ton. It is safe to take 15 lb. as an average since the friction of the locomotive is such a small percentage of the total tractive effort, and a change of several pounds in either direction will not affect the weight of the locomotive appreciably, and the effect on the capacity of the motors will be negligible.

The effect of the frictional resistance of the load will vary with the length and severity of the grades. If the track is practically level throughout, then a small change in the frictional resistance may have considerable effect on both weight and equipment. If, however, the grades are long and severe the effect will be small.

When a locomotive is operating at a constant speed on a straight, level track, the drawbar pull available for hauling a trailing load (provided there is sufficient motive power) is limited only by the adhesion that can be obtained between the driving wheels and the rails. When starting, the drawbar pull available is reduced, depending upon the rate of acceleration. As this rate is seldom more than 0.2 to 0.25 mi. per hour per second, the drawbar pull will be reduced from 19 to 24 lb. for each ton weight of locomotive.

If there are no grades the weight of the locomotive will be affected considerably by the rate of acceleration. With heavy grades, however, the acceleration will have little effect since the rate can be kept low if it becomes necessary to start on the heavy grade. Accordingly with the low rate of acceleration common to mine service this factor can be considered negligible as regards the weight of the locomotive, in view of the fact that a greater percentage of adhesion can be allowed for starting by the use of sand.

Drawbar Pull with Cast-Iron and Steel Wheels

It has been found in practice that with cast-iron wheels a running drawbar pull equivalent to an adhesion of 20 per cent. of the weight on the drivers can be obtained with clean dry rails on level track, without the use of sand. A steel-tired or rolled-steel wheel seems to obtain a better grip on the rails, and a drawbar pull equivalent to an adhesion of 25 per cent. can be obtained under the same conditions. When starting heavy trips and when on steep grades it is permissible to use sand, in which case a drawbar pull equivalent to 25 to 30 per cent. for cast-iron wheels and 30 to 33⅓ per cent. for steel wheels can be expected.

Where grades are short the higher rates of adhesion may be used, but for long grades it is not the best practice. The writer has obtained by dynamometer tests adhesion values as high as 40 to 45 per cent. by the use of sand. The average of the tests was, however, much lower so that it is not good practice to count on such high values. These high percentages require the liberal use of sand on both rails, a practice which should not be encouraged as the sand increases the frictional resistance of the locomotive and cars, and tends to work into the bearings and gears.

Where no grades exist the weight of the locomotive should therefore be five times the drawbar pull for cast-iron wheels and four times for steel wheels, unless the

---

*Engineer, Westinghouse Electric & Mfg. Co., East Pittsburgh, Penn.

rate of acceleration is such that additional weight is required. When, however, a locomotive with a trailing load is ascending a grade the drawbar pull is necessarily greater than that required to overcome the friction of the trailing load as the weight of the load has to be lifted up the grade. For every one per cent. grade 20 lb. per ton should be added to the drawbar pull required on straight level track since 20 is one per cent. of 2000 lb.

The effect of the grade on the locomotive as well as on the load must be considered. The heavier the grade the less will be the drawbar pull of a locomotive. This becomes evident when an abnormal grade is considered on which a locomotive will be barely able to propel itself, and if any trailing load is added the wheels will slip. The greater tendency for the wheels to slip on a grade is due to the increased tractive effort necessary to propel the locomotive itself and the weight transfer due to grade.

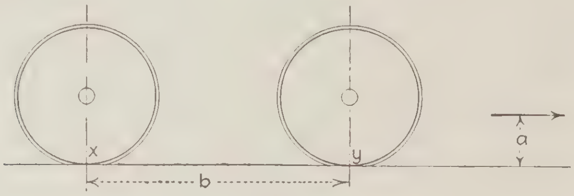


FIG.I.

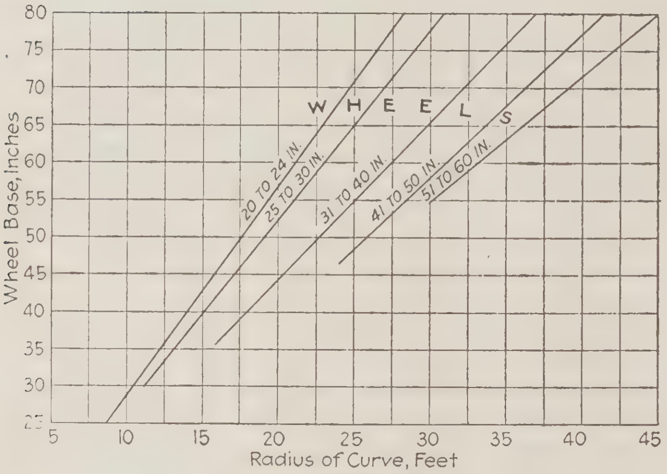

FIG. 2.

FIG. 1. ILLUSTRATES HEIGHT OF DRAWBAR AND WHEEL BASE. FIG. 2. SHOWS RELATION BETWEEN WHEEL BASE AND RADIUS OF CURVATURE

The weight transfer due to grade will depend on the wheel base and height of the center of gravity. With a short wheel base and a high center of gravity the weight transfer will be considerable. The modern mine locomotive is, however, constructed with a low center of gravity and a fairly long wheel base so that with the ordinary grades encountered the weight transfer is not serious.

The weight transfer due to height of drawbar will also affect the drawbar pull if the wheel base is short and the drawbar high. In Fig. 1 a represents the height of drawbar and b the wheel base. A horizontal force at the drawbar will act as on a bell crank one of whose arms is a and the other b. If the horizontal force represented by the drawbar pull is in the direction of the arrow, an upward force will be exerted at x and a downward force at y. If the drawbar pull is represented by D then the moment about y will be Da. This moment divided by b will give the lifting force at x. The adhesion of the wheel x will of course be lessened by the lifting force.

Assume a locomotive weighing 12 tons with a wheel base of 5 ft. and the height of drawbar 10 in. At 25 per cent. adhesion Da will be $6000 \times \frac{10}{12} = 5000$ ft.lb. The upward pull at x will be $5000 \div 5 = 1000$ lb. The normal weight at x is 12,000 lb. therefore the weight when the drawbar pull is 6000 lb. will be 11,000 lb. so that the adhesion will be ${}^{3000}/_{11000} = 27.2$ per cent. It is thus to be seen that with the ordinary height of drawbar and wheel base the drawbar pull is not seriously affected. In metal mining a much higher drawbar is sometimes required so that the wheel base must be lengthened to lessen the tilting effect.

By tieing the axles together by means of side rods, chains or gears the effect of weight transfer due to grade and height of drawbar can be eliminated, but these devices have not proven successful from an operating standpoint.

HOW TO DETERMINE THE WEIGHT OF A LOCOMOTIVE

Since the weight of the locomotive must be known before the amount necessary to add to the tractive effort for acceleration and grade can be figured, it is best to use a simple formula to determine the weight of the locomotive:

$$W = \frac{5 \times FA}{2000} = \frac{FA}{400}$$

for cast-iron wheels on a straight level track.

$$W = \frac{4 \times FA}{2000} = \frac{FA}{500}$$

for steel wheels on a straight level track.

$$FA + 20 \times G \times A + 20 \times G \times W = 400\ W$$

for cast-iron wheels on a grade.

$FA + 20 \times G \times A + 20 \times G \times W = 500\ W$ *for steel wheels on a grade.*

W = Weight of locomotive in tons.
A = Weight of trailing load in tons.
G = Grade in per cent.
F = Frictional resistance of trailing loads in pounds per ton.

In the above equations the term FA is the drawbar pull on straight level track; $20 \times G \times A$ is the added drawbar pull of the trailing load due to grade; $20 \times G \times W$ is the added tractive effort of the locomotive due to grade and the drawbar pull of the locomotive is lessened by this amount when compared with level track; $400\ W$ and $500\ W$ represent 20 per cent. and 25 per cent. adhesion for cast-iron and steel wheels.

The application of these equations can be better understood by considering an actual example. Assume a trip of 30 cars weighing 4 tons each including the load. The trailing load will therefore be 120 tons. Assume the frictional resistance of the cars to be 30 lb. per ton. Then on a straight level track:

$$W = \frac{30\ A}{400} = \frac{3600}{400} = 9 \textit{ tons for cast iron wheels}$$

$$W = \frac{30\ A}{500} = \frac{3600}{500} = 7.2 \textit{ tons for steel wheels}$$

On a one per cent. grade the weight will be:

$$30 \times 120 + 20 \times 1 \times 120 + 20 \times 1 \times W = 400\ W$$

or $W = 18.4$ *tons for cast-iron wheels.*

$30 \times 120 + 20 \times 1 \times 120 + 20 \times 1 \times W = 500\ W$
or $W = 14.6$ *tons for steel wheels.*

On a 3 per cent grade the weight will be:

$30 \times 120 + 20 \times 3 \times 120 + 20 \times 3 \times W = 400\ W$
or $W = 31.7$ *for cast-iron wheels.*

$30 \times 120 + 20 \times 3 \times 120 + 20 \times 3 \times W = 500\ W$
or $W = 24.5$ *for steel wheels.*

The above figures show a decided advantage of steel wheels over cast iron, and is one of the reasons why they are becoming more popular. Steel wheels cost more than cast iron and should have a little more clearance allowed to take care of the wear. The extra cost is, however, more than compensated by the added adhesion available. Steel-tired wheels may be trued up about two times before it becomes necessary to replace the tires.

The above figures also show that grades may become the principal feature in determining the weight of the locomotive. For this reason the length and percentage of each grade should be determined and also the length of the cars. Mine cars will range from 7 to 10 ft. long so that a trip of 70 to 80 cars will range from 500 to 800 ft. in length. In many instances severe grades are only 200 to 300 ft. long, in which case only a portion of the load may be on the grade at one time, consequently a much lighter locomotive could be used than if the steep grades were as long or longer than the trip.

In some cases the operating conditions are such that loads are handled down the grade, while the cars are always empty on the return up grade. This often means that safe braking conditions require a heavier weight of locomotive than is necessary to ascend the grade with the empty cars. If the grades are short and without sharp curves at the base it is not so important to figure closely. However, when the grades are long and severe or have sharp curves at their base, the weight of locomotive should be figured in a manner similar to that in the above formula, except that the formula will be modified to subtract the frictional resistance of the load, since it assists the braking. The formula will then be:

$20 \times G \times A + 20 \times G \times W - FA = 400\ W$ *for cast-iron wheels.*

$20 \times G \times A + 20 \times G \times W - FA = 500\ W$ *for steel wheels.*

In case the grade, curve and track conditions are very bad, and the question of safe handling down the grade is paramount then the adhesion factors of 20 per cent. for cast-iron wheels and 25 per cent. for steel wheels should be decreased to suit the particular case. Fairly safe figures to use are 15 per cent. for cast-iron and 18 to 20 per cent. for steel wheels.

SHORT RUNS REQUIRE A HEAVIER LOCOMOTIVE

Occasionally a locomotive is required for service which consists of short runs with quick starts. In this service, the weight of the locomotive will have to be increased.

The unit of acceleration is generally taken at an increase in speed of one mile per hour for each second of time; i.e., if the rate of acceleration is 0.5 mile per hour per second, the increase in speed at the end of ten seconds will be 5 miles per hour. To accelerate a ton of dead weight at the rate of one mile per hour per second, a force of 91.3 lb. above the frictional resistance must be applied.

This figure is obtained as follows: The force of gravity accelerates a given weight at the rate of 32.2 ft. per second per second. A rate of one mile per hour per second, is equivalent to 1.46 ft. per second per second. It will therefore require a force of $1.46 \div 32.2$ times the weight of a body to produce an acceleration of one mile per hour per second, or $1.46 \div 32.2 \times 2000 = 91.3$ lb. per ton.

Since a locomotive has rotative as well as translative inertia the value 91.3 will be increased by an amount depending upon the speed and radius of gyration of the rotating parts. A safe figure to use for a mine locomotive and trip of cars would be about 95 lb. per ton. In mine and industrial work where the speeds are from 6 to 8 miles per hour, the rate of acceleration is, as a rule, taken at from 0.1 to 0.2 miles per hour per second.

If high rates of acceleration and retardation are to be used the weight formula will be as follows:

$FA + 95\ B\ (A + W) = 600\ W$ *for cast-iron wheels on level track.*

$FA + 20\ G\ (A + W) \times 95\ B\ (A + W) = 600\ W$ *accelerating up a grade.*

Bringing trip to a stop on a down grade,

$FA + 20\ G\ (A + W) + 95\ B\ (A + W) = 400\ W.$

Here B is the rate of retardation in miles per hour per second.

For steel-tired wheels, 666 W can be used on level and up grades, while 500 W should be used on down grades. The values 400 W, 500 W, etc., should be selected according to the service conditions.

The resistance of curves can be neglected, as a rule, unless they are long or have a short radius. Ordinarily only a small portion of the train will be on the curve at one time so that the drawbar pull to be added should be calculated on the basis of the number of cars that can be placed on the curve simultaneously. The number of pounds per ton to be added for curves will average 0.5 lb. per ton per degree (about 0.3, however, for short curves with the gage spread). The value of a curve in degrees can be obtained by dividing 5730 by the radius of the curve in feet.

Care should be taken that the wheel base is not too great for the curve of the track. Fig. 2 shows the relation between wheel base and radius of curvature and from this curve one can readily determine the minimum curve that a locomotive with a given wheel base can safely negotiate.

Sometimes the weight of the locomotive figures out much too heavy for the weight of rails used in the proposition under consideration. If it is impractical to change the rails, the alternative is to reduce the number of cars per trip, so that the weight of the locomotive can be reduced. A larger number of locomotives of the smaller type will then be required, but the cost of operation may be reduced by coupling them in tandem so that only one operator is required for two machines. In this way full trips can be handled.

The following table gives safe practice regarding the proper weight of rail which should be used for various weights of locomotives:

Locomotive Weight on Two Pairs of Wheels, Tons	Weight of Rail, Lb. per Yard
4 to 6	16
6 to 8	20
8 to 10	25
10 to 13	30
13 to 15	40
15 to 20	50

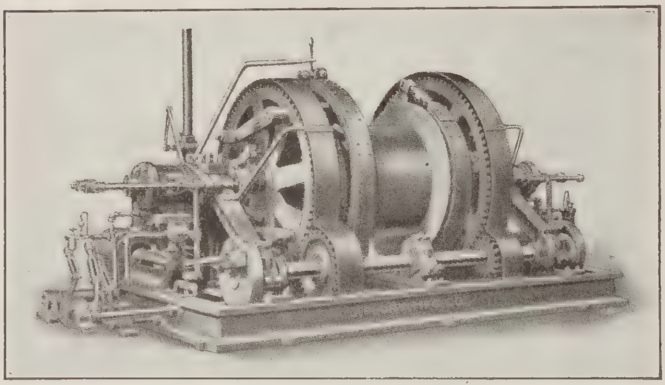
An Improved Type of Two-Speed Hoisting and Haulage Engine

By J. E. Werner*

During the many years that hoisting and haulage engines have been in use, manufacturers have made many kinds of machines to meet the various requirements. These hoists may be classified according to the relation of the drum location to the driving mechanism, that is, direct drive, single geared, compound geared and two speed. They may be driven by steam, air or electricity.

In numerous mining and contracting operations, it has become necessary to install two-speed hoists, in order that the same machine may be used for pulling loads over different grades. The load on a hoist increases as does the pitch of the grade. In order to maintain the horsepower constant an abrupt increase in grade should be accompanied by a decrease in the rope speed so that a change of gear ratio is desirable.

Until recently, this change of speed was made by means of sliding pinions, or jaw clutches engaging in pinions, the latter driving the drum gears. In order to shift these pinions or clutches, thereby increasing or decreasing the rope speed, the revolving parts are entirely stopped, or moved slowly, so that these parts may be properly engaged. This causes loss of time and also requires skill on the part of the operator.



A Flory Hoist Designed for Coal-Mining Service

In view of the fact that delays and experienced operators are important factors in production costs and that users of hoists aim to reduce expense to a minimum, an improved type of two-speed hoist has been put on the market, which eliminates jaw clutches, sliding pinions, extra shafts, bearings, etc. permitting the speeds to be changed instantly and requiring no experienced operator.

This improved type of hoist as illustrated herewith is built both for steam and electric power. It is a combination of two Werner type band friction clutches operating on the same drum shaft. The two-speed arrangement is made by means of two different-sized gears driving the drum and meshing in relative sized pinions.

Since the speed of rotation of the pinion shaft remains constant, the operator at will can increase or decrease the revolutions per minute of the drum by throwing the friction clutches on the small or large gears, respectively.

The construction is simple, easily adjusted, and operated with slight exertion on the part of the driver. The friction bands are thrown on or off by means of steam- or air-cylinder thrusts controlled by a slight movement of levers placed in a battery. These thrusts are actuated by regulating valves, while the speed of the piston travel in the cylinder is governed by small exhaust check valves.

The principal advantage of the Werner type band friction clutch is that the stress from the drum is transmitted through the bands directly to the teeth of the gears, instead of through the drum shaft, as is the usual practice. The torsional stresses set up in the drum shaft are thus eliminated.

The heavy-duty gear is secured to, while that for light duty revolves on the drum shaft. These gears with their corresponding frictions are controlled by separate levers, so that either clutch can be thrown on or off while the gears are in motion, thus saving time in stopping and starting. Users find this feature both advantageous and economical.

The friction-clutch combination is simple, consisting of a sliding sleeve on the drum shaft, connected by links to two sliding crossheads fitted in guides, so that by moving the sleeve parallel to the shaft the crossheads move at right angles to the same.

These crossheads are connected to a series of levers, two moving on trunnions, and two keyed to rocker shafts. One end of the rocker shaft carries a double stub, to which the friction bands are fastened. By moving the sleeve in or out along the drum shaft, the bands are thrown on or off.

This type of two-speed hoist, which is built by the S. Flory Manufacturing Co., Bangor, Penn., has been on the market for several years and has proved itself to be highly efficient for mining and contracting operations.

Extracts from a Superintendent's Diary

A weary, dejected Belgian came into my office today and insisted that our company was badly in need of his services at the coke ovens, in spite of the fact that our coke-oven foreman had told him that he was laying off men every day and could positively not think of employing new men. The man was so persistent in his efforts to obtain an interview with me that I could not refuse him a hearing in spite of the apparent hopelessness of his case.

Judging by his English, he had been in this country several months at least, as he had little trouble in making himself understood.

Without wasting any time on preliminaries, he informed me in the most brusque manner imaginable that we needed him to lute our oven doors. He said that we didn't have a man on the job who knew the first thing about luting ovens, and for that matter he hadn't seen one who did since he left Belgium. Then he went on to explain that luting ovens in Belgium was only intrusted to men who had been trained to the work from childhood, generally by their fathers who had been luters also.

A man fitted for a life work under such conditions took great pride in his work; for example, if several luters were employed on one battery, each man carried a marking stick to put a distinguishing mark on each door, so that if a question ever arose as to any particular door he could protect himself. During his recital I tried to imagine one of our door daubers resenting an accusation that one of his "buddies" was doing better work than he, but I couldn't stretch my imagination that far.

Then he went on to say that he had been to several byproduct plants in this country and found that they used expensive doors that didn't require skilled luters, and when he had inquired into the reason for such unnecessary expenditures, he was told that they could not use the simpler doors so successfully used in European byproduct practice because they could not get the right kind of men to handle them. One very frank superintendent, who had traveled much in Europe, had informed him that the mechanical labor-saving inventions, so common in America, were a matter of necessity and in reality should be considered as a reflection on the skill of American workingmen.

This intimation that European workingmen can accomplish tasks beyond our own men aroused my curiosity, and I could not resist the temptation to send for our coke-oven foreman and request that he reconsider the Belgian's application. I want to see what effect common everyday American clay, hand mixed for daubing purposes, will have on a true artist.

The Belgian's advent recalled to my mind an experience we had with a dauber several years ago. The fellow came into my office after wandering around the camp and suggested that he could increase our coke yield by improving our system of drafting. We employed him and gave him a free hand. After a few days he decided that the clay which we had been using was not suitable, and he experimented with various nearby clay banks. Six months passed and then he suddenly disappeared. Shortly thereafter a farmer entered a suit against us for using clay from his farm without his permission or knowledge. Our legal department settled the suit out of court by agreeing that clay taken under such circumstances should be considered almost as valuable as gold.

We never were able to learn whether the mysterious dauber got any of the settlement money, but if he didn't, we certainly owe his memory an apology.

Mining Fatalities in West Virginia Show Decrease

The list of fatalities in the coal mines of West Virginia during the month of January has just been issued by the Department of Mines, and shows that 22 workmen were killed during the month, as compared with 37 in January, 1914, and 29 during the preceding month. Of this number two died from injuries received in previous months, reducing the total to twenty.

While the usual percentage of deaths was due to carelessness and disobedience to mine rules, the decrease is most gratifying, and especially in McDowell County, the heaviest coal-producing county in the state, where only three fatalities were reported during the month. Of the others, five were reported from Fayette County, three from Marion, two each from Mineral, Raleigh and Logan, and one each from Brooke, Kanawha, Mercer, Mingo and Upshur counties.

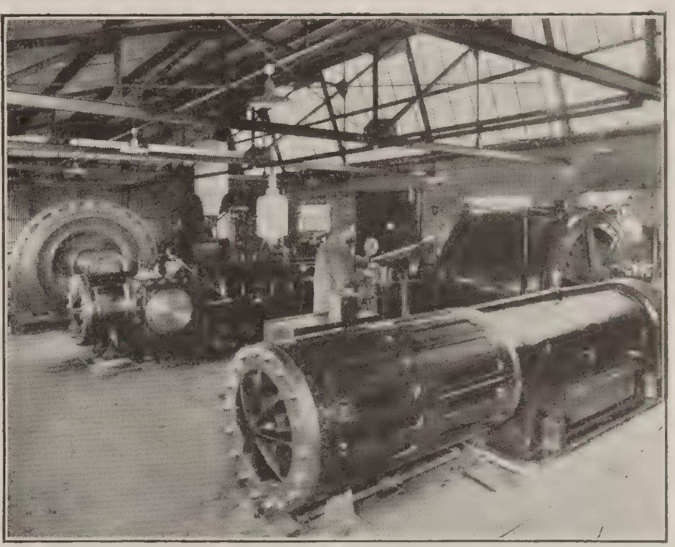
A classification of the fatalities shows that 11 met death from falls of roof and coal, 2 from railroad cars, 4 from mine cars, 1 from locomotives, 1 from a monitor, 1 by electrocution, 1 by explosives and 1 from an unclassified cause. Four occurred outside the mines. Of the men killed 14 were Americans and 8 foreigners.

A New Hoisting Engine

To meet the ever increasing demand for greater output in coal mining and to lessen the manual labor of handling the heavier machinery required therefor together with increased weight and strength to resist the shock to which mine hoists are always subjected, a new hoisting engine has been introduced by the Crawford & McCrimmon Co., Brazil, Ind.

In this design the important parts exposed to excessive stress are made of steel, while the valves and valve gear are of an improved type in which the valves are perfectly balanced and at the same time free to tip upon a slight back pressure, thus relieving the cylinders from the danger incident to a slug of water which may be pulled over from the boilers.

The hard work devolving upon the engineer in handling large engines of the ordinary type with their heavy link motions and balance weights is largely mitigated in this design by the application of a new link motion which embodies a stationary link not shifted on reversal of the engine, but only the link block and its radius valve rod, which are light and easy to handle.



HOISTING PLANT OF AMERICAN COAL MINING CO., BICKNELL, INDIANA

The machine is provided with a steam reverse and a steam brake in addition to an emergency brake. A new throttle valve is supplied, in which a differential lever motion is employed and a toggle pressure applied in closing.

The cylinders are fitted with large ports and the main valves are double ported. The ease and freedom with which these valves may be tipped up in an emergency obviates any necessity for pop safety release valves on the cylinders.

In the makeup of the winding drums the spiders through which the whole power is transmitted are made of steel in two halves and are double keyed to the shaft. The connecting-rods are of forged steel with solid ends. The crossheads are also of steel casting. The piston rods are metallic packed and the operating levers are all conveniently grouped. The whole design is intended to make the engine not only durable in operation but easy to handle, both of which considerations tend toward large output.

Gasoline Mine Haulage as Compared with Mule Haulage

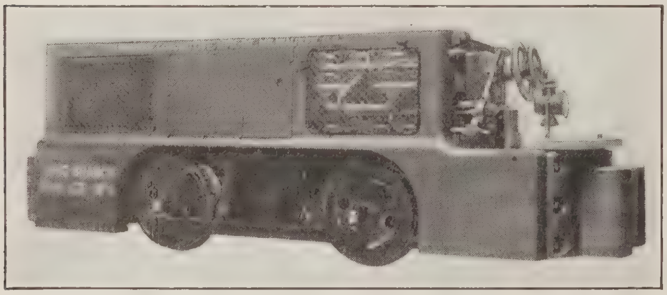
SYNOPSIS—Comparison of costs of coal transportation with mules and with a gasoline locomotive showed a difference in favor of the mechanical haulage of 19.17c. per ton mile. The yearly saving effected is estimated as $3372 while the output was materially increased.

The advance of mechanical equipment in the field of coal transportation at the mine is causing the mine mule to disappear, and the prediction is sometimes made that within a few years the mule will have practically vanished from the larger operations. The number of these animals now employed is already on the decrease, and the rapidity with which they are being supplanted with mechanical apparatus gives weight to the above prediction.

The mule has long been a factor in the haulage problem and one of the chief items of expense at the mines. In order to show a profit the operator must get his coal onto the railroad cars in the cheapest manner compatible with prompt shipment. The mule-drawn car is a relic of the past, and that it must go is apparent since it has been demonstrated that mechanical haulage is cheaper and, all things considered, more efficient.

A Mine Mule Now Used Only in Gathering

In the banishment of the mule from American mines, gasoline promises to be an important factor. The present is often referred to as the gasoline age, and it is certain that this fuel is coming to be one of the most generally used sources of power and locomotion.



The Gasoline Engine Employed for Haulage

One of the best illustrations of these facts obtainable anywhere is to be found in the operation of the Long Branch Coal Co. at Long Branch, Fayette County, W. Va. Here gasoline haulage has greatly reduced the expense of coal transportation even while the output has been materially increased. The mine in question is owned and operated by the above mentioned company headed by P. M. Snyder, the land being leased from the Snyder-Boom Co. It is under the direct management of L. Graney, one of the youngest men in the state to occupy the position of manager. It is a new mine, but has been placed on an effective operating basis and is now working full time whenever railroad cars can be secured.

The supplanting of the old system of mule haulage was done in 1913 with the idea of cutting down operating costs. The company purchased a Milwaukee M-35, 7-ton gasoline locomotive. This was put into service in the summer of 1913. At the end of the month of August, a comparison was made with the month of February, the most productive month during the régime of mule haulage. A summary of this comparison is given below:

COMPARATIVE COSTS OF THE TWO SYSTEMS OF HAULAGE

Total cost of mule haulage, per month	$810.00
Total cost of gasoline haulage, per month	529.63
Decrease in haulage cost, per month	$280.37
Total coal tonnage by gasoline locomotive, tons	11,601
Total coal tonnage by mules, tons	7,848
Increase in coal output, tons	3,753

The analysis of the above summary is shown by the following detail comparison between the cost of haulage by mules and by a combination of gasoline locomotive and mules for gathering.

Mule Haulage—Month of Feb., 1913

Length of haul one way, ft	2000
Maximum grade against loads, %	5.625
Average grade against loads, %	3.0
Total tonnage per month of 24 days	7848
15 mules—feed and upkeep per day @ $0.60	$9.00
11 drivers—wages per day @ $2.25	24.75
	$33.75
24 working days @ $33.75—cost per month	$810.00
Total haulage cost per ton of coal	0.103
Total haulage cost per ton mile	0.272

Gasoline Locomotive Haulage in Connection with Gathering by Mules—Month of August, 1913

Length of haul one way, ft	3000
Maximum grade against loads, %	5.625
Average grade against loads, %	3.0
Total tonnage per month of 25 days	11,601
Expense of mules and drivers for gathering, 25 working days	$313.20

COST OF OPERATING LOCOMOTIVE 25 DAYS

1 motorman @ $3.00 per day	$75.00
1 trip rider @ $2.00 per day	50.00
300 gal. gasoline @ $0.20 per gal.	60.00
38 gal. engine oil @ $0.40 per gal.	15.20
3 gal. black oil @ $0.16 per gal.	0.48
Cup grease	0.50
Waste	0.25
Repairs on motor	15.00
Total operating expense of locomotive	$216.43
Total haulage cost per month	$529.63
Total haulage cost per ton of coal	0.0456
Total haulage cost per ton mile	0.0803
Cost per ton of coal—mule haulage	0.103
Cost per ton of coal—locomotive haulage	0.0456
Saving per ton of coal	$0.0574
Cost per ton mile—mule haulage	$0.272
Cost per ton mile—locomotive haulage	0.0803
Saving per ton mile	$0.1917
On a basis of 12 months the cost by mule haulage for one year ($810 × 12)	$9720.00
By locomotive for one year ($529 × 12)	6348.00
Yearly saving	$3372.00

In short, with the gasoline haulage system the tonnage of the mine has been increased on an average of 25 per cent. per month, and the company has dispensed with 6 double teams or 12 mules and 6 drivers, a total monthly saving in expense of $496.80.

The hauling is not yet entirely accomplished by gasoline motors, as the mules are still used for gathering. The mine tracks are to be extended, in order that the more satisfactory and cheaper service of the locomotive can be taken advantage of to the greatest possible extent.

So satisfactory were the results with the gasoline locomotive that the management of the company installed a second machine the following year, and now have both in operation.

The particular locomotive referred to above is classified by the manufacturers as an "M-35," 7-ton, 42-in. gage machine, and in the above work handled 8 loaded mine cars at a trip, each car carrying 1⅗ tons of coal. The coal is hauled from three partings.

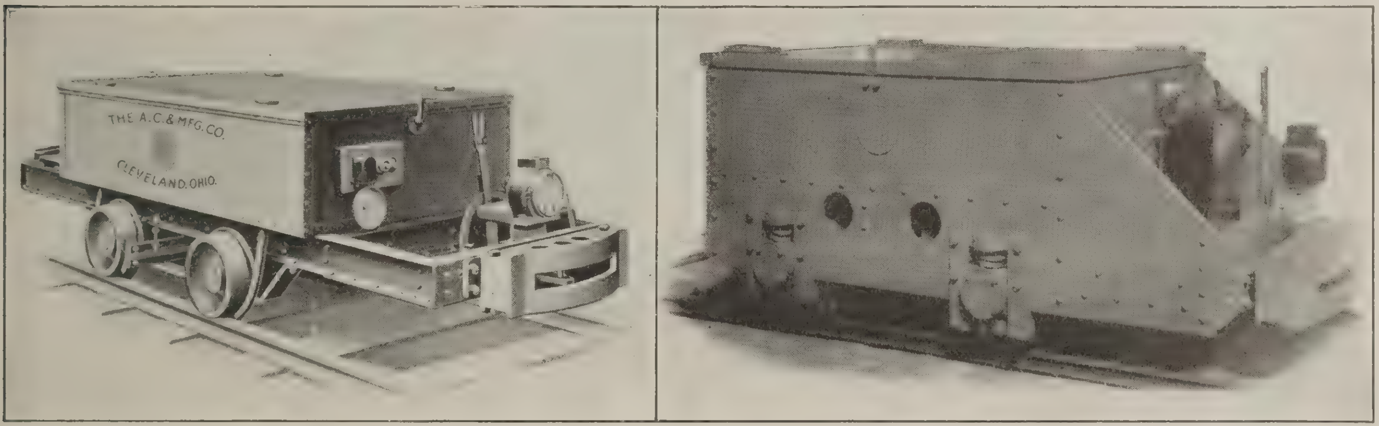
At the mouth of the mine the locomotive drops the loads at the head of a 2100-ft. incline and goes back with the empties. The incline handles 5 cars at a trip, and works on the gravity principle, the loaded cars on their descent pulling the empties back up the mountain side. At the foot of the incline the cars are taken down a tramroad, 4100 ft. to a tipple on the Virginian R.R. This tipple is capable of handling 1200 tons of coal daily.

Economy in Mine Haulage

By R. S. Richards*

SYNOPSIS—Although horses and mules have in the past been used to a considerable extent for transporting coal underground, their place is now being taken by locomotives. Storage-battery machines in this service reduce the costs of coal moving about three-fifths.

Economy in mine haulage is a subject which has been, and will continue to be, much discussed among mining men. The competition of the present day renders it imperative that the operator who would dispose of his product profitably must give transportation of coal in and around the mine his closest attention.



Two Distinct Types of Storage-Battery Locomotives

Mules and horses have long been used for the propulsion of mine cars. In the larger and more progressive mines of today, however, they have been supplanted in large measure by the locomotive. Horses and mules require feed and bedding, which is a considerable item of expense. Furthermore, they must have shoes, harness and occasional medical attention. The life of an animal in this service is limited, due to the unfavorable conditions under which he has to work, the class of work performed and the inevitable accidents. Good drivers are difficult to secure, as most competent men prefer work which returns a greater remuneration. But, above all else, the tonnage handled is not entirely satisfactory.

There are four general types of locomotives employed in and about the mines. These may be classified, according to their driving power, as steam, compressed-air, gasoline and electric. The steam-driven machine has many objectionable features which render it unsuited to employment underground, chief among these is the large volume of smoke and gas given off by the fire. Compressed-air locomotives emit no noxious gases. They are not, however, employed to as great an extent as some other types.

The gasoline locomotive has found favor in some locations, but the presence of the exhaust gases, as well as the sparks sometimes accompanying them, render their use objectionable under certain conditions. Furthermore, the gasoline engine has not yet been brought to that state of perfection where it may be absolutely relied upon under all circumstances.

Electricity is used for power or lighting in a large percentage of mines. The current may be obtained either from a private source or purchased from a central company. To extend the use of current to the propulsion of electric locomotives would not require any considerable expenditure, the bonding of the rails and stringing of the trolley wires being the most important items to be considered.

The Three Types of Electric Locomotives

Generally speaking, electric locomotives may be divided into three classes or types; the trolley type, the storage-battery and the combination trolley and storage-battery varieties. Where the mine is already provided with electric current, the trolley type is the more economical, especially on long hauls. The danger from the trolley, however, must not be lost sight of.

The storage-battery locomotives now on the market are giving excellent results and are especially desirable for remote mines where a continuous supply of electricity is not obtainable. While a current for charging the storage battery is, of course, necessary, this can be produced by a small generator, which represents only a slight investment. Where the mine is already equipped for trolley locomotives, those of the storage-battery type may in many cases still be used to considerable advantage. At those mines where the power plant is loaded well up to its capacity, the storage-battery locomotive finds its special value, as the current for driving the machines may be obtained at night or at other times when the generator is not running under full load.

---

*10522 Olivet Ave., Cleveland, Ohio.

For cross-entry and room work, probably no form of haulage system can surpass for economy and convenience the storage-battery locomotive, hence, the expense and annoyance of the gathering cable are done away with. No trolley wire or other conductor is required and the bonding of rails is unnecessary.

Tests in various mines have shown that the average cost of gathering with storage-battery locomotives is about 2c. per ton as against 4 to 5c. with mule haulage. Where operators are forced to sell their product at a profit of only 5c. per ton, and many are at the present time selling it at cost, or even less, this saving is a considerable item. If the machine is equipped with a reliable storage battery and is properly constructed, the purchaser need have no fear concerning its operation. Such machines are easily cared for and are practically foolproof.

The combination type of locomotive is merely a combination of the trolley and storage-battery machines. It finds its greatest application where a general-utility locomotive is desired.

The Labor Situation

SYNOPSIS—The northeastern Ohio situation shows no change. A strike in Fayette County, the Jamison strike in Marion County, and the trouble at Ronda and Dry Branch focus attention on West Virginia. A strike in Kentucky shows signs of coming to a speedy end.

The report of D. J. Keefe and Hywel Davies on the northeastern Ohio strike apparently has been held back in the hope of a settlement. John P. White, the president of the United Mine Workers of America, William Green, the secretary-treasurer of that organization and several members of the Pittsburgh Vein Operators Association have met with Secretary of Labor Wilson, and have tried to forestall the report with a settlement. On Mar. 2 the report was formally delivered.

It is said to state that the operators offered to accept the report of the conciliators as final and binding. This the miners refused. The operators then offered to leave the matter to arbitrators, allowing the conciliators to choose the arbiters. The miners again refused, offering to arbitrate provided the mines resumed work at the increased wages demanded by the miners and that umpires be appointed by miners and operators. The operators refused to accept this arrangement, as a disagreement between operators and miners in regard to the appointment of umpires would effectually block the arbitration.

Arbitration Not Desired by Eastern Ohio Miners

The operators then offered to arbitrate, providing that the nonpartisan umpires should be selected by the judges of the northern district of Ohio. The miners again refused. The operators then proposed arbitration with umpires selected by the President of the United States. Again the miners demurred, and finally the secretary-treasurer, William Green, withdrew the agreement of the union officials to submit the differences to arbitration and stated that the only settlement that the union would accept was one which conceded the original demands of the miners. So, after all, no good resulted from a conference into which the union men never entered in good faith.

They promised the legislature when the Green bill was passed that they would not increase the price of coal. Now they are trying to increase its cost by 2.39c. per ton. The actual increase, which is larger, is, of course, difficult to gage. Its amount is dependent on the amount of slack coal which careless mining will make.

Some Believe Strike Near Settlement

There are some who believe that the strike may be settled by arbitration, despite the refusal of the miners to accept that mode of settlement. Such prognosticators draw hope from the conference now called by the Secretary of Labor. It is intimated that he will urge upon the miners the necessity for arbitration and that President Wilson may be called upon to name the arbitrators. It is understood that the proposal submitted by the operators at the last Cleveland conference still stands. This provided that the miners name three members of the board, the operators three and the judges of the federal court of the northern Ohio district the other three, the board to consist of nine members.

Some think that Secretary Wilson has not made public the contents of the report, because he believes that there is yet some chance for settlement of the strike and that the publication of the document might prejudice the situation. The proposal of the operators for arbitration follows:

> In accordance with the understanding at the adjournment last Thursday that three names be submitted by the operators of eastern Ohio to constitute part of an arbitration board for the purpose of deciding the matters in dispute which have resulted in the past ten months' strike in the mines of eastern Ohio we have selected and herewith submit the names of C. E. Maurer, S. P. Robbins and G. M. Jones.
>
> These names are submitted with the understanding that they, together with three members selected by the miners, shall choose three disinterested members, who shall constitute a complete arbitration board of nine members and that the decision of this board shall be final and binding on both the operators and miners.
>
> In the event that the members selected by the operators and miners are unable to agree on the election of the three disinterested members within three days from date, then we agree that the said disinterested members shall be appointed by the President of the United States.

As we go to press, we learn that the meeting at Washington has been held and that the conference was suspended, so that the miners' leaders might have time to return to Ohio and confer on the proposals made to them.

Three Centers of Unrest in West Virginia

The interest in the labor situation has shifted in some degree to West Virginia. Apparently the Jamison Coal Co. did not cease its practice of supplying the miners with powder without promising compensation. This is said to have amounted to 4c. on the car. Apparently the strike is not spreading as was anticipated. The authorities are working hard to reduce the illicit selling of whisky, some men having tried to smuggle in 20 gal. on Feb. 22.

The Ronda and Dry Branch strike seems to be nearing a compromise. It is only the gas coal which makes an excessive amount of slack, and it is only in regard to this that the question of scale arises.

Fifteen thousand men in the Fayetteville district are seeking a 10 per cent. increase in wages on all mining and day work, and demand that dues and assessments be checked off at the office. They also demand a 9-hr. day and the free use of a building in which to hold the meetings of the local union.

The union men deposed President L. C. Rogers and seven other officers on charges of using the funds of the United Mine Workers of America to secure their election, and for "other wrongful and fraudulent acts." The International Executive Board will investigate the charges.

Du Pont Company Arranges Its Labor Troubles

In a telegram to S. J. Gish, president of the Central Coal & Iron Co., of Central City, Ky., a Du Pont corporation, John P. White, president of the United Mine Workers of America, declares that the International Executive Board will suspend the order for the closing down of the mines of the company. This has been done because President Gish agreed to comply with the contract dated Apr. 1, 1914, between the Western Kentucky Operators' Association and the United Mine Workers of America, provided that in the settlement of disputed questions the company should appoint its own arbitrator in place of the commissioner of the operators' association.

In Colorado the men have been acquitted who were tried for shooting guards during the strike. The men killed were riding in an automobile at La Veta.

Success

The big SUCCESS number of Coal Age which will be issued Apr. 3 promises to eclipse all expectations. If you have made a practice of occasionally writing for Coal Age, your record will be incomplete should you fail to have a contribution in this particular issue. If you have been bottling up all your mining experiences, and thereby "hiding your light under a bushel," this special number of Coal Age is by all means the appropriate time for you to make your debut in the literary field of the technical world. Get busy today and start the preparation of a SUCCESS article along the lines outlined in our foreword last week.

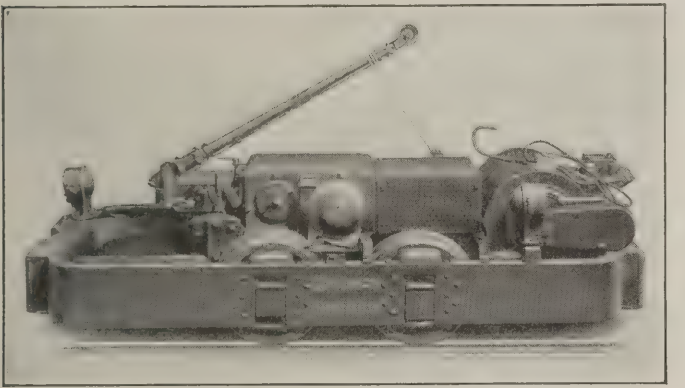
Electric Gathering Locomotives

By E. C. De Wolfe*

SYNOPSIS—In most modern mines, the gathering locomotive has replaced the mule for haulage purposes. Aside from economy considerations, the gathering locomotive is a physical necessity if large outputs are to be handled. Old mines can be equipped with such locomotives as well as newer operations. These machines have a multitude of uses.

The past ten years in bituminous mining history have been marked by no advances of greater moment than the development and wide adoption of locomotives for gathering, as auxiliary to the main haulage system in performing the "mule" service of distributing the empty cars to the miners and making up the loads into trips for hauling out. Arguments for and against the use of locomotives in gathering ceased long ago, as actual demonstration of the advantages of the new way gradually removed all basis for reasonable opposition.

Admitting the existence of possible exceptions, the statement is nevertheless warranted and easily defensible, that the mule is no longer a "necessary nuisance" in extensive or permanent service underground. Stabled in the mine he is a constant item of danger in various ways. Subject to indisposition and injury he is uncertain in regularity and length of service. A voracious consumer of feed, and requiring regular care, his "upkeep expense" goes on through idle days or weeks just the same as in production time.



Low-Vein Type of Gathering Locomotive

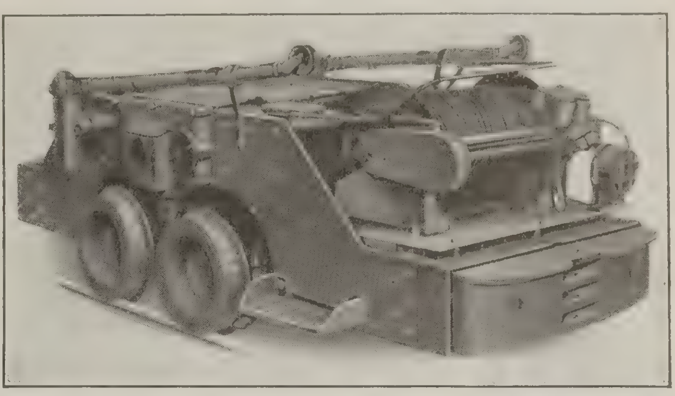
Animal haulage is not economical, either in first cost, operative expense, life of useful service or salvage return on disposal. Why, then, the mine mule?

For modern mines of large production, the gathering locomotive proposition bursts all bonds of relative economy considerations and takes rank as a physical necessity. None of the recent top-notch records in rapid development of new mines to large productive capacities could possibly have been made without organized mechanical systems of car handling from the face to the dump. For these operations there is no question as between mule and motor, but only as to what methods of locomotive gathering and haulage will be best, and what types of locomotives will be most suitable.

Gathering locomotives, generally speaking, are of small size and light weight as compared to locomotives for main haulage service. Hence they are admirably adapted in a most natural way to the development requirements of any mine, small or large, from its early days to its period of maximum tonnage and greatest haulage distances.

Some Mines Never Employ a Mule

One highly successful mine manager has illustrated his belief in early installation of locomotive haulage by saying that when he opens a mine and has room for a rail-length of track he puts in a pit car, and when he can double this length of track he puts in a small locomotive to haul the car, adding cars then until a second locomotive is called for by considerations of cars to handle, distances to run, divergence of entries, and advisability of having spare equipment to insure against possible interruption of the work. Certain it is that there are many mines in which no mule or horse has ever worked and where the haulage has been mechanical from the beginning.



Gathering Locomotive with Two Trolley Poles

The first locomotive—of gathering type, even though not at first equipped as a full-fledged gatherer—does all the haulage work. A second is added later to assist. A third and possibly others also divide the same work as the development progresses, all of them doing combination gathering and haulage work, or some of them serving only to gather, making up light trips which the others handle as haulage locomotives.

When later conditions call for the installation of a heavy locomotive for regular main haulage work, the lighter locomotives are all released for strictly gathering duty and the haulage becomes automatically a comprehensive system, which has grown in economical fashion with the needs of the work at costs consistent with the advancement of the development and output.

New and Old Mines

The new mine can readily be laid out and advanced with direct reference to the most effective operation of a complete system of mechanical haulage. Entry widths and spacing, room depths and necks, track character and curvatures, rail weights and bonding, switch locations and lengths, etc., are easily arranged to suit the plan of haulage which is to be used, and changes of the development plan can be made as experience or unforeseen conditions may dictate.

---

*537 South Dearborn St., Chicago, Ill.

Nor does the older mine often present serious difficulties in the economical installation and in the operation of a gathering system. Of course the older the mine and the more modest its past methods, the more care is called for in the selection of a suitable locomotive equipment for working to the extremities of the development. In all but mines of most indifferent management and lax methods, the change is entirely practical and by no means prohibitive in cost.

For electric locomotives, the entry tracks must be bonded, and trolley wire hung. If the locomotives are to work into the rooms, the use of wood rails should be discontinued and steel laid, though not necessarily bonded, as the fishplates furnish satisfactory bonds for the short distances represented by maximum room depths. If duplex cables are used on gathering reels, the room tracks are not depended upon for current return.

Tracks must be laid and maintained more carefully than for mule gathering, for only by having fairly secure tracks can the advantage of the greater speed of the locomotive be realized dependably and with proper safety to men and equipment.

Goodman "Universal" Gatherer Pulling Loaded Car from Room

Room curves sometimes have to be changed, and rib corners cut away for proper clearance, though certain available types of strictly gathering locomotives in small sizes can usually be operated through the same clearances as the mine cars already in use. Minor alterations are necessary in various items of mine condition and operation, but all are in the direction of improvement and are well repaid independently of the advantages to be derived from the new gathering system itself.

However, where conditions are exceptionally bad, or local exhaustion not far ahead, or other aspects reasonably oppose the installation of the locomotives, such parts of the mine can best be continued on the old basis, while newer territory is changed to the better way, and all advancement work planned and operated similarly from the start.

So the operator with a new property has no monopoly of opportunity for enjoyment of the advantages and economies of locomotive gathering.

Three Methods of Gathering

Gathering methods are as variant in details as any other phase of mine operation, but in a general way they fall under three broad classes, applied singly or in combination.

1. *Entry Gathering*, wherein the miners push the empty cars from the entry to the face and return the loads to the room neck or onto the entry. The locomotive in this work usually operates on some plan whereby it distributes the empties of an in-trip to the room partings along one entry and goes at once to another entry to make up an out-trip of loads already pushed out by the miners. Local conditions or personal preferences determine whether the locomotive (a) pushes the trip of empties up to the head of the entry and drops them off at the rooms on the return, leaving itself a free way out to the main or side entry and to another room entry where the loads there waiting can be bumped ahead to make up a trip, which then is pulled to the main haul siding; or (b) pulls the empties in behind and drops them off at the rooms, crossing to the parallel entry to make up the load trip to push out to the siding.

The locomotive for this work may be of simple haulage type, in suitable weight, and requires no special features other than provisions for rapid handling and close control. If the miners leave the loads in the room necks and the locomotive has no electric conductor cable for enabling it to depart from the trolley wiring, it works with a car or two always ahead to reach the cars in the room necks without itself leaving the entry track.

Even for this plan of gathering it is well to have available the "gathering reel" of electric cable for enabling emergency operation into rooms or beyond the end of the trolley wiring on the entry.

Working into the Rooms

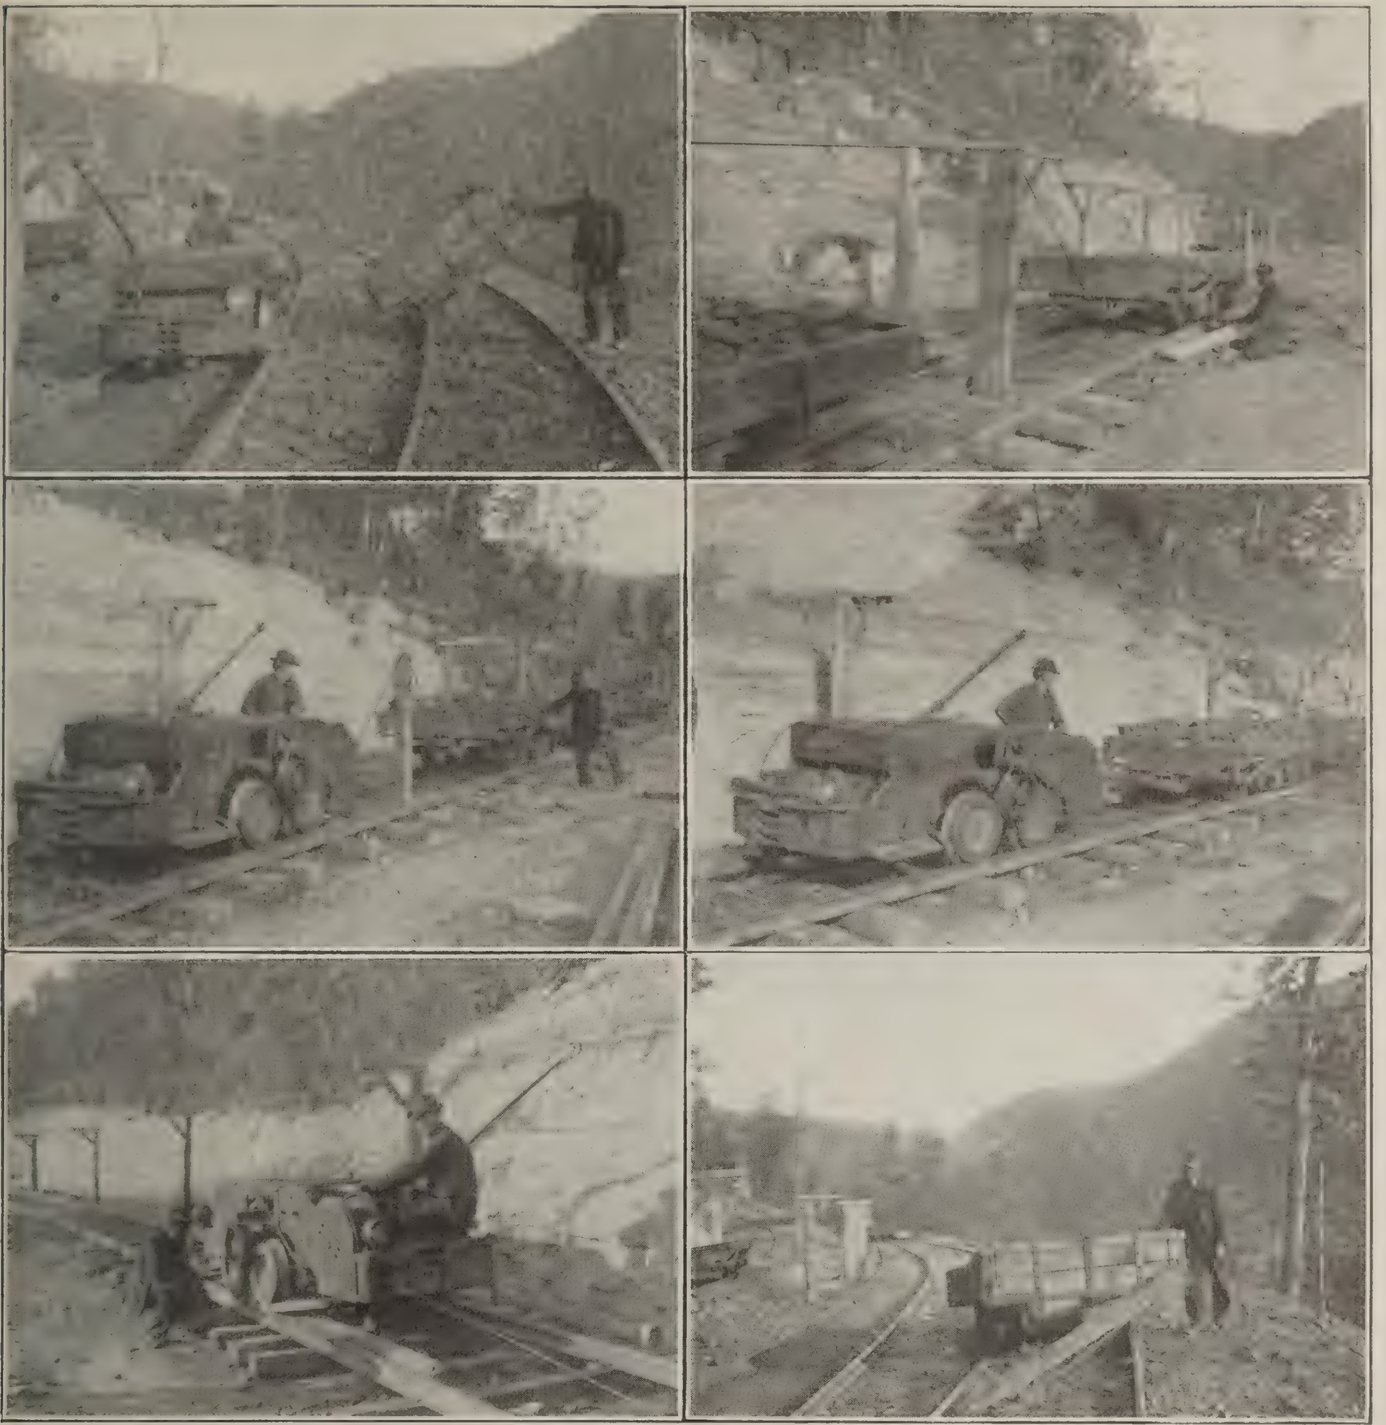
2. *Face Gathering*, wherein the locomotive regularly works into the rooms, hauling the loads from the face, and usually placing the empties in loading position for the miners. For this service the locomotive is equipped with a reel of electric cable, single or duplex, whose terminal or terminals are attached to the trolley wire, or trolley wire and track, on the entry to maintain the electrical connections for the locomotive as it works into the room. The cable is handled automatically by the reel, from which it pays off as the locomotive enters the room, and onto which it is wound again as the locomotive returns. A 500-ft. length of cable permits working full depth about three 300-ft. rooms, and proportionately more rooms of less depths, with one attachment of the terminals on the entry.

The trip rider or brakeman attaches the terminals of the cable, usually remains by them while the locomotive does all it can with that setting, and then moves them up to another setting and sees that the cable is properly reeled in when the work in that entry is completed. The reel is always on the "outward" end of the locomotive, opposite to the motorman, who therefore is in front as he enters the rooms and can readily couple on the loads.

Gathering on this plan usually starts at the head in the entry and the loads as successively brought out may be coupled up at once, the trip being then complete when the last car is brought out and coupled on, or they may be dropped at intervals along the entry as brought out and then bumped back to make up the trip as a whole after they are all "reeled out."

Single- and Double-Room Tracks

In some mines the men push their empties to the face, the locomotives entering the rooms only to pull the loads. In others the miners are forbidden to move a car and



Showing Special Uses to Which the Crab Reel May Be Put

From Top to Bottom, First Column: Overturning Car for Repairs; Rerailing First Car in Trip; Rerailing the Locomotive Itself. Second Column: Rerailing Last Car in Trip; Rerailing Any Car in Trip; Straightening a Car Slewed Crosswise

the locomotives do all the work of placing and pulling. A still further refinement of room management is practiced in mines where intensive production is desired and physical conditions permit. Where rooms are cut wide enough to make the laying of double room tracks advisable or practicable as an assistance to rapid work in car loading, the rapidity of loading is further assisted by eliminating waits for cars on the part of the loaders. The gathering locomotive bringing in a trip of empties places them on, say, the left-hand tracks in the rooms, then at once or later pulls the loads from the right-hand tracks. Thus the miners always have cars and lose no time in idleness between the pulling of a load and the placing of another empty, as is unavoidable with single track. An approximation to double-track advantages is possible, however, where conditions permit, by pairing adjacent rooms and handling their cars alternately as on double tracks in single rooms.

Using the Crab Reel

3. *Face Gathering from Entry,* is designed for mines or local territories where for any reason it is impractical or undesirable to operate the locomotives into the rooms, as in pitching seams with rooms turned to rise or dip, or rooms in very low coal off entries brushed for good haulage height, or in old areas where tracks are too light or too poorly laid for reasonable safety of locomotive operation, etc. For this work the locomotive is equipped

with a "crab" reel, or power-driven drum and wire rope, with which it may reach long distances for cars to which it cannot go itself.

The locomotive remains on the entry and the trip rider goes into the room with the wire rope, whose end ring he couples to the car to be brought out. With a wag of his head he signals the motorman, who starts the drum drive and so draws the car to him. As it rounds the room curve he starts the locomotive also and, passing the latch, pulls the car out onto the entry track for coupling to the trip he is gathering.

For rooms to a steep rise the rope is operated through a snatch block anchored or secured to a jack at or near the face, thus serving to haul an empty in and lower a load out. For this work the length of rope must be at least twice the maximum room depth or other working distance.

FOR UNIVERSAL SERVICE

A locomotive equipped with both electric conductor cable and wire rope reels is fitted to perform any single gathering duty, or to operate in combinations of any or all the foregoing systems. Such a locomotive is of truly "universal" class and is so designated. It may do entry and switching duty, work into rooms, or reach with its wire rope. It may run to the length of its electric cable away from the trolley wiring and then reach on to the length of its wire rope for whatever it may be desirous of securing from such combined distances.

The crab reel is also of service in numerous miscellaneous and emergency ways, which alone are important enough to warrant the presence of the universal equipment on at least one locomotive at every mine.

The wire rope is useful in rerailing derailed cars, or even the locomotive itself. Broken cars may be overturned off the tracks at any point inside the mine or outside, or at the shop where repairs are to be made. Obstructing timbers or other heavy objects may be removed from the track or dragged wherever wanted. Rails, props or other material may be recovered from abandoned rooms or from under falls of roof. Methods of performing several of these "stunts" are shown in the accompanying figures.

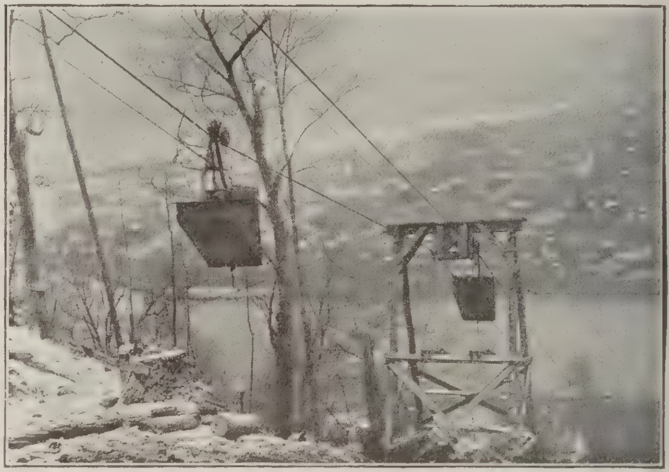
The gathering locomotive, in design and equipment, should be built as a gathering locomotive from start to finish—it must not be an adaptation of some regular main haulage type, with nothing to classify it as a gatherer but its light weight and the attachment of a reel of electric cable.

Utmost success in gathering by locomotives is dependent upon proper consideration of local conditions, proper decision as to the system of handling to be applied, proper selection of the right type of gathering locomotive, and proper operation of the equipment. Some mines fail to realize what they expect, and might readily secure, because they fail to realize first that the system and equipment cannot run themselves. Thorough organization of a comprehensive haulage system is essential to top-notch results, and of course the maintenance of tracks, wiring, cars and locomotives in good shape for reliable and continuous operation is equally necessary.

With these matters given due attention—as of course they should be under any circumstances and for any sort of equipment—the gathering locomotives, and the entire haulage for which they are the feeders, will render good account of themselves on the record sheets.

An Aerial Tramway for Handling Coal

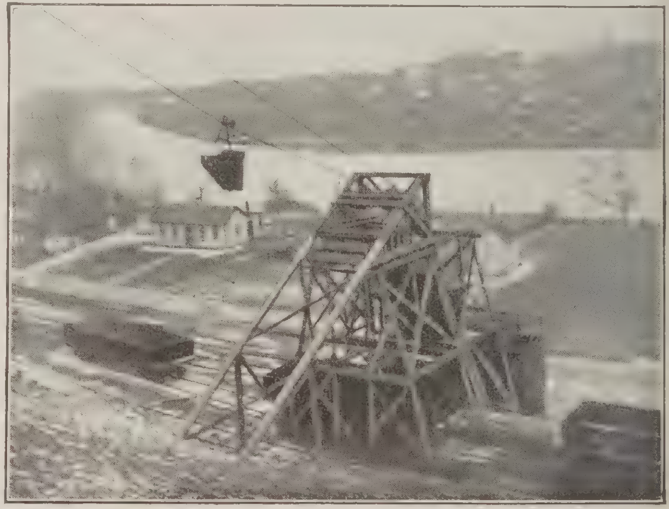
The accompanying illustrations show the loading and discharging stations of an aërial tramway installed by the Broderick & Bascom Rope Co., of St. Louis, Mo., at the mine of the Harlan Home Coal Co., at Harlan, Ky, This property is, however, now being leased and operated by the Republic Coal Co.



TRAMWAY SHOWING LOADED AND EMPTY BUCKET

The tramway is of the two-bucket or jig-back type. The length is 900 ft. with a fall of 430 ft. in this distance. The maximum capacity of the tramway is 45 to 50 tons per hour, each bucket carrying 2700 lb. of coal.

One attendant only is required for the operation of the tramway. This man is located at the loading station and controls the gate levers for filling the buckets as well as the brakes regulating the speed of the line. At the discharge end, the buckets are tipped and dumped automatically.



THIS VIEW SHOWS THE DUMPING TERMINAL WHERE THE COAL IS LOADED INTO RAILROAD CARS. NO DUMPERS ARE NEEDED AT THIS DISCHARGE TERMINAL

The track cables on this equipment are 1⅜ in. in diameter, while the traction rope is ⅝ in. in diameter. The installation has been in operation for four months.

Coal Transportation in Eastern Kentucky Mines

By Martin Prehn

SYNOPSIS—An attempt to show how conservation and organization can effect big operating savings through the judicious selection and use of equipment. Roller-bearing wheels enabled a saving of more than 1c. per ton.

One of the newest of the big coal developments in Kentucky is that of the Elkhorn Mining Corporation, with mines at Fleming, Haymond, Hemphill, Garrett and Wayland. The company's mines in this district—which takes its name from Elkhorn Creek—are served by the Baltimore & Ohio and Louisville & Nashville R.R. A rather exhaustive description of the manifold activities of the company appeared on p. 1041 of the June 27, 1914, issue of Coal Age.

The Elkhorn district is new, and for that reason presented a wonderful opportunity for the development of an intensely modern and up-to-the-minute plant. Every possible contingency was looked upon as a sure-to-come occurrence; it can, therefore, be imagined how complete are the appointments, and in how many ways—physical and social—the property has been protected to safeguard income for all time.

It was sought to increase the efficiency of employees (and, directly, that of the equipment they handle) by caring for their welfare. To this end, unusually comfortable dwelling houses, of 6 and 8 rooms each, were erected; churches, schools, municipal buildings, stores, etc., were supplied. In short, the company built 5 actual towns—Fleming, Haymond, Hemphill, Garrett and Wayland—and provided them with comforts usually unsought in mining communities, simply to get "spirit" *into* its men and more efficient work *out* of them.

This insistence on practical efficiency went beyond the personal element in that its tests were applied rigidly to all parts of the mechanical plant before these were finally approved and standardized.

Power Purchased from Outside Company

Therefore, in order to prevent loss of interest and tying-up of capital, a private power plant was not built. Instead, current is purchased on contract from the Consolidation Coal Co., of Jenkins, Ky., whereby total power expense is said to have been much reduced. And where rates for electricity are reasonable, this method appears to be efficient and economical for various excellent reasons.

Of course, it is one of the elementary principles of economics that anything idle produces waste. That draws the line tightly and it is naturally impossible to keep everything going at capacity all the time; but electrical energy, when furnished by central stations, works very closely to that point. There is no outlay for prime movers or generating equipment (and the interest on such investments is saved); there are no standby losses, which must otherwise occur about every mine, however well regulated or organized it may be; only the power used is paid for; the voucher charge represents money that is being spent for a live purpose; and there are *no* power expenses when power is not being used in doing useful work.

But we are not arguing for the central station, nor for the isolated plant. The endeavor is simply to show how the Elkhorn Mining Corporation manages to mine coal cheaply, sell it cheaply and earn a good profit—the one combination of circumstances that does most to discourage inexpert governmental interference.

Just as railroading is the biggest single industry next to agriculture in the nation at large, so in mining, transportation is the biggest single item, aside from the actual extraction of coal.

An examination of the Elkhorn Mining Corporation's transportation plant should, therefore, lead to interesting and instructive conclusions, especially because the prime aim throughout centers about the ratio of investment to return—and none but the most favorable ratio possible is accepted.

Where Two Mules Hauled 28,000 Lb. The Cars Had Roller-Bearing Wheels

Advantage was taken of every feature that would in any way aid in the reduction of costs, or the increase of efficiency. It was sought to reduce first cost and its constantly accruing interest for the entire transportation plant by adopting a liberal policy in the purchase of the details of the equipment.

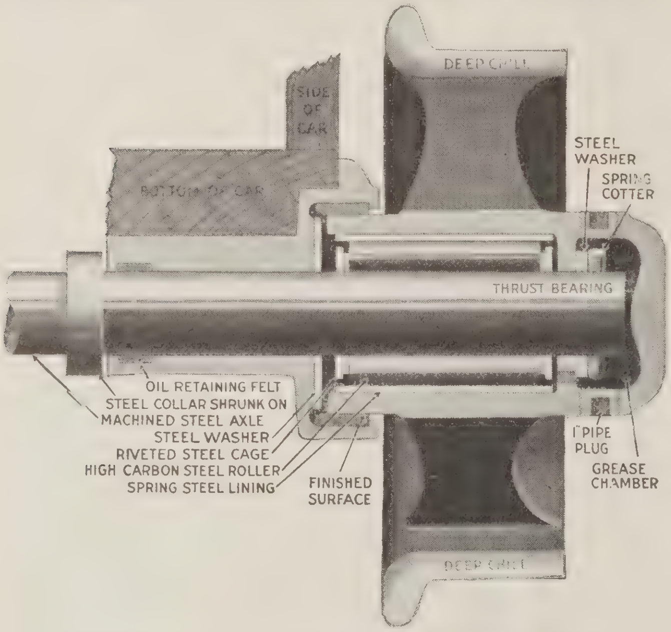
This was done by making a careful survey of the situation in the usual manner and then arriving at the highest-profit-producing equipment by a process of elimination. Take locomotives, for instance. Naturally, the number and size of locomotives were determined, first, by the average 24-hr. tonnage; secondly, by the total resistance of cars at the most difficult part of the track; thirdly, by the average speed and the average number of daily train movements.

In such cases, figuring should be liberal, and allow a fair margin for overload, extensions to plant or unexpected increases in output. By this process a gage may be secured on the first cost of locomotives (and cars). Such a careful plan will also give an approximate cost for curved and tangent rail, ties, switches, crossovers, targets and other track appurtenances, since the weights of these things are generally determined by the loaded-axle weights of the locomotives.

This is the crucial point at which a decision one way or the other determines for all time whether or not the transportation plant will be economical—a payer of good dividends—or wasteful, in the modernly accepted sense of the word.

DECIDING ON A TYPE OF WHEEL

The extensive experience of the deciding powers of the Elkhorn Corporation caused them to weigh carefully the question of car wheels. Many severe tests were conducted to ascertain, if possible, if any existing type of wheel would be able to so reduce the resistance of cars equipped with it, that it would enable lighter rail, lighter locomotives and less electrical energy to handle the given tonnage in the given time. It is perfectly obvious that the discovery of such a wheel—even if its own first cost were very high—would be an extremely economical and profitable investment, since, by permitting the use of lighter apparatus, it would materially reduce the first cost of the system as a whole and make additional and continuous reductions in operating costs by reducing maintenance and current consumption.



SHOWING DETAILS OF THE ENTERPRISE WHEEL

The widespread use of roller-bearing wheels of various kinds suggested a possible solution. Certain types were found to be particularly well fitted for the condition in hand, and after further tests revealed decided operating savings of a most important nature.

It was found that a given locomotive could haul a train equipped with roller-bearing wheels over a given piece of track in half the time and with half the power consumed for a similar train equipped with plain-bearing wheels. Getting down to a dollar-and-cent basis this shows an average saving, for power alone, of one-third cent per ton of coal hauled, when the price of current is 1½c. per kw.-hr. To this must be added the savings for which certain features of the type of wheel that was finally chosen are wholly responsible.

The Elkhorn Mining Corporation finally chose as standard the Enterprise wheel, made by the Enterprise Foundry & Machine Works, of Bristol, Virginia-Tennessee. The wheel is of the same general design as all roller-bearing wheels made by this company and had the benefit of individual metallurgical treatment by Asa W. Whitney, the Enterprise works' car-wheel metallurgist.

THE OPERATION OF THE WHEELS PRODUCED MATERIAL SAVINGS

By enabling a locomotive to handle double tonnage, the same tonnage at twice the normal average speed; or normal tonnage at half the usual current consumption, virtually 50 per cent. of the normal locomotive equipment may be released for other service, or resold at second-hand value. It is also true that with proper wheels, lighter (and cheaper) locomotives may be purchased, followed by a lower investment right down the line. At any rate, the natural reduction in maintenance and operating expenses by far offsets any higher first cost of the wheels.

It was found, also, that to the savings already shown must be added a substantial reduction in labor charge, made up as follows: Release of 50 per cent. of trip crews, which amounts to doubling the tonnage per man, without affecting his original daily wage; the elimination of oil boys, resulting from the fact that lubrication no oftener than twice a year has proved ample. And another saving, not too insignificant to be overlooked, is the use of the lubricant itself, due to its enforced economical use.

A detailed analysis of the cost sheets would be burdensome; but a summary of the savings in lubrication, power, motor-crew expense and wear and tear on motor and other equipment was found to average from 1¼ to 1½c. per ton of coal mined.

And since this saving affects only one department—transportation—it will be realized how extensive it may become when the same scientific methods are applied throughout all the workings, as in the case of the Elkhorn Mining Corporation.

Graded Schools and Kindergarten at Mount Hope, W. Va.

Few towns in any community can boast of a better school system than that found in Mount Hope, a mining town in Fayette County, West Virginia. With a population of about 2500 this town has a handsome new high-school building, a large graded school and a kindergarten with a total enrollment of 750 pupils and an average attendance of over 600. Most of them are children of the workmen employed in the mines in that section. Taken altogether, it is about as healthy and comfortable-looking a bunch of youngsters as could be imagined. They are children of various nationalities, as their builds and countenances indicate. The mines at Mount Hope are operated by the Mount Hope Coal & Coke Co.

A Record Output

The Ebensburg Coal Co.'s No. 1 mine at Colver, Penn., broke all its previous daily records for production on Feb. 25, the output being 4524 net tons.

Notable Hoisting Installations

By R. C. Greenfield

SYNOPSIS—A description of some radical departures in the design and operation of mine hoists. One of the plants is capable of handling 4000 tons of coal in 8 hr. from a depth of more than 400 feet.

The subject "Electricity in its Relation to Mine Hoisting," has been reviewed each year with increasing interest, due to the wonderful advancements that have been made in the electrical field.

The interest displayed in the past year's review is only more marked than that of former years; because of the fact that the advancement in mine hoisting exceeded that of previous years.

Among the interesting and without doubt the most notable installations of the year are the two hoisting plants installed by the Illinois Midland Coal Co., at Kincaid, Illinois.

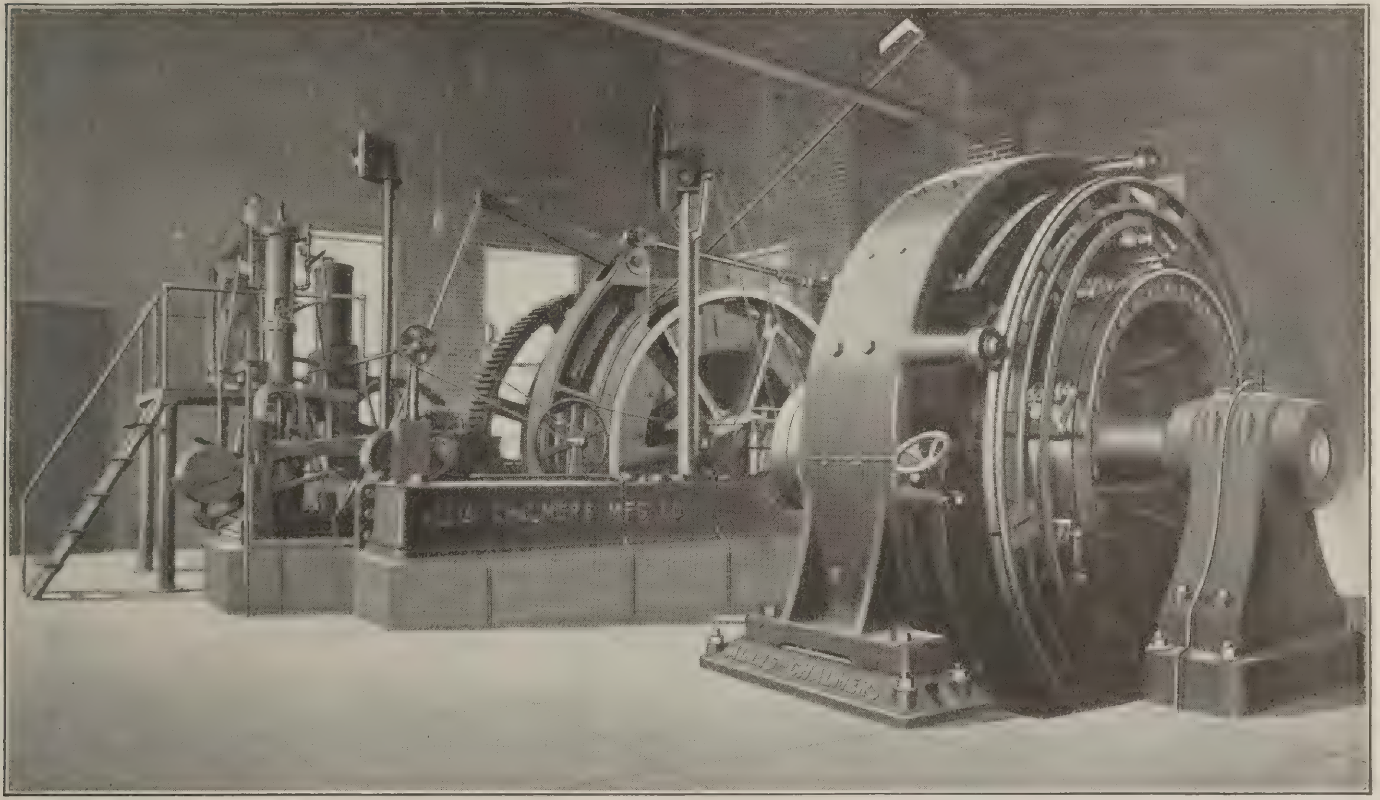
These plants are duplicate installations, and one of them will be found illustrated in the accompanying cut. Each plant is designed to handle 4000 tons of coal in 8 hr. from a depth of 410 ft. A short description of one of the plants will suffice for both.

The hoist motor is of the slow-speed type operating on continuous current at 500 volts and at 65 r.p.m. and is rated at 675 hp. It is controlled by the Ward-Leonard system.

The flywheel set consists of a wound rotor induction motor rated at 450 hp., a direct-current generator rated at 550 kw. and an 8-ton steel flywheel. The set also has a direct-connected exciter rated at 22½ kw. The hoist is designed to operate normally in balance. The maximum rope pull on one rope is 20,000 lb. and the maximum rope speed 1660 ft. per minute.

One of the many interesting features of this installation is the auxiliary alternating-current motor drive which was furnished for hoisting men and supplies.

This auxiliary motor drives the hoist through a set of double-reduction gearing, the main pinion of which is provided with a shifting mechanism which allows of its being thrown both in and out of mesh and locked in either position. When it is desired to handle light loads or men, the flywheel set can be shut down and the hoist operated by means of this auxiliary motor, thus obtaining greater economy in operation. When the auxiliary motor is not required the pinion is thrown out of mesh and the gearing stands idle. The complete equipment, including hoist, motor, motor-generator flywheel set, switchboards, and auxiliary apparatus was designed and furnished by the Allis-Chalmers Manufacturing Company.



Hoist and Motor Installed in Plant of Illinois Midland Coal Company

Another Interesting Installation

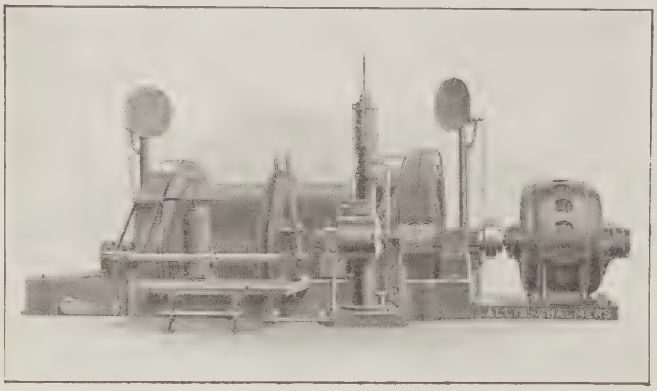
No less interesting are the hoisting equipments furnished another mining company during the past year.

These consist of three Allis-Chalmers double-drum electric hoists, two of which were designed to have a maximum load of 16,880 lb. and a maximum speed of 680 ft. per minute; the third has a maximum load of 14,900 lb. and a maximum speed of 1000 ft. per minute. These hoists are driven by 250-hp. and 300-hp. alternating-current motors, respectively.

Each installation consists, in addition to the hoist and motor, of an Allis-Chalmers liquid controller operated from the operator's platform, dial indicators provided with safety overwind switches and governor-operated slow-down devices. These latter work in conjunction with the brake engine and controller and operate to slow down and stop the hoist, should it exceed the speed limit, or attempt to overtravel and carry the cage into the sheaves.

The overwind switch operates in connection with the dial indicator and is so arranged that at a predetermined amount of overtravel the switch will open and cut off current from the hoist motor and from a solenoid-operated valve located on the brake engine, which automatically applies the brake at a speed regulated by the setting of the valve.

The slow-down device consists of a flywheel governor driven from the drum shaft by a chain in order to secure positive action, and of a solenoid-operated valve located in the controller tank operating in connection with the governor. In case the operator fails to slow down the hoist, when approaching the end of travel, the valve automatically operates and slows down the motor. The operation of this valve is dependent on the position of the cage and also on the speed of the governor.



DOUBLE-DRUM ELECTRIC HOIST BUILT FOR DAVIS COAL & COKE CO.

THE HOISTING PLANT OF THE DAVIS COAL & COKE CO.

Another characteristic and noteworthy installation is the hoisting plant of the Davis Coal & Coke Co.

This installation consists of a double-drum electric hoist, a 300-hp., 550-volt, 60-cycle, 3-phase, 600-r.p.m., variable-speed motor and a magnetic-type controller operated from a master drum. The hoist is designed to operate normally in balance. The maximum rope pull is 16,900 lb., and the maximum rope speed is 1300 ft. per min. One of the drums is keyed to the shaft while the other is driven by a multi-tooth type jaw clutch made of cast steel. The drums are carried on a common shaft.

Each drum is served by a powerful brake of the band type. Dial indicators are provided as also overwind devices. The hoist is operated by a variable-speed motor through a single reduction of "Wuest" double-helical cut gears.

The complete plant, including hoist, motor, switchboard and auxiliary apparatus was also designed and built by the Allis-Chalmers Company.

Recent Legal Decisions

Duty to Insulate Electric Wires—A coal operator is liable for injury to a miner caused by his coming in contact with an uninsulated electric wire on stepping aside in a mine passage to permit a mule and car to pass. (Michigan Supreme Court; Hazzard vs. Consolidated Coal Co.; 149 Northwestern Reporter, 991.)

Carrier's Liability for Discrimination—Suit against a railway company under the laws of Ohio to recover damages for discrimination in furnishing switching facilities must be brought within six years after the cause of action accrues. (United States Circuit Court of Appeals, Sixth Circuit; Hocking Valley R.R. Co. vs. New York Coal Co.; 217 Federal Reporter 727.)

Phases of Coal Sales Contracts—Under a contract for a sale of fuel to be delivered in carload lots and paid for on receipt of each car, the mere fact that the seller returned a check for a shipment on the mistaken ground that it did not cover the agreed price did not constitute such breach as entitled the buyer to rescind the contract, the seller having later admitted the mistake. But the buyer's failure to pay for 15 cars delivered was a breach which entitled the seller to rescind as to further deliveries. (Michigan Supreme Court; Stevens vs. Forrest; 149 Northwestern Reporter, 982.)

Duty to Miners' Loaders—Loaders employed by miners who have a contract with a mine operator for the widening of an entry and removal of coal and slate at a stated price per ton for coal mined, are employees of the operator in the sense that he is under legal obligation to use an ordinary degree of care to provide such loaders with a reasonably safe place of work; they being paid by the operators, although their wages are deducted from the amount due the contracting miners. Kentucky Court of Appeals, Bon Jellico Coal Co. vs. Murphy, 171 Southwestern Reporter 160.)

Responsibility for Death of Miner—A Colorado coal operator is liable for death of a coal miner, killed while on the slope of a mine when struck by a runaway car, if the accident is directly attributable to failure of the operator to provide places of refuge along the slope and proper safety devices at the head of the slope to avoid cars running away, and to negligent failure of another employee to properly couple the car to other cars before starting it down the slope. (Colorado Supreme Court; Taylor vs. Parkdale Fuel Co.; 144 Pacific Reporter, 1138.)

Authority of Officer of Corporation—Validity of Contract—One who is secretary, treasurer and general manager of a coal corporation has implied authority to bind it by a contract to buy coal within the scope of the company's business. When it appears that two parties have agreed through correspondence upon a contract of sale on certain terms, it will be deemed to be mutually binding, although one of them afterward refuses to sign a formal contract embodying the terms of the agreement. (United States Circuit Court of Appeals, Third Circuit; New York & Philadelphia Coal Co. vs. Meyersdale Coal Co.; 217 Federal Reporter 747.)

Damages in Condemnation of Land—In a suit by a coal company to recover for damages to land caused by condemnation of a strip by a railroad company to widen its right-of-way, it is held that the damages are to be measured by the depreciation in the market value of the whole tract caused by the taking. In determining the value of the land immediately before the condemnation, it is proper to consider the purposes for which the land was adapted, such as the operation of a coke plant in connection with an existing furnace plant. (Pennsylvania Supreme Court, Marine Coal Co. vs. P. M. & Y. R. Co.; 92 Atlantic Reporter, 688.)

Pennsylvania Statute Concerning Boreholes—Rule 18 of Article 25 of the Pennsylvania Bituminous Mining Act of June 9, 1911, reads: "In the cutting of clay veins, spars or faults, entries or other narrow workings, going into the solid coal, in mines wherein explosive gas is generated in dangerous quantities, a borehole shall be kept not less than 3 ft. in advance of the face of the work, or 3 ft. in advance of any shothole drilled for a blast to be fired in." Held, that enactment of this rule constituted a proper exercise of the legislature's power to provide for the safety of miners. Compliance with the requirement is necessary, although clay veins, spars or faults are not being cut, and are not known to exist in the place, and although there may be an honest difference of opinion as to the benefits to be derived from enforcement of the rule in a particular instance. (Court of Quarter Sessions, Fayette County; Commonwealth vs. Halvert; 42 Pennsylvania County Court Reports, 545.)

Reliable Inclined-Plane Equipment

In many portions of the coal fields of the United States, particularly western Pennsylvania, West Virginia and eastern Kentucky and Tennessee, the coal deposits lie in such a position that it is necessary to lower the output of the mine down a hill to the point of shipment. Under such conditions the force of gravity is often taken advantage of for the operation of the haulage equipment, and what is known as a self-acting inclined plane installed.

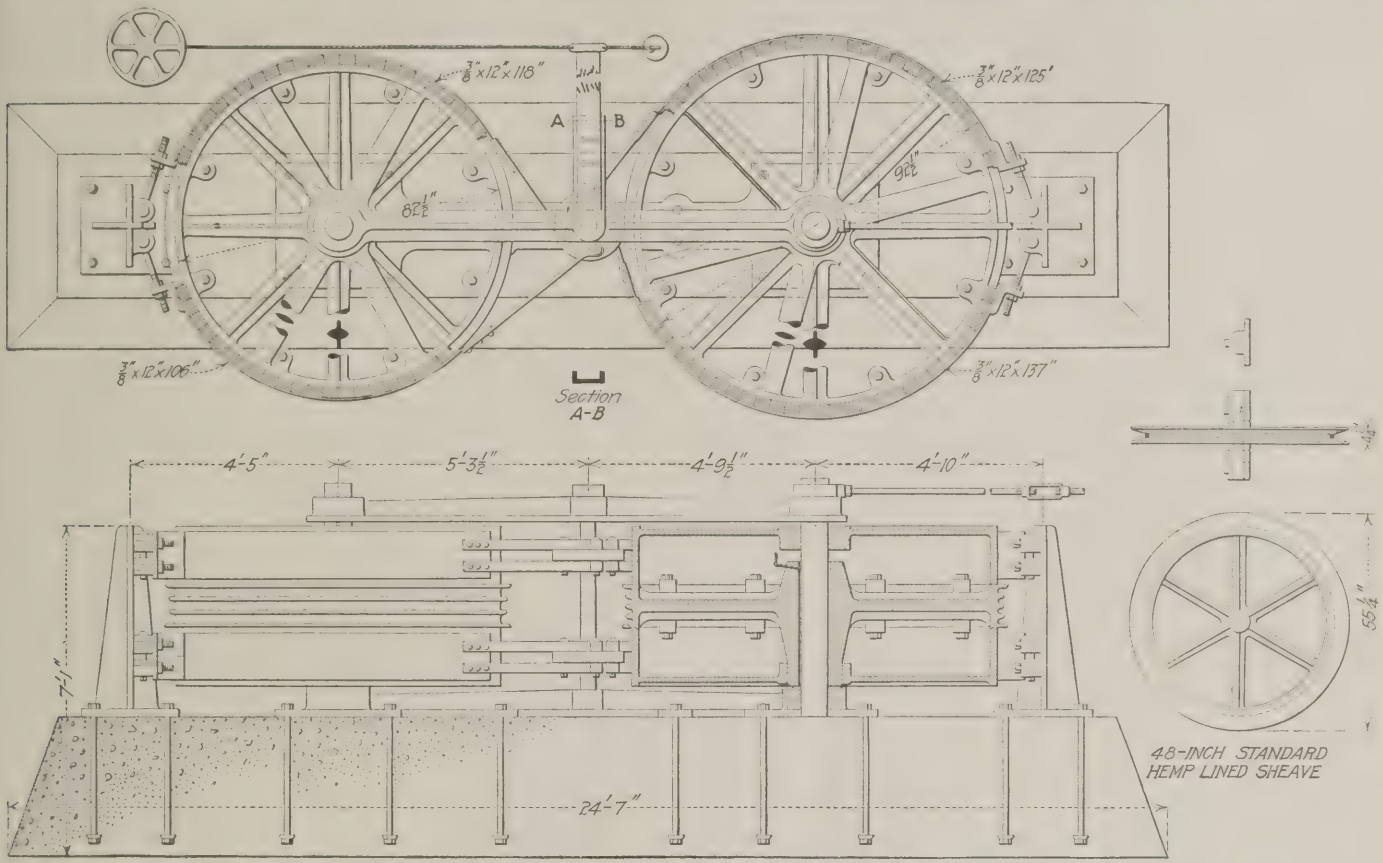


Fig. 1. A No. 16 Special Inclined-Plane Machine

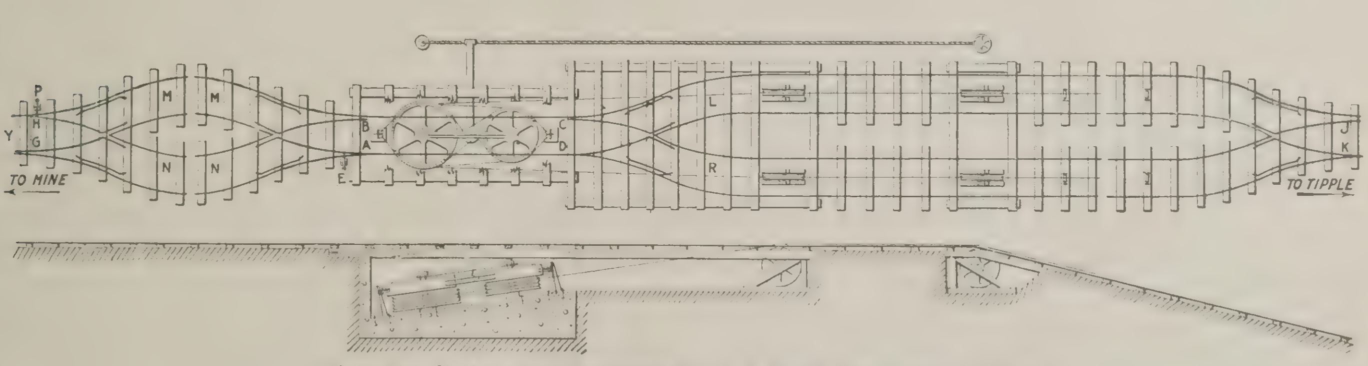

Fig. 2. Plan and Section of a 4-Rail Inclined Plane

The installation of this type of haulage, while apparently extremely simple, requires considerable care in the selection of the most advantageous location for the inclined plane and a thorough study of the topography of the ground traversed. It is highly essential not only to secure the most advantageous loading and dumping facilities, but also to provide proper machinery for perfectly controlling the loads and empties under all conditions. Such a machine must be abundantly strong to withstand exceptional stresses, and also have ample braking surface in order to control, check or stop each trip at any point on the plane with but slight exertion on the part of the operator.

The J. C. Stine Co. of Tyrone, Penn., which makes a specialty of coal-mining equipment, manufactures no less than 16 sizes of inclined-plane machines, all of which are similar in principle but differ in details of construction.

In this type of machine, which may be built either vertical or horizontal, the cable, which is continuous, passes back and forth between two pulleys, each provided with a series of rope grooves.

As is well known the resistance of a rope to slipping on a pulley increases directly with the square of the number of turns, thus, two complete coils of the rope upon the sheaves have a grip equal to four times that of one coil. Three coils have a holding power equal to nine times that of one coil, and so on. The result of this is that with but a few turns of the rope around the two pulleys an enormous holding power is secured, sufficient to carry any load which it may be desirable to handle upon the inclined plane.

In the machines manufactured by the above named company careful provision is made for braking. The brake wheel or wheels, as may be observed in the accompanying drawing, which shows a No. 16 special machine, are cast independent of the grooved wheel, thus relieving the latter of the stresses incident to braking. The brake bands, which are lined with renewable maple blocks, are so arranged that all are operated at the same time by the manipulation of a single lever.

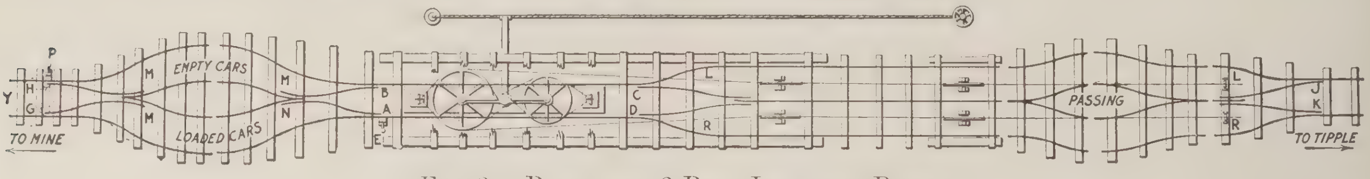

Fig. 3. Plan of a 3-Rail Inclined Plane

So far as the inclined plane itself is concerned one of the most difficult tasks confronting the person who contemplates the installation of one of these devices, is the track layout. The accompanying illustrations, Figs. 2 and 3, show two typical arrangements, one for a three-rail and the other for a four-rail incline. These layouts, however, are susceptible of many variations, as the inclined-plane machine may be placed either as shown below the track level or may be raised to the level of the ground between the tracks or placed to one side as the circumstances of the individual case show to be most desirable.

*

The Kentucky Compensation Act

By A. L. H. Street*

Several weeks ago I referred to a decision of the Court of Appeals of Kentucky holding certain features of the compensation act of that state to be unconstitutional. The decision seems to have created some general misapprehension as to the validity of the law, for the Court of Appeals has just handed down a supplemental opinion to make the original opinion more explicit. The court now makes it clear that the law is to be deemed invalid only so far as it purports to limit the amount which may be recovered for injury to an employee who has not expressly elected to come within the provisions of the law, and so far as the act provides for payment into the state compensation fund of any part of compensation due for death of a man who leaves no dependent relatives. The supplemental opinion reads, in part:

"First—The provisions of the present compensation act, as far as they affect the employer, are unobjectionable, as they do not conflict with any provisions of the Constitution.

"Second—Any employee coming within the provisions of the act may voluntarily agree to accept its provisions fixing and limiting his recovery in case of injury.

"Third—He may likewise voluntarily accept the provisions of the act fixing the amount that shall be recovered in the event of his death, and said sum should be paid to his dependents, if he leaves any, and, if not, to his personal representative. The legislature has no power to direct that this sum shall in any event be paid into the compensation fund."

Suggesting amendment of the law, the court adds:

"Fourth—Some provision should be made in the act whereby the employee signifies his acceptance of the provisions of the act by some affirmative act on his part. Silence on this subject should not be construed into acceptance.

"Fifth—Provision should be made in the act for appeal to a court of competent jurisdiction for review in all cases where compensation is denied, or where a less sum is allowed by the board than that claimed by the injured employee." (State Journal Co. vs. Workmen's Compensation Board, 172 Southwestern Reporter 674.)

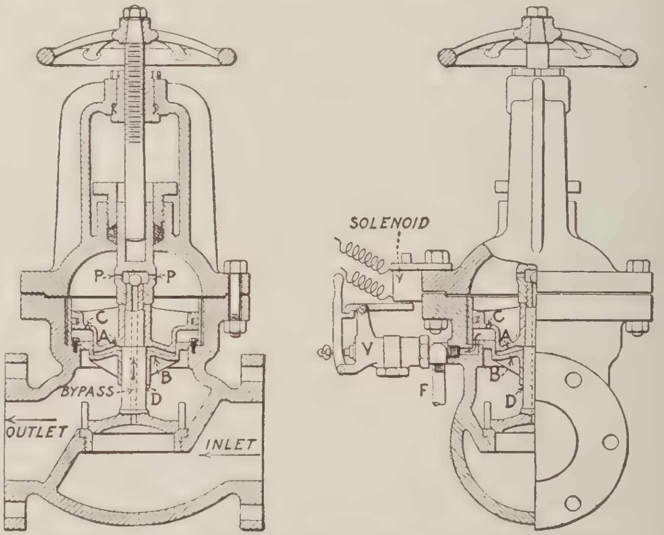
A Remote-Control Valve

An examining board in conducting a license examination for stationary engineers once asked the question: "What steps would you take in case the governor belt on the engine broke?" To this one of the applicants replied: "Unless I was within reach of the throttle I would take the engine-room steps three at a time."



Sectional Views of Emergency Trip Valve

When the power plant is running smoothly and each machine is faithfully performing its allotted function a multiplicity of safety devices is a superfluity. But when machine parts fail and the entire plant is threatened with disaster or destruction the most effective means of averting trouble is none too good. The first and most important lesson which the careful horse trainer impresses upon the colt he is breaking is implicit and unfailing obedience to the command "Whoa." In like manner the power-plant designer takes careful cognizance of the fact that the occasion may arise when it will be necessary in order to save the plant or even human life to stop either the entire plant or various units thereof easily and instantly. Deprived of steam the engine operating under load quickly "dies."

---

*Attorney-at-law, St. Paul, Minn.

In order to facilitate the immediate stoppage of either the entire plant or any of its constituent units the Golden-Anderson Valve Specialty Co., of Pittsburgh, Penn., has devised a line of valves, one of which is shown in the accompanying illustration. This particular valve may be controlled in any one of four methods: (1) Automatically, that is closing upon rupture of the pipe or other steam passage between the valve and the engine; (2) electrically by means of the solenoid; (3) by hand through manipulation of a valve in the small branch steam pipe; (4) by hand through the medium of the valve wheel in the ordinary manner.

This valve is intended as an emergency shut-off or engine stop valve and may be operated either by hand from the floor of the engine room or by push button or switch from the engineer's office or other points in the plant.

In an installation provided with this or similar devices which may be operated instantly from a remote point there is no necessity for "taking the engine-room steps three at a time" when a steam pipe bursts or an engine for any reason "runs away."

Safety Conditions for Wire Rope in Mine Hoists

By J. Bradford Richards*

SYNOPSIS—Interesting and valuable data relative to the care of hoisting ropes. All stresses that occur in daily operation are carefully cited and analyzed. Observations on the "factor of safety."

In any operation where men are to be hoisted from or lowered into a mine, the wire rope should be selected with the capacity for not only lifting the load, but doing so with a safe margin. This margin is called by mining engineers the "factory of safety." It varies from 4 to 8 times the load, and is rarely less than 5. By the load is meant the total weight lifted including the weight of the rope itself. Thus the ultimate or breaking strength of the rope is equal to the load multiplied by the factor of safety used.

There are two principal reasons why such margins of safety are justified. One is that, after having become worn out from use, or deteriorated by conditions, or both, the rope must still have a safe margin of reserve strength in order to prevent accident. The other reason is to provide against the mechanical losses from stresses due to bending over the drums and sheaves, starting and stopping, attaining speed, and the friction of the running gear.

Stresses Due to Bending and Friction

Stresses due to bending vary according to the sizes of drums and sheaves. If standard sizes are used, they are about 10 per cent. of the ultimate strength of the rope. If sizes one half the standard are used, about 20 per cent., and so on in inverse proportion. By "standard sizes" are meant those sizes as advised by wire-rope manufacturers in their catalogs. Stresses due to friction should not exceed 2 per cent. of the load for fair conditions.

Stresses induced by starting, stopping and speeding up, vary according to depth of hoist and rate of service or tonnage hoisted, but should not exceed 12 per cent. of the load in short lifts, or 25 per cent. of the load in deep shafts. Thus, when the several losses, including those due to wear and deterioration, are accounted for, the factor of safety is found to be justified.

Corrosion, by acid or sulphurous waters and dampness of the mine, is a frequent cause of deterioration. For this reason, failure to apply liberally a good rope dressing is another cause of deterioration. As a necessary factor for improved service, the importance of a well saturated rope cannot be overestimated.

That portion of the rope where the lower end is attached to the cage is also subject to deterioration. As the slack is taken up at the beginning of hoisting and the rope is pulled taut, the swaying is converted into vibrations; and, as the cage is wound toward the head sheave, these vibrations are increased and crowded into the shortening space. The effect on the socketed end is obvious. Crystallization of the wires takes place at this point. Therefore, at regular intervals, a portion of the rope next to the socket should be cut off and the end resocketed.

Advantage should be taken of these times of resocketing, to cut lengths sufficient for samples for observation and examination. By unlaying the strands and wires the condition as to deterioration of core and internal abrasion of the wires can be ascertained. If desirable these samples can be tested for strength and other physical properties at a laboratory fitted for this purpose. The facts learned in this way are a necessary adjunct to the daily inspection, as it is impossible for the eye to see the inside of the rope.

Daily Inspections Are Advisable

While keeping informed thus at these regular intervals as to the internal condition of the rope, it is desirable to be able to judge of the progress of wearing generally, by superficial observation at the daily inspections. Frictional wear and corrosion externally, abrasion of the wires and deterioration of the core internally, due to use and conditions, are taking place. When the wires are worn down, thereby reducing the cross-section and lessening the strength of the rope, broken wires begin to appear along its surface. As wearing continues, the number of breaks increases. The significance of this increase is the evident sign of diminishing strength, because the broken wires are the result of the weakened condition.

As long as the breaks are far apart, the frictional tenacity of the rope does not relax, so that its strength is not impaired in proportion to the number of breaks. But when several are observed near one point, as within one rope lay, the strength is much more affected. Thus, it is, that the number and location of the broken wires become largely an index of the safe condition of the rope. In other words, a certain number of broken wires in one rope lay, together with a certain loss by frictional wear as found by gage, is an indication of a definite lowering of the factor of safety; and finally, a point will be reached when this percentage of loss coincides with that point fixed as the limit of safety of the rope.

---

*Assistant engineer, Hazard Mfg. Co., Wilkes-Barre, Penn.

The following table is appended to show the several stresses in the case of a 1200-ft. hoist. Wire rope used, 1½-in. cast steel, standard construction. Time for a single hoist, 45 sec. Maximum speed 2000 ft. per min. Weight per foot of rope, 3.55 lb. Weight of 1200 ft., 2.13 tons. Weight of cage and material to be hoisted, 9 tons. Size of drum and head sheave, 12 ft.

TABLE SHOWING STRESSES IN A HOISTING ROPE

Stresses Due to	In Tons	In per Cent. of Ultimate
Load (including weight of rope)	11.13	17.5
Friction (2 per cent. of load)	0.22	0.3
Starting, stopping and speeding up (about 12 per cent. of load)	1.34	2.2
Bending (about 5 per cent. of ultimate for 12-ft. sheave)	3.17	5.0
Total working stress	15.86	25.0
Net safe margin	47.58	75.0
Ultimate strength	63.44	100.0

Factor of safety = Ultimate strength ÷ Load = 5.74 when new.

Net factor of safety = Ultimate strength ÷ Total working stress = 4 when new.

After a further loss of 25 per cent. from use, the ultimate strength would be reduced to 47.58 tons. The factor of safety would then be 47.58 ÷ 11.13 = 4.3 and the net factor of safety would be 47.58 ÷ 15.86 = 3, if there had been no change in the other stresses. But while the rope has worn down it has stretched, causing the stress due to bending to increase. The result is that after a loss of 25 per cent. from use, the net factor of safety would be less than 3.

For safe conditions, an original factor of safety of 4 as a minimum and preferably 5 should be used. And when from loss of section through frictional wear, or deterioration through all other conditions, or both, the rope shows a total loss of 25 per cent. of its original strength, the danger point has been reached.

This subject is now being carefully investigated by the U. S. Bureau of Mines, and a report with recommendations will doubtless be made in due course on its findings.

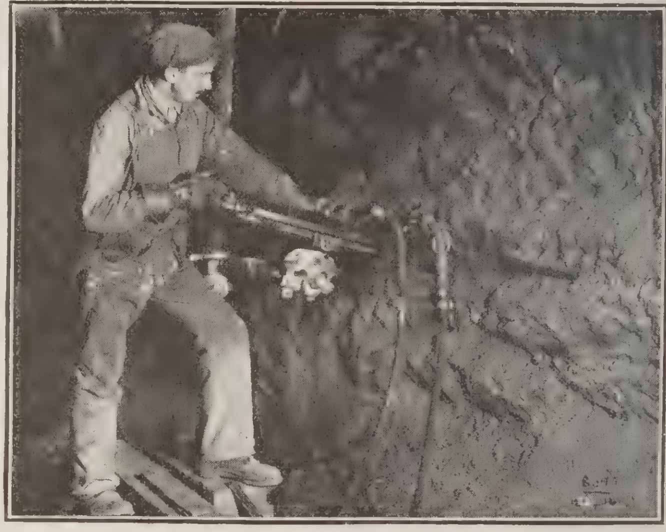
Mounted Jackhamers

Jackhamer drills have been extensively employed in coal mines for many purposes, including taking down top rock, breaking down coal, driving gangways and in general development work. The success attained in this field has been due to certain unique features which the machine possesses, such as its high speed of operation, its ability to penetrate any material, from the softest coal to the hardest rock without changing steels, the ease with which the tool is operated due to its automatic features and comparatively light weight and its general ruggedness and simplicity of design.

While the standard unmounted jackhamer is suitable for most of the operations of mining coal, occasions may arise where the drilling of horizontal holes has to be carried on and under such circumstances the effort of holding the drill to the work is apt to tire the workman.

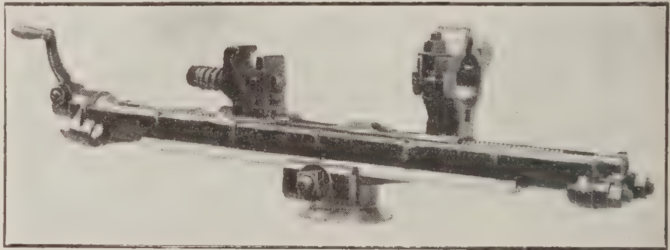
Realizing the need for a mounting that would not be cumbersome, but at the same time would be heavy enough to withstand rough usage, the Ingersoll-Rand Co., 11 Broadway, New York, developed, after considerable experimentation, the mounting shown in the accompanying illustrations which is known as the "JM-6" type.

It is but an instant's work to clamp the standard jackhamer in the carriage of the mounting. Therefore, a single drill may be used conveniently for the twofold purpose of drilling horizontal and vertical holes without serious loss of time in making changes. Whether used as a mounted or as a hand drill, the jackhamer retains all the advantages due to its rapid drilling speed, the self-rotating feature and the efficient means for keeping the borehole clean.



A Mounted Jackhamer in Use

A water-feed device of the Leyner type has recently been developed for use with the jackhamer whenever trouble from dust arises. The "JM-6" mounting is adapted for use with both plain and water-feed types of these drills. The clamp which grips the handle of the drill is provided with a cushion spring to take up the shock when a steel is being pulled out of a hole. The forward clamp on the carriage does not grip the machine firmly, but serves only as a support and guide.



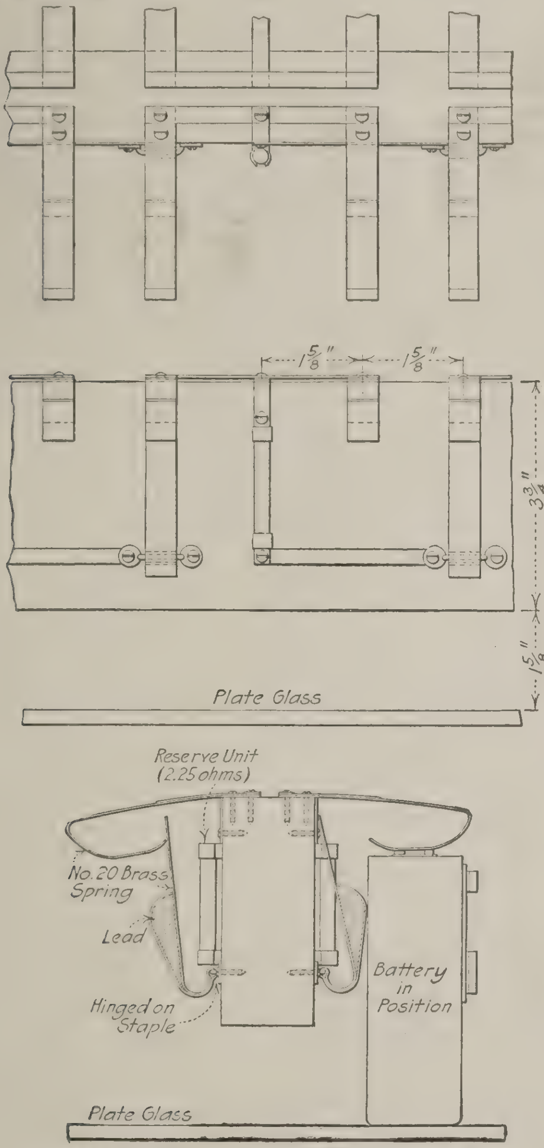
The Drill Mounting

The mounting is adapted for use either on the arm of a vertical column or a horizontal shaft bar, while the cone upon which the shell rests will fit into any 5-in. Sergeant saddle or clamp. The sliding cone gives a quick adjustment when setting up and can be used to increase the length of feed whenever necessary. The length of the feed-screw is a full 24 in. Adding to this the slide of the cone on the shell, which is over 19 in., it will be seen that the total travel is in excess of 43 in.

and may be obtained whenever desired. The total weight of the mounting is 63 lb. Steel castings and drop forgings are employed throughout in its construction, insuring ability to withstand hard usage.

Pottsville Charging Rack for Miner's Electric-Lamp Batteries

Where the miner's electric lamp is being used in large quantities, charging racks are provided with contacts arranged to facilitate the insertion of the storage batteries each day for charging.



Details of Pottsville Charging Rack

Considerable annoyance and delay have been experienced with the designs now in use, and, with the view of overcoming all objections to this part of the equipment, the Philadelphia & Reading Coal & Iron Co., the pioneers of the electric cap lamp, recently brought out the equipment shown in the accompanying sketch and known as the "Pottsville charging rack."

It consists essentially of two brass springs connected to the positive and negative charging circuit which makes the contacts with the positive and negative terminals on the battery. There is also a pivoted weighted brass spring which makes contact with the positive charging spring when the battery is removed, and a resistance unit connected between the weighted spring and the negative charging spring. The charging springs are reinforced with a pressure spring and are so designed that little travel is made when a battery is inserted, thus insuring a flat strong contact on the battery terminals and preventing the contacts from bending out of position.

When the battery is placed on the charging rack, contact is first made for an instant with the battery terminals and the two charging springs before the weighted spring is reached. This position does not short-circuit the battery as the charging current is flowing through the resistance and the voltage drop across the resistance will balance the battery voltage, hence no current flows. If the charging circuit is off when a battery is put on the rack, the battery will for the instant discharge through the resistance at only its normal discharge rate, hence it is impossible to short-circuit the battery.

As the battery is pushed forward under the charging springs, it moves the weighted pivoted spring forward, breaking its contact with the positive charging spring and diverting the charging current through the battery instead of the resistance which is now cut out. When the battery is taken out of the charging contacts, the above process is reversed and the charging current is reëstablished through the resistance, thus leaving the main charging current value undisturbed without sparking at any contacts.

As the voltage drop across the resistance is practically the same as the battery voltage, any number of batteries may be put on or taken off the charging rack without any adjustment of the charging current value. Since the pivoted-contact device operates by weight, it is always positive in its action and needs no attention for adjustment; the movement of the charging spring at the point of contact produces a wiping action which keeps the contacts clean.

Anthracite Notes

A little known phase of the anthracite mining industry is the use of expensive barometers at the principal collieries of all the big companies, especially where the mines are gaseous. When the atmospheric pressure is decreasing, gas is released more easily, and the firebosses all look at the barometers before going into the mines to make their morning inspections. When the barometer is going down they look and test with extra care for gas.

Following the example of the large coal operators, a movement is on foot among several of the so called independent operators in Scranton to train first-aid teams with the coöperation of the Y. M. C. A. Last year teams from the Bull's Head Coal Co., Green Ridge Coal Co., Clearview Coal Co., Carney & Brown, and Nay Aug Coal Co. were given twelve weeks' training, but held no contest. This year State Mine Inspector S. J. Phillips, who is fostering the movement, hopes to induce the Peoples' Coal Co. and the Spencer Coal Co. also to join, and there may be an inter-company contest for a cup offered by the Y. M. C. A. and a banquet. The medical director is to be Dr. Harry Smith, and the expenses will be borne by the companies. Forty-two boy scouts from 12 to 16 years old are now being trained in first-aid-to-the-injured practice at the Scranton Y. M. C. A.

Explosion at the Layland Mine

A severe explosion occurred at 8:25 a.m. on Mar. 2 at the Layland, or No. 3 mine, at Layland, W. Va., a town lying at the head of the Quinnimont branch of the Chesapeake & Ohio Ry. in Fayette County, near the eastern edge of the New River coal field. The mine is owned by the New River & Pocahontas Consolidated Coal Co., an affiliation of the Berwind-White Coal Mining Co. It is working the Fire Creek bed.

It is early yet to state how many lives were lost. Reports show that 10 men were saved and probably 174 were killed. Of these, the bodies of 17 have been recovered. The force of the explosion was so violent that the stone arch over the main portal of the mine was destroyed, windows were broken within a radius of 300 yd., and the explosion was felt for miles around. A. B. Cooper, who was delivering groceries to a house about 75 yd. distant from the mine, was blown against a telegraph pole and killed.

The work of rescue is being aided by rescue car No. 8 of the U. S. Bureau of Mines, which, when the explosion occurred, was located at Glen Alum, Mingo County, W. Va., a village which, from a railroad point of view, is quite remote from the scene of the accident. The rescue force did not arrive till night, but the work of recovering the bodies and the few living men had been actively prosecuted all day by local miners.

Operators Disagree on Co-operative Plan

By H. S. Mikesell

It seems that notwithstanding the persistent efforts put forth by H. C. Adams, of the Jones & Adams Co., for a return to the 1¼-in. lump screen basis by all the operators of the Western bituminous territory, which has been considered by many a matter of vital importance to the soft coal production of the country, the coöperative plan suggested will not become operative. This is mainly for the reason that the eastern Kentucky and Franklin County, Ill., operators will not join in the movement.

These two interests with heavy production are probably at the present time the strongest competitors for Western tonnage and market six or seven different sizes of coal. With their refusal to enter into the suggested arrangement is seems inopportune for the operators of other districts in the five states to standardize their lump production on a 1¼-in. basis.

The eastern Kentucky and Franklin County operators claim that there are many advantages to them in the preparation of the different sizes they are now making, and while Indiana, Ohio and West Virginia operators apparently strongly favor standardization, the undertaking now fails because of the disinclination of these two districts to coöperate with the rest. It is quite obvious to the operators in favor of this plan that its adoption would result in the production of less coal in excess of demand, and it was welcomed by a majority of the retail coal dealers, although some of the railroads were opposed to it because it meant extra expense in sizing the coal in engine chutes, and especially where the railroads were burning egg or smaller sizes and had not been accustomed to use lump.

It is regrettable that here is another case where the producers cannot all agree on a coöperative plan of merit when it is evident to every soft-coal operator that the present method of preparation is most unsatisfactory and unprofitable. The screening of 4-in., 6-in. and even 8-in. lump coal in sufficient quantities to take care of the fall and winter demand for these sizes has always resulted in the production of numerous grades of small coal for which there is no regular demand. These small sizes accumulate every season, and have to be sacrificed at almost any price to relieve the car situation. The effect has always been to demoralize the market. The only alternative seems to be compulsory legislation to prevent this economic waste.

Gain in Production of Somerset County, Penn.

The production of the twentieth bituminous district of Pennsylvania comprising all Somerset County south of Holsopple increased in 1914. The inspector, F. W. Cunningham, says that he believes that no other district in Pennsylvania will show a gain.

The low percentage of volatile matter in the coal of Somerset County renders it of high heating quality and smokeless. Consequently it is highly desirable for naval, marine and industrial uses while unsuited for coking in ordinary beehive ovens. The inactivity in the steel business has therefore not affected it while the demand for a coal, not only pure but also efficient and for one free from smoke has given Somerset a lead over many of its competitors. Coal is no longer bought because it has a pretty look.

We give the outputs for 1913 and 1914 of the seven leading companies. The production of only one of these declined last year.

STATISTICS OF BITUMINOUS DISTRICT NO. 20 OF PENNSYLVANIA

Mines (87 in operation)	108
Tons of coal shipped to market	6,713,727
Tons used at mines for steam and heat	166,122
Tons sold to local trade and used by employees	26,263
Total tons of coal produced (gain 262,647)	6,906,113
Coke ovens (all idle)	225
Tons of coal produced by pick mining	4,965,793
Tons produced by compressed-air machines	298,661
Tons produced by electrical machines	1,641,659
Persons employed inside of mines (gain 1126)	7,365
Persons employed outside (gain 240)	950

PRODUCTION OF COAL—SHORT TONS

	1913	1914
Consolidation Coal Co.	1,952,760	1,990,638
Jenner-Quemahoning Coal Co.	918,259	932,035
Quemahoning Coal Co.	631,480	669,193
Brothersvalley Coal Co	488,083	550,481
Somerset Smokeless Coal Co.	483,327	505,767
Knickerbocker Smokeless Coal Co.	241,905	311,128
Baker-Whiteley Coal Co.	201,627	200,265

Don'ts for First-Aid Men

Don't stimulate with alcohol; aromatic spirits of ammonia is preferred. Procure hot coffee as soon as possible.

Don't tear clothing from a person burned; cut it off.

Don't expose to the air large burned surfaces; dress them quickly.

Don't think that in the great Safety-First movement you are working for the special interest of your employer. You are not; you are working for yourself and your fellowmen.

Don't attempt to give stimulants to an unconscious person. The fluid may run into his lungs instead of his stomach.

Editorials

Private Privilege

History has been full of the contests between the people at large and private privilege. Whenever the latter appears, there are always many fulminations against it as if it were new, and not an old offender rearing its ugly head once more.

So we must not get unduly angry when the miner at the face tries to do what men who pride themselves on better mental equipment and even, in their folly, on better moral status have repeatedly tried to do in the past. Nevertheless, though the miner is by no means the first or only offender, the public must be firm. The miner must not be allowed to restrict the foremanship and inspectorship to the particular class of men that have mined coal at the face as he purposes to do with the help of the electorate in Senate Bill 160, now in the Pennsylvania legislature.

When we look over the list of inspectors and foremen we are disposed to say that practice has almost excluded all men but miners from the positions in question. There has always been a disposition to qualify and select such men. Law or no law, they have been usually so chosen. There is no deep-seated conspiracy against the man of the pick and the drill. Perhaps this is as it should be, but nevertheless the passage of a restrictive law is not to be commended.

The miner should always be careful lest he stir up retaliatory measures. Why not pass legislation forbidding miners to enter the legislature unless they have served a period as page-boys or scriveners, or preventing them from being operators unless they have spent a period at billing coal? We may as well be logical in making our requirements.

It must be remembered that there are many things nearly as important to the safety of the miner as safe coal-getting. There are gas inspection and removal, the province of the fireboss; safe timbering, the work of the timberman; safe ventilation, the part of the bratticeman; the avoidance of breaking into accumulations of water and gas, the function of the surveyor; the maintenance of safety appliances, the duty of the mechanical engineer; and the general coördination of these and many other duties, the daily occupation of the supervisional force.

And it is fair to ask, Is mining the only wisdom-giving function around a coal mine? Moreover, should the miner be the sole care of legislature and union, or is a man to be chosen or rejected for his abilities alone and not according to certain arbitrary tests which a majority ordains?

Apparently the miners have used their numerical superiority in the union to back their demands against those of other union men. Let them remember that if the right to hold office depends on voting strength, then the hewer of coal is not entitled to any place in the gift of the people. The farmer would by that right carry away all the honors, and the miner would be compelled to spend his labor at the pleasure of the man who followed the plow.

Just as the farmer is not justified in tyrannizing over the public, so is the miner without excuse in forcing his numerical superiority on the other mine employees and in saying, "You shall not seek preferment, because you belong to only a small category of workers."

"Business as Usual" but under Difficulties

The American operator's little tale of woe has worn him till he is weary with its iteration, and we will not refer to it now. We will rather lift the curtain today on the conditions under which the British coal trade is doing "business as usual" but under difficulties. The British coal master tries hard, like a good business man, to assure the world that business is unaffected by the war, but we feel he must agree with the American coal-mine operator and confess that the times are grievously out of joint.

To begin with, the shipment of coal, coke and patent fuel for January was only 60 per cent. of that of a year ago when there was no war. The foreign bunker trade of the British has been equally reduced in percentage. But, it must be remembered, that this does not include coal sold to the admiralty. So perhaps the fall of 2,300,000 tons per month in exports and 360,000 tons in foreign bunker trade is made good by these governmental purchases.

But it is those who are not supplying the navy who will suffer most in the coke and patent-fuel decline, and the west Yorkshire producers who mine fuel of the coking and patent-fuel type doubtless have suffered severely. The fact that South Wales is busy supplying the fleet hardly makes amends to the Yorkshire man for the decline in his own market.

The coal operators in west Yorkshire have had to face, in common with other operators, a decrease in the receipt of props of 30 per cent. and an increase in their price of about 45 per cent. And concurrently they have to meet a threatened strike of the coal miners who thought the great world war would give them an unequaled opportunity to increase their minimum wage. The operators gave way "with the object of avoiding the disastrous consequences of a coal strike in a national crisis" and conceded the contentions of the workmen's representatives as they specifically stated in their reply "during the continuance of the war between this country and Germany."

Increasing wages when work is not steady is a trying task, for the fixed charges, the pumping, the maintenance of the workings, and the banking of fires all bear heavily on the operator. The price of exported coal has gone up 3 per cent., or 10c. per ton, since the war started, but the west Yorkshire operator will have to look for a further rise if, during the war, he is to participate in "dividends as usual."

The Storage-Battery Locomotive

The evidence is constantly accumulating that the storage-battery locomotive has come to stay and perhaps even to oust its rivals. It is of course not absolutely safe in the presence of gas, but as the sparks it makes are not near the roof, the danger is lessened, for the gas must be in large quantity if it is to settle so low as to be ignited.

Another increase of safety with the battery locomotive results from its shortened electric circuit. The current does not pass from the power house to the motor and back through the rails to the generator, but the circuit is contained within the locomotive—not even the wheels are included in its range.

Thus if it is true that there is a risk of stray currents prematurely igniting shots, the current of the storage-battery locomotive can meet the accusation with a perfect alibi. And, of course, as there is no conducting wire, there can be no short circuits to ignite gas, coal dust or wooden structures.

The travel of the electric current along the drawbars and couplings of a train of mine cars has always been a strong objection to the trolley locomotive, as it has occasionally shocked men and ignited powder. For this reason operators have sought to improve the grounding of the traction rigging and to make powder cars relatively nonconducting throughout. In other cases the powder car has been hauled around by a mule.

The battery locomotive, however, having its current self-contained, does not offer any such risk. It seems that it would serve admirably for hauling men and transporting material, explosive and otherwise, into and out of the mines. By switching off the electric current on the main haulage road, the loading of men on the man trip and their passage along the road at the beginning and end of the day would be robbed of its dangers, some of which, though unnecessary, are unavoidable so long as careless and ignorant men are employed.

True, the use of a section insulator at the point of embarkation or disembarking has been occasionally adopted and has probably saved many lives, but the adoption of the battery locomotive for haulage is even more a safeguard against such accidents and removes, as has been said, the further danger of the ignition of powder.

In view of the fact that the storage-battery locomotive is not absolutely safe, but only safer than other forms of electrical haulage, it will probably not be adopted for that cause alone. But it has many other advantages.

In mines where all or part of the night load is quite light, it is customary to delay pumping till the mines are closed down. In the Middle West not much water has to be pumped. In other mines the water often runs out by gravity. Consequently, if undercutting is done at night and the coal is loaded and hauled out by day, there is a third shift during which the storage-battery locomotives can be charged. This tends to keep the load curve even and to save in expense. Additional boosting of the locomotive batteries can be performed during the lunch hours and when shifts are being changed, should the batteries need it and should the men walk to their work.

It has been generally thought that the storage-battery repairs would be excessive, but it must be remembered that there are no trolley harps, wheels and supports to be maintained in condition. The cnance of the armature bearings and poles heating or rubbing is about the same in both battery and trolley locomotives. The battery renewals *might*, however, cost so much that the cost of harps, wheels and supports would appear only a trifling drawback to electric locomotives.

This does not seem to be proved in practice, where the batteries are of the right kind. At Kellogg, Idaho, three types of locomotives were used. Because the conditions under which the statistics were collected are manifestly unfair to one locomotive, because the work it was required to perform was unduly light, because it was only credited with useful work and not with the waste rock it hauled, and because its time of service has been short, we will omit all reference to it. One 2½-ton locomotive operated with a combined repair and upkeep cost of $0.00359 per ton. Roughly this is three tons to the cent. The running of a 4-ton locomotive cost $0.00434 per ton of mineral hauled.

These figures, which are evidently of reasonable magnitude and not warranted to cause objection from those who think of purchasing storage-battery locomotives, are nevertheless loaded with costs which do not rightly belong to them. They include the cost of alterations and partial rebuilding at the time when the battery locomotive was installed. The locomotives had to be adapted to the charging system, and provision had to be made to protect them from the water issuing from the chutes under which they had to pass.

As the first locomotive had run only 20 months and the second only 17, this first cost had much to do with the repair and maintenance charges. G. W. Gwinn, who read a paper on these locomotives at the recent meeting of the American Institute of Mining Engineers, stated that the company's engineers believe that the upkeep and repair charges will be 75 per cent. less than for trolley locomotives doing the same work. This is based on an actual experience with excellent makes of trolley locomotives and gives no consideration to the expense of maintaining trolley wires and track bonding, which kept two men busy practically all the time on the somewhat longer stretches of trolley haulage.

⁂

The House Mines Subcommittee has made its report on the conditions in Colorado. It states that "Mr. Rockefeller has done much for the uplift of people in other parts of the country and in foreign lands, spending millions of dollars in this work, yet he has not endeavored to improve the conditions of the more than 6000 employees in the company with which he is connected." All we can say is that if he hasn't, someone has, as our series of articles on the sociological work of the Colorado Fuel & Iron Co. amply proves. But, unintentionally, the report is fair, for in blaming him later for his direction of the Fuel Co., it incidentally must give him credit for the good work that company has done to ameliorate conditions in the mine villages.

⁂

Representative Whittacre of Columbiana County, Ohio, has introduced a bill to relieve conditions in that state by requiring the state board of administration to buy only Ohio coal. Apparently Ohio is on the high road to nullification. Logically the next move would be to put a tax on coal imported from neighboring states.

Discussion By Readers

Drying Washed Coal

Letter No. 5—Several replies have been written to the letter of John Hammond, Coal Age, Nov. 28, p. 879. All of these articles have justly conceded the superiority of the centrifugal drier over all other known methods.

The reduction in percentage of moisture obtained by this method of drying, however, cannot be stated in a general way to be a certain amount, without giving all the conditions and factors entering into the case. In order to definitely control the moisture content of the product delivered from a centrifugal machine, it must at once be clear to anyone that four things are absolutely essential; namely, control of the speed of the machine; control of the capacity of the machine; control of the time that the material is to be held in the drier; and the character of material to be handled.

The speed of the machine will be limited by the strength of the material entering into it and will probably not much exceed 6000 ft. per min., at the periphery. The speed being thus limited, the remaining factor under control should be the time that the material is held in the machine before being discharged. The character of the material handled will largely determine the time of retention in the machine. Experiment only will determine this time factor for a given percentage of reduction of moisture.

Having adopted a suitable time factor and speed for a given material, the *capacity of the machine* is then determined by the size of the container, as it will be clearly seen that a drier is merely the conveyor of a given amount of material as determined by its volume, in a given time. To attain control of the time factor in a large-capacity machine was the problem confronting many experimenters in coal drying. In small-capacity machines used for drying sugar, salt, sulphate, etc., this control is obtained by loading the machine while at rest, then running it for a definite time until the moisture content was reduced the desired amount. The machine was then stopped and unloaded. Such a method is, of course, out of the question with the large capacities required in drying coal.

Carl Wendell, a graduate mining engineer of Frieburg, Germany, and now experimental engineer for the Illinois Steel Co., began the serious study of the methods of drying washed coal for the coke ovens in the steel plant five or six years ago. After building five different machines and spending some twenty thousand dollars, he finally developed a machine of large capacity with continuous feed and continuous discharge. In this drier, the time factor was absolutely under control. It is interesting to note that Mr. Wendell experimented with cone-type machines fed at the apex and depending on the centrifugal force developed by the rotation to slowly drive the coal down or up the slopes, while at the same time driving off the moisture. He experimented with cones having the apex upward and driving the coal downward, as well as with inverted cones that drove the coal upward. Due to the clogging and building up of the material and the erratic discharge, however, this method was finally abandoned. Plows and scrapers were tried to remove the material from the screens; but these wore the screens excessively and, as can be readily conceived, gave no control of the time or of the moisture content and consumed an excessive amount of power in scraping off the packed material.

Mr. Wendell finally built two machines, both of which gave absolute control of the time factor and entirely did away with scraping or plowing in the discharge of the material. The two machines, however, accomplished this end in different ways. The last one built was a complete success for large capacities and is now made so that it is possible to retain the material from a few seconds to a quarter of an hour or longer, by simple gear changes.

Three of these machines have been installed in the Woodward Iron Co.'s plant at Woodward, Ala. They are handling from 50 to 60 tons per hour. They retain the coal, approximately, one-half minute and reduce the moisture from 30 and 50 per cent. to an average of about 8 per cent., which is the amount required by the coke-oven department of the Woodward Co., to obtain the best results in the ovens. The coal is driven at a speed of, approximately, 6000 ft. per min., in these machines. The moisture in this coal could be further reduced, in the two ways mentioned above; namely, by speeding up the machine to 7000 or 8000 ft. per min. or by increasing the length of time in the machines. It must be borne in mind, however, that the external moisture in any material is all that can be reduced by the centrifugal process. Water of composition is not expelled by this process.

Coke-oven men differ in their ideas as to what is the proper percentage of moisture in coal for coking purposes. The moisture content seems to affect both the quantity of the byproducts and the quality of the coke produced. The centrifugal dryer has demonstrated its ability to produce a product of proper moisture content for any reasonable demand of coke-oven operators.

Longwall in the Pittsburgh Seam

Letter No. 2—In his letter referring to the recent discussion of the question of the adaptation of the longwall system of mining to work in the Pittsburgh seam, Coal Age, Feb. 13, p. 303, G. R. Waddell suggests that this system should be adopted and used in working the eastern Ohio No. 8 seam. He quotes S. A. Taylor as being opposed to its adoption and saying that "the roof breaks up too high, sometimes as much as twenty feet, and the bottom is too soft." That statement is true over practically the whole district.

Everybody knows that the overlying strata have an important bearing on the success of longwall mining; but what Mr. Taylor referred to was that, anywhere from three to thirty feet above the coal in this seam, is encountered a limestone stratum that refuses to break, being too thick. Consequently, when the coal has been mined without leaving sufficient pillars and the strata immediately above this coal have caved, the thick limestone supporting the upper measures gradually sags or bends under the enormous weight, until it comes to rest on the mine floor. This bending exerts a great pressure on the face of the live workings—not the moderate roof pressure that Mr. Waddell describes, but a heavy squeeze that closes all entries and proves disastrous to the mine. All roof falls that occur in the No. 8 seam, in eastern Ohio, only break to the limestone. On numerous occasions, operators have tried to get a break of this same limestone, in order to stop the progress of the squeeze over the live workings but have had little success.

Mr. Waddell appears to criticize the mine officials of this district; and suggests some ignorance on their part. Allow me to say that, while there are some officials in the district whose knowledge of mining would warrant such an aspersion, the district also possesses many brainy and capable coal men.

Invariably when a superintendent and mine foreman from Pennsylvania take charge of a mine, either in this district or the West Virginia Panhandle, they want to start to draw the pillars as they do in the same seam in the Pittsburgh district. Let some of the men from there who have tried it testify as to the results.

I have had a varied experience in eastern Ohio and the Panhandle mines and have been observant of conditions and results and worked along recognized progressive lines. At present I am operating not farther than eight miles from Mr. Waddell, and if he can show me a mine that is being worked on either the longwall or the room-and-pillar system and getting 85 per cent. of the coal in eastern Ohio No. 8 seam, I will be grateful; but he will have to show me.

ENGINEER.

Stopping Payroll Leaks

Letter No. 2—In addition to the interesting suggestions given by J. Kenvin, in reference to stopping payroll leaks, COAL AGE, Feb. 20, p. 343, I would like to add the following:

The foremen's timebook should be used but once. If the company pays twice a month, the timebook should run from the first to the fifteenth of the month, and from the sixteenth to the thirty-first, inclusive. These books should contain as few leaves as possible so that they can be filed away in a small space, after the records have been entered on the payroll sheet. Each foreman should turn in his book to the office on the first and the sixteenth days of the month and receive a new book for his use until the next pay.

The payroll clerk should check up the books turned in by the foreman with the daily reports to see that they agree, and care should be taken to place each item of expense in its proper column so that a full account can be kept of the payroll expenditures. It too often happens that not sufficient care is taken in the making out of the daily report and the proper distribution of the time is left for the foreman's monthly report.

Every mine superintendent who does his duty makes a careful inspection of the cost-sheet each day the mine is running. By this means, he knows the actual cost of producing coal each day; and if this cost of production is excessive, he will investigate immediately to ascertain the cause. It frequently develops that the daily cost of production at a mine fluctuates or is temporarily increased by the habit that some mine foremen have of turning in time for men that has been omitted from a previous report. There is no question but that the time worked should be entered on the payroll, in order that men will not lose their pay because of the forgetfulness of a boss; but this should come to the superintendent's attention, that more care may be exercised in the making out of future reports. Instances of this kind that occurred in my own experience were referred to the superintendent for authority to make the entry on the payroll. If this is not required, the opportunity is offered for padding the payroll.

With a little care and the use of proper blanks, the daily cost-sheet can be kept in a manner that will show at a glance the cost of production per ton of coal mined, for each day. The arrangement of the daily report should be such as to divide the expense in the same manner as required by the payroll-sheet. It is a good plan to make a close comparison between the weigh-sheet and the daily report.

As has been suggested, it is the duty of the engineer to check all measurements of contract work. He should make these checks from his own spads driven in the roof and not rely upon paint marks, as these are often changed by men disposed to crooked work. There is not the same danger of an engineer's spad being changed, as any meddling with this would at once be detected by the engineer. Instances have come to my notice where paint marks have been altered and the mistake has not been discovered until some time later when the reports of yardage were compared with map measurements and found to considerably exceed the actual distance driven.

Mining Laws, Legislation and Mine Regulations

Letter No. 36—In a recent letter, COAL AGE, Feb. 13, p. 303, discussing needed mining laws and legislation, George D. Evans referred to the anthracite law of Pennsylvania requiring that an applicant for a mine-foreman's certificate must not only be able to pass the examination, but must also give satisfactory evidence that he has had at least "five years' practical experience as a miner," which he stated was then being contested in the Pennsylvania courts to determine the intended meaning of the words "practical experience as a miner."

In this connection, it will be of interest to know that in order to qualify for the position of mine foreman or assistant mine foreman in an anthracite mine in Pennsylvania, one need not have had the five years' practical experience in mining coal at the face or cutting coal directly from the vein, as demanded in the law. This conclusion was reached lately by the Court of Common Pleas of Dauphin County, Penn., in the case of Matthews vs. Roderick. The suit was brought to enjoin issuance of certificates to 142 persons who had passed examinations for mine foremanship and assistant foremanship, but had not had the specific experience mentioned in the law.

In dismissing this suit, the court said: "The statute, however, does not, in terms, declare what is necessary to constitute the five years' practical experience as miners. It does not say that this experience must be in cutting coal or in the doing of any particular work in a mine. A person successfully passing an examination must satisfy the board of examiners that he has had five years' practical experience as a miner, and each board is left to determine in the case of each applicant whether he has had the statutory practical experience to entitle him to a certificate of qualification to act as a mine foreman or assistant mine foreman. The members of these boards must possess practical experience as miners or as owners, operators or superintendents of mines, and the legislature seems to have left to the discretion of the several boards the determination of what the practical experience really is."

A. L. H. Street,
Attorney at law.

St. Paul, Minn.

Letter No. 37—The interesting letters relating to mine laws and legislation that have appeared in Coal Age for some time past have, unquestionably, been of educational value to the large number of readers. Mining law is one of the subjects that receives the least notice, while it should be given the closest attention by all who are engaged in that industry. It is the recognized rule of procedure by which the government seeks to regulate and establish the safety and preservation of life and property by imposing certain duties on both workmen and officials.

The workman is prone to regard some of the law's requirements as being restrictive of his liberties and an infringement of his rights, while the mine official, under pretext of enforcing the law as affecting the workman, frequently adopts a course of procedure that tends to emphasize this opinion. If all parties concerned would carefully read and study the different letters published on this subject they would see the necessity of making and complying with orders that are conducive to the safety and welfare of mine workers and much of the misunderstanding that now exists would be avoided.

The mining laws of every state contain defects and discrepancies and these could not be wholly eliminated, even if the laws were framed by our most practical and scientific mining men. Such defects and discrepancies, however, are of small consequence so long as it is possible to discern and know the meaning or spirit of the law.

In many instances, the interpretation of the law will depend on the desire of both workmen and officials to "play safe" as Sim Reynolds so aptly expressed it, Coal Age, Jan. 9, p. 93. When, however, one part of the law is inconsistent with and contradicts another part, a compliance with such an inconsistency that will endanger life or property may justly be regarded as criminal if intentional.

Such an inconsistency exists in the bituminous mining law of Pennsylvania (1911). For example, Art. 10, Sec. 1, reads:

> The use of open lights is prohibited in any entry, airway, traveling way, room, or any other working place where explosive gas is being generated in such quantity as can be detected by an approved safety lamp, also in pillar workings where a sudden inflow of explosive gas is likely to be encountered, and all such places shall be worked exclusively with locked safety lamps.

Again, Art. 28, Sec. 2, reads:

> The provisions of this act as to mines, or portions of a mine, generating explosive gas in quantities sufficient to be detected by an approved safety lamp shall not apply to any mine wherein explosive gas is being generated only in live entries.

In Art. 10, the mine inspector is given discretionary power with respect to compelling the use of locked safety lamps in places where his judgment deems their use is necessary, but he is not given discretionary power to permit their *nonuse* in places where they are required by law. However, Art. 28 seems to limit the discretionary power of the inspector granted in Art. 10, so that, if the mine management desires to work such places with open lights, they can do so and it is beyond the power of the inspector to prevent such action.

That compliance with such a law would be productive of harm was clearly demonstrated in the Cincinnati mine explosion, Apr. 23, 1913. It is no argument to urge in support of this act that ample ventilation can be kept up to the face by means of brattice, as this precaution was taken throughout the mine in the case just mentioned, and yet 96 lives were lost. The explosion occurred in an entry that was not generating explosive gas, Coal Age, Vol. 3, p. 807. I regard this as a strong argument against the use of *mixed lights* in mining, which so many of our expert mining men and mining journals seem to favor.

One writer, commenting on this disaster, states that the mine foreman was at fault in not complying with General Rule 18, of the bituminous law, which states that in such places "a borehole shall be kept not less than three feet in advance of the face of the work, or three feet in advance of any shot-hole drilled for a blast to be fired in"; but this requirement refers to "mines wherein explosive gas is generated in dangerous quantities." Under the conditions, the mine foreman could not be held legally responsible, as he was within the law. I may add that a compliance with Sec. 1, of Art. 28 is equally if not more dangerous than that of Sec. 2; but the former is not contradictory of the provisions of any previous article.

I believe that all practical mining men will agree with the statement that the operation of a mine, under the provisions of Art. 28, is not consistent with the general spirit of the law, in that it restricts the discretionary powers of the inspectors in an important particular and renders their efforts to safeguard life and property practically useless, and legalizes action on the part of the mine management that would be criminal if it were not for this section of the law.

No matter how conscientious and scrupulous the mine foreman and the inspector may be, in regard to the enforcement of the precautions for safety; no matter how well they may know that such procedure may be productive of the most disastrous results, they can be overridden by the operator, because the law sanctions his action. If the Department of Mines of Pennsylvania earnestly desires to eliminate or reduce accidents, it would be well to see that the law is expurgated of such inconsistencies and contradictions and that the mine foreman and inspector are not handicapped by the statutory provisions of such incongruities.

I. C. Parfitt,
Assistant Foreman.

Jerome, Pa.

Tractive Effort vs. Draw-Bar Pull

In connection with the excellent explanation given of the tractive effort a locomotive can exert, COAL AGE, Dec. 5, p. 917, I thought the following definitions of the terms "tractive effort" and "draw-bar pull" would help to further elucidate their meaning and use.

The *tractive effort* of a locomotive is the force exerted by the motors at the wheel rim. The *draw-bar pull* of a locomotive is the force it is able to exert to pull a trailing load.

When the locomotive is on a level track the tractive effort is equal to the draw-bar pull plus the friction of the locomotive, which consists of wheel friction, journal and axle-bearing friction, and windage. The windage is not much of an item in a mine locomotive. The tractive-effort curves of the motors most always include the gear losses, so that the difference between the *input* to the motors and the power represented by the tractive effort consists of motor and gear losses.

On a grade the difference between the tractive effort and the draw-bar pull is the same as for a level, plus 20 lb. per ton of locomotive, for each 1 per cent. of grade. It will be readily seen that a grade will finally be reached when the part of the tractive effort due to grade will just balance the adhesion of the wheel to the track when the draw-bar pull the locomotive can exert becomes zero. Any steeper grade will cause the wheels to slip and the locomotive will slide down the grade.

So far, I have assumed that the locomotive is traveling at a constant rate of speed. During acceleration the portion of the tractive effort necessary to accelerate the locomotive will not be available for draw-bar pull. This acceleration will absorb about 100 lb. per ton for each one mile per hour per second rate of acceleration, which will give the same loss of draw-bar pull that a 5 per cent. grade will produce. However, the rates of acceleration in mine service are usually only 0.2 to 0.25 mile per hour per second, so that this loss is not great.

The draw-bar pull or, as you state, "tractive force," is therefore limited by the weight of the locomotive, the adhesion of its wheels to the track and the grade of the road, while the tractive effort is only limited by the capacity of the motors. As you have already said, the tractive effort may be very much greater than the draw-bar pull. This may be caused by the motorman holding his brakes on while notching up, which is a bad and dangerous practice, and is one of the evils resulting from "overmotoring" a locomotive.

GRAHAM BRIGHT.

East Pitsburgh, Penn.

Study Course in Coal Mining

By J. T. BEARD

The Coal Age Pocket Book

MINE-LOCOMOTIVE HAULAGE

A mine locomotive consists of a heavy iron frame or bed mounted on wheels, which are operated through a system of gears by steam or air cylinders or powerful electric motors built in the frame.

It is common in mines to speak of the locomotive as the "mine motor," "haulage motor," or simply "motor." It is necessary, however, to avoid confusion, to distinguish between the **locomotive,** which is the machine, and the **motor** by which it is driven.

Types of Mine Locomotives—Mine locomotives are classified, according to the power used to drive them, as **steam, compressed air** or **electric,** all of which are employed under the varying conditions in mining.

Adaptation to Mine Use—The use of steam locomotives in coal mining is very limited owing to the annoyance and danger arising from the presence of the exhaust steam and gases in the mine entries. Such locomotives, however, are frequently found employed in small drift openings, but rarely in other cases.

The **choice** between compressed-air and electric locomotives for mine use is almost wholly governed by the question of relative cost of installation and maintenance and the adaptation of these two kinds of power to the various operations and requirements in the mine. Obviously, it would not be advisable, generally, to install and operate two large power plants with their separate systems of transmission in the mine where one such installation will perform the work that is required.

Where a compressed-air plant is already in operation supplying power to drills and coal-cutting machines, compressed-air locomotives can be used with greater economy for hauling the coal, supplies and refuse in the mine. The same principle holds true in respect to electricity. Where this power is already in use for operating machines at the working face it will be advantageous and more economical to employ electric locomotives for haulage purposes.

Compressed Air, Advantages and Disadvantages—The air exhausted from compressed-air machines is a decided advantage in the ventilation of headings and chambers driven ahead of the air. On the other hand, the system of pipes required to conduct the power from the compressors on the surface to the machines at the face is cumbersome and rigid, which makes it comparatively difficult to extend, alter, repair and maintain. In case of accident, this system may furnish the air needed to sustain the lives of entombed miners cut off from the regular air supply.

Electricity, Advantages and Disadvantages—The electric transmission of power possesses a great advantage in the flexibility of the system, which makes it easy to install, extend, alter and repair. The use of electricity in gaseous mines is always attended with more or less danger owing to the possibility of the gas being ignited by the sparking of wires, switches or brushes. There is also the danger of shock to men and animals.

The Coal Age Pocket Book

Hauling Capacity of Mine Locomotives—The load that a locomotive will haul depends on the **grade of the track;** the **weight of the locomotive** resting on the driving wheels; the **adhesion of the wheels** to the rails and the condition of the track and general rolling stock or mine cars hauled, assuming of course that the power of the motors is proportioned to the weight on the drivers and their adhesion to the rails, since these two factors practically determine and limit the **draw-bar pull** of the locomotive or its hauling capacity.

Tractive Effort of Locomotive—The tractive effort of a locomotive is the effort it can exert to move the entire load, which includes its own weight in addition to that of the cars hauled.

Assuming what is true in a properly designed mine locomotive that the effective power of its motors is in proportion to the weight on the drivers, the tractive effort, which is the force of the motors available at the circumference of the drivers, cannot exceed the adhesion of the wheels to the rails or the **wheels would slip** and the locomotive and its train would not be moved.

The adhesion of the wheels to the rails will vary according to the material of the wheels and rails and the presence of any lubricating matter, as water, clay, grease, etc. The **coefficient of friction,** in haulage, may vary from 0.15 to 0.20, depending on conditions; but, in coal mining practice, it is only safe to assume a value of, say 0.16, which makes the tractive effort practically one-sixth of the weight on the drivers.

Mine locomotives are commonly built so that the entire weight of the locomotive rests on the driving wheels. The foregoing makes clear why mine locomotives are rated on a basis of their weight in tons and not on the horsepower of their motors, since the **tonnage of a locomotive** indicates its possible tractive effort from which its hauling capacity can be calculated in accordance with the known data in regard to grade and conditions of track, rolling stock, etc., which together determine the track resistance.

Track Resistance—What is commonly called "track resistance" includes all the frictional resistances (outside the motor gears) that oppose the movement of the locomotive and its train **on a level track.** It is estimated in pounds per ton of moving load.

Track resistance, in mines, may be safely estimated as, say 50 lb. per ton of moving load. With good rolling stock (14-in. wheels), proper lubrication and well ballasted track, this may be reduced to 40 lb. per ton, while improved car wheels with ball or roller bearings make it possible to estimate on a track resistance of 30 or even 20 lb. per ton, in exceptional cases.

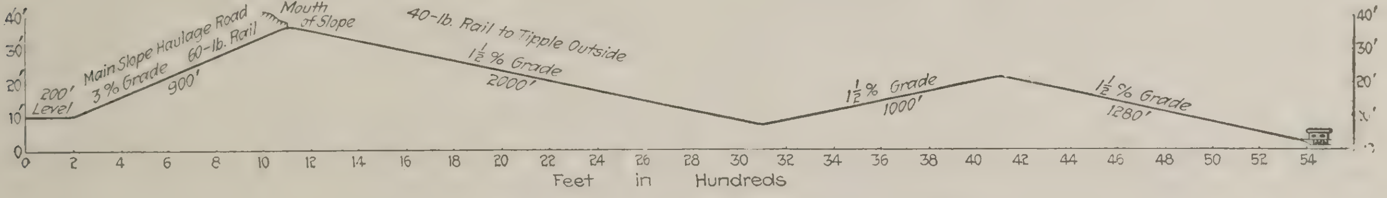
Grade Resistance—When haulage is performed on an incline, the weight of the load resting on the incline produces a pull commonly called the "gravity pull" acting in a line parallel to the track. For grades not exceeding 10 per cent., the gravity pull or grade resistance is $0.01 \times 2000 = 20$ lb. per ton for each per cent. of grade.

Inquiries of General Interest

Electric-Haulage Problem

I desire some information on the installation of an electric-haulage plant at our mines. At the present time, we are hauling the coal from the slope to the tipple, a distance of nearly a mile, using for this purpose a steam locomotive. We desire such information as will enable us to purchase an equipment that will prove satisfactory.

It is proposed to haul the coal from the siding at the bottom of the slope, in trips of 30 cars. The empty cars each weigh one ton and have a capacity of 1.5 tons. This will make the total weight of the loaded trip 30 (1 + 1.5) = 75 tons. The accompanying profile of the road, extending from the siding at the slope bottom in the mine to the tipple where the coal is loaded into the railroad cars, shows the length and grade of each portion of the track and the weight of rail in use at the present time.



PROFILE OF TRACK FROM BOTTOM OF SLOPE TO TIPPLE

Kindly state the size of electric motor that will be required for this haul; also the weight of rail and style of rail bond that should be used, the size of trolley wire required for the transmission of the power from the generator to the mine, and the required horsepower of the generator and boiler.

JOHN E. KELLEY, Supt.,
Big Four Coal Co.

Boonville, Ind.

The first step is to estimate the weight of locomotive required to haul a loaded trip of 75 tons up a 3-per cent. grade, under ordinary mining conditions. In mining practice, it is not safe to estimate on what is commonly called the "track resistance" as being less than 50 lb. per ton. To this must be added 20 lb. per ton for each per cent. of grade or, in this case, 3 × 20 = 60 lb. grade resistance, which makes the total resistance 50 + 60 = 110 lb. per ton of total moving load including the locomotive.

Also, in mining practice, the coefficient of adhesion of the wheels to the rails should not be estimated as exceeding 0.16, which makes the tractive effort that the locomotive can exert to move itself and the loaded trip 0.16 × 2000 = 320 lb. per ton. Then, since this tractive effort of the locomotive must be equal to the total resistance of the entire moving load including the locomotive,

$$320\,W_m = 110(W_m + W_t) = 110\,W_m + 110\,W_t$$

and $$W_m = \frac{110\,W_t}{320 - 110} = \frac{110 \times 75}{210} = \textit{say 40 tons}$$

This shows conclusively that, under the adverse conditions common in coal mining, a 40-ton locomotive would be required to haul a loaded trip of 75 tons up a 3-per cent. slope. This of course provides for the worst conditions that are liable to exist, in respect to both the track and rolling stock in the mine.

Before going further, it will be well to estimate the weight of locomotive that will be required to haul the same loaded trip on the 1½-per cent. grades outside of the mine. In this case, the track resistance, as before, is 50 lb. per ton, but the grade resistance is 1.5 × 20 = 30 lb. per ton, which makes the total resistance 50 + 30 = 80 lb. per ton. This gives for the required weight of the locomotive

$$W_m = \frac{80 \times 75}{320 - 80} = \textit{25 tons}$$

We would suggest here that the same weight of locomotive will haul practically two-thirds of the number of cars up the slope that it can handle on the outside grades, as shown by transposing the formula previously given and finding the load that a locomotive can be expected to haul regularly up grades of 1½ and 3 per cent., respectively, under the conditions named, thus,

On a 3-per cent. grade:
tractive effort of locomotive, 320 lb. per ton;
track and grade resistance, 80 lb. per ton.

Loaded trip, $$W_t = \frac{320 - 110}{110}\,W_m = 1.9\,W_m$$

On a 1½-per cent. grade:
tractive effort of locomotive, 320 lb. per ton;
track and grade resistance, 80 lb. per ton.

Loaded trip, $$W_t = \frac{320 - 80}{80}\,W_m = 3\,W_m$$

For this reason, it might be well to provide a siding at the top of the slope that will hold 20 or 40 cars as desired, and make three trips on the slope for every two trips to the tipple, using a 25-ton locomotive for the entire work.

So far, we have only considered relative weights of the locomotive and the load it can be expected to handle regularly and satisfactorily on different grades, under the worst conditions that are liable to exist or arise in mining practice. It is important to remember that having assumed a coefficient expressing the adhesion of the wheels to the rails, it is the *weight* of the locomotive that determines the tractive effort the machine can exert, regardless of the power of the motors or engines with which it is equipped. It is a fatal mistake to equip a locomotive with more power than its weight will permit it to utilize.

Examination Questions

Hoisting Engineers' Examination Held at Terre Haute, Ind., Sept. 10, 1914

(*Selected Questions*)

Ques.—(a) Why should scale never be allowed to accumulate in a boiler? (b) How can the bad effects of scaling be prevented?

Ans.—(a) The formation of scale in a boiler prevents, to a large degree, the transmission of heat from the furnace to the water in the boiler and decreases, to that extent, the production of steam per pound of fuel burned and lowers the efficiency of the boiler. Again, the presence of scale in a boiler has a tendency to induce overfiring, with the result that the fireplates of the boiler are often blistered or bulged. When this occurs there is danger that the cracking of the scale may permit the water to gain access to a red-hot plate, which would generally cause the explosion of the boiler. The formation of scale has, also, the effect to deteriorate the iron and weaken the boiler.

(b) The bad effects of scaling are best prevented by avoiding the formation of scale, by purifying the feed water used in the boiler. The purification of the feed water will depend on the impurities it contains. Water containing sediment held in suspension should be permitted to stand awhile in settling tanks from which it can be drawn for use as required. The precipitation of sediment and organic matter in water is facilitated by heating or boiling. Acid feed waters must be treated with salts that will neutralize the acids and prevent them from attacking the iron of the boiler.

In general practice, the purification of feed water is accomplished by settling, feed-water heaters, the use of soda ash to neutralize the acid of the water, or the use of graphite or petroleum (coal oil) either of which has the effect to disintegrate the scale and prevent, to a large extent, its adhesion to the iron plates of the boiler. The powdered graphite or the oil is introduced into the feed water before it is pumped into the boiler. Where scale forms readily, the boiler should be blown off at regular intervals, say at least once a week. In some cases, the results are improved by blowing off 3 or 4 inches of the water each night.

Ques.—(a) What is the purpose of a flywheel on an engine? (b) What is the effect if a flywheel is too light for its work? (c) What is the effect if the flywheel is too heavy?

Ans.—(a) The purpose of a flywheel of an engine is to regulate the motion of the engine and render its speed uniform, by virtue of the stored energy of the wheel.

(b) If the flywheel is too light for its work, it does not properly regulate the motion of the engine, which continues to have a variable speed of rotation, running slower or faster as the load is increased or decreased.

(c) If the flywheel is too heavy, it renders the work of the engine heavy and laborious, absorbing more energy than is required for the purpose intended and increasing the time for acceleration and retardation when starting and stopping the engine. The excessive weight of the wheel also adds to the wear and tear of the machinery.

Ques.—(a) For what purpose are bearings bushed? (b) What metals are generally used for this purpose, and why?

Ans.—(a) The purpose of bushing machine journals or bearings is chiefly to reduce the friction and to overcome the effects of wear by making it possible to replace the bearings when worn, by a new one inserted in its place.

(b) The metals most commonly used in bushing are babbitt, brass or bronze. Various compositions of copper, tin and zinc are used for this purpose. The composition commonly known as "babbitt metal" is an alloy of copper, tin and antimony. This alloy is much used because of its antifrictional properties and because of the ease with which it can be molded about a journal or bearing.

Ques.—Explain why it is economical, in many cases in mining practice, to employ compressed air or electricity in place of steam power.

Ans.—In the use of compressed air or electricity, it is possible to transmit the power over considerable distances more conveniently and with less loss than in the use of steam. The transmission of steam power for any considerable distance is not only attended with much loss, owing to condensation in the pipe line, but, in mine entries, the radiation of the heat from the pipes and the presence of the exhaust steam in the workings are objectionable. Moreover, the steam has a bad effect on the mine roof, in many cases.

Ques.—What are the advantages and disadvantages of using electricity for power or other purposes, in coal mining?

Ans.—For answer to this question, see Study Course in Coal Mining, p. 434.

Ques.—(a) If a pump is located at the bottom of a shaft 300 ft. deep, what is the pressure per square inch when the pump is in operation? (b) How many gallons of water will a tank hold, the diameter of the tank being 53 in. and its height 9 ft. 11 in.?

Ans.—(a) The pump's static head is 300 × 0.434 = 130.2 lb. per sq.in. The pressure when the pump is in operation cannot be calculated without knowing the size of the column pipe and the quantity of water discharged. For example, assuming a discharge of 250 gal. per min. through a 4-in. column pipe, in this case, the effective head when the pump is in operation is

$$h_1 = h + \frac{G^2 h}{800\,d^5} = 300 + \frac{250^2 \times 300}{800 \times 4^5} = \textit{say } 330\ \textit{ft.}$$

(b) This tank is a cylinder having a sectional area of $0.7854 \times 53^2 = 2206+$ sq.in. Its depth is $9 \times 12 + 11 = 119$ in. The capacity of the tank in gallons is, therefore, $2206 \times 119 \div 231 = 1136$ gal.

Coal and Coke News

Harrisburg, Penn.

Governor Brumbaugh and Attorney General Brown have prepared tentative drafts of six bills designed, in a comprehensive fashion, to carry into effect the state administration's idea as to a workmen's compensation act.

They have also prepared the proposed amendments to the constitution, which would, if adopted by the people, give the Legislature power to enact a compulsory compensation law. The law proposed for this session is elective. The constitutional amendment in question has already passed one session of the Legislature. If it be passed by the present session, the people may vote it into the constitution next November.

The six bills, as tentatively framed by the attorney general are: First, the workmen's compensation act, which provides a schedule of compensation at the rate of 50 per cent. on the wages received for varying periods. This bill provides that the act shall apply to all accidents occurring within the state, irrespective of place where the contract for hiring was made, renewed or extended.

Second: An act creating a bureau to enforce the workmen's compensation act.

Third: An act creating a state insurance fund.

Fourth: An act regulating policies of insurance against liability arising under Article 3, of the workmen's compensation act.

Fifth: An act creating and authorizing mutual liability associations.

Sixth: An act to overcome all constitutional objections to the exemption of any class of labor.

Compensation for injuries: For total disability, 50 per cent. of wages for first 500 weeks; maximum, $10 a week; minimum, $5 a week. For partial disability, 50 per cent. of the difference between the wages received at the time of injury and the earning power thereafter; maximum, $10 a week; maximum period, 300 weeks.

Compensation for death: Minimum, $1.50 a week to dependent brother or sister; maximum, $12 a week to widow with four children; period of death compensation 300 weeks; death compensation to children until they reach the age of 16.

It is estimated that there will be 60,000 compensable accidents annually. The compensation bill enlarges the right of an employee to recover in an action at law aganist his employer.

In case of the injury or death of an employee, it shall not be a defense of the employer in any action that the injury was caused by the negligence of a fellow employee, or that the employee had assumed the risk of the injury, or that the injury was caused in any degree by the negligence of such employee, unless it be established that the injury was caused by such employee's intoxication or by his reckless indifference to danger. The bill provides that the burden of proving such intoxication or reckless indifference shall be upon the defendant and the question shall be one of fact to be determined by a jury.

Employer Is Liable for All Negligence

The employer shall be liable for the negligence of all employees while acting within the scope of their employment, including engineers, miners, mine foremen, firebosses, mine superintendents, officers of vessels, etc., and all other employees licensed by the state or other governmental authority if the employer shall be allowed by law the right of free selection of such employees from the class of persons thus licensed.

This is a very perplexing question since the miners are employed upon examination in the anthracite region under state auspices, and other mine employees in both regions are hired by foremen who are chosen by state examination, the operators cannot be held responsible for the payment for injury or loss of life, and a decision of the Supreme Court recognizes the responsibility of the state in employment, because of the state examination.

Compensation to alien dependent widows and children not residents of the United States shall be the same in amount as is provided in each case for residents, except that, at any time within one year after the death of injured person, the employer may, at his option, commute all future installments of compensation to be paid alien dependents not residents of the United States by paying such alien dependent two-thirds of the total amount of such future installments. Alien widowers, parents, brothers and sisters not residents of the United States shall not be entitled to any compensation.

Coal operators while pleased in some respects with the bill will no doubt make a strenuous fight against the provision of the employers' law defenses, which should be retained to him in cases where the employee does not elect to accept compensation under the act.

The expense of administration of the act is apparently to be borne by the state for only two years. The employer will be compelled to pay an insurance company or state commission to conduct the business, which will no doubt be opposed by operators. The provision that after Dec. 31, 1915, the employer will be presumed to have accepted the act is not taken to kindly.

The provision as to payments to aliens will be bitterly fought by the bituminous operators, as they claim this clause is too liberal. As the foreigner with a family benefits equally, apparently, with the American citizen. Today the foreigner enjoys all use of hospitals and other institutions, to which he does not contribute, while his own money is sent back to the old country, and should not participate fully until he becomes an American citizen.

The united forces of the manufacturers and the coal operators, it is expected, will be brought to bear to reduce the concessions granted to workmen in the Brumbaugh bills.

PENNSYLVANIA

Anthracite

Scranton—It is reported that there is over 7000 miles of underground tunnels in the anthracite mines of Pennsylvania. It is said that the Philadelphia & Reading Coal & Iron Co. has more than 800 miles of timbered gangways and that there is a total of 2000 miles of these underground passages in the Schuylkill region alone.

Nesquehoning—The fire that broke out in the inside workings of No. 9 colliery of the Lehigh Coal & Navigation Co. on Christmas day, is burning despite strenuous efforts to extinguish it. Every time the fire has been partly under control the flames would break out again. The company is now sinking a shaft to the burning section and through this opening it is proposed to flood the interior with culm and water. The fire is raging almost under the business section of the town, near the old tunnel plane to Summit Hill.

Plymouth—One lone individual miner, who refused to pay his union dues, was the cause of tying up the Nottingham No. 15 colliery of the Lehigh & Wilkes-Barre Coal Co. on Feb. 25. The mine workers learned that he was in arrears and when he appeared at the head of the shaft he was requested to secure the necessary button, but refused and descended the shaft alone, the workmen refusing to either ride with him or work until he should pay his dues. Thus the action of one man prevented a thousand or more tons of coal being mined and caused a loss of hundreds of dollars in wages.

Pittston—For the second consecutive year, not a single death from the explosion of gas occurred in the mines of the eighth anthracite inspection district in 1914, according to the report of Mine Inspector S. J. Jennings, which was recently forwarded to the Bureau of Mines. The eighth district includes 15 collieries and 27 mines in upper Luzerne County. The production for the year was 3,943,873 tons, as compared with 4,012,653 tons in 1913. There were 37 fatal accidents, all but two occurring inside the mines, which means that for every life lost, 112,682 tons were mined. Forty per cent. of the fatalities were due to falls of roof. The majority of the accidents were of the class termed "avoidable." In 1913 there were 47 fatalities.

Bituminous

Punxsutawney—The scale office and scales and a portion of the tipple of the No. 7 mine of the Berwind-White Co. operated by the Anita Coal Mining Co. were destroyed by dynamite Feb. 24. The office was partly demolished and part of the tipple destroyed and the scales torn to pieces. This is the second attempt to destroy the scale house, and the company officials are unable to determine who the dynamiters may be.

Uniontown—By the recording of deeds in the County Recorders Office, the long struggle between the H. C. Frick Coke Co. and W. J. Rainey for possession of the Mount Braddock farm and its underlying coal has been ended. With the exception of small strips necessary for the Rainey company in order to mine its coal the surface now belongs to the Frick interests. The Frick company also possesses two-thirds of the coal and the Rainey company owns the remainder. Almost 650 acres are embraced in this tract.

Connellsville—A pronounced improvement has taken place in the Connellsville coke region, and production and shipments are about equal at 270,000 tons weekly. This is the best record since the first half of 1914, but will shortly be exceeded when 418 more ovens will be fired by the H. C. Frick Coke Co. It is believed that the 300,000-ton mark will be reached before the close of the first quarter.

Allanvale—Officials of the Consolidated Coal Co. are pushing the extensive improvement work at the Shaw mines, recently acquired by the company, as if there were no slump in the coal business. A 4-ft. vein of coal is to be developed, and preparations now being made to mine it show that the output will be heavy from the beginning of operations and that the supply will be large and dependable. Company officials state that they intend to be ready for the revival in demand whenever it comes.

WEST VIRGINIA

Fairmont—The grand jury empaneled to inquire into the crimes said to have been committed by strikers recently at Farmington has made a report and returned indictments charging 114 men with various offenses, ranging downward from riot and conspiracy to murder. There may be some trouble in making arrests, in anticipation of which the local company of the national guard is ready for service. Mines Nos. 7 and 9 are to resume work shortly, and this is also expected to bring about a clash. The funeral of Constable W. R. Riggs, who died as the result of a beating received at the hands of the strikers, drew an immense crowd.

Charleston—Following the conviction of Romeo Campi and John H. Riley, fire bosses of the Carlisle mine, where several men were killed a few weeks ago by an explosion, Earle Henry, chief of the Department of Mines, recently announced that any boss found neglecting his duty will have his license revoked. The convicted fire bosses were fined $50 each and forfeited their licenses. The foreman, Pilkington, who was also indicted was acquitted, but had his license revoked.

Huntington—The two men who pleaded guilty to polluting the waters of the Guyan River were fined a total of $150. They are employees of the United States Coal & Oil Co. Insufficient evidence caused the discharge of three others arraigned on similar charges. These men had permitted mine water containing sulphur to run into the river killing many fish in the stream.

Plans are now on foot looking to the organization of an association of West Virginia coal operators which will have for its object the extension of export coal trade especially in South America, the standardization of grades of coal, ascertaining and publishing costs of coal production in West Virginia and the dissemination of actual and reliable information about the industry in the state with the elimination of destructive and wasteful competition as far as this purpose can be lawfully accomplished. It is said that permanent headquarters will be established in Huntington, as this point can be more easily reached than any other center from all the mining fields of the state.

ALABAMA

Montgomery—Governor Henderson announces that he will soon make an inspection of the conditions in the minig camps operated with convict labor. It is expected that he will make some suggestions relative to the management of convicts to the Legislature when it reassembles in July.

KENTUCKY

St. Charles—In spite of warnings which were posted by alleged "possum hunters" near the Carbondale mines, white miners are being employed daily and for the present the mine is working full force and full time. It is not expected that the warnings will make trouble.

Baskett—The Pittsburg Coal Co. on Feb. 20 made the best run of the year, with an output of 437 tons of coal. Ninety men worked 8 hours and loaded 14 railroad cars. The best one-day record ever made at the mine was 637 tons. The company has a contract which will keep the mine going all summer and by Apr. 1 it hopes to have an output averaging 700 tons a day.

Rockport—The Rockport Coal Co. has closed its mines here for an indefinite period. This throws 125 men out of work.

Central City—The impending shutdown of the mines of the Central Coal & Iron Co. has been forestalled by an order from John P. White, president of the United Mine Workers of America, who has suspended the order of the International Executive Board pending a personal investigation of the controversy involving the mines of the company and the union workmen, which involves the matter of arbitration. The Central company has orders which will permit operation of the mines four days out of the week.

OHIO

Columbus—The Green anti-screen law passed by the Ohio legislature a year ago has been held constitutional by the United States Supreme Court. The Gallagher bill now pending in the Ohio legislature is aimed at this law. While operators in the Hocking Valley are opposing the amendment, those in eastern Ohio are fighting for its enactment.

J. M. Roan, Ohio chief mine inspector, was called to Zanesville recently to investigate a complaint arising from the use of a new cutting machine in the Elk mine at that place. The machine which has just been placed on the market is an overcutter and it was averred that the dust left was dangerous as an explosion might result. A specimen of the cuttings has been taken for analysis.

Martins Ferry—The largest number of defendants ever named in a suit filed in the Belmont County Court are involved in an action to quiet the title to real estate, filed for the Ohio River & Western Coal Co. Clarence Armstrong and between 600 and 700 others are the defendants. The petition contains copies of 236 deeds for tracts of coal land in the southern part of Belmont County. The suit is the outgrowth of the sale of the coal land and it was necessary for the company to bring suit to have the titles established in the county records.

INDIANA

Vincennes—The Indian Creek mine, near here, with an output of 3307 tons of coal in eight hours, on Feb. 24 set a new one-day record for the state, eclipsing its previous record by 204 tons. Six hundred men are employed at this mine.

ILLINOIS

O'Fallon—The lives of 150 miners were endangered during the past week at the Ridge Prairie mine, two miles west of here, when fire broke through a brick wall and filled the mine with smoke and gas. The miners at work at this time were only part of the 250 men regularly employed. It is understood that the fire has been burning in the unworked portion of the mine for something like two years. This section, however, had been bricked in and the property was supposed to be safe. Heat from the fire crumbled the brick. A mine-rescue car soon arrived on the scene with experts to advise means of fighting the fire.

Harrisburg—O'Gara coal mine No. 8 recently closed for an indefinite period, throwing 300 men out of employment.

ARKANSAS

Fort Smith—The purchase of the Bache-Benman Coal Syndicate's property by the United Mine Workers of America, District 21, was recently officially called off. The Union deposited $50,000 early in January as an evidence of good faith. It is believed that Judge Youmans of the United States District Court who named a receiver for the corporation, will not order the property sold.

OKLAHOMA

Muskogee—The Dow Coal Co. recently filed a voluntary petition in bankruptcy in the United States Court. The company's indebtedness is more than $250,000, while its assets including real estate and machinery and accounts due aggregate $226,000.

COLORADO

Denver—Two of the four bills intended to increase the authority of the state government in strike disorders recently passed the House. One imposes a penalty for refusing to obey an order issued by the National Guard, and the other imposes a penalty for resisting the militia.

Golden—The State School of Mines recently announced a short course in coal mining to be given from Apr. 5 to May 28. The course is for practical coal miners and is designed for the purpose of giving them an opportunity to improve their work and benefit themselves in their position. The instruction includes mining, chemistry, mathematics, drawing and geology. No fees are to be charged for instruction and the course is open to all.

PERSONALS

Charles B. Levy has retired from the presidency of the Guarantee Coal Co. with which he has been connected for some time.

H. E. Marks, for some years Pittsburgh representative of the Asbestos Protected Metal Co., has been elected vice-president and manager of sales.

M. T. Ashton, Boston sales representative of the Pennsylvania Coal & Coke Corp., has been made Boston manager for D. Nicoll & Company

James Emery, representing the Pittsburgh-Westmoreland Coal Co. has optioned 1100 acres of coal land, four miles south of Ellsworth, Washington County, Penn. This option was secured at $320 per acre.

L. W. Brand, of Benton, Ill., was recently appointed receiver for the Hart-Williams Coal Co., of Benton. The assets are given as $400,000 and the liabilities are $200,000. The property will be disposed of as soon as possible.

Frank Albright, of Sumner County, Ala., was recently appointed statistician in the State Mining Department by Chief Sylvester, and the appointment confirmed by the governor. Mr. Albright will at once take up the duties of his new office which will be largely clerical.

George M. Jones, of the Geo. M. Jones Co., went to Washington recently as a member of a committee appointed by the Eastern Ohio Coal Operators' Association, to confer with Sec. of Labor Wilson regarding the resumption of operations by the eastern Ohio mines, which have been closed since last April.

George and Harry Whyel, of Uniontown, Penn., have acquired the property of the Killarm Coal Co., located near Monongah, W. Va. The Killarm property was formally owned by Worth Kilpatrick and J. A. Armstrong of Connellsville, and other associates. It consists of approximately 1200 acres of the Pittsburgh seam, and adjoins the property of the Fairmont Coal Co. This coal is in the heart of the Fairmont District and the quality is equal to any of the Fairmont operations. . This mine was opened several years ago, and was electrically equipped, tipple, houses, store, and other equipment necessary to operate the same were built, but on account of some local conditions the owners decided not to continue operation, and it has been practically abandoned for several years.

TRADE CATALOGS

The Armstrong Cork & Insulation Co., Pittsburgh, Penn. "Permanent Fortifications." Eight pages, 7x6 in.; illustrated.

The Weinman Pump Mfg. Co., 270-280 Spruce St., Columbus, Ohio. Bulletin No. 51. "Weinman Power Pumps." Illustrated, 16 pp. 6x9 in.

The Waterbury Co., 80 South St., New York City, "Waterbury Fibreclad Wire Rope." Twenty-three pages, 3½x6¼ in.; illustrated.

The Portable Safety Lamp Co., 10 Johnson St., Newark, N. J. "Hubbell Electric Hand Lantern." Leaflet of six pages, 3¼x6 in.; illustrated.

The Atlas Car & Mfg. Co., Cleveland, Ohio. Bulletin No. 1175. "Storage Battery Locomotives, Cranes and Cars." Illustrated, 32 pp., 9½x6 in.

The Goulds Mfg. Co., Seneca Falls, N. Y., Bulletin No. 119. "Single Stage, Single Suction Centrifugal Pumps." Twelve pages, 7¾x10 in.; illustrated.

NEW PUBLICATIONS

The Oregon Bureau of Mines and Geology. "The Mineral Resources of Oregon"; 161 pp. 6½x10 in., illustrated.

Seventeenth Annual Report of the Bureau of Labor and Industrial Statistics of the State of Virginia, 1914. Bound volume of 192 pages with many tables.

Department of the Interior, U. S. Geological Survey. Bulletin No. 590. "Reconnaissance of the Geology and Oil Prospects of Northwestern Oregon." By C. W. Washburne; 111 pp., 6x9 in., unillustrated.

Department of the Interior, Bureau of Mines, "Metal-Mine Accidents in the United States During the Calendar Year 1913," compiled by Albert H. Fay. Seventy-three pages, 6x9 in.; unillustrated.

Department of the Interior, U. S. Geological Survey. Bulletin 570. "Results of Spirit Leveling in Wisconsin, 1897 to 1914, inclusive," by R. B. Marshall, chief geographer. Eighty-six pages, 6x9 in.; unillustrated.

CONSTRUCTION NEWS

Piedmont, W. Va.—Miller Bros. will shortly open for development a large body of coal on the J. O. J. Greene property which they have purchased.

Somerset, Penn.—Talk of an extension of the Western Maryland R.R. into the Jenner-Quemahoning coal field of Somerset County has been resumed, and predictions have been made that construction work will be started during the coming year.

Piedmont, W. Va.—The Davis Coal & Coke Co. is constructing another power plant at mine No. 52, near Franklin. It will furnish power for operating the mines which will use electrical cutting machines and locomotives for transporting the coal to the tipple.

Cordova, Ala.—The Diamond Coal Co., J. S. Shannon, president, N. L. S. Lunsford, vice-president, announces that it will install electric machinery at the property of the Oak Leaf Coal Co. recently purchased, containing about 1000 acres of coal land and will develop for a capacity of 250 to 500 tons per day of coal.

Steubenville, Ohio—A syndicate has been busy during the past few weeks buying up coal lands in Germany Township, Harrison County, Ohio. The company is purchasing the land outright and expects to start development during the summer. A branch of the Wheeling & Lake Erie will be built to the property.

Chicago, Ill.—The Roberts & Schaefer Co. has just secured contracts for the building of Marcus patent coal tipples for the Harty Coal Co., Mullens, W. Va., the Moffat Coal Co., Oak Creek, Colo., the Henderson Coal Co., Hendersonville, Penn., the Sunnyside Coal Mining Co., Denver, Colo. These plants are modern installations and will be equipped with thorough screening and picking facilities.

Shenandoah, Penn.—James Bros., individual operators, recently struck a 30-ft. bed of mammoth vein anthracite at their stripping operations on Bear Ridge Mountain at Gilberton. This with the rich beds recently discovered on Locust Mountain, gives a large supply of the finest kind of anthracite. The James Bros. will commence the erection of a large breaker at once, giving employment to hundreds of men and boys.

NEW INCORPORATIONS

Hazard, Ky.—The Perry County Block Coal Co. has been organized with a capital stock of $30,000. The incorporators are R. L. Peters, L. C. Winfrey, and W. E. White.

Rutland, Ohio—The Hobson Coal Co. has been incorporated with a capital stock of $10,000, by W. E. Williams, David Rees and others, for the purpose of engaging in mining.

Bellaire, Ohio—The Pinney Fork Coal Co. has been incorporated with a capitalization of $150,000, by Charles F. Bachman, C. W. Dickens, J. F. Johnson, E. M. Findley and W. R. Dorsey.

New Philadelphia, Ohio—The New Philadelphia Coal & Mining Co. has increased its capital stock from $5000 to $10,000 and leased several mines belonging to the defunct Goshen Coal Co.

Akron, Ohio—The Akron Coal Co. has taken over the interests of the Loomis Moss Coal Co. and increased its capitalization to $300,000. The Loomis Moss Coal Co. will retain its incorporation but its capital will be reduced from $100,000 to $5000.

Hombre, Ky.—The Wheelerson Coal Co. has been organized with $50,000 capital with the intention of developing the old McIntyre tract and conducting operations which will give employment to several hundred men. R. M. McIntyre, of Hombre, and P. T. Wheeler and J. B. Allen, of Hazard, are promoters of the company.

Philippi, W. Va.—The W. H. Hauser Co. has been incorporated with a capital stock of $25,000. The incorporators are E. T. Thompson, W. H. Hauser, Austin C. Merrill, Gordon B. Ramsey, Arthur S. Dayton, all of Philippi. The incorporation is in order to conduct mercantile establishments, trade in real estate, mine coal, drill oil wells, and deal in general stocks and bonds of all kinds.

Emma, Ky.—The Floyd Mining Co. has been organized and incorporated with $50,000 capital; Ben E. Tate is president and Henry L. Coe, secretary, treasurer and manager. The company will develop 1000 acres, equipping to produce 100 tons daily. A small power plant will be installed, with a 250-volt generator, and an electric cutting machine, boiler, engine, with two breast, or short wall, coal-cutting machines, fan and motor.

INDUSTRIAL NEWS

Charleroi, Penn.—Inspector Charles P. Byrne, of the 21st bituminous district of Pennsylvania, recently submitted his report which shows a total tonnage of 5,502,506 tons for the year ending December 31, 1914.

Pekin, Ill.—The United States District Court at Peoria recently ordered T. W. Dodecker to sell the Champion Mine on the premises on Mar. 10 at 11 a.m., Mr. Dodecker was appointed receiver of the Champion Coal Co. recently.

Washington, D. C.—Increases in the coal rate proposed by the Santa Fé, Illinois Central and Toledo, Peoria & Western railroads from Illinois mines to points in Indiana and Iowa, were recently suspended by the Interstate Commerce Commission.

Columbus, Ohio—The Ohio Public Utilities Commission has approved of the application of the New York Central System to issue $70,000,000 four-per cent. bonds to take up a former issue. It is one of the steps toward a reorganization of the system.

El Paso, Tex.—The American railroads' embargo on coal and oil into northern Mexico was recently raised. It had been installed as the result of a dispute between the American roads and the Villa railroad management over the free delivery of American owned equipment.

Pittsburgh, Penn.—The steamers "Thomas Dodsworth" and "F. M. Wallace," of the Monongahela River Consolidated Coal & Coke Co. cleared for Louisville Feb. 27 with tows of coal totaling about 1,200,000 bushels, also two freight barges each carrying 1400 tons of manufactured iron and steel.

San Francisco, Calif.—The Western Fuel Co. in recently answering the Government suit for recovery of $861,576 in custom duties, which it is alleged the company withdrew through fraudulent methods in the weighing of imported coal, denied practically every allegation made.

Harlan, Ky.—A meeting has been called of coal land owners in this section of eastern Kentucky, to start a movement looking toward interesting capital in the construction of a railroad to open up the coal lands in the Clover Fork region of eastern Kentucky and southwest Virginia.

Connellsville, Penn.—The newly organized American Connellsville Coke Co. which recently acquired the properties of the Sunshine Coal & Coke Co. has announced that 400 ovens will be fired shortly. The American Steel Co. of Pittsburgh is interested in the new firm, but it will operate as a merchant coke interest.

Indiana, Penn.—The report of Thomas F. Lowther, mine inspector for the 26th bituminous district comprising the territory within a radius of 20 miles of Indiana, shows a decrease of nearly 700,000 tons in the amount of coal mined in the district in 1914 as compared with the previous year. Depression in business is given as the cause.

Hazelton, Penn.—The report of Mine Inspector, D. J. Roderick of the 11th anthracite mine inspection district for the year 1914, shows that 6,240,102 tons of coal were mined. There were 31 fatalities during the year. The figures for 1913 were 5,875,770 tons with 23 fatalities. The G. B. Markle Co. led in tonnage with 1,704,909 tons. There are 80 mines in the district, 78 of which were in operation.

Charleston, W. Va.—The statement of the shipments of coal and coke over the lines of the Norfolk & Western Ry. for the month of January revealed shipments amounting to 1,957,153 tons, showing a decrease of 127,406 tons from shipments in January of 1914, when 2,084,559 tons were hauled over the line, but an increase of 242,913 tons over the preceding month of December when only 1,714,240 tons were carried.

Portsmouth, Ohio—A 10-day test of a new variety of washed stoker coal was started recently on the engines of the Norfolk & Western R.R. between Portsmouth and Columbus, under the supervision of J. B. Stewart, of the car allotment commission, and H. S. Walker, road foreman of engines. The tests will be made on the Mallet type of locomotives, and if they prove successful the new coal will be used largely.

Columbus, Ohio—M. J. Caples, of the Chesapeake and Ohio R.R. system who has been located in Columbus in charge of the proposed line of the company from Portsmouth to Columbus announces that the project has not been abandoned but that it is being held up indefinitely by the uncertain conditions of the financial world. The route for the new line has been laid out and everything waits on the question of financing the project.

Greensburg, Penn.—Chauncey B. Roth, inspector of the 2nd bituminous district, has completed his annual report for 1914, which shows that 8,854,848 tons of coal and 2,190,169 of coke were produced in the county, a decrease in the production of coal as compared with 1913 by 182,621 tons, while that of coke was 525,979 tons. There are 56 mines in the district, 53 of which were in operation. Twenty-six fatal accidents occurred, and 42 non-fatal accidents.

Fayetteville, W. Va.—Railroad men report the most serious freight congestion at tidewater ever known. Practically no coal has been sent to tidewater for over two weeks. In the vicinity of Newport News, the Chesapeake & Ohio is reported to have 12 miles of cars on the siding. The only class of freight that appears to be going through without delay is horses, of which some 50 cars a day are passing over the Chesapeake & Ohio, all these animals being destined for English and French armies.

Charleston, W. Va.—Figures showing the total shipments of coal and coke over the lines of the Chesapeake & Ohio R.R. during December and the year 1914 as a whole, with comparisons with the preceding year, have been made public, showing large increases. During December 1,513,375 tons were shipped, as compared with 1,472,127 tons in December, 1913, while the year showed total shipments of 20,778,880 tons, as compared with 17,490,166 for the preceding year, an increase of 2,488,714 tons.

Knoxville, Tenn.—Following the appointment of Neal Robinson as receiver for the La Follette Coal, Iron & Railway Co. several officers and employees of the company have tendered their resignations which have been accepted. A. D. MacFarlane, chief engineer and assistant manager of operations under the receiver of the La Follette Coal, Iron & Railway Co., has been appointed to immediate charge of operations of the Iron company. It is reported that the Iron company will resume operations under the receiver shortly.

Columbus, Ohio—A bill for the regulation of freight rates on coal shipments in Ohio has been introduced in the Ohio General Assembly. Senator Vorheis, of Guernsey County, is fathering the measure. The bill goes even farther in the regulation of freight rates than the former announcements showed. The schedule of rates is as follows: For more than 300 miles haul, 85 cents per ton; 225 to 300 miles, 80 cents; 175 to 225 miles, 75 cents; 135 to 175 miles, 70 cents; 100 to 135 miles, 65 cents; 75 to 100 miles, 60 cents; 50 to 75 miles, 50 cents; 35 to 50 miles, 40 cents; 20 to 35 miles, 30 cents and less than 20 miles, 25 cents.

Pittsburgh, Penn.—Including a recent sale of coal lands amounting to about 11,000 acres which was transferred from the Pittsburgh Coal Co. to the Monongahela River Consolidated Coal & Coke Co. on the basis of $813 per acre, there has been in the past three years about $30,000,000 of high grade coal lands purchased in the Pittsburgh district, and at a rate of over $900 per acre. An increasing demand for export coal and an improved demand in the domestic markets, together with a shortage of mine workers as soon as trade revives, is the basis for considerable optimism among the coal operators of the Pittsburgh district.

Pittsburgh, Penn.—Acting upon the knowledge which has been disseminated by United States engineers who have demonstrated that in every million gallons of water drained from the coal mines in the Pittsburgh district, there is at least one ton of valuable chemicals, the H. C. Frick Coke Co. is constructing a chemical laboratory at its Davidson mine near Connellsville for the recovery of the acids and chemicals contained in the water pumped out of that operation every day. From this water it is expected to produce sulphuric acid, paint pigment, hydrates and fertilizer. All of these products are in demand and the supply thereof in the past has been largely drawn from foreign countries.

Coal Trade Reviews

General Review

Anthracite collieries rigidly curtailing production and April circulars prevail. Competition keen on new bituminous contracts. Prompt market continues flat with no indications of any improvement in sight.

The recent cold snap has shaken out a few additional orders for anthracite but it is clear that all sections of the country are heavily overstocked and dealers are concentrating their efforts on working off the surpluses before the summer discount goes into effect. With the individuals pushing hard for business at the April circular, or even occasionally less, the large companies are hard pressed to find a disposal for even their limited output which is very light, as a result of the rigid curtailment policy in effect. A few terminal points are reported congested with coal on which large demurrage may accrue before it can be moved.

Negotiations on new contracts continue to absorb more attention as the season advances. It is developing that competition is exceedingly keen while consumers are more critical as regards quality, and an unusually large number are testing out new coal in an attempt to secure bargains. The buyer is showing no interest at all where purchases can be conveniently delayed, and those closing are proceeding very cautiously.

In the prompt market there has been a renewed inquiry off shore which is relieving the pressure slightly at the loading piers, but some consignment coal is appearing and prices are uneven with a strong tendency to decline. Railroads are cutting down their requisitions still further and mine operations continue on a curtailed basis. The premiums on vessel tonnage to foreign ports still prevail so that the situation in coastwise freights is as uncertain as ever.

While actual conditions remain unchanged in the Pittsburgh district, the attitude of the trade is more discouraging. With the winter practically over, so far as the coal interests are concerned, the operators have a better realization of how exceedingly poor the market situation is; at no time during the past season has there been any flurry in the demand or shortage of supplies, and the outlook in the future is even more uncertain. Lake shippers are showing no interest whatever in buying, and although the periodical opening of navigation is now close at hand, it is evident that practically no tonnage will move in that direction until well into the season, if then.

In Ohio much the same conditions prevail; dealers are busily engaged in cleaning up their stocks, while mine operations are heavily restricted, a great many having closed down indefinitely and others working only one or two days a week. The only encouraging feature in the situation is a tendency to hold coal somewhat closer in order to tone up the market in preparation for negotiations on new contracts.

The Middle Western market has reached a point where it is not believed that even a severe cold snap would serve to stimulate much business. Prices are down to a level where there is no further room for any reduction, while mine operations are still restricted and the large terminals congested with coal, a considerable tonnage of which is on consignment. On new contracts buyers are already feeling around for concessions on last year's figures.

ATLANTIC SEABOARD

BOSTON

Pocahontas and New River market dull and almost featureless. Off-shore inquiry somewhat improved. Georges Creek still in heavy supply but no move as yet on delivered prices. Canvassing in progress for spring orders on anthracite.

Bituminous—About the only new feature in the situation on Hampton Roads coals is a renewal of inquiry for cargoes off-shore. Shippers who have postponed South American delivery in the hope freight rates would ease off are now being required to send coal forward, and this is relieving the pressure somewhat at the loading piers. Coastwise there is practically no change. The clear weather has allowed transportation to move regularly and receipts are now well up to current demand.

Prices at the distributing points for shipment inland are uneven as compared with a fortnight ago. Cargoes have arrived with unsold balances and quotations have sagged in consequence; $3.75 was quoted a few days ago, on cars Boston, and so long as such figures are named the prospect is the less favorable for closing yearly contracts on a higher basis.

Advice is still freely given to delay purchases and more than a few buyers appear to be guided by it. Except for a relatively few plants that are working on war orders, textile and shoe factories are on short time and are proceeding very cautiously as to the future. There is almost an entire lack of interest in purchases of coal, especially in cases where they can be postponed for two or three months.

The Georges Creek interests, although under severe curtailment, continue to have accumulations at all points and find that even contract demand is very light. No delivered prices have yet been heard from these shippers, although it would seem they could not be much longer withheld if any buying materializes on the part of their usual consignees.

The Pennsylvania operators, on the other hand, are offering every inducement in the way of uniform price over a year's period but no particularly large contracts have so far been taken from the Southern shippers yet. An amount of Pennsylvania coals of high grade is still coming forward both for testing purposes and to enable certain buyers to keep out of the market on Southern coals.

Water Freights are unchanged; $1.60 has been paid on coal from Hampton Roads to Puerto Rico points in sailing vessels that are ordinarily in the coastwise trade. Less is heard of coal freights across the Atlantic since the new aspect of things in the North Sea.

Anthracite—Spot demand is almost nil in this territory. Dealers are more concerned with working down their stocks so that too much will not be carried over into April. Salesmen are already busy receiving orders for spring shipment and from present appearances the demand then will be only a little less than normal. Stocks are so light along the Maine coast that should there be a cold March there will be a good deal of eagerness for early April shipments.

Current quotations on bituminous at wholesale are about as follows:

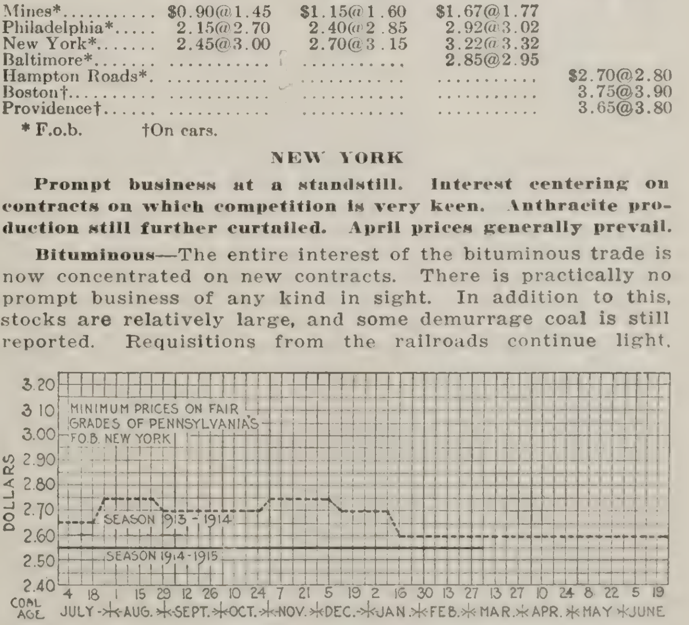
	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*..........	$0.90@1.45	$1.15@1.60	$1.67@1.77	
Philadelphia*.....	2.15@2.70	2.40@2.85	2.92@3.02	
New York*.......	2.45@3.00	2.70@3.15	3.22@3.32	
Baltimore*.......	....	....	2.85@2.95	
Hampton Roads*.	....	....	....	$2.70@2.80
Boston†.........	....	....	....	3.75@3.90
Providence†.....	....	....	....	3.65@3.80

* F.o.b. †On cars.

NEW YORK

Prompt business at a standstill. Interest centering on contracts on which competition is very keen. Anthracite production still further curtailed. April prices generally prevail.

Bituminous—The entire interest of the bituminous trade is now concentrated on new contracts. There is practically no prompt business of any kind in sight. In addition to this, stocks are relatively large, and some demurrage coal is still reported. Requisitions from the railroads continue light, some new reductions being reported during the current week. With the exception of isolated plants working extra time on war orders, which is resulting either directly or indirectly in requisitions for additional tonnages, the situation has seldom ever been so flat. Mine operations are still heavily curtailed,



particularly on the off-qualities, the demand for which is especially light. Bunkering trade is only fair; the declaration of the war zone in the North Sea is not apparently affecting the off-shore trade, the difficulty still hinging on the shortage of vessel tonnage.

On new contracts the situation is still uncertain. What business has so far been closed has been on the same basis as last year, with possibly a few exceptions where concessions have been forced. But competition for business is extraordinarily keen this year, and conservative observers are convinced that some shading of old figures will ultimately prove necessary.

The prompt market is not changed from past quotations extending over several months which we continue as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—With the individuals offering coal clear down to the April circular, and apparently having plentiful supplies, the large companies adhering rigidly to the winter price schedule, are hard pushed to find an outlet for their production, even under the heavily restricted operations now in effect. A feature of the curtailment propaganda during the past week was the unexpected announcement of a full week's suspension by the Lehigh Valley; this company has been unusually successful in moving its product up to the present time, and the necessity for such a drastic restriction is significant of the trend of conditions.

The dealers are making every effort to clean up their stocks in order to avoid carrying over any high-price coal after the spring discount goes into effect. It can scarcely be said that there is a shortage on any sizes with the possible exception of buckwheat and broken coal; the intermittent operations at the collieries have so disruptured the customary routine of business that the output of these sizes has at times been temporarily short, though not to such an extent as to cause any anxiety. The large companies will no doubt begin the new coal year with exceptionally heavy stocks on hand. Further evidence of the adverse conditions prevailing in the trade is seen in the unusually large volume of coal loaded on Lake vessels.

The market is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	4.85@5.35	5.30	4.80@5.30
Stove	5.35	4.85@5.35	5.30	4.80@5.30
Chestnut	5.60	5.10@5.60	5.55	5.05@5.55
Pea	3.55	3.40@3.55	3.50	3.30@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.35@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.90@2.25
Barley	1.80	1.70@1.80	1.75	1.30@1.75

BUFFALO

Operators pushing hard for business, which is having an adverse effect. Indications point to a dull market for some time. Independents quoting the April circular on anthracite and the coal year is about concluded.

Bituminous—There is a steady, but small trade, with sellers pushing hard for business which is hurting the market. They are urging all the coal on customers that they can and with the spring contracting season now at hand, this is having a decidedly adverse effect.

Slack is weak again but with the approach of the Lake season, all bituminous, especially slack, should be improving. From reports made at Upper-Lake ports it does not appear that there is going to be any help to the Lower-Lake trade this spring from that direction. Indications now are that the trade is bound to be dull for an indefinite time and it will take a large increase of tonnage to improve it very materially.

Some shippers found their closing February trade considerably better than it had been for some time and look for a further increase during the current month, while others will not admit that the improvement is worth mentioning and it is clear in any event that a large increase of tonnage will be necessary to put bituminous trade on a profitable basis. There is no change from the bottom quotations and Pittsburgh lump is $2.80, three quarter, $2.70; mine-run, $2.55 and slack, $2.15, with Allegheny Valley sizes about 25c. lower. All slack sells about on a par.

Anthracite—The trade for the coal year is about at an end. The late cold weather has added a car order here and there, but March is always quiet and a reduction is expected toward the close of the month. It appears that there has been rather too much coal sold in many districts and this will accentuate the general slowing down. The independent mines and jobbers are freely offering March deliveries at April prices but they are apparently not getting much tonnage, even at this cut. The large companies have sold a normal amount and will not push for trade at present.

There is some stocking of anthracite, besides the loading into Lake vessels. There is no surplus of egg in this market; all the loading and stocking have been confined to the smaller sizes, and this should be favorable to a brisk spring trade westward. At present there is about 175,000 tons afloat in the harbor for spring delivery.

PHILADELPHIA

Anthracite buyers show a marked indifference. Retailers' stocks sufficient for present requirements. Offerings at April circular numerous. Bituminous still characterized by weakness, and contracts on new business proceeding slowly.

Anthracite—The absence of any kind of weather conducive to the consumption of coal has almost brought the market to a standstill. The large companies maintaining the full circular prices are finding themselves hard pushed to dispose of their output, even on curtailed operations. During March a year ago, a succession of snow storms, coupled with low temperatures, injected considerable activity into a period which as a rule is dull, but the prospects for such a condition this year are growing more remote daily. The dealers are well intrenched in the matter of supplies, and have no difficulty in filling any gaps in their stocks at less than circular.

At the present time, more attention is being devoted to the conditions that are likely to prevail during the new coal season. The output this season has been more than the market will absorb, and many of the large companies will go into the new coal year with stocks far in excess of what is usually the case. The current output of pea, usually far from sufficient to supply the winter demand, has this year proved adequate, and accumulated stocks are likely to be carried over. The falling off in the demand for chestnut, and the increase in the call for stove are also likely to bring about the introduction of some policy to equalize the demand for these two sizes.

Outside of broken coal, for which there is an active demand at present, there seems to be little or no specific call. The fact that all sizes have been offered at substantial concessions down to the April circular or less to dispose of coal nearing the demurrage limit, makes the buyer very uncertain. Tidewater business to New England has been reduced to a minimum; it is understood that the terminal points are crowded with coal, and that substantial demurrage bills are likely to be incurred.

Prices at Tidewater rule about as follows:

	Circular	Individuals
Broken	$4.75	$4.50
Egg	5.00	4.80@4.90
Stove	5.00	4.90@5.00
Chestnut	5.25	4.90@5.00

Bituminous—There seems to be nothing in the bituminous market at the present time that would indicate an upward trend, either in prices or demand. Contracting proceeds slowly, possible purchasers apparently preferring to buy on the market for their current requirements, rather than enter into agreements which invariably call for higher quotations than spot offerings.

HAMPTON ROADS

Movement for week shows up well. Demand seems to be increasing with prices stationary.

Dumpings over the Tidewater piers for the week have shown up well. There have been heavy coastwise shipments to New England ports and a fair number of export cargoes. In addition to this the government has taken about 8000 tons for San Francisco, this cargo having been shipped by the str. "Cacique."

The demand for New River and Pocahontas run-of-mine and prepared sizes has improved somewhat, and there has also been a little demand for high volatile coals. Prices remain stationary. Present indications are that the February dumpings will show a decided increase over January figures. Export cargoes for the week have gone to Manzanilla, Buenos Aires, Genoa, Canal Zone, Pernambuco, Havana, Santiago, and San Juan, Porto Rico. Sailing vessels are still being employed in the export trade.

BALTIMORE

Contracting period engrosses attention of the trade. Export shipments holding up fair. Anthracite stimulated slightly by colder weather, but no branch of business is very brisk.

Were it not for the activity on new contracts, business would be unusually dull. As it is many coal men report more than the usual difficulties in placing their coal to advantage, and the current month will probably see many more consumers trying out fuels to secure bargains, than for a number of years past. Shipments of trial lots go to make up a large part of the tonnage now moving outside of coal intended for export, which remains quite active from this port.

Reports from West Virginia, western Maryland and Penn sylvania show much activity in developments for larger tonnages. The colder weather has helped anthracite sales in small way; there is nothing doing in larger business except negotiations along contract lines. No branch of the trade is brisk just now. Spot sales have been almost wiped out for soft coals, and the few sales made are about on a par with the prices for the past two or three weeks.

Exporting business holds up well, a number of charters for March loading having been announced. January of this year saw a movement of 89,779 tons, and February of 79,029 tons, the total movement for the first two months of 1915 being 47,262 tons in excess of the same periods of 1914. A maintenance of this average would give a yearly shipment of 1,012,848 tons, a considerable gain over the total figures of 1914.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Willesden	British	Baltimore	River Plate	3141	
Franklyn	British	Norfolk	West Coast Italy	3161	
Banan	Norwegian	Baltimore	Guantanamo	948	
Nellie W. Craig		Norfolk	Bermuda	488	$2.25
Van Allens Boughton		Baltimore	Boston	1909	
Petra	Norwegian	Baltimore	Puerto Barrios	1292	
Edgar W. Murdock		Norfolk	Buenos Ayres	1215	
Australia (ship)	Italian	Philadelphia	Genoa	1442	
Gladys		Newport News	Porto Rico	645	
J. Edward Drake		Philadelphia	Galveston	789	$1.87½
Alderney	Norwegian	Philadelphia	Havana	1970	

Note—Steamers are indicated by **bold face** type, all others being schooners.

OCEAN FREIGHTS

Prompt steamers difficult to obtain and rates continue to advance.

The freight market again advanced during the past week, principally owing to the increased demand for steamers for grain cargoes. Prompt boats are very scarce and difficult to obtain. Since our last report only a few steamers have been chartered for export coal.

Rates quoted below, under present conditions, are bound to be more or less uncertain.

To	Rate	To	Rate
Havana	**$3.00**	Guantanamo	**$3.75**
Cardenas or Sagua	**3.75**	Demerara	5.50@6.00
Cienfuegos	**3.50**	Bermuda	3.75@4.25
Port of Spain, Trinidad	**3.50**	Vera Cruz	**3.50**
St. Lucia	**3.50**	Tampico	**3.50**
St. Thomas	**3.50**	Rio	**10.20**
Barbados	**3.50**	Montevideo, Buenos Aires or La Plata	**9.60**
Kingston	3.50@4.00	Mediterranean	**11.40**
Curacao	**3.25**	Valparaiso	**8.40**
Santiago	**3.75**		

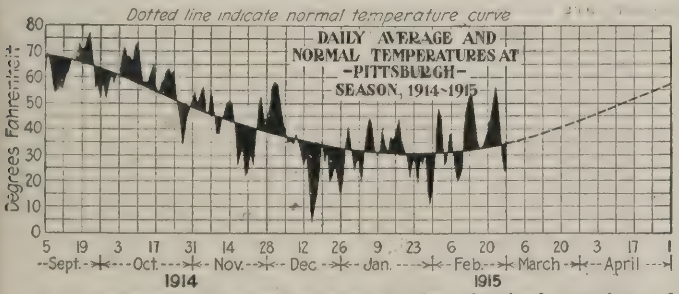
Note—Rates noted in **bold face** type are only approximate.
W. W. Battie & Co.'s Coal Trade Freight Report.

OHIO VALLEY

PITTSBURGH

Trade more depressed as season progresses without bringing any improvement. Asking prices continue almost nominal.

As the new month of March appears the coal trade is brought to a stronger realization of how poor the market situation is. The backbone of winter has certainly been broken, and without there having been even a single fortnight in which the domestic demand could be considered even passably good. It is now barely a month to Apr. 1, the conventional date for the closing of annual contracts, with practically nothing done in this direction and scarcely any negotiations seriously undertaken.



It is only six or seven weeks to the physical opening of Lake navigation, but the actual opening, as to the moving of any noteworthy tonnage of either ore or coal, appears to be in the dim and distant future. As to contracting for Lake coal, there has been scarcely any as yet, and the large Lake shippers are showing no interest. Apparently they will be able to move nearly all the coal for which they can now see a demand without making any season contracts, having fairly large tonnages from affiliated mining interests or from long-term annual contracts. The only Lake coal tonnage noted in these reports as closed in the past few weeks was a contract extending over a period of years.

The mental attitude in the trade is one of greater depression than a few weeks ago, though the actual market situation is unchanged. Domestic demand is moderate. Manufacturing demand makes a good comparison with the extremely poor conditions of last December, but has shown no improvement in the past two or three weeks, and the same is to be said of railroad demand. As for a long time past, quotations are almost invariably cut when anything like a good order appears. We continue to quote prices that are regarded as nominally representing the market, though they represent the basis from which departures are made, rather than the basis upon which any considerable tonnage is sold: Slack, 90c.@$1; nut and slack, $1.05; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district.

COLUMBUS

The continued warm weather has weakened the trade still further. Production is at a low ebb. Outlook on new contracts generally adverse.

General weakness is still the chief characteristic of the local trade. The recent high temperatures have caused a still further falling off in domestic demand, which has really been the backbone of the trade. Dealers are not inclined to buy under present conditions and are devoting their energies to cleaning up their present stocks. Very few orders have been placed and cancellations are still one of the striking features. Little is now expected of the trade here until the stocking-up period arrives.

As a result of the decreased domestic demand, production in Ohio fields has been still farther curtailed. Reports from the Hocking Valley show that the output is only 25% of normal; the same figures are also reported from Jackson, Crooksville and Cambridge. Massillon is producing about 35% and Pomeroy Bend, 50% of the average. Many of the mines have been closed down indefinitely and others have been operated only one or two days weekly.

Prices are somewhat weak at the same levels which have prevailed for some time. Rescreened lump is selling in small quantities but other domestic grades are slow. Pocahontas is still quite popular. Steam business is heavy in every direction and sales agents have considerable difficulty in renewing contracts. Many of the steam users have been content to buy their supply on the open market. It is feared that when contracts are renewed it will be at some sacrifice.

Little is doing so far in the Lake trade; some coal has been loaded for shipment to the Northwest, but it is only a small amount. Just how active the Lake business will be is a matter of conjecture so far.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.45	$1.50	.....
Inch and a quarter	1.30	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	0.60	0.65	0.55
Coarse slack	0.50	0.55	0.45

CINCINNATI

Cold weather causes a local flurry in domestic, but the trade continues at a standstill. Market virtually on a spring basis. New contracts the only business in sight.

The trade has now settled down into the usual between-seasons attitude, operators being convinced that it will be impossible to add anything further to the winter's business; this seems to have had the effect of putting an end to heavy price concessions. The agencies also have their eyes on the coming spring business and are not inclined to jeopardize this with offers at ruinous prices. There also seems to be little distress coal offering on this market, probably for the same reason. Some consignment coal is reported at other points, but shipments to Cincinnati on that basis appear to have been discontinued as useless. Prospects for spring business are considered favorable, especially by Kentucky and West Virginia interests.

LOUISVILLE

Operations being curtailed and prices low.

The Kentucky market continues unsatisfactory, with suspension of operations more or less general in the Western field and imminent in the Eastern. Continuation of the warm weather and the most limited demand for any of the domestic sizes have caused a stiffening in the nut and slack market, due to scarcity of that grade rather than to increase in the demand; some of the better grades are commanding from 65 to 75c. Other coals are unchanged in price.

BIRMINGHAM

Coal market very quiet and mine operations heavily restricted. Large sales of pig iron.

The past 10 days has brought little change in either lump or steam coal. There is practically no demand outside of regular yearly contracts. The mines are running on an average of two to three days per week. Blacksmith coal is about normal. There have been several large sales of pig iron recently, though the prices are far below normal.

COKE

CONNELLSVILLE

Coke market continues stagnant marketwise, with heavier production and shipments by the producer-consumer class.

The coke market continues without important incidents. There are no furnaces going into blast that would need to purchase coke, such increases in furnace operations as have occurred, or are in prospect, being by those who have their own production or closed contracts late in the old year. We quote: Prompt furnace, $1.50@1.55; contract furnace, to July 1, $1.60; to Dec. 31, nominal, $1.75; prompt foundry, $2@2.25; contract foundry, nominal, $2.20@2.30, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Feb. 20 at 271,090 tons, an increase of 20,235 tons, and shipments at 269,888 tons, an increase of 20,345 tons.

Buffalo—There is nothing to indicate a stir in the coke market. A moderate amount is selling and that is likely to be the extent of the trade for an indefinite time. Coke prices remain on the former basis of $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

Chicago—Furnace and foundry coke is listless, with prices remaining about the same as last week. Domestic sizes are quiet, with no better absorption. Quotations are as follows: Byproduct, $4.75@4.90; Connellsville, $4.60@4.80; Wise County 72-hr. (select), $4.50@4.75; gas coke, $4.10@4.25; furnace, $4.50@4.65.

THE STEEL INDUSTRY

February record shows an increase but it is questionable whether it can be maintained. Railroad buying fair.

The February record of larger specifications by buyers and of broadening operations of mills has created a good feeling in the steel trade, but with it a question is raised as to the maintenance in March of the recent rate of new bookings. The advance of heavy steel products to 1.15c., Pittsburgh, put into effect Mar. 1, finds many consumers covered for this month at 1.10c., while not a few have contracts at 1.10c. that will carry them one or two months into the second quarter. It is not likely, therefore, that bars, plates and structural steel will be active enough to really try out the new prices.

The month starts with steel ingot production at 60 to 65% of capacity, the latter being the Steel Corporation's rate. Due to the heavier shipments last month—and shipments are the real barometer—the Steel Corporation's unfilled orders at the end of February, while more than at the end of January, showed a smaller increase for the second month than for the first.

A number of independent producers have had the same experience as the Steel Corporation—larger shipments in February than in January, but with a tendency to quietness showing itself as the month ended.

While disappointing as to cars and locomotives, there is no great complaint of railroad buying of rails, which for the first two months of the year has exceeded 500,000 tons.—"The Iron Age."

MIDDLE WESTERN

CHICAGO

General weakness prevails. No improvement in domestic coals. Smokeless fuels still inactive and depressed. Some hardening in steam coals.

Coal buying drags along in a discouraging way, and demand for domestic sizes is at a standstill. All efforts to stimulate sales have proved fruitless, and spring-like weather has played havoc with the situation. The Indiana and Illinois mines are operating at three days per week, and some only two days. Tracks at the Indiana mines are congested with coarse coal, and in southern Illinois there is a considerable tonnage of the finer sizes on consignment. Operators see no improvement in sight, even though a cold snap should arrive, and it is felt that the winter is mostly over.

More stability is evident in screenings, due primarily to curtailment of production. Free screenings are very spotty; in some districts none are available, and in others they are plentiful. Prices for domestic sizes are at the bottom, and retailers report a slowing up in the demand from consumers.

The movement of coal from the Indiana mines during February will probably fall 25% below that for the same month last year. A number of mines have suspended with the expressed intention of remaining idle for an indefinite period. Prices on domestic sizes range as low as $1.30 per ton, and there hardly seems to be room for further reductions. Mine-run is selling around $1 per ton.

Circular prices on Franklin and Williamson County coals are being maintained, but shipments are scarce. Screenings have improved. Operating time is averaging about two days per week.

In the Springfield District the working time averages about three days per week. The domestic demand still continues weak and the railroad demand has been reduced.

In Hocking, 50 cars of lump on demurrage were offered at any price to effect disposition. This coal has not been absorbed, and the major portion of it will be sold for demurrage and carrying charges.

Smokeless coals show no improvement, and some producers are accepting any reasonable offer for mine-run. The situation is extremely unfavorable.

Anthracite is flat, due to the near approach of the April prices. Some of the independents have quoted 40c. per ton under list in a futile effort to force the market.

Prevailing quotations are as follows:

	Williamson and Franklin Cos.	Springfield	Sullivan	Clinton	Carterville

ST. LOUIS

Screenings market temporarily stimulated. February an unsatisfactory month for the coal trade.

Toward the close of last week, the screenings market tightened up, but not to the extent that was anticipated. Williamson and Franklin County 2-in. screenings went to 80c. and 85c. and Standard 2-in. advanced to 65c. With the beginning of March, however, there is a better demand for domestic sizes, both locally and from the country section, and this has eased the screenings market some. But unless there is some cold weather to follow, this domestic demand will be light and only temporary, which will put steam sizes back into their own.

February was the mildest in the history of the local coal trade. Summer prices prevailed on all coals from the Williamson-Franklin County field, both raw and washed, as well as from the Standard district. Pennsylvania anthracite is at a standstill, and practically no smokeless is moving in at all.

KANSAS CITY

Weather continues favorable but mines are slowing up with the approach of spring. Prices lower.

The slow season for the operators has arrived, although winter still prevails. A number of mines were reported closed during the week and some others are operating only part time. This is mainly the result of the usual spring slowing down, but is partly caused by an over supply of coal on the cars in Kansas City. Nearly all companies have been obliged to pay demurrage, and in the anxiety to move their coal, much cutting of prices occurred last week. Cherokee lump fell off 25c. to $2 and nut dropped about 10c. to $1.85 or $1.90. Both Missouri and Kansas steam coal sells now at $1.25, but the price went as low as $1.10 early in the week.

PORTLAND, ORE.

Volume of business for the season well up to the average. Summer discount on Wyoming and Utah coals.

The fuel business has held up splendidly during February, contrary to expectations of dealers and the final analysis for the season will probably show that business was up to the average. The Utah and Wyoming mines took off 50c. per ton on Feb. 1 but the retail prices here have not been affected yet; the reduction is that usually announced for May 1 when summer prices go into effect. Washington mines usually maintain the same prices winter and summer. There is said to be little likelihood of any Atlantic Coast coal coming into this field by way of the Panama Canal, owing to the scarcity of attractive carriers.

PRODUCTION AND TRANSPORTATION STATISTICS

PENNSYLVANIA RAILROAD

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for January of the current year and the 12 months of 1913 and 1914, in short tons:

	January		Twelve Months	
	1915	1914	1914	1913
Anthracite	894,529	915,027	11,201,150	10,711,335
Bituminous	3,571,345	4,117,514	47,769,227	51,526,267
Coke	685,546	853,412	9,548,354	13,892,825
Total	5,151,420	5,885,953	68,518,731	76,330,427

BALTIMORE & OHIO

The following is a statement of coal and coke tonnage moved over this system and affiliated lines during November and December of 1914 and January of the current year:

	November		December		January	
	1914	1913	1914	1913	1915	1914
Coal	2,324,271	2,939,975	2,227,899	3,005,914	2,293,406	2,917,834
Coke	185,466	343,387	232,594	269,998	221,395	274,955
Total	2,509,737	3,283,362	2,460,493	3,275,912	2,514,801	3,192,789

COAL FREIGHT DECISIONS

The Illinois Coal Cases—I. C. C. Nos. 5346, 5668, 5698, 5698 Sub-No. 1 and Investigation and Suspension Docket No 237.

1. Upon complaint and intervening petitions alleging (1) that the so-called Springfield group of Illinois is unduly large and that the application of the same rate from all coal mines in this group to destinations in the Northwest unjustly discriminates against the mine operators in the northern part of the group by depriving them of the advantage of their location nearer to the common markets; and (2) that the present spread of 70c. in the rates from southern Illinois over those from northern Illinois to the same destinations is not sufficient and should be increased to $1; it is **Held:**

That no basis has been shown of record for dividing the present Springfield group or for increasing the present rate differential against the southern Illinois mines. Nor does the record justify a modification in any of the other rate groups involved in the proceeding.

2. No unjust discrimination against St. Louis or other violation of the act to regulate commerce shown of record in the present relation of rates on coal from Illinois mines moving to that point as compared with rates on coal from the same mines to East St. Louis.

3. The proposed increase of 5½c. per ton in the rates on coal to St. Louis from Illinois mines found to have been justified.

Investigation and Suspension Docket No. 448—Rates on coke from Chicago and Peoria, Ill., to St. Paul, Duluth, Minn. and other points.

1. Proposed increased rates on coke in carloads from St. Louis, Mo., Chicago, Waukegan, and Peoria, Ill., Milwaukee and other points in Wisconsin, and Menominee, Mich., to points in Minnesota other than Duluth and in Wisconsin, Iowa, and South Dakota, justified.

2. Proposed increased rates on the same commodity from the same points of origin to Duluth, Minn., held unreasonable to the extent that they exceed $2.15 per ton.

I. C. C. No. 6712—Public Utilities Commission of Idaho vs. Oregon Short Line R.R.

Rates for the transportation of bituminous coal in carloads from Kemmerer and Rock Springs, Wyo., to points in southern Idaho not shown to be unreasonable. Complaint dismissed.

FOREIGN MARKETS

GREAT BRITAIN

Demand in excess of supply. Prices high and sellers cautious about commitments.

The coal industry is still suffering a great deal from the abnormal difficulties which have come upon it as a result of the war. There can be no doubt that the demand for practically every class of coal remains in excess of the available supply, and in the circumstances prices have an upward tendency all around. Even in the North East Coast shipping centers, and in South Wales, where scarcity and irregular arrivals of tonnage have often combined to depress the export market, the trade tide seems to have turned definitely at last, and, despite the continued high level of freight rates, business is decidedly better.—"The Iron and Coal Trades Review."

Feb. 19—For all classes of coal the market remains in an extremely strong condition. Supplies are unobtainable for this month while the various collieries are heavliy booked for March. Quotations are approximately as follows:

Best Welsh steam	$5.40@5.52	Best Monmouthshires	$4.92@5.04
Best seconds	4.92@5.28	Seconds	4.80@4.92
Seconds	5.04@5.16	Best Cardiff smalls	4.14@4.26
Best dry coals	4.80@5.04	Cargo smalls	3.60@3.84

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport both net, exclusive of wharfage.

Freights—Chartering is fairly active but business is below normal owing to the difficulty of arranging loading turns. Rates are approximately as follows:

Gibraltar	$5.04	Naples	$7.92	Las Palmas	$4.80
Malta	....	Venice, Ancona	10.20	St. Vincent	5.16
Marseilles	5.79	Alexandria	6.96	Rio Janeiro	6.48
Algiers	5.40	Port Said	6.96	Monte Video	5.64
Genoa	7.92			River Plate	5.88

Note—These quotations are based on an exchange rate of one shilling equals 24 cents.

Exports—British exports for January and the past three years were as follows:

	January			Year		
To	1912	1913	1914	1912	1913	1914
Russia	226,040	239,004	....	4,046,644	5,998,434	3,087,805

Coal Contracts Pending

It has been found impossible to eradicate all inaccuracies from this department; since its inception 2.5 per cent. of the items listed have been reported as incorrect, in spite of the fact that we are paying a higher average scale of remuneration for this matter than has ever been paid by this, or any other coal journal. In the collection of this information the customary sources of inquiry, such as clipping bureaus, press reports, etc. were rejected because of their unreliability. Only information obtained directly from the source of the proposed business, or a seemingly reliable connection, is accepted, and much of this is drawn through our affiliations with other leading technical journals. In justice to ourselves and our readers, we believe this brief statement to be warranted. It is only through the close cooperation of all concerned that this department can attain a lasting success and be of real benefit to the coal trade. We will, therefore, appreciate any and all information relative to inaccuracies of contracts listed below.

No. 88—Vincennes, Ind.—The City Electric Lighting Co., at this place, contracts for about 5000 tons of mine-run coal and screenings some time during the current month. The approximate cost is $1.45 for mine-run and $1.15 for screenings and the business is done on a competitive basis (p. 318). Address Mgr., A. J. Hetz, The City Electric Lighting Co., Vincennes, Indiana.

No. 93—Jersey City, N. J.—The lowest bid submitted to the Hudson County Boulevard Commissioners for furnishing and delivering 2500 gross tons of best quality pea coal (p. 356) was from Behrens Bros., Paterson Plankroad, Secaucus, N. J. Address Clk. of the Bd. John C. Sweney, Boulevard Comrs., County Courthouse, Jersey City, N. J.

No. 131—Rochester, N. Y.—The Board of Education at this place will be in the market during the current month for about 6000 tons of anthracite and 6000 tons of semi-bituminous coal (p. 357). Address Secy. J. S. Mullen, Municipal Bldg., Rochester, N. Y.

No. 135—Baltimore, Md.—Henry Sonneborn & Co., at this place, purchase an annual supply of from 3500 to 4000 tons of standard mine-run soft coal (p. 357). In general the contract is let during March. Address Pur. Agt. A. Mainzer, Pratt and Paca St., Baltimore, Md.

No. 138—Baltimore, Md.—The Calvert Bldg. contracts for an annual supply of 5000 tons of standard mine-run soft coal, usually during the current month (p. 358). Address Pur. Agt. Franklin G. Lauderman, Calvert Bldg., Baltimore, Md.

No. 157—Detroit, Mich.—Sealed proposals will be received up to 2 p.m., Mar. 9, by the Board of Water Commissioners for furnishing 25,000 tons of bituminous mine-run coal (p. 398). The Board reserves the right to order, before Aug. 15, 2000 additional tons at the contract price. Each bid must be accompanied by a certified check for $500. Address Secy. H. A. Gilmartin, Board of Water Commissioners, Detroit, Mich.

No. 164—Detroit, Mich.—Sealed proposals will be received until 2 p.m., Mar. 9, by the Board of Water Commissioners for furnishing about 700 tons of bituminous and 40 tons of anthracite coal to be delivered at the storage yard, emergency station and office of the Board of Water Commissioners (p. 399). Address Secy. H. A. Gilmartin, Board of Water Commissioners, Detroit, Mich.

No. 170—Pontiac, Mich.—Bids will be received until 1:30 p.m., Mar. 11, for furnishing the Pontiac State Hospital with a supply of coal for one year commencing May 1, 1915 (p. 399). The approximate quantities are 7500 tons of free-burning three-quarter lump bituminous coal and about 500 tons of anthracite coal (250 tons grate, 250 tons stove, and 30 tons chestnut). Prices must be f.o.b. hospital, and bidders should specify location of mine. Address Steward E. H. Halsey, Pontiac State Hospital, Pontiac, Mich.

No. 186—Natick, Mass.—The Natick Gas Light Co. at this place advises that it has discontinued the manufacture of gas and will not be in the market for 3000 tons of bituminous coal, as stated in a previous issue (p. 398). Address B. J. Bean, Natick Gas Light Co., Natick, Mass.

No. 188—Sturgeon Bay, Wis.—The local utility commission will be in the market for about 4000 tons of coal, contract for which will be made during either this month or next (p. 399). Youghiogheny three-quarter coal is ordinarily used, and the price is about $3 per ton. Address Supt. James E. Johnson, Sturgeon Bay Utility Commission, Sturgeon Bay, Wis.

No. 191—Metropolis, Ill.—The local water and light department will be in the market during March or April for about 2700 tons of 2-in. screenings (p. 399). This business is usually closed at about $1.60 per ton. Address Frederic N. Cover, C. E., City of Metropolis Water & Light Dept., Metropolis, Ill.

No. 214—Grand Junction, Colo.—The Grand Junction Electric, Gas & Mfg. Co. at this place will be in the market about Apr. 1 for approximately 7500 tons of bituminous coal, the present contract being closed at $1.54 per ton. Address Gen. Mgr. E. A. Sunderlin, Grand Junction Electric, Gas & Mfg. Co., Grand Junction, Colo.

No. 215—Martins Ferry, Ohio—The Municipal Electric Light & Power Plant will be in the market about Apr. 1 for from 3000 to 4000 tons of bituminous mine-run coal. The present contract was closed at $1.45 to $1.50 per ton. Address Supt. J. W. Tush, Municipal Electric Light & Power Plant, Martins Ferry, Ohio.

No. 216—Frederick, Md.—The Municipal Electric Light Plant at this place will be in the market about Apr. 1 for approximately 1100 tons of Big Vein Georges Creek coal. The present contract was closed at $3.20 per ton, f.o.b. Frederick. Address Clk. Jacob H. Schmidt, The Municipal Electric Light Plant, Frederick, Md.

No. 217—Dixon, Ill.—The Illinois Northern Utilities Co. of this place will be in the market about Apr. 1 for 45,000 tons of screenings, mine-run, and egg coal. The approximate cost per ton is $2.80 unloaded. Address F. M. Smith, Fuel Dept., Illinois Northern Utilities Co., Dixon, Ill.

No. 218—New Britain, Conn.—The Board of Education will be in the market during March or April for about 1500 tons of hard white ash or Old Company's Lehigh coal. Address L. H. Pierce, Finance Com., Board of Education, New Britain, Conn.

No. 219—Hillsdale, Mich.—The Board of Public Works will be in the market about Apr. 1 for 3500 tons of West Virginia mine-run coal, the present contract being closed at $2.50 per ton. Address Contract Agt. J. C. Hanson, Municipal Electric Light & Water Plant, Hillsdale, Mich.

No. 220—Richmond, Va.—Bids will be received until 2 p.m., Apr. 14, for furnishing the U. S. Post Office 400 tons of bituminous coal. Address Custodian H. T. Thornton, U. S. Post Office, Richmond, Va.

No. 221—Columbus, Ohio—Bids will be received until 2 p.m., Apr. 14, for furnishing the U. S. Post Office 700 tons of bituminous coal. Address Custodian S. A. Kinnear, U. S. Post Office, Columbus, Ohio.

No. 222—Bayonne, N. J.—Sealed proposals will be received by the Board of Education until 8 p.m., Mar. 18, for furnishing about 2500 tons of coal, the amount to be made up of 1500 tons, more or less, of egg, stove, or nut coal, and 1000 tons, more or less, of pea coal. Address Secy. W. J. Tomlin, Board of Education, Ave. C and 26th St., Bayonne, N. J.

No. 223—Independence, Iowa—Bids will be received by the City Clerk until Mar. 8, for furnishing the coal supply for the city during the year ending Apr. 1, 1916. Prices should be submitted for No. 2 washed coal, f.o.b. Independence, giving the B.t.u. dry and wet basis. About 125 car loads of 80,000 lb. each are used per year. Address City Clk. Rufus Brewer, Independence, Iowa.

No. 224—New Albany, Ind.—Bids will be received by the Auditor, Floyd County, until 10 a.m., Mar. 4, for furnishing coal for the court house, poor asylum, and county jail during the fiscal year. Address Audr. Julian T. Miller, New Albany, Ind.

No. 225—Madison, Wis.—The Board of Education of this place will be in the market during April or May for about 500 tons of anthracite pea and Pocahontas coal. This contract is usually awarded to a local dealer, the award being made on a competitive basis. Address Chief Clk., Board of Education, Madison, Wis.

No. 226—Portland, Ore.—The Board of Education will be in the market during April for about 2000 tons of steam coal. The present contract was let at $6 per ton. Address Chief Clerk, Board of Education, 401 Court House, Portland, Ore.

No. 227—Wabash, Ind.—The Wabash Water & Light Co. will be in the market about Apr. 1 for 7500 tons of southern Indiana No. 4 slack coal. The present contract price is $1.70 per ton, delivered. Address Mgr. T. W. McNamee, Wabash Water & Light Co., Wabash, Ind.

No. 228—Cambridge, Mass.—The Board of Education will be in the market about Apr. 1 for 5000 tons of anthracite and bituminous coal. The present contract was awarded at $5.73 for anthracite and $4.36 for bituminous. Address the School Committee, City Hall, Cambridge, Mass.

No. 229—Bennettsville, S. C.—The Bennettsville Electric & Water Plant will be in the market about Apr. 1 for 7500 tons of semibituminous coal, the present contract price being $3.75 per ton. Address Mgr. E. C. Morrison, Bennettsville Electric & Water Plant, Bennettsville, S. C.

No. 230—Eldon, Iowa—The City Electric Light & Water Works will be in the market about Apr. 1 for 1200 tons of 1¼-in. screening, the present contract price being $1.75 per ton in bin. Address Mgr. C. A. Flint, Municipal Electric Light & Power Plant, Eldon, Iowa.

No. 231—Easthampton, Mass.—The Easthampton Rubber Thread Co. will be in the market about Apr. 1 for 1500 tons of bituminous coal, delivery via N. Y., N. H. & H. R.R. Address Pur. Agt. W. L. Pitcher, Easthampton Rubber Thread Co., Easthampton, Mass.

No. 232—Middletown, Conn.—The Middletown Electric Light Co. will be in the market for 5000 tons of bituminous coal about Apr. 1, delivery via water. Address Pur. Agt. L. C. Whitney, Middletown Electric Light Co., Middletown, Conn.

No. 233—Fair Haven, Vt.—The United Shirt & Collar Co. will be in the market about Apr. 1 for 4000 tons of anthracite coal, delivery via D. & H. R.R. Address Pur. Agt. W. A. Pine, the United Shirt & Collar Co., Fair Haven, Vt.

No. 234—Middletown, Conn.—The Russell Mfg. Co. will be in the market about Apr. 1 for 3500 tons of bituminous coal, delivery via water and teams. Address Pur. Agt. L. deK. Hubbard, Russell Mfg. Co., Middletown, Conn.

No. 235—Springfield, Mass.—The United Electric Light Co. will be in the market for approximately 20,000 tons of bituminous coal about Apr. 1, delivery via N. Y., N. H. & H. R.R. Address Pur. Agt. W. L. Mulligan, United Electric Light Co., Springfield, Mass.

No. 236—New York, N. Y.—The International Paper Co. will be in the market about Apr. 1 for 200,000 tons of bituminous coal, deliveries at their various plants via water and rail. Address Pur. Agt. G. E. Smith, 30 Broad St., New York, N. Y.

No. 237—Northampton, Mass.—The Northampton Electric Lighting Co. will be in the market about Apr. 1 for 2500 tons of bituminous coal, delivery via N. Y., N. H. & H. R.R. Address Light, Heat & Power Corporation, Boston, Mass.

No. 238—Chicago, Ill.—The Grand Crossing Tack Co. will be in the market about Apr. 1 for a year's supply of Youghiougheny ¾-in. lump coal and Illinois or Indiana mine-run coal. This company consumes about 75 tons of Youghiogheny ¾-in lump coal per week, and 160 tons of Illinois or Indiana mine-run coal per day. Address Grand Crossing Tack Co., 75th St. and Stoney Island Ave., Chicago, Ill.

No. 239—Hartford, Conn.—The Columbia & Electric Vehicle Co. will be in the market for 2500 tons of bituminous coal about Apr. 1, delivery via N. Y., N. H. & H. R.R. Address Columbia & Electric Vehicle Co., Hartford, Conn.

No. 240—Bellows Falls, Vt.—The Robertson Paper Co. will be in the market about Apr. 1 for 4000 tons of anthracite coal, deliveries via B. & M. R.R. and Rutland R.R. Address Pur. Agt. F. H. Babbitt, Robertson Paper Co., Bellows Falls, Vt.

No. 241—Fall River, Mass.—The Stafford Mills will be in the market for about 11,000 tons of anthracite coal on Apr. 1, delivery by team. This supply is bought from local dealers. Address Pur. Agt. Samuel Wilkinson, Stafford Mills, Fall River, Mass.

No. 242—New York, N. Y.—The Rutland R.R. Co. will be in the market about Apr. 1 for 150,000 tons of bituminous coal, delivery all rail. Address Gen. Pur. Agt. F. H. Greene, Grand Central Station, New York.

No. 243—Manchester, Conn.—Case Bros. will be in the market about Apr. 1 for 2000 tons of bituminous coal, delivery via N. Y., N. H. & H. R.R. and teams. Address Case Bros., Manchester, Conn.

No. 244—Taunton, Mass.—The Elizabeth Poole Mills will be in the market about Apr. 1 for 1500 tons of anthracite and bituminous coal, deliveries by team. This supply is usually bought from local dealers. Address Henry Lovering, Elizabeth Poole Mills, Taunton, Mass.

No. 245—Southington, Conn.—The Peck, Stow & Wilcox Co., Southington, Plantsville, East Berlin and Elmwood, will be in the market about Apr. 1 for 10,000 tons of bituminous coal, delivery via N. Y., N. H. & H. R.R. Address Pur. Agt. W. H. Neal, Peck, Stow & Wilcox Co., Southington, Conn.

No. 246—Haverhill, Mass.—Lennox & Briggs will be in the market about Apr. 1 for 1800 tons of bituminous coal, deliveries via water and B. & M. R.R. Address George Lennox, Lennox & Briggs, Haverhill, Mass.

No. 247—Montpelier, Vt.—The Capital City Gas Co. will be in the market for 2000 tons of gas coal about Apr. 1, delivery via Central Vermont R.R. Address Capital City Gas Co., Montpelier, Vt.

No. 248—Mt. Tom Junction, Mass.—The Mt. Tom Sulphite Pulp Co. will be in the market for 11,000 tons of bituminous coal about Apr. 1, delivery via B. & M. R.R. Address Mt. Tom Sulphite Pulp Co., 50 State St., Boston, Mass.

No. 249—Middletown, Conn.—The Connecticut Hospital for the Insane will contract about Apr. 1 for 9600 tons of anthracite and bituminous coal, delivery via N. Y., N. H. & H. R.R. Address Superintendent, Connecticut Hospital for the Insane, Middletown, Conn.

No. 250—Waterbury, Conn.—The United Gas Improvement Co. will be in the market about Apr. 1 for 5000 tons of anthracite coal, delivery all rail via N. Y., N. H. & H. R.R. Address United Gas Improvement Co., Philadelphia, Penn.

No. 251—Bellows Falls, Vt.—The Rockingham Paper Co. will be in the market for 2000 tons of bituminous coal about Apr. 1, deliveries via D. & H. R.R. and N. Y. C. R.R. Address Pur. Agt. G. H. Babbitt, Rockingham Paper Co., Bellows Falls, Vt.

No. 252—Taunton, Mass.—The Taunton State Hospital will contract about Apr. 1 for 3000 tons of bituminous coal, delivery by team. Address Superintendent, Taunton State Hospital, Taunton, Mass.

No. 253—Rutland, Vt.—The Rutland R.R., Light & Power Co. will be in the market about Apr. 1 for 3000 tons of gas coal, delievries via D. & H. R.R. and N. Y. C. R.R. Address the Rutland Ry., Light & Power Co., Rutland, Vt.

No. 254—Montville, Conn.—The C. M. Robertson Co. will be in the market about Apr. 1 for 3000 tons of bituminous coal, deliveries via D. & H. R.R. and N. Y. C. R.R. Address Pur. Agt. T. E. Robertson, C. M. Robertson Co., Montville, Conn.

No. 255—Taunton, Mass.—Reed & Barton will be in the market about Apr. 1 for 1500 to 2000 tons of anthracite and bituminous coal, deliveries by team. This supply is usually bought from local dealers. Address Pur. Agt. L. A. Hodges, Reed & Barton, Taunton, Mass.

No. 256—Ludlow, Vt.—The Black River Woolen Co. will be in the market about Apr. 1 for 1000 to 1500 tons of bituminous coal, delivery via Rutland R.R. Address Pur. Agt. Geo. P. Levey, Black River Woolen Co., Ludlow, Vt.

No. 257—New Haven, Conn.—The Department of Charities and Correction will contract about Apr. 1 for 1100 tons of bituminous and anthracite coal. This coal is purchased from local dealers, delivery by team. Address the Department of Charities and Correction, New Haven, Conn.

No. 258—Albany, N. Y.—Sealed proposals will be received until noon, Mar. 24, for supplying various state institutions with coal for one year, beginning Apr. 1, 1915. Address Agt. and Warden Thomas Mott Osborne, Sing Sing Prison, Ossining, N. Y.; Agt. and Warden Charles F. Rattigan, Auburn Prison, Auburn, N. Y.; Agt. and Warden William J. Homer, Great Meadow Prison, Comstock, N. Y.; Agt. and Warden John B. Trombly, Clinton Prison, Dannemora, N. Y.; Medical Supt. R. F. C. Kieb, Matteawan State Hospital, Beacon, N. Y.; Medical Supt. Charles H. North, Dannemora State Hospital, Dannemora, N. Y.

No. 259—Fall River, Mass.—The Algonquin Printing Co. will be in the market about Apr. 1 for 12,000 tons of anthracite and bituminous coal, delivery by water. Address Pur. Agt. W. H. Jennings, Algonquin Printing Co., Fall River, Mass.

No. 260—Erie, Penn.—Sealed proposals will be received until Apr. 1 for furnishing a six months' supply of coal to the Soldiers' and Sailors' Home at Erie. Address Col. John P. Nicholson, Flanders Bldg., 15th and Walnut St., Philadelphia, Penn.

No. 261—Avon, Conn.—The Ensign Bickford Co. will be in the market about Apr. 1 for 2500 tons of bituminous coal, delivery via N. Y., N. H. & H. R.R. Address the Ensign Bickford Co., Avon, Conn.

No. 262—St. Louis, Mo.—Bids will be received until Apr. 14 for furnishing and delivering 360 tons of bituminous coal to the Federal Building. The specifications require 2-in. lump or over. Address Custodian Fountain Lorthwell, Federal Bldg., St. Louis, Mo.

No. 263—Fall River, Mass.—The American Linen Co. will be in the market about Apr. 1 for 10,000 tons of bituminous coal, delivery by water. Address Pur. Agt. J. E. Osborne, American Linen Co., Fall River, Mass.

No. 264—New York, N. Y.—Sealed bids will be received until 10 a.m., Mar. 6, for furnishing and delivering to the Police Department of the City of New York anthracite coal for use in all boroughs, and also for the steamboat "Patrol" and launches of the Police Department. The security required is 30% of the total bid, and a deposit of 1½% must accompany each bid. Delivery to be completed before July 1, 1915. Address Police Comr. A. Woods, 240 Center St., New York.

No. 265—Meriden, Conn.—The Meriden Gas Light Co. will be in the market about Apr. 1 for 9000 tons of gas coal, delivery via N. Y., N. H. & H. R.R. Address Charles A. Learned, Meriden Gas Light Co., Meriden, Conn.

No. 266—Boston, Mass.—The City of Boston will be in the market about Apr. 1 for a supply of coal for various public buildings and city departments. The present contract was let during May, 1914, and provided for coal as follows: 600 tons for the Children's Institute, 5000 tons for the Infirmary Dept., 10,000 tons for the Ferry Dept., 6000 tons for the sewage-pumping plant at Calf Pasture, 5000 tons to the penal institutions, 9000 tons for the City Hospital and approximately 27,000 tons to other city departments. Address Supt. of Supplies D. F. Doherty, City Hall, Boston, Mass.

No. 267—Pittsfield, Mass.—The S. A. & C. Russell Mfg. Co. will be in the market about Apr. 1 for 2500 tons of bituminous coal, deliveries via B. & A. R.R. and N. Y., N. H. & H. R.R. Address Pres. H. R. Russell, S. A. & C. Russell Mfg. Co., Pittsfield, Mass.

No. 268—Buffalo, N. Y.—Sealed proposals will be received until 2 p.m., Mar. 15, for furnishing anthracite and bituminous coal as required by the Police Department and Patrol Boat for the year beginning Apr. 10. Bids are to be accompanied by a certified check for $500 and a bond of not less than $5000 is required. Address Board of Police Comrs., Headquarters Bldg., Franklin and Seneca St., Buffalo, N. Y.

No. 269—Warehouse Point, Conn.—The Hartford & Springfield St. R.R. Co. will be in the market about Apr. 1 for 4000 tons of bituminous coal, delivery via N. Y., N. H. & H. R.R. Address Hartford & Springfield St. R.R. Co., Warehouse Point, Conn.

No. 270—North Adams, Mass.—The North Adams Gas Light Co. will be in the market for 18,000 tons of gas coal about Apr. 1, delivery via B. & M. R.R. Address H. L. Ogden, 131 State St., Boston, Mass.

No. 271—Brattleboro, Vt.—Twin-State Gas & Electric Co. will be in the market for about 500 tons of anthracite coal Apr. 1. Deliveries via B. & M. R.R. and Central Vt. R.R. Address, Twin-State Gas & Electric Co., Brattleboro, Vt.

No. 272—Millis, Mass.—Joseph W. Herman & Co., will be in the market for 400 tons of coal about Apr. 1, delivery via N. Y., N. H. & H. R.R. Address, Joseph W. Herman & Co., 159 Lincoln St., Boston, Mass.

No. 273—Naugatuck, Conn.—The Naugatuck Malleable Iron Co. will be in the market about Apr. 1 for 10,000 to 15,000 tons of bituminous and gas coal, delivery all rail via N. Y., N. H. & H. R.R. Address, Naugatuck Malleable Iron Co., Naugatuck, Conn.

No. 274—Pittsfield, Mass.—Helliwell & Co. will be in the market for 1500 tons of bituminous coal about Apr. 1, delivery via N. Y., N. H. & H. R.R. Address, Helliwell & Co., Pittsfield, Mass.

No. 275—Claremont, N. H.—Claremont Power Co. will be in the market for 1000 tons of bituminous coal about Apr. 1. This coal is usually purchased from local dealers. Address, Claremont Power Co., Claremont, N. H.

No. 276—Bennington, Vt.—The Bennington Gas Light Co. will be in the market for 175 tons of anthracite and 50 tons of bituminous about Apr. 1. This coal is purchased from local dealers. Address, Superintendent, Bennington Gas Light Co., Bennington, Vt.

No. 277—Oxford, Mass.—David N. Taft will be in the market for 500 tons of coal about Apr. 1, delivery via N. Y., N. H. & H. R.R. Address, David N. Taft, Oxford, Mass.

No. 278—Thompsonville, Conn.—The Thompsonville Water Co. will be in the market for 500 tons of bituminous coal about Apr. 1, delivery via N. Y., N. H. & H. R.R. and teams. Address, Superintendent, Thompsonville Water Co., Thompsonville, Conn.

No. 279—Windsor Locks, Conn.—The Northern Connecticut Light & Power Co. will be in the market for 800 tons of bituminous coal about Apr. 1, delivery via N. Y., N. H. & H. R.R. Address, Northern Connecticut Light & Power Co., Windsor Locks, Conn.

No. 280—Mittineague, Mass.—The Southworth Co. will be in the market about Apr. 1 for 3000 tons of bituminous coal, deliveries via N. Y., N. H. & H. R.R. and teams. Address, C. A. Edgerton, Southworth Co., Mittineague, Mass.

No. 281—Laconia, N. H.—Winnepesaukee Gas & Electric Co. will be in the market for 300 tons of anthracite and 300 tons of bituminous coal about Apr. 1, delivery via B. & M. R.R. Address Winnepesaukee Gas & Electric Co., Laconia, N. H.

No. 282—Meriden, Conn.—The School Board here will place a contract for about 800 tons of anthracite coal in April. This coal is purchased from local dealers. Address, chairman of Committee on Buildings, School Department, Meriden, Conn.

No. 283—Holyoke, Mass.—The Holyoke St. Ry. Co. will be in the market about Apr. 1 for 9000 tons of bituminous coal, delivery via N. Y., N. H. & H. R.R. Address, Holyoke St. Ry. Co., Holyoke, Mass.

No. 284—Bristol, N. H.—The Dodge-Davis Manufacturing Co. will be in the market about Apr. 1 for 700 tons of bituminous coal. Delivery via B. & M. R.R. Address, Dodge-Davis Manufacturing Co., Bristol, N. H.

CONTRACTS AWARDED

No. 94—New York, N. Y.—The following are the bids and awards on this contract (p. 356) which provides for furnishing and delivering bituminous coal for fire companies in the Boroughs of Bronx and Queens: Olin J. Stephens, Inc., $570, Bronx (awarded contract); Rudolph Reimer, $495, Queens (awarded contract); Consolidation Coal Co., $1078; Jamieson & Bond Co., $83.30 (informal). Address Fire Comr. Robert Adamson, Municipal Bldg., New York.

No. 98—New York, N. Y.—The following are the bids and awards on this contract (p. 356) which provides for furnishing and delivering anthracite coal: No. 1, for the fire companies in the Borough of Queens, only one bid was submitted, that being from Jamieson & Bond Co., at $715 (awarded contract). No. 2, for the fireboats, Wm. Farrell & Sons, $6479; Commercial Coal Co., $3324 (awarded contract); Meyer-Denker-Sinram Co., $6112.50; John F. Schmadeke, Inc., $5995; Bacon Coal Co., $3384; Burns Bros., $12,675.50. No. 3, for the companies in Dist. No. 23, Borough of Brooklyn, John F. Schmadeke, Inc., $2100; A. J. & J. J. McCollum, Inc., $1995; Bacon Coal Co., $1947 (awarded contract); Rudolph Reimer, Jr., $21,000; C. H. Reynold & Son, $2043. Address Fire Comr. Robert Adamson, Municipal Bldg., New York.

No. 154—Stamford, Conn.—This contract (p. 398), which called for 5000 tons of gas coal, has been awarded. Address G. D. Leland, Supt. Stamford, Gas & Electric Co., Stamford, Conn.

No. 163—Boston, Mass.—The Quincy Cold Storage and Warehouse Co. advises that they have already closed their contract for coal (p. 399.) Particulars are not available. Address Treas. & Mgr. Geo. H. Stoddard, Quincy Cold Storage & Warehouse Co., 133 Commercial St., Boston, Mass.

CONTRACT NOTES

The Board of Administration, Springfield, Ill., recently awarded a contract to Walton & Co. for furnishing anthracite coal to the Chicago State Hospital at Dunning, Ill., at $6.81 per ton. Address Fiscal Superv. Frank D. Whipp, Board of Administration, Springfield, Ill.

There are growing evidences that operators of Eastern Kentucky intend to more actively solicit business in Indiana, Illinois and Iowa. More arrangements are under way with Indiana and Chicago wholesale jobbers to handle these coals next season, and attempts are being made to substitute these coals for West Virginia splints, with some success. The coals are favorably received by the retailers, and their competition with Indiana and Illinois coals necessarily must increase with the efforts being put forth.

Press reports state that contracts have been signed for 1,000,000 tons of Pocahontas coal for France and England, to be delivered by the Norfolk & Western and the Virginian Ry. at Sewalls Point and Lambert Point, Va. The coal is to be loaded into British ships before June 1.

The Boston Safe Deposit & Trust Co., 100 Franklin St., Boston, Mass., purchase about 1600 tons of coal per year, the usual contract being made with the Staples Coal Co. Deliveries are made as required.

R. M. Sutton & Co., Baltimore, Md., uses an annual supply of 500 tons of standard mine-run coal. At present no contract exists, and bids for furnishing this supply might be considered. Address Pres. John R. Sutton, R. M. Sutton & Co., Baltimore, Md.

C. E. Cotting, Boston, purchases coal for nearly two hundred buildings, and generally closes the contract with the Metropolitan Coal Co. Address Supt. D. F. Kilgour, 11 Pemberton Sq., Boston, Mass.

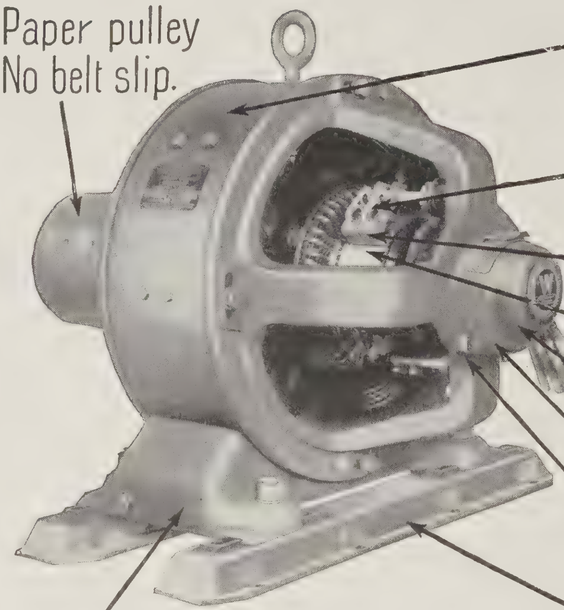
One of three rescue stations built by the State of Illinois in 1911. Since then, 516 men have been given mine-rescue and first-aid certificates. This station at Benton serves an area of 10,000 square miles



Paper pulley
No belt slip.
Rolled openhearth steel frame
Great strength - Compactness - Light weight.
Brush position fixed for all loads and either direction of rotation.
Brushes have very long life.
Sparkless commutation.
Large bearings. Dust-proof - Non-leaking.
Automatic oil-ring lubrication.
Oil overflow plug. Insures proper filling.
Forged openhearth steel slide rails with belt-tightening screw.
Forged openhearth steel feet.

"The SK for Mine"

This is what the Superintendent, or Manager, who has used it says—

Because the above features make it the best motor for driving—

Fans
Crushers
Hoists
Pumps
Shaker Screens
Tools
Conveyors
Washers
Dumpers

Write to a *user* and ask *him* how the SK is doing in *his* mine, tipple or shop.

Subscription price $3 per year, in advance, for 52 numbers to any postoffice in the United States or possessions, and Mexico. $4 to Canada. $5 or its equivalent to any other foreign country.

Subscribers in Great Britain, Europe and the British Colonies in the Eastern Hemisphere may send their subscriptions to the London Office, 6 Bouverie St., London, E. C., England. Notice to change address should be written to the NewYork Office in every instance.

Advertising copy should reach New York Office by Thursday of week prior to date of issue. Entered as second class matter, October 14, 1911, at the Postoffice at New York, New York, under the Act of March 3, 1879.

VOLUME 7 MARCH 13, 1915 NUMBER 11

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD—PROCRASTINATION: *Page* 449

The dangers of putting off until tomorrow or some other day the work that should be done now are clearly pointed out. The dilatory fellow will find out that prosperity for him may do a little procrastinating on its own account. COAL AGE, Vol. 7.

*PLANT OF THE NOKOMIS COAL CO.: *Pages* 450-452

Severe competition in the coal fields of the Mississippi Valley forces operators to cheapen costs and improve the quality of the mine product by all means possible. The plant here described was designed, not only to handle an enormous output, but to prepare it in the most thorough manner. Warren R. Roberts. COAL AGE, Vol. 7.

*EFFECTS OF THE EUROPEAN WAR ON OUR EXPORT TRADE—I: *Pages* 453-455

The views of a fuel expert of one of the oldest coal-exporting firms in the country are of particular interest in connection with prospective developments in the foreign trade. Commerce is gradually adapting itself to the new conditions, and it is now possible to anticipate with fair accuracy what we may reasonably expect to gain in the world's coal markets. J. S. Burrows. COAL AGE, Vol. 7.

COAL AND COKE PRODUCTION IN PENNSYLVANIA: *Page* 455

*THE WENDELL CONTINUOUS CENTRIFUGAL DRIER: *Pages* 456-458

Early history of the development of the continuous centrifugal drier invented by Carl A. Wendell. The difficulties to be overcome in drying the washed coal as it comes in a continuous supply from the washing machines. A detailed description of the drier and its continuous operation, together with the tabulated results of three of these machines installed at the Woodward Iron Co.'s washery at Woodward, Ala. E. A. Holbrook. COAL AGE, Vol. 7.

*CHICAGO COAL DEALERS VISIT NEW RIVER FIELD: *Page* 458

COAL AGE, Vol. 7.

*AUTOGENOUS WELDING BY THE THERMIT PROCESS: *Pages* 459-561

When powdered aluminum is mixed with iron oxide and a portion of the mixture heated to a certain temperature, a self-propagating reaction is started whereby the oxygen leaves the iron and unites with the aluminum. This chemical transfer of the oxygen evolves intense heat and results in the formation of highly heated liquid low-carbon steel, which may be employed for autogenous welding. Frank H. Kneeland. COAL AGE, Vol. 7.

EXTRACTS FROM A SUPERINTENDENT'S DIARY: *Page* 461

*A NEW CAR STOP AND SHOCK ABSORBER: *Page* 462

COAL AGE, Vol. 7.

MINERAL EXHIBIT AT SAN FRANCISCO: *Page* 462

ROCKEFELLER SECURES INTEREST IN CONSOLIDATION COAL CO.: *Page* 462

PROPOSED COMBINE OF INDIANA-ILLINOIS OPERATORS: *Page* 462

LABOR SITUATION: *Page* 463

Not while the union has money will the eastern Ohio strike end. The union and the miners are united in that determination. The Gallagher amendment of the Ohio Assembly will wipe out the Green anti-screen bill. The strike near Fairmont, W. Va., ends as suddenly as it began. COAL AGE, Vol. 7.

EDITORIALS: *Pages* 464-465

Trail Hitting and Mine Safety—Success—Failure—The Outlook on Ocean Freights—Some Intimate Points on the South American Trade—Ueber Alles.

SOCIOLOGICAL DEPARTMENT: *Pages* 466-470

*Education in Colorado Fuel & Iron Co. villages. The schools have found some difficulty in combating the general apathy. Nevertheless, much good institutional work is being done with the help of the sociological department. The opportunities for education are excellent for those who desire to embrace them. COAL AGE, Vol. 7.

DISCUSSION BY READERS: *Pages* 471-474

Recognition of Bravery. Letter No. 3—The Formation of a Flame Cap. Letter No. 1—Drying Washed Coal. Letter No. 6—Mining Laws, Legislation and Mine Regulation. Letters Nos. 38 and 39.

STUDY COURSE IN COAL MINING: *Page* 474

Tractive Effort of a Locomotive and Drawbar Pull.

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

Here's a story so good in its logic that I want to call it to your attention. It was printed in *System* some time ago.

◦ ◦ ◦

"I remember distinctly that when I was a small boy my father used to buy magazines and bring them home. He always tore off the advertising sections and threw them away. Sometimes he used them for shaving paper.

"When I got old enough to shave, I tore advertising sheets out of the back of the magazines and used them for shaving paper. Perhaps I may have inherited my father's point of view. He was a sea-faring man and resented what he called 'the attempts of infernal tradesmen to get me to buy their miserable stuff.' When I began to use advertising sheets for shaving paper, occasionally something would strike my eye and all of a sudden it occurred to me that there might possibly be something interesting in advertisements. I began to read them. They were interesting and I continued to read them.

"I still read them. As a matter of fact, I find the advertising sections of the magazines about as interesting as what the publishers call 'pure reading matter.' The pictures nowadays are quite as good as those in the body of the magazine. The English also is good.

"Advertisements are interesting to me because they have to do with real people, real things and real facts. The body of most magazines has a pretty generous sprinkling of fiction, stories about imaginary people, imaginary places and imaginary situations. There is an atmosphere of unreality about a good deal of it.

"The advertising pages on the other hand have the real stuff in them. The writer of fiction is expected to draw on his imagination. The writer of advertisements (P. T. Barnum, to the contrary, notwithstanding) must confine himself to facts, if he is going to last.

"This reading of advertisements certainly has had its effect on me as a consumer. Unless there are some intervening circumstances, I buy things which I have seen advertised.

"I think I have more confidence in advertised than in unadvertised goods. I feel that I know them. I feel much towards advertised articles as I do towards people that I have heard of or heard my friends speak of, or that I have seen many times. I feel acquainted. In buying an article which I have seen advertised I have a feeling of confidence.

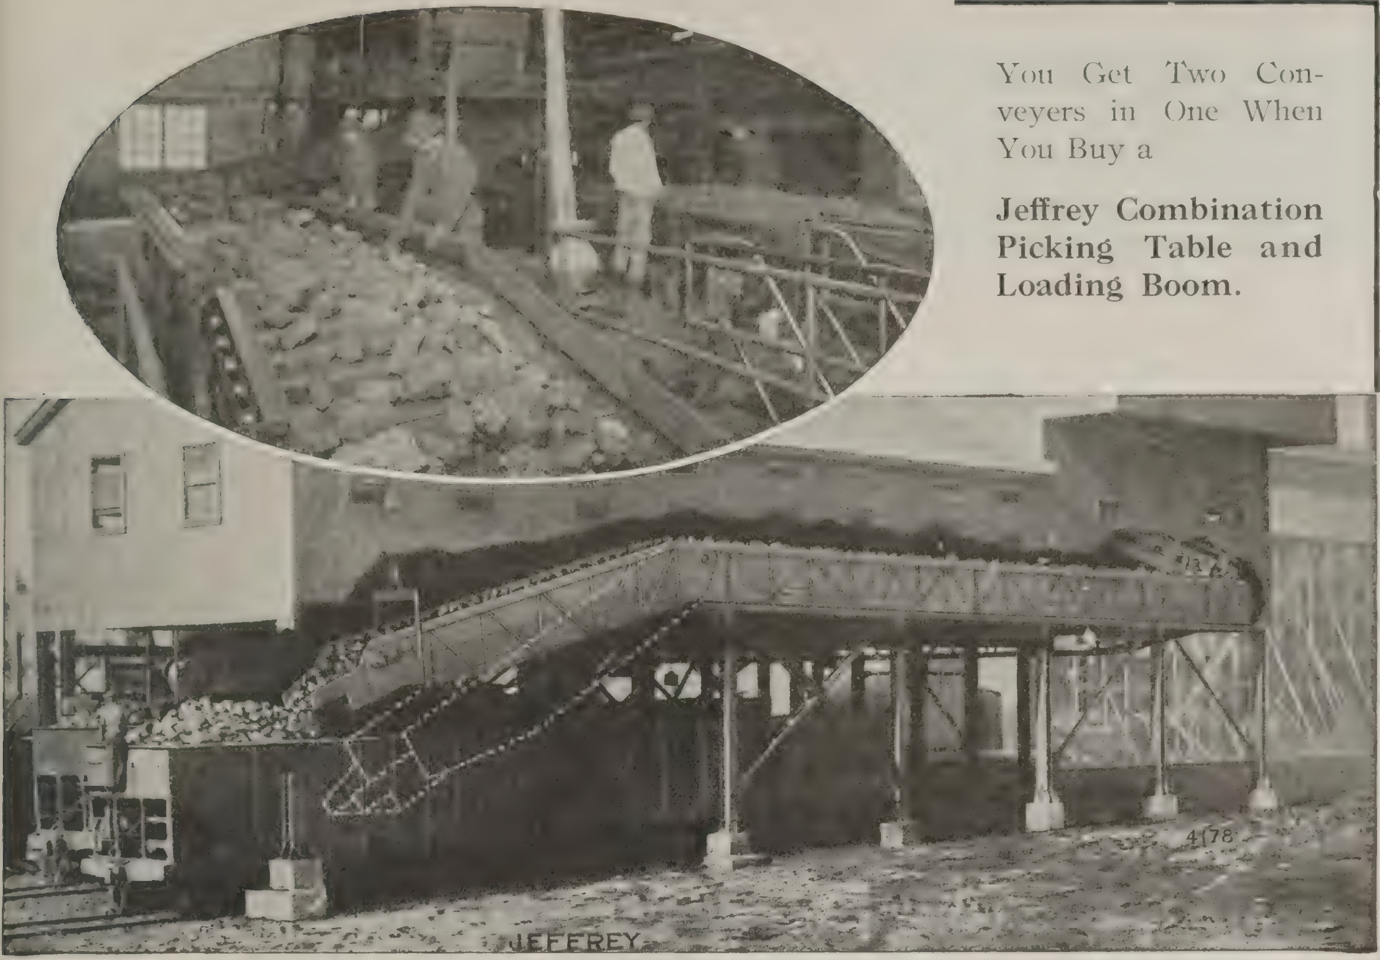
"I suppose my mental processes are about as follows: This thing must be good or it would not be advertised—nobody will spend money in getting people to buy a worthless thing—if it is worthless every buyer will tell every other buyer and the advertiser's money will be thrown away. It has got to be good or it won't stand advertising.

"This is particularly true of things which I have seen advertised for a long time. I suppose I reason about as follows: People must buy this thing or the manufacturer couldn't afford to advertise it so extensively and so long. If people keep on buying it, it must be giving satisfaction. If it is giving satisfaction to other people, it probably will to me.

"It generally does."

You Get Two Conveyers in One When You Buy a

Jeffrey Combination Picking Table and Loading Boom.



Clean Your Coal Thoroughly Eliminate Breakage in Loading

Many Operators are Increasing the Selling Price and Demand for their Coal through the Use of

Jeffrey Combination Picking Tables and Adjustable Loading Booms

Our **STANDARD Picking Tables,** with perfect discharge flights and steel thimble roller chains, form a moving pan, which makes an ideal arrangement for picking the refuse from the coal.

The **Jeffrey Loading Boom** eliminates the long drop to the bottom of the railroad car and the consequent breakage. It practically lays the coal down into the car. It is mechanically balanced, thus requiring little power to operate. Can be applied to new and old tipples.

G-E Form D Compressed Terminal Railbond

Railbond Economy

A well bonded return circuit means low resistance at track joints, reducing the waste of electrical energy at these points to the minimum.

G-E Compressed Terminal Railbonds

will positively accomplish the following economies if installed throughout your mine railway system:

More cars hauled each trip
More trips in given time
Fewer armature and field coil burnouts
Fewer repairs for the bonding gang.

Mine haulage efficiency is improved by installation of G-E compressed terminal railbonds

Ask our railbond engineers.

Here is the Point

What We Do It With

The advent of the simplified type known as the LAWSON TRAMWAY puts the whole subject of Short-Haul Transportation on a new basis. The Aerial Tramway has hitherto been strictly an emergency apparatus, to be resorted to when all other reasonable means of transportation fail. The standard or narrow gauge road, traction engines, motor trucks, etc., were first figured on as the preferred plan. But if on account of severe grades, sharp curves, deep canons, river crossings, etc., none of these were feasible, then, as a last resort, the Aerial Tramway was called in; and performed its service well, as a rule. Nevertheless, its high initial cost, its endless and heavy upkeep, and its lack of general flexibility to adapt itself to the best route, have always stood in the way of its broader application.

Now comes the Lawson Tramway into court. It is no longer "aerial" at all except in the most limited sense of the term. It sticks close to earth at a general height of 10 feet to the top rail except in crossing local depressions. Curves present no obstacles. Its cost delivered and erected is far lower than any other tramway. It is built in short sections and hence can be extended or shifted in location at will. **Above all, its cost of maintenance is a mere fraction of that of any other tramway.** In short, it is as sensible and simple as a cart—which, in fact, it is substantially.

It is our purpose to press home these facts until they are thoroughly understood. The Lawson Tramway will then be not the **last** but the **first** resort as the solution of the Short-Haul Problem. Where railroad service ends, the Lawson service begins. It even replaces the mule.

The various engineering problems presented are of the most stimulating character. In application no two tramways are alike. Our clients may be assured that Lawson Tramways are not "built by the mile and sawed off to order," but each case receives the closest engineering study with the interest of our client always paramount to every other consideration.

Motors Wound with

Deltabeston

Wire Are Protected Against Burn-Outs

A coil of smoke and the smell of burning varnish are the signs of another mine motor shutdown and repair bill.

Up to the time that "Deltabeston" Magnet Wire was introduced, there was nothing to insure definite service-life from motors.

"Deltabeston" Wire is covered with an all-asbestos insulating medium of great mechanical strength and toughness. It possesses high dielectric strength and is of such high melting point that it will not soften under the maximum temperature reached by coils in the most severe services.

When buying any kind of a motor or when having your present motor rewound specify "Deltabeston" Magnet Wire and you will eliminate motor troubles.

Look into this today—We will be glad to send our C-A Folder and a free sample for testing.

COAL AGE

Vol. 7 NEW YORK, MARCH 13, 1915 No. 11

Procrastination

By M. D. Cooper

Are you a procrastinator? Are you putting off, for an indefinite future time that may never arrive, something you ought to be doing today?

A Specific Case

A SUPERINTENDENT *who took charge of a mine a year ago remarked, on his way to the office during one of the first days of his connection with the company, that he did not like the looks of an old engine, a mass of junk lying nearly across his path. "I'll have that removed in short order," he said. But he has postponed the departure of the engine, and it still remains. In fact, it will probably stay where it is until some official higher than himself suddenly bears down on him with a few short, crisp remarks.*

Another Instance

AT ANOTHER MINE *the blower fan is located on a small area of sloping ground. In winter there is real danger of a person slipping and falling against the rotating fan wheel. Everyone in authority at that particular mine is aware of the danger. However, the very ease with which the danger could be eliminated by erecting a short fence made up of a few feet of chain or two or three lengths of old pipe has resulted in the development of a general spirit of procrastination in regard to it. An accident, of course, will recall attention to the surroundings of the fan.*

SUCH cases as that of the fan make one almost ready to believe that some people have twisted the old saying around and actually follow a revised version of their own, which probably is, "Never do today what you might as well do tomorrow."

The difficulty with such a motto is that it sounds sweet and musical today; but generally for its follower tomorrow arrives with a thud, and the contented procrastinator of yesterday finds himself thrown in with the things of yesterday—things the usefulness of which is gone.

On the other hand, there is a mighty comfortable feeling that takes hold of all of us when we know that we are keeping our work up to the top notch; when, because of our careful planning and the fact that things are being done on time, everything goes "dead right." ("Dead right" is rather an uncommon expression, isn't it? We've heard many times of things going "dead wrong," but we need not forget that it is possible to make things go "dead right.")

"Leave it to time," said the ancients. Our sorrows and our ills and our injuries were left for time to heal. But today we are beginning to realize that we must not put off things for the future, waiting for accidents to happen and then applying the cure.

TODAY we must use our brains and our energy to prevent accidents and reduce to a minimum those things that must unavoidably be left to time. What are you doing *now* in your mine, or around your ovens, or in your town?

You doubtless have a force you feel compelled to keep at work during the present dull season. Are you using it to best advantage, or are you procrastinating—killing time? Are the stoppings in your air-courses being tightened up? Are the loose frogs in your haulageways, that you never can touch during busy periods, being repaired? Are you employing most advantageously the men you are compelled to keep on the payroll in fixing up the thousand and one little details you can't stop for when you are running at full capacity?

Or, on the other hand, perhaps you are just waiting. Business is dull, but prosperity will return. There is no need of bothering about much, say some. Yes, surely prosperity will return. But remember its return will inevitably be surer and sooner to those places where best efforts have been put forth for its welcome. The dilatory fellow, who keeps putting things off, will doubtless find out that prosperity, for him, may do a little procrastinating on its own account.

Plant of the Nokomis Coal Co.

By Warren R. Roberts*

SYNOPSIS—Severe competition in the coal fields of the Mississippi Valley impels operators to cheapen costs and improve the quality of the mine product by all means possible. The plant here described was designed not only to handle an enormous output but to prepare it in the most thorough manner.

The severe competitive conditions which exist in the Central Mississippi States have compelled coal operators to resort to every means at their command to secure advantages and thereby markets. In certain districts where the quality of the coal is such as to need less preparation than that from some other locality, producers have given their attention to increasing their tonnages and thereby reducing the cost of production.

One of the mining districts in Illinois where unusually large production has been secured is that including the coal field from Gillespie, southward through Staunton and Livingston, and thence northeast to Nokomis. Within this district are located several of the largest producing mines in the state, as well as some new operations which are being developed for still larger capacities than even the largest mines within the district.

At Gillespie, Ill., there are located three mines of the Superior Coal Co., which have averaged daily productions of about 4000 tons each and often exceed this amount.

The Mount Olive & Staunton Coal Co. has two mines near Staunton, Ill., both of which are large producers. No. 2 is especially interesting in this connection as it has an average daily capacity of about 4000 tons.

At Livingston is located the mine doubtless having the largest average production. This mine is operated by the New Staunton Coal Co., and before the recent business depression, which has undoubtedly somewhat curtailed its output, it often produced approximately 4500 tons per day and several times exceeded this amount.

The above discussion of large tonnages is only recited in order to indicate the requirements when a new mine is opened in this district, which is to equal or exceed the production of some of those already existing.

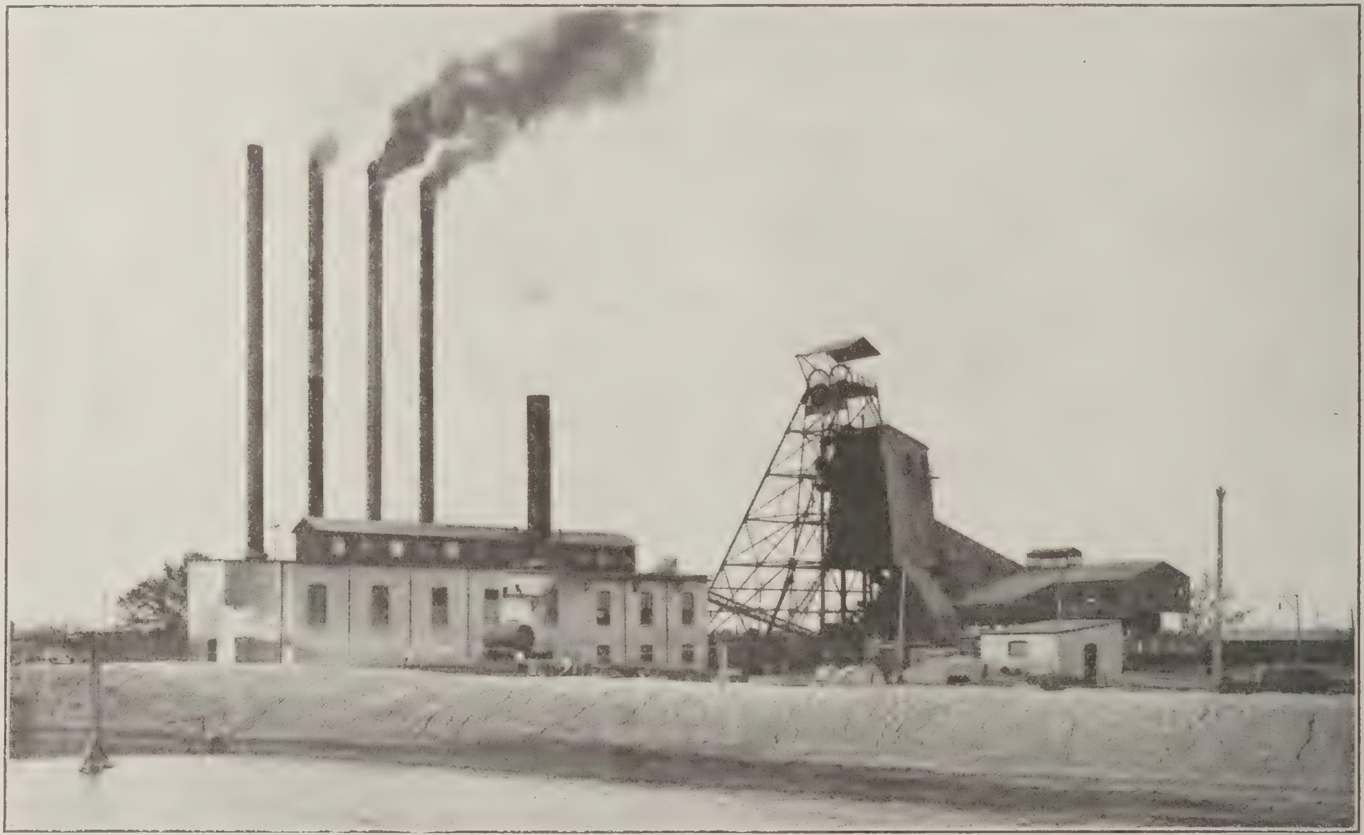

Fig. 1. General View of Tipple and Power House

Some three years ago J. E. Rutledge, of St. Louis, Mo., general manager of the New Staunton Coal Co., organized a new firm and began the development of a valuable tract of coal just south of Nokomis, Ill. It was the desire of Mr. Rutledge and his associates to develop a mine which could easily produce 5000 tons of coal per day. He, therefore, in sinking his shafts, developing his underground layout and building the top works, made all of his plans for this extreme production. The plant which this article describes and illustrates will indicate in a somewhat meager way how well he has accomplished what he set out to do.

---

*President, Roberts & Schaefer Co., Chicago, Ill.

The top works consist of a large steel four-track tipple; a combined power and boiler plant; a large building including the various shops for blacksmithing, carpentry and general repairing; a complete water system, including a large reservoir; and several lesser buildings.

The illustration in Fig. 1 gives the general view of the plant showing especially the tipple and combined boiler and power house.

Fig. 2 is a closer view of the tipple, taken so as to especially illustrate the sheds adjoining the tipple for housing the loading booms on the lump and egg tracks and including the weigh house for all the railroad track scales.

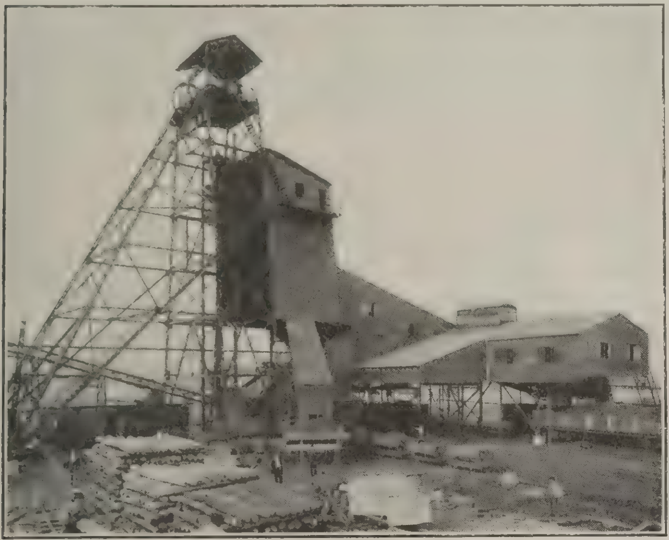

FIG. 2. ANOTHER VIEW OF THE TIPPLE, SHOWING SHEDS OVER LOADING BOOMS

A brief description of the tipple equipment will be of interest not only on account of the magnitude of the screens, weigh hopper, etc., but because of the excellent preparation that is given to the coal by the introduction of the two combined picking tables and loading booms. While picking tables and loading booms have been quite commonly used in some other states, they are a new feature of preparation in Illinois.

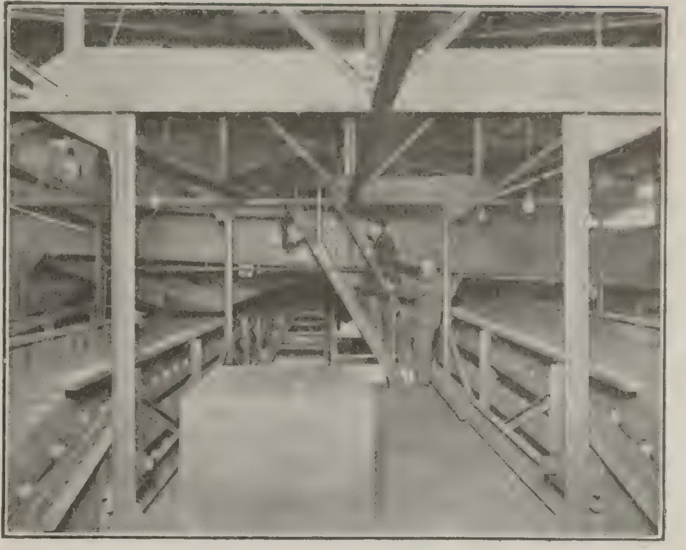

FIG. 5. HORIZONTAL PORTION OF THE LOADING BOOMS

On account of the depth of the shaft, which is about 600 ft., it was necessary to use a large mine car and self-dumping cages to reach the desired capacity of 5000 tons per day. The pit cars, therefore, at this mine are designed to hold about four tons of coal, which being mined on a run-of-mine basis, is dumped directly into the weigh basket, from which it is discharged into a receiving hopper large enough to hold the contents of some two or three pit cars. From this receiving hopper the coal is delivered uniformly by a reciprocating feeder onto the shaking screens. This regularity of the flow of coal onto the screens enables them to take care of a larger tonnage and secure a better preparation than otherwise could be attained.

LARGE SCREENS ARE EMPLOYED

Fig. 3 is a view of the shakers taken from the lower end and to one side, in order to illustrate the driving equipment for this massive pair of screens, which are 10 ft. wide and about 57 ft. long and are double decked on the rear portion.

Fig. 4 illustrates particularly how the shaking screens deliver coal onto the lump-picking table. Only a portion

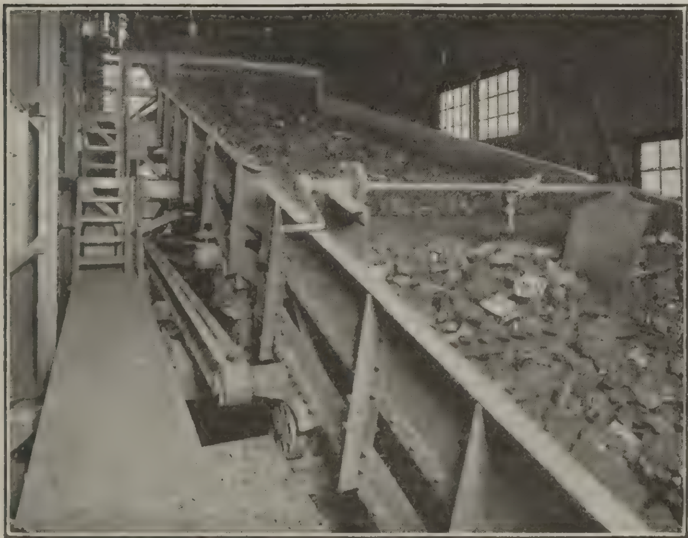

FIG. 3. VIEW LOOKING UP THE SHAKING SCREENS

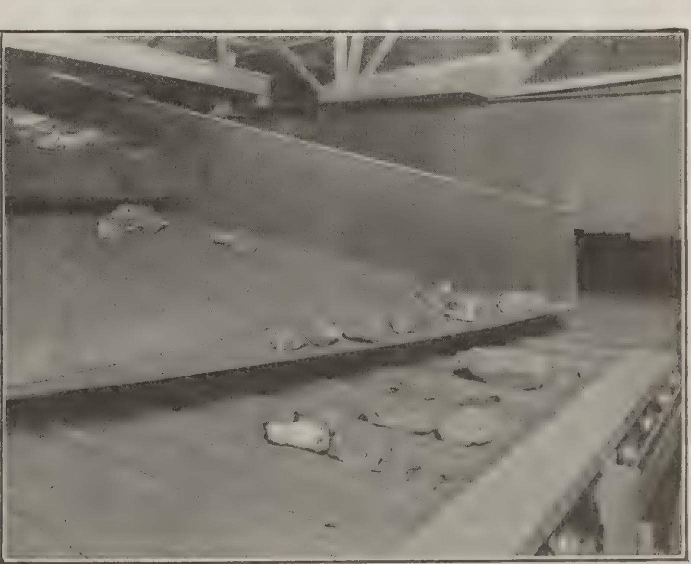

FIG. 4. THE DELIVERY OF SHAKING SCREENS TO THE PICKING TABLE

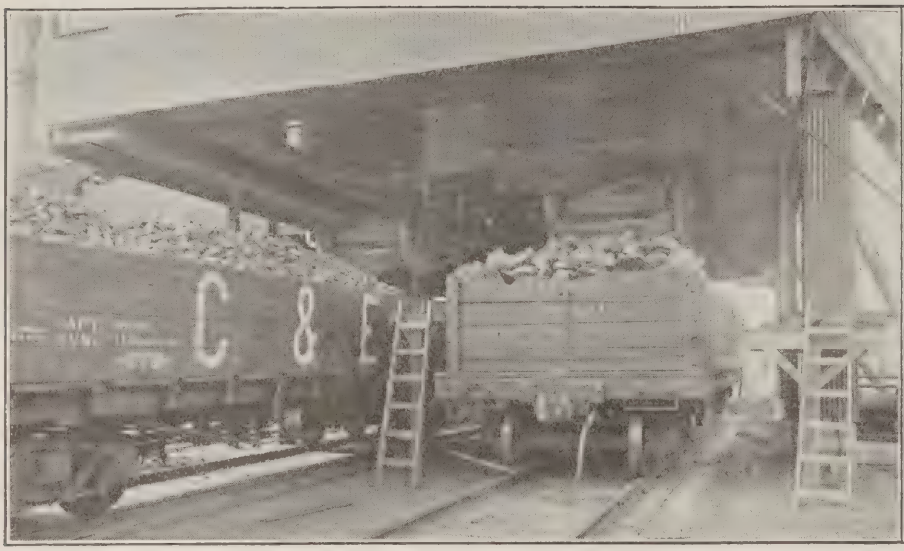

Fig. 6. End View of Loading Booms

Fig. 7. Interior of Weigh House

of the screen is shown, but enough to indicate that the coal is practically laid onto the picking table.

Fig. 5 illustrates that portion of the booms next to the shaking screens which is placed on the horizontal and is used as a picking table. This view shows readily the facilities for picking both the egg and lump coal.

Fig. 6 gives an end view of both the lump and egg booms, showing how nicely they deliver the coal with the least breakage and at the same time trim the cars without manual labor.

Fig. 7 is an interior view of the weigh house showing the beams of the four 80-ft. railroad track scales, by the use of which not only all the empties, but all the loads are weighed.

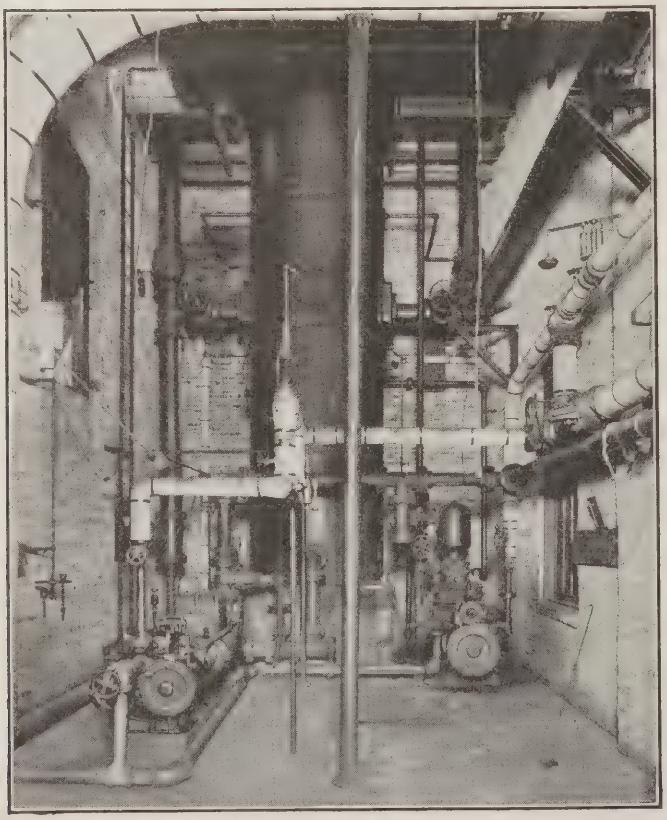

Fig. 8. Interior View of Pump Room, Showing Pumps and Feed-Water Heater

The engine house contains one of the largest hoists in Illinois, consisting of a pair of 28x48-in. direct-connected engines, operating a double drum 10 ft. in diameter. These are standard engines with all modern safety appliances, and are fully capable of handling the four-ton car of coal, which together with the weight of the self-dumping cage, cable, etc., makes a total load of 14 tons.

Fig. 8 is an interior view of the pump room, which is located between the hoist and the boiler rooms of the power house. This pump room not only contains the boiler feed pumps, but the large vertical heater shown which heats the boiler feed water with the exhaust steam from the hoisting engines.

While this mine is still comparatively young, it has already attained a tonnage of about half its ultimate capacity, and with the present rapid development of the underground work, with the resumption of normal business conditions which would make it advisable to increase the production, it will not be long until the ultimate capacity for which the mine and plant were both designed, namely, 5000 tons in 8 hours, will be reached.

The Roberts & Schaefer Co., engineers and contractors, of Chicago, designed and built this complete plant.

Who Is the Most Successful Coal-Mining Man You Know?

The SUCCESS number of Coal Age, Apr. 3, will be devoted to men engaged in mining, as well as to methods and machines used in getting out the coal. You undoubtedly have in mind, or number among your acquaintances, some man engaged in this industry who has created for himself quite a successful career. Perhaps the man you are thinking of has worked in a lowly position without any educational advantages, and in spite of such a handicap has been thrifty enough to purchase a home, raise and educate a family. Or, it may be that the man you have in mind has fought his way to a position of authority in the mining field. Both such men are successes, and nothing is more interesting and inspiring than the true story of how they have overcome difficulties. Pick out your man and prepare a sketch of his life at once. Send it to us immediately, and if possible include a photo of the person you write about.

Effects of the European War on Our Export Trade--I

By J. S. Burrows*

SYNOPSIS—The following views of a fuel expert of one of the oldest coal-exporting firms in the country are of particular interest in connection with prospective developments in the foreign trade. Commerce is gradually adapting itself to the new conditions and it is now possible to anticipate with fair accuracy what we may reasonably expect to gain in the world's coal markets.

It is generally believed that the European conflict is America's opportunity to establish herself in the coal markets of the world and to accomplish, in a short time, what it has taken England and Germany decades to do. There has been much extravagant speculation concerning export business and many statements have been made which are plainly illusory. Among other things it is hoped that we will be able to increase our foreign markets for coal, and it is the purpose of this paper to substitute for mere conjecture a rational basis on which to formulate an estimate of our prospects.

The World's Coal Supply

We are in a unique position as regards the European conflict and all of the usual economic factors which govern supply and demand have been completely upset. At the same time the war itself has brought about certain new conditions which have now had time to crystallize as governing trade factors for the war period, and it is now possible to arrive at some logical conclusions as to the outlook. As both the supply and demand for coal have been greatly curtailed, the subject will be divided under these two general heads, and the normal and extraordinary conditions now in effect will be reviewed.

TABLE 1. PRINCIPAL COAL-PRODUCING COUNTRIES OF THE WORLD

Country	Output[1]	Loss[2]	Remarks
Great Britain	287	20%	Production exceeds consumption. Largest exporter of coal
France	40	75%	Consumption exceeds production. Imports coal
Russia	30	?	Consumption exceeds production. Imports coal
Japan	21	nil	Production exceeds consumption. Exports coal
English allies	378		
Germany (coal and lignite)	275	Note[3]	Production exceeds consumption. Second largest exporter, and imports some coal
Austria	51	Note[4]	Consumption exceeds production. Imports coal
Belgium	22	Prob. 100%	Consumption exceeds production. Imports coal
German allies	348		
Total, belligerents	726		
India	15½	10%	Production exceeds consumption. Exports coal
Australia	12½	10%	Production exceeds consumption. Exports coal
New Zealand	2½	nil	Production exceeds consumption. Exports coal
Canada	13½	nil	Exchanges coal with U. S. Balance in favor U. S.
South Africa	10	nil	Imports and exports coal
Spain	3½	nil	Consumption exceeds production. Imports coal
Other countries	19		Mostly importers
Total, foreign neutral countries	76½		
United States	509	nil	Production exceeds consumption. Exports coal
World total	1⅓ billion		

[1] Normal output based on the returns for 1913. Figures indicate millions of gross tons.

[2] Reduction in output during the war period.

[3] Now German territory.

[4] Reduced to home requirements and those of Austria, Belgium and possibly Holland.

In normal times, the world's coal production and consumption (since coal is mined as needed) are, in round figures, one and one-third billion tons. Table 1 gives a list of the principal countries which contribute the bulk of this vast total. The belligerent nations have been grouped according to their alliances to show the normal productive capacity of each side, and the neutral countries have also been grouped together to show the tonnage which has not been directly affected by the war. It will be seen that nearly 90 per cent. of the world's supply of coal is furnished by the United States, Great Britain, Germany, France, Belgium and Austria, of which the United States' proportion is 40 per cent., while 50 per cent. is mined in the other countries mentioned, all of which are now at war.

These coal-producing countries may be separated into three classes, as follows:

Class 1—Those countries which have a productive capacity of all needed varieties of coal in excess of home requirements and are normally exporters of coal.

Class 2—Those countries which produce less than their own requirements and must normally import coal to make up the deficiency.

Class 3—Those countries which lack certain varieties of coal for special industrial purposes, such as gas making, and which must import these grades.

In the first class (those which have an excess production over home needs) are the United States, Great Britain, Germany, Australia and Japan. These countries can provide their own fuel under any conditions, or in other words, are independent of the rest of the world in this respect, and in normal times they have to seek a foreign market as an outlet for their surpluses. Germany, it is true, has always imported some coal from England, but she need not do so, and to offset this, it may be said that quite recently the London gas works purchased a considerable tonnage of German coal.

In the second class (those countries which find it necessary to supplement their home production with imported coals to meet their own requirements) are France, Russia, Austria, Belgium, Spain, and miscellaneous smaller producers.

The third class, embracing countries which find it necessary to import coal for special purposes, includes Canada, South Africa, New Zealand and India. Most of the countries which come within this class, notably Canada, India and South Africa, could, if the necessity arose, take care of themselves. For instance, Canada annually buys over four million tons of anthracite from the United States, which is preferred to the home product for domestic heating purposes, but which could be replaced with her own bituminous coal in the event of her being unable to obtain supplies from us.

From this classification it will be seen that the countries enumerated in class two must depend, to a very great extent, on the countries which are fortunate enough to be-

---

*Fuel expert, Castner, Curran & Bullitt, Inc., Norfolk, Va.

long in class one, while under present conditions the countries which come within class three will play only a small part in the readjustment of trade.

PRODUCING COUNTRIES THAT IMPORT COAL

It is interesting to note in passing that the strongest nations in the present crisis fall in class one, which bears out the economic theory that the progress and strength of a nation depend primarily on its fuel resources. It is also interesting to note that the principal countries in the second class are now the theater of war. For this reason we may dismiss them from consideration with a few words.

Belgium—The Belgian coal trade, along with other industries, has been practically destroyed; her coal fields have been overrun by the armies of both sides, and it will be a long time before the damage is repaired and anything approaching normal conditions established, even should an attempt be made to work the mines under German control.

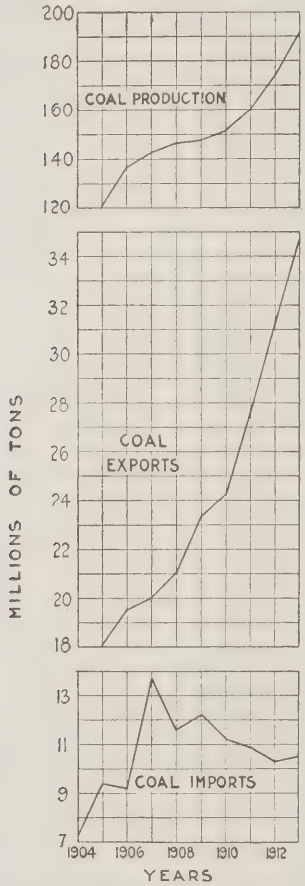

CHART I. GERMAN PRODUCTION, EXPORTS AND IMPORTS

Austria—While the Austrian coal trade is affected to a far less extent than that of Belgium, her normal production of 50 odd million tons will probably be seriously curtailed through the requisitioning of both men and transportation for military purposes.

France—The French output is normally about 40 million tons per annum. An English estimate* places the war period production of this country at the rate of six million tons per annum, or a reduction of about 75 per cent.

The coal fields of the Pas de Calais and Northern France are now in the war zone, and even after the fighting has shifted to other districts, a return to anything like normal production will be greatly delayed by repairs to transportation facilities, as well as to the mines. These fields supply nearly three-fourths of the coal mined in France, the balance coming from the Southern part of the country, where Messrs. Hailey & Davies estimate the reduction in output through enlistment to be fully 50 per cent.

Russia—While at no time a very important factor as a coal producer, Russia may be expected to make every effort to increase her normal output to as near her reduced home demand as possible, for cut off from England as she is, she will have to stand on her own resources.

Spain—The remaining country in class two is of so little consequence as a coal producer as not to affect the general situation in one way or another. It is probable that, as a neutral country, her production has been unaffected by the war.

To briefly summarize class two we are safe in concluding that they have practically ceased to be producers for the time being and that such reduced quantities as they require, must be largely obtained from other sources.

THE EXPORTING COUNTRIES

Class one, embracing the United States, Great Britain, Germany, Australia and Japan, covers all of the potential competitors for foreign trade and represents about 90 per cent. of the world's coal production. Japan and Australia are somewhat limited in their export opportunities, the former by the quality of her coal and the latter by her smaller tonnage. At the same time, these countries are factors to be reckoned with in the world's markets, the United States having felt this competition even at home, where Australian and Japanese coal is perhaps better known on the Pacific Coast than the American product.

The coal exports of Australia aggregate from two to three million tons annually, while those of Japan are around four million tons. On the West Coast of South America, Australia proves a most formidable competitor of ours, while Japan may be expected to take such trade as she is in a position to handle, besides being the dominant factor in the Far East.

During the war period, while it is hardly to be expected that the output of coal in Japan and Australia will increase, there is every reason to believe that the supply will be about normal and that these countries will have their usual surplus for export purposes. In Table 1, I have allowed a reduction of 10 per cent. in the case of Australia to take care of a possible loss in output caused by her contribution of men to the British forces, although it is not known to what extent the supply of labor has been affected.

With Australia and Japan disposed of, we come to the two dominant factors in international trade—Great Britain and Germany. In normal times we can scarcely be classed as a competitor of these countries except in our own markets. While we lead the world as a coal producer, we stand far down in the list as an exporter, Great Britain leading with Germany second. These three nations produce over a billion tons, or more than 80 per cent. of the world's supply.

By reducing their productions and exports to percentages of the totals for the three nations, as shown in the following table, we get a fair comparison of the United States with the two principal exporting countries:

TABLE 2. PRODUCTION AND EXPORTS OF THREE LEADING COUNTRIES

	Total Production	Total Exports	Proportion of Output	
			Exported	Used at Home
United States	48%	16%	4%	96%
Great Britain	27%	56%	26%	74%
Germany	25%	28%	13%	87%

GERMANY

As Germany is the most seriously affected of the three leading countries in this class, we will first examine into her supplies. In normal times she produces, in round numbers, 275 million tons of fuel, of which about 85 million tons is classed as lignite. Her lignite is used mainly at home, while her exports are taken almost wholly from her bituminous supply.

A better idea of her production may be had from the following tables where the detailed figures are shown by districts.

---

*Messrs. Davies & Hailey, of Cardiff.

TABLES 3 AND 4. GERMAN OUTPUT OF COAL AND LIGNITE FOR 1912 AND 1913

Coal Table 3

District	1912	1913
Prussia:		
Dortmund	100,265,000	110,722,000
Breslau	46,584,000	49,077,000
Bonn	17,736,000	20,657,000
Clausthal	708,000	948,000
Halle	9,000	8,000
Total Prussia	165,302,000	181,412,000
Saxony	5,066,000	5,471,000
Alsace Lorraine	3,539,000	3,817,000
Bavaria	791,000	811,000
Total	174,698,000	191,511,000

Lignite Table 4

District	1912	1913
Prussia	67,476,000	70,256,000
Saxe-Altenburg	4,162,000	
Saxony	5,332,000	6,316,000
Brunswick	1,726,000	
Anhalt	1,492,000	
Hesse	444,000	
Bavaria	1,700,000	1,895,000
Other states	8,000	
Total	82,340,000	78,467,000

Note. Figures are in gross tons.

About 25 per cent. of the lignite is used in briquetted form, in which industry Germany may be considered the leader. Six million tons of coal briquettes are also manufactured annually, and it is appropriate to state here that the attention the Germans give to the preparation of their coal for market is far above that of any other country. Wherever German and British coal has competed on anything like an equal basis, and the decision between the two fuels has been close, the superior preparation of the German product has frequently proven the deciding factor. Thus the successful German invasion of the French market against English coal a few years ago has been credited entirely to the perfect manner in which the German fuel was prepared for French requirements.

Germany's exports for 1913 are shown in detail in Table 5. This table also includes coke, which is given here solely as a matter of interest, a review of the coke situation not being contemplated in this paper. Germany's enormous byproduct industry, on which depends her position as a producer of chemicals, dyes, etc., gives her a considerable surplus of excellent coke for export, some of which finds its way to the Pacific Coast of the United States.

Up to the beginning of the war, German exports had grown to more than 40 million tons which, however, does not represent her surplus, for she has always imported some coal from England (11⅓ million tons in 1913). Her home consumption is in round figures 250 million tons (including both coal and lignite), which would indicate in comparison with her production an actual surplus of something less than 30 million tons. The accompanying chart, No. 1, shows a comparison of her production, exports and imports over the past ten years.

TABLE 5. EXPORTS OF COAL FROM GERMANY IN 1913
(Gross Tons)

			Briquettes		Total	
Neutral Countries:	Coal	Lignite	Coal	Lignite	Fuel	Coke

Total	10,544,219	10,133	1,229,664	548,052	12,332,068	1,388,052
Countries at war with Germany:						
Belgium	5,728,406	....	442,843	103,720	7,174,969	936,516
France	3,242,175	....	319,908	64,075	3,626,158	2,354,918
Great Britain	11,064	....	....	....	11,064	5,418
Russia (European)	2,103,210	....	....	....	2,103,210	546,191
Total	11,084,855		762,751	167,795	12,915,401	3,843,043
German Allies:						
Austria-Hungary	12,152,500	49,527	....	116,756	12,308,783	1,051,670
Total exports	33,781,574	59,660	1,992,415	832,603	556,252	6,282,365

The enormous growth of the German coal exports, as shown on this chart, has been a matter of grave concern to the British shippers who in many markets have felt keenly the effect of this growing competition.

It has been estimated that the German production will be curtailed 40 per cent. during the war period, which will give her an output of 110 million tons. The exact figures, however, are of little value in the present calculations, for it must be evident that in her present position, and with Great Britain in command of the sea, Germany will have no surplus of consequence beyond home requirements and the needs of her allies and neighbors; it must be remembered that she is connected with the Italian markets by the Gothard Railway and has continued to make some shipments over that route.

It should be understood that, like other industries in this methodical country, the coal trade is thoroughly organized, is under government control and the distribution and sale of coal are strongly centralized. Hence the supply is systematically regulated to meet the demand, and in this respect, Germany stands alone.

We have ample evidence of her preparedness for war in more than a military sense, and it is not far amiss to assume that this preparedness includes a complete program for the coal industry to cover all conditions. Besides coal for naval use, railways and other direct military purposes, the byproduct ovens may have to operate at above their normal rate to obtain benzol for motor fuel in the event of the petroleum or gasoline supply being shut off. It is safe therefore to assume that the German mining industry is not as badly disorganized as might at first seem.

The shipping situation and outside factors, however, take Germany out of foreign markets for the immediate future, and it is quite probable, until the end of the war.

(To be Continued)

⁂

Coal and Coke Production in Pennsylvania

Following is a tabulated list showing the production of coal and coke, by the several operating companies in the second bituminous inspection district of Pennsylvania, C. B. Ross, mine inspector for the district. All of these operations are situated in Westmoreland County.

Name of Operator	Tons of Coal	Tons of Coke
Jamison Coal & Coke Co.	3,280,250	553,340
Latrobe-Connellsville Coal & Coke Co.	838,036	250,103
Keystone Coal & Coke Co.	610,559	226,434
Hostetter-Connellsville Coke Co.	579,621	366,847

The Wendell Continuous Centrifugal Drier

By E. A. Holbrook*

SYNOPSIS—Early history of the development of the continuous centrifugal drier invented by Carl A. Wendell. The difficulties to be overcome in drying the washed coal as it comes in a continuous supply from the washing machines. A detailed description of the drier and its continuous operation, together with the tabulated results of three of these machines installed at the Woodward Iron Co.'s washery at Woodward, Ala.

Prominent among recent improvements in coal-washing machinery is the Wendell Continuous Centrifugal Drier, now in operation at the new coal washery of the Woodward Iron Co., Woodward, Ala. Its unique principle and possible field of application demand the close attention of all engineers interested in centrifugal drying.

The inventor of this machine, Carl A. Wendell, is experimental engineer for the Joliet works of the Illinois Steel Co. Several years ago, while engaged in testing work at the company's coal washery at Joliet, Ill., Mr. Wendell encountered the universal difficulty of economically drying the finer sizes of washed coals—an operation that is a prerequisite to successful coking. After four years of work and the expenditure of many thousands of dollars by the people interested, a satisfactory continuous centrifugal drier was perfected and given exhaustive tests at the coal washery mentioned above. Last summer a battery of three of these driers was installed at the Woodward washery. Their continuous operation, night and day, for four months has since demonstrated their ability to stand up under the hard knocks of a large commercial washery and in the hands of the usual washery labor.

General Considerations

In washing coal, the finer the preliminary crushing to which it is subjected the more perfectly will the coal and fine refuse contained be disengaged from each other, and the more perfect will be their separation in the coal-washing machines. This is especially true of the finer flakes of pyrite, the removal of which is usually so necessary before a coal is fit to be made into metallurgical coke. Furthermore, since modern practice in coke making often demands that 80 per cent. of the coal shall pass through a 1/8-in.-mesh sieve, it would seem that fine crushing and washing would produce an ideal product for coke making.

Coal washing is a process involving submergence in water, and only those who have tried to drain and save the finer sizes of the washed coal, say the sizes below 5/8 in. in diameter, realize the outlay and loss of time involved in the usual arrangement of draining bins. An enumeration of these difficulties would disclose the weaknesses and failure of most coal-washing plants, in respect to the finer sizes of coal. The ridding of the coal of its moisture, by means of a centrifugal drier, is not in itself a new idea. Several forms of centrifugal dewaterers, among which may be mentioned the English "Wilton" machines, have been applied to drying washed coal, but have met with the following difficulties:

1. The tonnage to be handled is far greater than that used in the usual centrifugal-drying processes. 2. These older driers had to be loaded, then started, brought up to full speed and finally stopped before their content could be discharged. This involved delay, and as the weight of a large centrifugal drier and its load was considerable, the horsepower expended in bringing the machines up to full speed at each charge was excessive. 3. This intermittent action interfered seriously with the feeding of the machine, as the washer preceding it is continuous in its action and, consequently, a storage had to be provided between the washer and the intermittent drier. 4. All previous attempts to make a drier continuous have involved the introduction of a stationary or differential plow or scraper inside the screen of the machine. As the coal lying against this screen is moving with a peripheral speed of over 6000 ft. per min., with the consequent great centrifugal force, such a scraper will either pulverize the coal and become quickly worn and broken itself, or it will tear and ruin the containing screen.

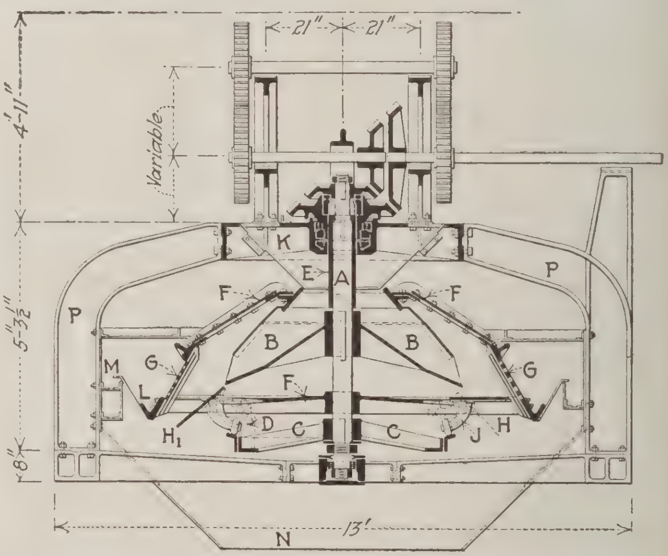

Fig. 1. Sectional Diagram of the Wendell Centrifugal Drier

Description of the Drier

The sectional diagram, Fig. 1, has been carefully prepared to show the essential parts only of the machine. The following detailed description of principle will refer to this figure, which is an elevation of which the plan would be circular. Fig. 2 is a general view showing the Wendell drier and frame, with all gears inclosed, for safety, as installed in the Woodward washery.

The following illustration will assist the mind to better understand the principle of the drier. Given a railroad train moving at 75 mi. per hr., any attempt to get aboard a train moving at that speed would naturally result in disaster. If, however, one was on another train, running parallel with the first and moving at a rate of either 74 or 76 mi. per hr.—a difference of only one mile an hour—no difficulty would be experienced in passing from one train to the other. This is the general basic principle on which is based the method of charging and discharging the drier while in rapid rotation: namely, differential speeds.

---

*Assistant professor of mining engineering, University of Illinois, Urbana, Ill.

To the central shaft *A* (Fig. 1), which revolves at, say 249 r.p.m., are attached the two feed-spouts *BB* and the cam frame *C* with its cam *D*. Outside of this shaft revolves the hollow retainer shaft *E* to which is attached the retainer *F*, the screens *G* and the discharge gates *H* and H_1. The speed of the outer shaft *E* is 250 r.p.m., or 1 r.p.m. faster than the inner shaft *A*. The gates *H* and H_1 are 16 in number, four in each quadrant. Each gate is attached to a tappet *J* and, normally, stays closed, as at *H*. When, however, the cam *D*, which is moving at a speed 1 r.p.m. less than the gates, is overtaken by a tappet *J* the gate is opened gently and without shock, as at H_1, letting out the dried coal contained in this section. When the cam has passed, the gate returns to its closed position, as at *H*, and the section is then ready to receive another charge of coal from the feed-spouts *BB*, the discharge from which is continuous. The position of the feed-spout on the shaft *A* is slightly ahead of the cam *D*, thus giving time for the gate *H* to close before the section will receive a new load of coal from the retainer.

From the above description it will be seen that the course of the coal is as follows: The coal, fed wet into the hopper *K*, falls into the revolving feed-spout *B*, from where it is thrown against the screen *G*. For a minute only, it stays in this section, revolving at a peripheral speed of over 6000 ft. per min. Any contained water is, of course, thrown through the screen into the water collector *L*, from which it is lifted by centrifugal force into the water sluice *M*. Each minute, as before stated, the cam overtakes and opens the gate of the compartment. Discharge takes place immediately, the outward slope of the screen *G* giving a downward component to the centrifugal force, which aids gravity in discharging the coal which has been dried and falls through the conical spout *N*, into a car or belt below. A heavy cast-steel frame *P* completes the necessary parts of the drier.

Fig. 3 shows the retainer *F* separated and removed from the outer shell of the machine and exposes to view the screen-plates *G* mentioned above. In the machines now in commercial use, these plates are double, made up of an outer ¼-in. steel plate, with ⅝-in. perforations on ⅞-in. centers, which act as a support for an inner plate of monel metal with $\frac{1}{16}$-in. perforations on ⅛-in. to ¼-in. centers. Of course, any other sizes might be used. Mr. Wendell has found that monel metal meets all the requirements better than any other that has been so far tried, it being noncorrosive and standing up well under the service to which it is subjected.

ENGINEERING DATA CONCERNING THE DRIER

The original design of the Wendell drier was estimated to handle 30 tons of coal per hour. The new design installed in Alabama has proven able to handle 50 to 60 tons of coal per hour continuously. Run at a speed of 250 and 249 r.p.m., the driers received washed coal from a ⅝-in. round-hole screen which contained from 30 to 40 per cent. of water. This mechanical moisture was reduced by the drier to 6 per cent. Wishing to have about 8 per cent. mechanical moisture in the coal charged to the coke ovens, the Woodward company decreased the speed of the drier to 215 r.p.m., and is now averaging the desired moisture. About 18 hp. is used per drier.

The weight of the revolving parts and the thrust of the vertical shaft are taken by four sets of ball bearings, which, being of the finest imported steel, secure the low, rolling friction that is necessary with heavy, high-speed machinery. As one shaft revolves in the same direction and at a speed of only 1 r.p.m. different from that of the other, practically all the wear usual in such cases is obviated.

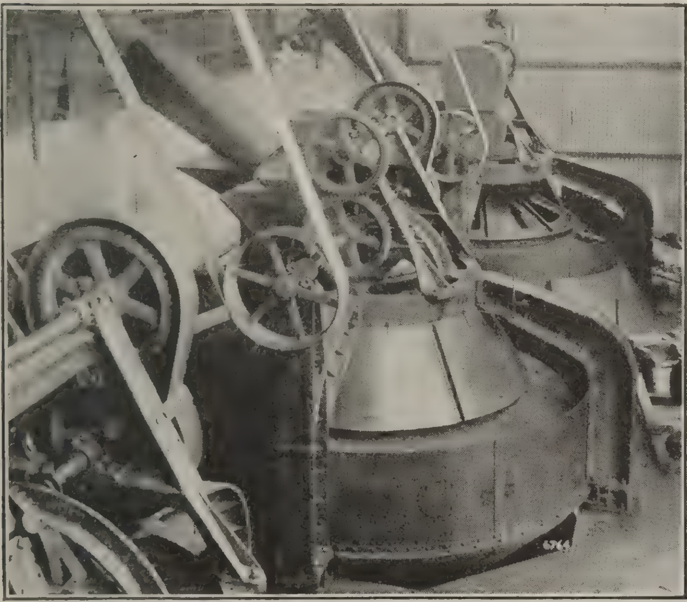

FIG. 2. WENDELL CONTINUOUS DRIERS, WOODWARD WASHERY, WOODWARD, ALA.

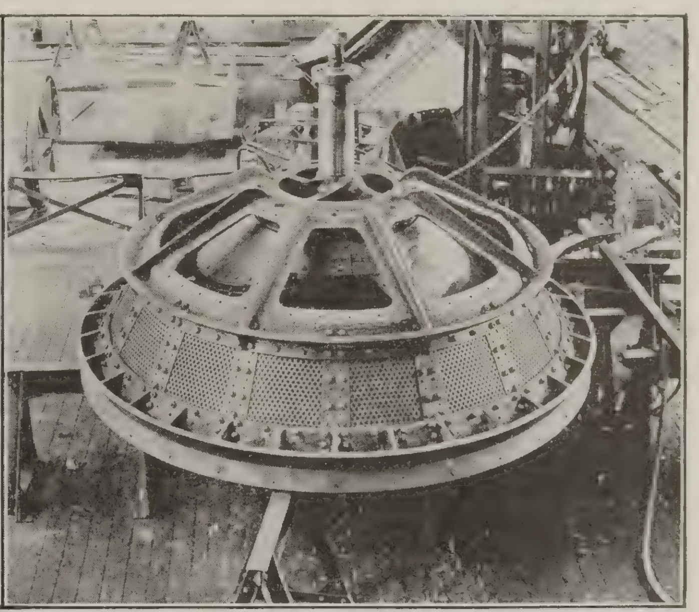

FIG. 3. DRIER WITH OUTER SHELL REMOVED, SHOWING RETAINER AND SCREEN PLATES

The drier may be fed directly from the washer or, by dewatering-bucket elevators, from recovery tanks. In spite of the larger amount of water in the direct feed, no greater amount of sludge was found in the water coming from the drier, under these conditions. It is probable that, as soon as the centrifugal action begins in the drier, the finer coal fills the interstices between the larger pieces, thus acting as a screen in itself.

BREAKAGE, LOSSES, ETC.

The following tests show the total breakage in the washery and drier combined, as now being made at the Woodward plant:

	Through ⅝-In. Round-Hole Screen, over ¼-In. Round-Hole Screen, Per Cent.	Through ¼-In. over ⅛-In. Per Cent.	Through ⅛-In. Per Cent.	R.p.m. of Drier
Raw coal to washery.....	27.5	32.3	40.2	
Washed coal, No. 1 drier..	15.2	34.1	50.7	227
Washed coal, No. 2 drier..	18.1	40.7	41.2	214
Washed coal, No. 3 drier..	19.6	43.1	37.2	204
Average of three driers...	17.6	39.3	43.0	215

It is obvious that both the breakage and the resultant moisture content may be changed by: 1. Changing the speed of the machine as a whole, thus increasing or decreasing the centrifugal force directly as the square of the speed. 2. Changing the gear ratio between the inner and outer shafts, thus changing the period of time that a charge is contained in the drier. 3. By reducing the capacity of a given machine, thereby reducing the thickness of the layer of coal on the screen plates through which water is to be driven.

To the engineering profession, in general, an inspection of the drier suggests, with modifications to suit different requirements, a wide field of application. As driers in sugar refineries, in sewage-disposal plants, in the manufacture of ammonium sulphate or even in the treatment of sands and slimes in an ore-dressing plant, such a machine has interesting possibilities.

In conclusion, the author wishes to thank Mr. Wendell for allowing the inspection of drawings and of the original machine; and also the Link-Belt Co. of Philadelphia and Chicago, by whom the machines are manufactured, for the photographs used.

Chicago Coal Dealers Visit New River Field

About fifty of the most prominent retail coal dealers of Chicago, and a few from other points in the Middle West, were guests of the C. & O. Ry. and the sales agencies and operators of the New River field last week. Four days were spent inspecting the mines in this field, and the visitors were enthused over the section, the quality of the coal and the care exercised in mining and handling it.

The party, which left Chicago on Sunday, was entertained on a special train throughout the week. They were joined in this section by a number of local men, who accompanied them throughout the trip. The itinerary included Loop Creek, Piney Branch, Winding Gulf, and other points on the C. & O. lines in the New River field.

CHICAGO COAL DEALERS AT ECCLES, W. VA.

On Tuesday evening a smoker was tendered them at the Dun Glen Hotel at Thurmond, which proved a most enjoyable affair. In addition to a number of talks and an evening of good fellowship, they were entertained by the Pork Chops Orchestra of Cincinnati.

This trip, in which business and pleasure were combined, was planned and managed throughout by H. M. Hall, general agent of the C. & O. at Chicago. The move met with the coöperation of the New River operators and sales agencies, who shared in the expense of the week's entertainment for the entire party. Several other prominent officials of the C. & O. also accompanied them.

Altogether the trip was a most pleasing one to the visitors and they were loud in their praise of the splendid entertainment accorded them and of the wonderful coal section they inspected.

Autogenous Welding by the Thermit Process

By Frank H. Kneeland

SYNOPSIS—When powdered aluminum is mixed with iron oxide and a portion of the mixture heated to a certain temperature, a self-propagating reaction is started whereby the oxygen leaves the iron and unites with the aluminum. This chemical transfer of the oxygen evolves intense heat and results in the formation of highly heated liquid low-carbon steel which may be employed for autogenous welding.

The chemical element aluminum has long been known to exist, being the most widely distributed metal in nature. In the natural state, however, aluminum is never found free, but always in combination with oxygen. The affinity between these two elements is so strong that, although aluminum has long been known to chemists, it was not until the invention of the electric furnace that this metal has been produced in anything like commercial quantities.

But aluminum in the form of kitchen utensils, electric transmission cables, etc., is by no means the only state in which it may be made to serve the purpose of man. Its strong affinity for oxygen when in a heated condition may be taken advantage of with results which are at once highly spectacular and utilitarian.

When finely divided aluminum is mixed in the proper proportions with a metallic oxide—barium, molybdenum, copper, iron—and the mixture heated to a certain temperature, a chemical reaction takes place accompanied by the evolution of heat, and the oxygen leaves the other metal, uniting with the aluminum. The resultant mass is thus composed of a liquid slag (aluminum oxide) and an almost pure metal in a molten state and well above the melting temperature.

For many years chemists knew of this reaction, and many attempts were made to utilize it for the reduction of various metals from their oxides. The greatest difficulty was encountered, however, in governing the reaction, since if this were started by heating the entire mass, its rapidity was practically equivalent to an explosion.

Dr. Hans Goldschmidt, while attempting to produce pure metals to be used in the alloying of steel for the famous German steel-making firm of Krupp, discovered that if the reaction were started only in a small portion of the mass it was not only self-propagating and would spread to all portions of the mixture, but that it was easily controlled. The first experiments of this nature were conducted with chromium oxide, resulting in the production of practically pure metallic chromium. Later experiments were made on other oxides, sulphides and chlorides and manganese, ferrochromium, molybdenum, ferrotitanium and other pure metals, and alloys were produced.

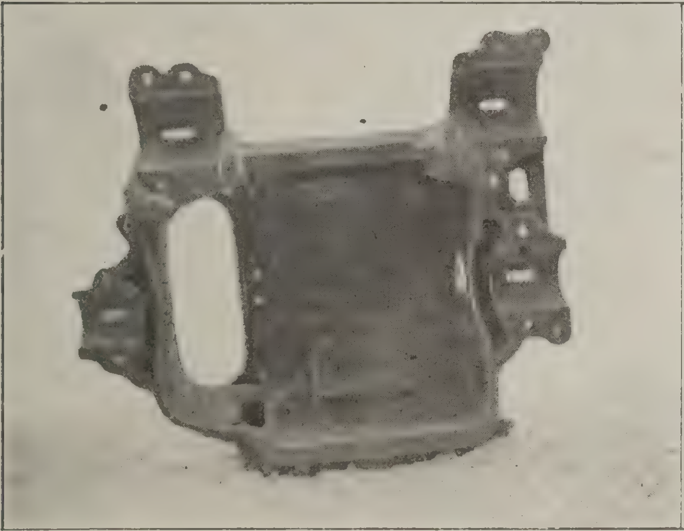

Fig. 1. Thermit Welds on Electric Motor Case

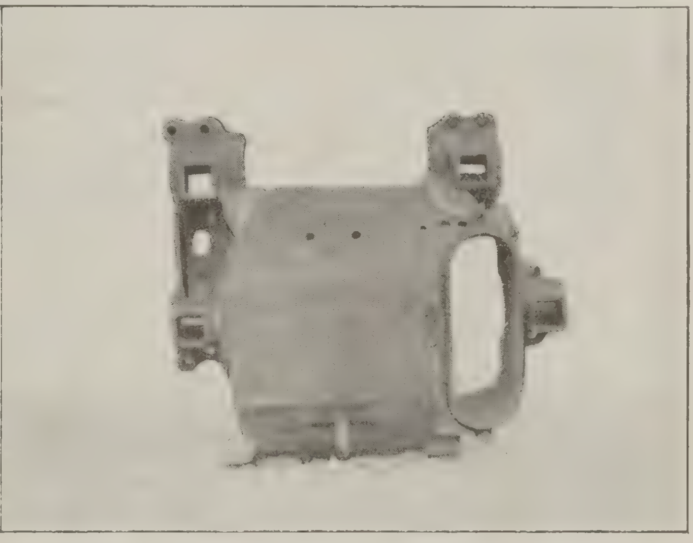

Fig. 2. Another View of the Same Motor Case

The Experiments with Iron

Among other substances with which Dr. Goldschmidt experimented was the oxide of iron. It was here found, however, that the reaction not only produced a very pure low-carbon steel, but that the heat evolved was extremely intense. The temperature attained was so high that it could not be measured by pyrometer, but has been calculated theoretically at 4881° F.

Dr. Goldschmidt at once decided that this extreme heat, produced quickly and easily and resulting in highly heated molten steel, could be advantageously employed in the arts and sciences. The mixture of powdered aluminum and iron oxide was named "thermit," and since its commercial introduction in 1901 has been steadily growing in favor for certain purposes, especially for heavy autogenous welds in steel or iron, cast or wrought.

It is needless to say, however, that like many another process spectacular in application and results, thermit has been the subject of much popular misconception and has been often credited, even by those who should know better, with powers and accomplishments which it does not in reality possess. The ability of a handful of this powder to melt a hole in a steel safe, for instance, is absurd.

On the other hand, the rapidity and violence of the thermit reaction are nothing short of spectacular and have called forth from various observers some extremely vivid expressions in lucid English.

After witnessing the welding of a 14-in. shaft for a rock crusher at the plant of the Goldschmidt Thermit Co. in Jersey City, one of the editors of the *Scientific American* described the reaction in the Nov. 18, 1911, issue as follows:

> After adding a teaspoonful of ignition powder (barium peroxide and aluminum flake) to each hopper, the reaction is started by introducing a red-hot iron bolt. A flash, a glare, a hiss and sputter, and clouds of smoke envelop all, as the elements wrestle in fierce combat for union with the coveted oxygen; the greater affinity of the aluminum quickly asserts itself, and after a 40-sec. round the iron is vanquished, thrown out of combination and enslaved in the service of man.

A TYPICAL APPLICATION

The application of thermit to welding is extremely simple. Let us assume, for instance, that a broken shaft, say 8 in. in diameter, is to be repaired. If this shaft is accessible for a distance of about 12 in. on all sides of the fracture, there is in certain cases no necessity of removing it from its bearings. In any case by means of drilling, chipping or hacksawing, the metal upon one side of the break is cut away for a distance of 1 or 2 in. so as to allow the thermit steel ample space to flow readily between the two parts and amalgamate with them.

The two portions of the shaft are next carefully aligned and secured in position, suitable allowance being made for the contraction of the metal forming the weld upon cooling. Wax is next forced between the ends of the two pieces of the shaft and built up in the form of a collar around the entire circumference. This wax forms the pattern for the weld and should be constructed accordingly. A mold-box, or flask, is next built around the shaft where the weld is to be made, leaving a clear distance of 10 to 12 in. on all sides.

The mold proper is now made and rammed. A mixture of fire clay and silica sand is used for the body of the mold, while brickdust is added to this mixture for the portion immediately surrounding the wax pattern. A pouring gate, a heating gate and a riser must also be provided, the two former passages connecting to the bottom of the wax pattern, while the riser of course leads upward from its highest point. The heating gate must slant downward from the pattern and out through an opening in the mold-box. The pouring gate may extend either vertically or on a slant upward through the mold. These passages, as well as the riser, are made in the ordinary manner by means of removable wooden patterns.

When the mold is complete and the gate and riser patterns are withdrawn, a gasoline heater is applied through the heating gate. This first melts out the wax pattern and then heats the inside of the mold and the ends of the shaft. The action of this torch should be continued until the parts to be welded have attained a bright red color.

In the meantime the crucible in which the thermit reaction takes place is made ready. This crucible is conical in form, lined with magnesia tar and provided with a tapping hole in the bottom. The latter is plugged in such a manner that a slight blow or push upward on a pin extending down through the hole will release the thermit steel, which will then flow into the pouring gate.

The proper amount of thermit to use may be found by multiplying the weight of the wax employed by 30, but for most classes of work tables of dimensions and weights of thermit have been compiled.

After the pieces to be welded have been made sufficiently hot the torch is withdrawn and the heating gate plugged with brickdust, sand and clay. The thermit reaction is next started in the crucible by means of a small amount of ignition powder, which is in reality barium thermit—a mixture of barium peroxide and powdered aluminum. The reaction of this powder, which may be started with a match, develops enough heat to start the reaction of the steel thermit.

The chemical reaction which takes place in the powdered thermit is represented by the following equation:

$$Fe_2O_3 + 2\ Al + heat = Al_2O_3 + 2\ Fe + heat$$

or

$$3\ Fe_3O_4 + 8\ Al + heat = 4\ Al_2O_3 + 9\ Fe + heat.$$

When the reaction is complete the tapping gate in the crucible is opened, and the highly superheated liquid steel is allowed to flow into the mold. Because of the cutting away of the broken ends of the shaft and the reinforcing collar originally formed in the wax pattern, the thermit steel entirely surrounds the ends to be welded; and possessing several hundred degrees of superheat, it actually melts and fuses with the original metal of the shaft, making a perfect and homogeneous weld.

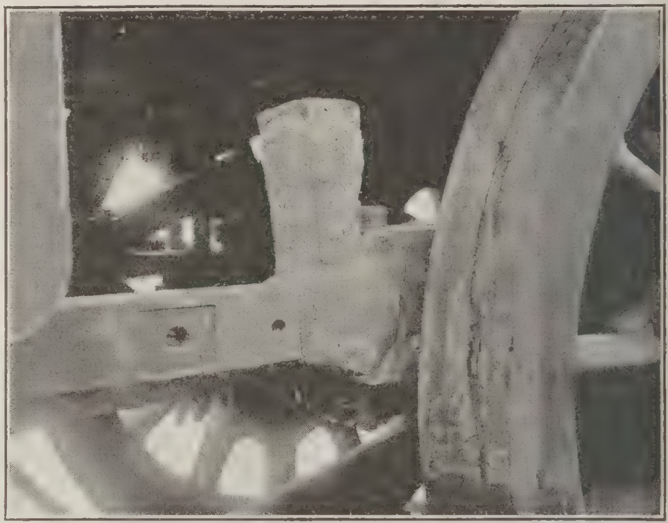

FIG. 3. WELD IN FRAME OF KELLYS CREEK COLLIERY CO.'S LOCOMOTIVE NO. 2

THE MOLD SHOULD BE LEFT IN PLACE FOR SOME TIME

To prevent chilling and consequent undue hardening of the steel, the mold should be left in place for several hours, mold and weld gradually cooling down together, thus tending to anneal the metal. When sufficiently cold, say in 12 hr., the mold may be knocked to pieces, the weld in the shaft cleaned by rapping or with a scratch brush, the gates and riser chipped or drilled off and the shaft put to work again.

Shafts are, however, by no means the only machine parts that may be repaired by the aid of thermit. Broken spokes in gears or flywheels may be easily mended; broken teeth in gearwheels may be recast and finished up either by hand or in a shaper; broken bedplates, frames, rocker-arms, connecting-rods, cylinder heads, the end or side plates of steam or electric locomotives, motor casings, locomotive drive wheels, pump casings or frames, etc., may be repaired with equal facility. A long crack in cast-iron is perhaps the most difficult repair to make by this method, and one which is seldom, if ever, accomplished with success. This is due to the fact that thermit steel possesses different physical qualities from cast-iron and has a greater coefficient of expansion. It consequently shrinks more than the iron in cooling, and since the crushing strength of the iron is greater than the tensile strength of the steel, the latter tends to pull apart. This action usually results in the formation of small cracks extending transversely across the weld. Repairs of this kind, especially if they must be water- or air-tight, can usually be better accomplished by some other means.

THERMIT IN PIPE WELDING

Another use for thermit, or rather for the intense heat which it generates, has been recently developed in the butt or end welding of pipe to form water, air, steam or ammonia lines. Here the ends of the pipe are faced off square and placed in a special mold. The thermit reaction is started in a flat-bottomed crucible, and when complete, both slag and metal are poured into the special mold around the pipe. The slag floating on top of the steel of course enters the mold first and thinly glazes both pipe and mold. The steel following later does not come into actual contact with either, but the heat developed is such that when the ends of the pipe are forced together under the action of suitable drawbars a perfect butt weld is secured. On cooling, the mold may be removed and the slag knocked off. A pipe line thus built up is, when completed, practically one continuous length of pipe and is correspondingly free from leaks.

Although most lines of industry, particularly the railroads of the land, have long since adopted the use of thermit in many classes of repair work, but few mining companies have seen fit to use this method of repair. Thermit is used at present, however, by several of the larger companies, both in West Virginia and Pennsylvania. Some of these firms have employed it for several years and are annually saving many hundreds of dollars in repairing broken parts that otherwise would be consigned to the scrap heap.

As all mining men know, the cost of repairing a breakdown in mining equipment can by no means be measured by the expense of repair parts. The real measure of the cost is the loss of output. The welding of a broken locomotive frame, a motor case, the main frame or bull wheel of a coal cutter not only renders useful at small expense material that would otherwise be lost, but also, since it can be accomplished in a few hours or at most in a few days, keeps equipment in operation which would otherwise be idle.

⁂

The SUCCESS Number of "Coal Age" on Apr. 3 will be the most practical number of this paper so far issued. The reason is that every story in this number describing a method or a machine must cover an instance of actual operation at a coal mine. These are the facts we are looking for, and it is such data as these that come in handy for application in our own daily work. Several of our readers are sending in little stories covering the life and work of men with whom they are acquainted or associated. All of these stories are interesting and tell how the subject of the sketch fought his winning fight in life. Have you sent in something yet? Do it today.

Extracts from a Superintendent's Diary

We have in our camp one man at least who is well versed in the science of political economy, assuming that his own estimate of his learning is correct. His discipleship might be described as a composite influence of Ricardo, Adam Smith, Mill, Marx and others, and he can quote from any of them, impromptu and at great length whenever occasion demands. It is more than possible that at times he takes liberties, innocently, no doubt, with the principles of his Patron Saints and gives them credit for ideas which they would not have been able to identify, but as none of his hearers are the wiser, and as the effect of his remarks, as concerns his audience, is always satisfactory, his accuracy is never questioned.

Like most self-appointed leaders of the downtrodden masses, he has a way of working himself up to the haranguing point on very slight provocation and with the first manifestation of approval from his audience, he braces up preparatory to taking the weight of the world upon his shoulders.

In reading any of the great works on political economy, sentences are occasionally encountered that seem to suggest rather faintly that the author felt that some of the evils of society could be remedied if his ideas might be intelligently carried out. It is not strange then that our economist, in absorbing the thoughts of all of the economists, should feel confident of his ability to lead his comrades out of the capitalistic mire and reform modern industry.

As an introduction for all of his set speeches he starts off with a statement alleging that capitalistic control over labor dates back several centuries to the time when the English owners of small farms allowed themselves to be deprived of their land by laws secretly demanded by the owners of the large town factories that were just beginning to spring up. Then he goes on to explain that changing conditions compelled many of those small land owners to abandon their farms, law or no law, but even they might have been able to regain their lands in time had it not been for the secret influence of the capitalists on the lawmakers. Capitalists never fight in the open, if he is to be believed.

Today I received a letter from our general manager in which he stated that for some time he has been receiving anonymous letters, sent to him by someone in our camp, complaining about many things in general but in particular about me and my efforts to discourage the public celebration of some holidays. The manager went on to say that at first he rather enjoyed the letters but now they were becoming annoying and he requested me to locate the writer if possible and deal with him as I saw fit. One of the anonymous letters was inclosed and I recognized the authorship at once.

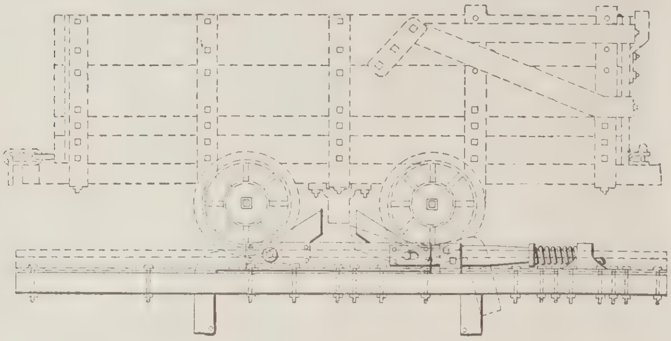
It happened that its author, the camp's political economist, the decrier of capitalistic duplicity, came into my office a few moments later to borrow a certain volume on taxation. I had the book in one of the drawers of my desk and just before passing it over to my visitor I picked up the letter from our manager and slipped it in between some of the pages. As he was leaving I remarked that I hoped that after he finished reading everything that he found in the book he would come back and give me his views as to an honorable way to deal with people who would not fight in the open.

A New Car-Stop and Shock Absorber

A device of interest to coal operators has just been placed on the market. It is the invention of Edwin W. Baum, of Nokomis, Ill., and is patented. The device is used as a car-stop and shock-absorber.

There has always been a loss of time connected with the caging of coal cars, due to the fact that cages heretofore have been constructed in a way that compelled the car being brought practically to a standstill before the signal to hoist was given.

The sketch shows the device installed on a cage platform in position to stop car and absorb shock of the same. This overcomes any and all loss of time in the caging of coal cars, as there is no limit to the speed with which they may be caged.



THE CAR STOP IN POSITION ON THE CAGE

This invention has been in daily use at the Nokomis Coal Co.'s mine, at Nokomis, Ill., since Sept. 19, 1914, and has been thoroughly tested with loaded cars weighing 7 tons which were released from automatic cagers located on a 4 per cent. grade.

This device overcomes all the weak points found in many other styles of cages as regards speed and safety.

The following is what the inventor claims for his invention: This device receives and absorbs the shock of the loaded or empty mine car when run on the cage, reducing to a minimum the wear and strain on cages, also preventing the breaking of lugs on the bottom of mine cars, and absorbing the shock of the rebound of the car when the cage leaves the dump. It requires practically no attention after once installed, and by reducing the number of daily wrecks, effects a considerable saving for the operating company.

Mineral Exhibit at San Francisco

To illustrate the development of the mineral resources of the United States the Geological Survey exhibit at the Panama-Pacific International Exposition includes a graphic representation of the output of the various mineral products of the country, based on the production per capita during the centennial year, 1876, and at the present time. Bituminous coal is represented by a block of coal weighing 1600 lb., the per capita production in 1876, and by another block weighing 5 tons (10,000 lb.), the per capita output in 1913. The anthracite blocks, on the other hand, indicate relatively small gain, from 1140 to 1880 pounds.

The per capita production of coke has increased from 134 lb. in 1876 to 700 lb. in 1913. At the earlier period no other than beehive coke was manufactured in the United States, but since then the interesting feature of coke manufacture has been the development of the retort oven, by which valuable constituents of the coal other than coke are recovered. The exhibit at San Francisco shows the quantity of coal consumed in retort ovens in this country in 1913, the quantity of coke produced from it, and the quantity of coal tar, benzol, and sulphate of ammonia recovered as byproducts. The quantity of gas recovered and utilized is also properly shown.

Rockefeller Secures Interest in Consolidation Coal Co.

It was recently here stated that John D. Rockefeller had acquired a substantial interest in Consolidation Coal Co., with a view to diverting some of its profitable coal traffic to Western Maryland Ry., in which Mr. Rockefeller is also heavily interested.

It is confirmed that he purchased, or what is its equivalent, underwrote, the issue of $7,000,000 7% two-year convertible debenture bonds, principal and interest of which can be converted into stock when the bonds fall due. This will give Mr. Rockefeller $8,000,000 Consolidation Coal stock at expiration of two years, in addition to which he has a two years' option on certain large blocks of other stock owned and held by interests close to the management.

Exercise of conversion privilege on debenture bonds and of stock option at end of two years will place Mr. Rockefeller in control of the management; and although it can be truthfully stated by officials that no stock has changed hands, and no immediate changes in board or officers will occur, it is also confirmed that Mr. Rockefeller is exercising enough influence at this time to divert 5,000,000 tons of Consolidation Coal traffic to Western Maryland, and that every preparation is being made by Western Maryland to handle this increased business.

While Senator Watson pointed out that many of the Consolidation's properties were not tapped by Western Maryland, and that the Somerset properties in Pennsylvania were 40 miles from the Western Maryland lines, it was also pointed out here that this traffic could be secured eventually by extension of Western Maryland lines into the Somerset fields, as well as others. Only last week Pres. Gray of Western Maryland, with a party of engineers, made a personal reconnaissance into the Somerset field, and is reported highly pleased with results of the trip.

Immediate accession of Consolidation Coal traffic for Western Maryland will, however, come from the company's properties in Maryland and West Virginia, at present accessible to Western Maryland. Evidences of this new traffic are expected to begin to show in Western Maryland's earnings before the close of this month. Fourteen million gross and five million net is the talk for next year.—"Boston News Bureau."

Proposed Combine of Indiana-Illinois Operators

The most important move to consolidate coal interests in America has just been started in Chicago. If the negotiations are carried through as now planned, the final organization will amalgamate the bituminous coal interests of Indiana and Illinois. It is estimated that more than $700,000,000 will be involved in the deal. Represented in the proposed combine are the Rock Island interests, the Peabody companies, the Miami Coal Co., the Bogle Coal Mining Co., the Dering Coal Co., also the Clinton, Vandalia, Monon, Green Valley, Jackson Hill, Schirke, New Central, Sugar Valley, Coal Bluff, Clove Valley, United Fourth Vein and a number of other companies. Active in perfecting the plans are W. S. Bogle, Carl Scholz and John T. Connery.

The general idea of the combine is to form a merger whereby the coal producers will be afforded an improved system of selling. Most careful attention is being paid to all the legal phases of the matter, as those interested are determined that whatever final plans are developed shall be within the law and meet with the approval of federal statutes.

The reasons for this merger will be published in "Coal Age" next week.

The Labor Situation

SYNOPSIS—Not while the union has money will the eastern Ohio strike end. The union and the miners are united in that determination. The Gallagher amendment of the Ohio Assembly will practically wipe out the Green antiscreen bill. The strike near Fairmont, W. Va., ends as suddenly as it began. The Rockefeller Foundation may provide for the wants of the gunmen of the union in Trinidad, Colo.

There are only two ways to end the Ohio strike within a reasonable time; either the operators or the miners must be compelled to make concessions. Neither side will willingly concede anything, and discussion is useless. The operators show their sense of right dealing by agreeing to arbitrate without reservations as to the arbitrators. The miners' representatives try to appear equally well disposed. They have deceived people several times with fair words relative to arbitration and discussion, but when any definite plan is broached, the representatives of the miners are unalterably opposed to it.

Another Conference Fails

As we stated last week, the negotiations between the operators and the miners' representatives and Secretary of Labor Wilson failed to bring about a settlement. On Mar. 3 the union leaders returned to Ohio, for it developed that they had no power to act on a settlement and their parleying was merely an attempt to give the public the idea that they were open for argument.

When they returned to Ohio they called a conference and the miners showed again, as they have frequently shown before, that they are unalterably for 47c. per ton of machine-mined run-of-mine coal. It is useless for the operators to deny this fact, for it is clearly established. The officials of the union called a meeting at Bridgeport, Ohio, on Mar. 5. About a thousand miners appeared to attend the meeting and it was evident then that there was no hall large enough for such a crowd. So the meeting adjourned to the Auditorium in Wheeling, W. Va. A resolution was passed criticizing Senators Howard and Moore, of the counties of Harrison and Jefferson, for their vote in favor of the Gallagher amendment to the Green antiscreen law.

Albasin Voices the Popular Demand

C. J. Albasin, president of the subdistrict on strike, made the following statement:

> We are going to stick for 47c., immaterial of what the benefits might be. We have been able to pull through the winter and can certainly do so in warm weather. We condemn Senators Moore and Howard for supporting the Gallagher bill, no matter what the legislature may do with the measure. Such a law will only complicate matters. This strike cannot be settled by legislation. We have worked for many years to have a mine-run law passed, and now the senators from our two big mining counties are trying to beat the miners. There will be no compromise other than on the 47c. basis.

The reader will please note the words "immaterial of what the benefits might be." There are distinct benefits to be gained by a reasonable wage in Ohio with its assurances of steady work. A higher wage than that formerly obtaining would mean a larger measure of idleness than ever before in eastern Ohio.

The Gallagher Amendment Is Popular

Whatever the miners and the union may think of the Green anti-screen law, the state senate of Ohio is almost unanimously disposed to give the miners and operators a chance to contract without reference to its provisions. The Gallagher amendment, passed by the state senate on Mar. 4, permits miners and operators to negotiate wage contracts on any basis they see fit and to disregard the mine-run provisions of the law. Where, however, they fail to agree the only basis on which a scale can be made is the mine-run plan.

The law thus remains, but it is for all practical purposes a dead letter when the amendment is duly signed. The emergency clause providing that the amendment, when passed by the assembly and signed by the governor, shall be immediately effective, was adopted by a vote of 24 to 8. Otherwise a referendum vote would have been necessary and a final decision would have been delayed till after the November election.

The discussion which preceded the vote could hardly be called a debate, as no strong opposition to the amendment developed. It is believed that the House of Representatives will adopt the amendment and that it may solve the situation in eastern Ohio. Many operators favor its passage, especially in the eastern Ohio district. Party lines were broken in the vote of the senate; 15 Republicans and 8 Democrats voted for it, and 4 Republicans and 5 Democrats against it. The leaders of both parties voted for the amendment.

Ohio to Oust West Virginia Coal

As part of a campaign to increase the use of Ohio coal, Chairman Whitacre of the house committee on labor has undertaken to father a bill compelling all public institutions in the state to use Ohio coal exclusively. It is alleged that the Ohio University and the Athens State Hospital, both located at Athens, Ohio, almost within a stone's throw of coal mines, have been using West Virginia fuel.

Governor Willis, in a recent speech at Cleveland, Ohio, declared that business was suffering from excessive regulation and said he believed that new legislation should not be passed to further restrict the operations of commerce. He is thus in declared lack of sympathy with such legislation to regulate coal freight rates as has been introduced by Senator Vorheis, of Guernsey County, but it is believed that in this particular matter his opposition to business regulation will be overborne by the force of the arguments favoring low freight rates for coal. The railroad men say that the rates named are too low to permit the railroads to make a profit.

No Allowance for Women and Children

The miners have been receiving $3 a week, 50c. additional where married and 25c. for each child. These additional payments have been stopped, but on Mar. 6 the matter was brought up at the Wheeling, W. Va., meeting and was satisfactorily adjusted. The men were notified at the meeting that the meager strike pay they were receiving might shortly be reduced, but the miners are in no relenting mood and voted to continue the strike "till death."

Arthur J. Morgan, owner of the Edgehill coal mine, north of Bellaire, Ohio, announced on Mar. 7 that he would accept the union scale of 47c. for machine-mined run-of-mine coal. The A. J. Morgan Coal Co. employs at the Edgehill mine about 100 men. It is easy to see that his secession from the operators' ranks is of little importance.

The Strike of the Jamison Men Ends

The strike at the Jamison Coal & Coke Co.'s mines in Farmington, W. Va., is drawing to an end. On Mar. 1 about 325 men returned to work at mines Nos. 7, 8 and 9. On Mar. 2 the number at work increased to 755. Over 100 men were at one time locked in jail for participation in the riots in which Constable W. R. Riggs lost his life.

Negotiations are still proceeding between the subscale committee of the United Mine Workers of America and the New River coal operators at Cincinnati, Ohio. The contract between the parties expires on Mar. 31, and the miners ask for a 10 per cent. increase, the check-off and the short ton.

Poverty in Colorado

The strike in Colorado has left much poverty in its train. The companies operating in that state had nearly all the men they needed when the strike came to an end. The Colorado Fuel & Iron Co. employed some of the strikers, but did not have places for the bulk of the men. Joe Rizzi, of Trinidad, wrote to John D. Rockefeller, Jr., appealing for relief for needy miners. Mr. Rockefeller replied to the chairman of the Chamber of Commerce of that town Feb. 25:

> At my request, Mr. Welborn has had an investigation made and advises that Mr. Weitzel has reported to him that in conference with several representative citizens of Trinidad none of them could give the names of any former employees of the Colorado Fuel & Iron Co. in need of help. As you doubtless know, the company is seeking to do all it can for its former employees and their families.

The Trinidad Chamber of Commerce replied the following day, asking for help to "relieve the distress in this community among other than your former employees by enlarging the scope of the work being done by the local officials of your company."

Kirchwey Was Right—The Rockefeller Foundation May Support Gunmen

Mr. Rockefeller replied that if the local authorities could not take care of the distress, "a situation would be presented which the Rockefeller Foundation might properly consider on representations from leading bodies and the governor of the state as to the extent of their inability to cope with the need." It is hardly probable that the state will do as suggested. It appears, however, that with the founders' good-will the Foundation may well aid in helping the gunmen of the union in the extremity which overpowers them, now that the union no longer supports them

Editorials

Trail-Hitting and Mine Safety

The movement to require strict temperance of the officials in the coal mines in Scranton, Penn., has its roots in the remarkable awakening to better living resulting from the recent religious campaign in Scranton.

Jenkin T. Reese, the mine inspector of the fourth anthracite district, in his annual report points out the increased tonnage per fatal accident and ascribes the improvement to the fact that "many of the miners have cut out booze and are now going to the nickelettes and concerts" instead of the saloon. He adds, "Many are trail-hitters and there is increased reading due to the war and this operates against the booze."

The men in the office and those in jeans are one in realizing that safety and efficiency demand that an end be made of alcoholism.

Success

It is not difficult to sail high and maintain an even keel when skies are clear and breezes light, but it is a different matter when the storms and winds of troublous times are on us. In these days of world war, the men who can smile and show a cheery countenance are those who have built their business structures on a solid foundation. They are the ones who have foreseen rough weather and prepared for the squall.

It is just this lesson that strikes home to all of us at present and causes the publication of a real SUCCESS number of Coal Age. This issue, as you have already been told, will appear April 3. Every reader and friend of the paper is specially requested to add his quota to the total matter that will be printed. The story may describe a man, a method or a machine. The only stipulation is that the facts of the description bear out conclusively the idea—success.

This particular issue of Coal Age will be greatly enlarged, and we propose to make its contents so diversified, interesting and valuable that no one will be able to lay the paper aside until all of the articles have been read. If we accomplish this aim, the SUCCESS number itself will be a SUCCESS, and the men who read it will know more and be greater successes than before.

Failure

It is a question in the minds of many men whether it is better to know what to do to attain success or to know what to avoid to escape failure. Perhaps a knowledge of both is the winning card. At any rate, we would like our readers, wherever it is possible, to submit a story for our SUCCESS number, telling how a man, a method or a machine has failed; what action or lack of action has brought on disaster.

It is through such knowledge that we all learn to avoid the pitfalls that beset our path, and if this can be done, we are well on our way to success.

What a lot of trouble and worry might have been avoided if John had only known that Tom had tried a certain scheme or followed a certain plan and failed. Talk about conservation! If we could only eliminate the duplication of failure by turning the bright rays of public attention on all great mistakes, a lasting benefit would accrue to humanity at large.

Therefore, if you can't tell us the story of a big success, write an account of the biggest failure you know about. The interest and value to the reader will be equally great in either instance.

Do it today.

The Outlook on Ocean Freights

In event of the war being prolonged indefinitely it is clear that ocean freights will still be attractive to the colliers already engaged. Under these conditions the reserve stocks of coal all over the world will be depleted sufficiently to create an emergency demand for American coal whatever the freight, and the shippers having off-shore tonnage available will be relatively independent of the coastwise market. There are recent developments that give color to that prospect.

The other factor is the state of general business. The bottoms now withdrawn from the coast will still be considered surplus, if conditions are not improved over 1914. The crucial time will be Apr. 1 probably, when coasters are released from last season's contracts. If more go off-shore, and the increasing number of sailing vessels loading export cargoes seems to tend that way, then New England will have to do business with the coal operators on the best terms obtainable. If it is decided that these boats shall take their chance on the coast, and business doesn't improve, or the export demand doesn't materialize, then it will be for the shipper and the transportation owner to meet each other on common ground.

This is a vital matter to a good many West Virginia operators, and developments this spring are bound to be closely watched.

Some Intimate Points on the South American Trade

The representative of one of the largest coal corporations in the country, who has just returned from a protracted visit to South America, has offered some interesting remarks on the coal situation there. Many of the points he covers have been repeatedly pointed out in these columns before, but there are other and more recent developments which have so far received little consideration.

Thus, for instance, in the matter of financing and arranging credits, the National City Bank of New York is proving a most important factor in the situation. This is a matter that has long been a stumbling block to the progress of American trade, our practice in this direction varying notably from that of European concerns, American operators having displayed an inflexible determination to have their own way in these matters. This financial house has been found extremely accommodating and too much credit cannot be given to its efforts to facilitate American trade.

The work of Mr. Barrett, of the Pan-American Union, is also most highly commended and recommended for hearty support. But, on the other hand, the work of the *attachés* of the American Commercial Service is proving ineffective and it is believed that this department leaves much to be desired.

It is also becoming clear that the opportunities for smaller concerns, with limited working capital, are at least questionable. Before a profitable business can be established, a considerable expenditure will be necessary; docks and bunkering facilities must be provided, while exhaustive tests of the American coal will be necessary in order to convince the buyers of its quality, and in addition to this, our operators are facing a competition with European producers of the bitterest kind, which cannot be lightly ignored. Obviously, these foreign companies will not tamely permit American coal producers to supersede them in these markets until they have exhausted every resource at their command.

To build up a satisfactory business we must send high-grade men, well informed in both a commercial and technical sense, and they should be able to speak the Spanish language. American commercial houses have already made some progress in the South American trade during the past five years, and there are still enormous possibilities for stronger concerns that are prepared to make a relatively heavy initial expenditure and approach the problem in a systematic and businesslike manner.

⁂

Ueber Alles

On the fifth of March the New York section of the American Institute of Mining Engineers held a banquet, and, as after dinner speaker, G. O. Smith, director of the U. S. Geological Survey, discussed "The War's Opportunities to Make America Mineralogically Independent."

E. G. Spilsbury was chairman and he critically declared that he thought we should desire commercial rather than "mineralogical independence." He was, however, willing to be "shown." Mr. Smith is a forcible speaker when he is attacked. He is a trifle diffident, however, when his fighting blood is not aroused. So his speech, which he described as an "exciter" to larger electrical units, was not equal to what it would have been had it been a reply rather than a prelude.

Without saying anything to which the most squeamish of foreigners could take offense, Mr. Smith took a ground commonly regarded as patriotic and which is the cause of much bad feeling between nations. Clearly the aim of the United States should not be to undertake to do that for which it has no marked fitness.

The ideal of some people is to ship all kinds of minerals to all parts of the world and take none in return—except gold and silver, which are also minerals and which also we are well fitted to produce. It is obvious that we cannot succeed in sending everything abroad and taking nothing in return. All we should try to do is to mine here whatever, like coal, we can mine best and take in return readily whatever other peoples can mine or manufacture to most advantage.

We should feel when we see the foreigner with something we want like the man in a store who sees a gewgaw which he desires. He is glad, not sorry, it is there, and he figures out how he can buy it. But nationally we are not so built; we want to sell all the time and never buy, and we hope thus to assure ourselves of our overlordship over the rest of the world.

And we are not alone in believing that our self-interest lies in antagonism to all other people. It was a Scotchman with a strong accent who said at the banquet mentioned that we should not allow our phosphates to be exported and then lauded the least happy utterances of that recent bulletin of the Geological Survey which has excited unfavorable comment abroad and which can hardly be said to comport with our national dignity.

And that Scotchman is only one of many Britons who have just that "Ueber Alles" way about them that we also too often have. We stole the expression "Made in U. S. A." from Europe, only we made, of course, a trifling and obvious change. This evidence of insularity is Europe's and not ours, though in our way we have our faults. Where England gave free trade, we fostered a protective tariff. In fact we have placed this so high that a "Made in U. S. A." campaign seems somewhat superfluous as a device to misdirect commerce.

All coal and other trade should be free not only of tariff, as this paper has often urged, but of sentiment. If there is any coal in Canada which serves our needs for certain purposes in certain places, let us by all means use it. Unfortunately for Canada, the Canadian coal along the sea coast must compete with the very best West Virginia and central Pennsylvania coals, which are as high as any in the world in evaporative efficiency, far superior to the coals of western Pennsylvania and Ohio—fuels with which Central Canada is supplied by the United States.

This is what makes competition in New England peculiarly difficult to Canadian operators. The good coals of Canada must compete with the superlative coals of the United States. The Canadian coal should, however, have some compensatory transportation advantages, provided the freight rates of Canada are as reasonable as our own. In the central part of the Dominion the quality is more equal, and the shipping facilities being well balanced, it is strange that Canada allows western Pennsylvania to carry off so much desirable trade.

In the West let not the Canadian worry. So long as G. O. Smith has the valuing of the lands, there is no probability of a great mineral development which will seriously compete with the Canadian minerals in British Columbia, Alberta and Saskatchewan. If, however, such a development took place, those provinces of the Dominion could not fail to profit.

After all, it is a folly to look upon the nations as rivals. The individuals in the same trade may be, but the nations are not. That for which a nation or part of a nation has no aptitude it should not strive to perform. There is certainly no patriotism in such a course. For no nation will ever prosper if it insists on "doing stunts," mineralogical or manufacturing, simply to show that such things are possible if it puts enough time, effort and capital into them and shows a necessary indifference as to the profits to be derived. For after all the nation lives for the welfare of its citizens and not *vice versa*.

Sociological Department

Education in Colorado Fuel & Iron Co. Villages

SYNOPSIS—The schools have found some difficulty in combating the general apathy. Nevertheless, much good institutional work is being done with the help of the sociological department. The opportunities for education are excellent for those who desire to embrace them.

The sociological work of the Colorado Fuel & Iron Co. is not so markedly developed in its schools for adolescent children as in its kindergartens. But most large corporations outside Cincinnati, Ohio; York, Penn., and Hammond, Ind.,* do absolutely nothing in the matter of promoting the education of children, regarding this with reason as the work of the school board.

Why Operators Have to Interest Themselves in Schools

In mine villages, however, the coal company, opening its mines often during the course of a brief year and anxious to obtain working men who are mostly married and have children, is obliged to urge, and sometimes to provide, the necessary schoolhouse accommodation. From the very first, therefore, a relation has existed between operating companies and school boards in the coal regions.

It has been found also in mixed mine and farming regions that the period of the school term is all too short—the farmers being desirous of saving the money they would have to spend in providing full-term education, the teachers being drawn from the farms and being anxious to aid in the farm work during the busy seasons, and the farmers themselves needing, or believing that they need, the help of both children and teachers at a time when a few hours' work may mean the making or the marring of the crop.

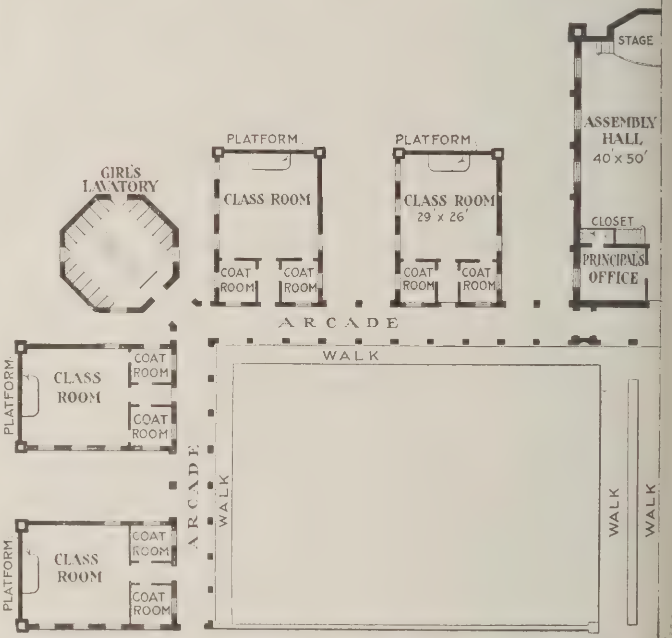
This being the case, the corporations often have difficulty in securing the longer terms of school customary in cities and often obtain the necessary funds by an assessment from the miners, which the latter voluntarily agree to pay. In other cases the company has to supply by a special appropriation the money needed for the extended period of school. Often, also, the corporation may have to erect the schoolhouse.

Schools and So Called Politics

This relation appears menacing to socialists and others who fear that the goodwill of the teachers toward the company may influence them in their instruction. The menace is perhaps not wholly a daydream. It is always a mistake and a lowering of one's manhood to let another do for one what one should do for one's self; but unfortunately there has been little disposition on the part of the body politic in the mining villages to do their part and manifestly little ability to perform it even if the disposition were present—so the difficulty must inevitably continue to exist. It is only part of the general menace which foreign tongues and alien illiteracy are constantly placing upon us.

The Colorado Fuel & Iron Co. has endeavored to develop the public schools wherever it has planted its villages. The school boards have been assisted in obtaining good teachers. Architects' plans have been loaned to school districts preparing to build.

At first, when the communities are too small to warrant the erection of a schoolhouse, the children have been transported to some neighboring village at the expense of the company. Thus the Cuatro children were carried to Tercio and back daily till Cuatro was provided with a school. Occasionally where funds were not otherwise available, as at Madrid, N. M., the teacher has been placed on the payroll of the corporation to prevent the closing of the schools.



Half Plan of a Block of One-Room Schoolhouses Exemplifying the Pueblo Plan

The room opposite the principal's office in the assembly hall is to be used by teachers

No Lack of Schools at Mine Villages

But though care is taken to provide schools, they are not as well attended as they should be. There is not a sufficiently general desire on the part of the parents to educate their children. This is not due to a deficiency in the teachers, who are claimed to be even more intelligent and better paid than those in the adjoining states.

The buildings are all new and attractive frame, brick or cement structures, admirably adapted for their purposes. Those at Pictou, Berwind-Tabasco, Rouse, Sopris, Segundo, Primero and Tercio are two stories high, with attractive, cheery classrooms, a kindergarten room and a hall for lectures, concerts and the social gatherings of the community.

---

*See article on "The Half-Time System" in Coal Age, Vol. 3, pp. 579-580.

In the schoolyards of several of these schools play apparatus has been installed, consisting of swings, teeters, rings and horizontal bars. The interior of the schools is hard finished throughout; the walls are adorned with good pictures, and each child has its individual desk. Where children live too far from the school building to walk, a conveyance calls for them at their homes in the morning and takes them home from school in the afternoon.

NEW SCHOOL AT MORLEY
MORLEY READING-ROOM AND SOCIAL-CLUB

Some of the Buildings at Morley, Las Animas County, Colo., near Trinidad. Morley Is One of the Colorado Fuel & Iron Co.'s Villages

Several of the school boards have established teachers' houses, following the practice of the sociological department of the Colorado Fuel & Iron Co. in dealing with its kindergarten teachers, and have also followed that lead in providing Christmas presents for the children.

The surgeons resident in the mine villages have used the schools for monthly talks on hygiene to the benefit of both teachers and pupils. The stereopticon has been used to assist in this work.

The Trip to the St. Louis Exposition

In 1904 all the teachers in the company's villages, both public-school and kindergarten instructors, were invited by the sociological department to visit the World's Fair at St. Louis, that they might study the educational and sociological exhibits. This took the place of the regular summer course for teachers held at Pueblo. The teachers agreed, in return for their transportation, to remain in St. Louis not less than two weeks, to visit the educational exhibit at least three mornings each week under the direction of members of the department, to submit to the department a thesis of two thousand or more words on some phase of the educational or sociological exhibit, and to return to teach at one of the Colorado Fuel & Iron Co.'s villages during the following year. For approximately three weeks about 20 teachers availed themselves of the opportunity.

The teachers wrote their theses on regulation and inspection of factories and mines; the insurance of the aged and the invalided; the erection of improved dwellings by employers, by individuals and by public authorities; general efforts for betterment of housing conditions; legal regulation and public management of the liquor trade; efforts for lessening intemperance; social settlements; humane societies; church and other institutional work; German kindergartens and public schools; training and certification of teachers; value of manual training in school work; plans and models for small schools; education of negroes; summer schools; school furniture and appliances; day nurseries; vacation schools; Japanese kindergartens and public schools; pay of school teachers; manual training; and Indian basketry in public schools.

In the 1903-1904 report, which was quoted so extensively in a previous article, occur the following remarks on the circulating libraries and social-industrial features in the schools:

Circulating Libraries

The circulating library is no longer an experiment, for the books have become increasingly popular and are more widely read than ever before. Especially is this true of the juvenile books, of which we have altogether too few. Here again we have found a point of contact between our department and the public schools, for the teachers have taken a great interest in these libraries and in several instances have offered prizes for the most intelligent reviews of the books read by the children. In one camp there was always a long line of children in waiting when the hour arrived for the exchanging of books. Of the 45 boxes comprising the Colorado Fuel & Iron Co.'s Circulating Library, 29 are devoted to English books for adults; 12 contain juvenile works and 4 contain works in the Italian language.

The increased circulation of the books has been very gratifying, averaging about 1200 books per quarter. The banner stations were Madrid, N. M., and the Minnequa hospital.

The most serious difficulty that the department has had to contend with has been the failure of some of the libraries to move promptly. In some instances the condition of the stage-roads at certain seasons of the year is responsible for this, but often it is due to the failure on the part of readers to return books promptly. Time and practice will no doubt satisfactorily solve this problem.

Mounted Photographs

The department has a collection of mounted photographs composing 30 sets of 12 pictures, each arranged according to artist, school or type. Each set has its own wooden shipping-case and is provided with a typewritten description or interpretation of all the pictures contained in it, together with a brief survey of the artist, school or type. Following is a list of the pictures in set No. 21, composed of Spanish paintings, which we give as a fair example:

Murillo—"Immaculate Conception," "Virgin of Seville," "Birth of the Virgin," "Madonna and Child," Flight Into Egypt," "Beggar Boy" and "Holy Family of the Bird."

Velasquez—"Portrait of the Artist," "Reunion of the Artists," "Philip IV of Spain," "Infanta Maria Theresa" and "Infanta Marguerite."

These groups of photographs are loaned to the public schools in the camps and moved from time to time.

Framed Pictures and Casts

The department also has a small fund given by interested parties for the purchase of casts and framed pictures with which to adorn the interior of the school buildings. Already several hundred dollars has been received and expended for this purpose. An effort has been made to keep in mind the needs and requirements of public schools and kindergartens.

Boys' and Girls' Social Clubs

Wherever the kindergarten teachers are located, there you will find groups of boys and girls organized for social and recreative purposes and still other groups whose aim is industrial education. For the kindergarten teachers are in a true sense social-settlement workers and conduct in the afternoons clubs and classes, mothers' meetings and all those forms of social effort which have become a recognized form of settlement-work.

Games and stories are still the source of interest for the smaller groups; while for the older boys and girls club-swinging, dancing, physical culture, basketball and target shooting form the chief attractions. Light refreshments also form a frequent innovation at the club meetings.

Special mention should be made of the physical-culture classes at Pictou, under Miss Mary Mason, the basketball teams at Starkville, under Miss Gertrude Heenan, and the Beaman Club at Tercio, under Miss Angie Gilbert. The last-named club has grown from a purely social to a literary organization, officered by its own members and conducted on strictly parliamentary lines. At the Thanksgiving dinner given by the club the toasts and speeches would have done credit to persons of maturer years.

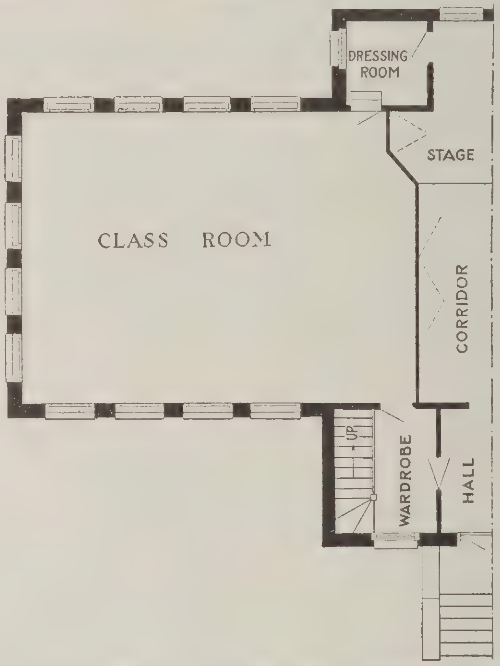
The club is now editing and publishing a little bimonthly newspaper, the "Tercio News." During the school year the teachers aided the children in this work; Miss Irene Haskell, of Tercio, was their helper and adviser during the summer. The children now have their own printing-press and hope soon to be able to do their own presswork. Thus the social club is developing into an industrial class. The basketball and physical-culture clubs were crowded, and during the year several excellent entertainments and exhibitions were given—in some cases free, in others to raise money for apparatus or uniforms.

Industrial Classes

One of the chief objects of the normal and industrial school conducted during the summer of 1903 by the department in its school building at Pueblo was that each of our kindergarten teachers should receive adequate instruction in cooking, sewing and basketry for the purpose of teaching these subjects in the camps.

The success of the experiment has been gratifying, for not only has the department been saved the salaries of two special teachers of sewing and domestic science, but the classes in these branches have been much better attended because of the greater confidence the camp residents have in the kindergarten teachers, who are with them all through the school year. Especially is this true concerning the foreign residents. A teacher who comes to a camp for a few weeks' course and then is gone again fails to gain the confidence and coöperation of the people.

The most noticeable feature of the year's work along industrial lines has been the increase both in the attendance and in the interest. Last September at the beginning of the school year, before our teachers could begin to organize their clubs and classes, the children came urging them to start the work and begging for admission.



Half Plan, Ground Floor of a Modern School Building with Rooms Lighted from Three Sides. One of the Alternative Plans Advocated by Dr. R. W. Corwin

In some of the camps the classes have had to be divided as they were too large for the teacher to handle. Especially has this been true of the sewing, which has been very popular. The girls have learned to do fine darning, stitching, hemming and embroidery, and many of them are making undergarments. The coming year they will be taught to make skirts, shirtwaists and dresses. Raffia classes have also been popular, probably because "in the spring a young maid's fancy lightly turns to thoughts of hats." Some of these hats were very pretty and original in design and handsome enough to be worn as "best" all summer.

Some of the boys in the manual-training classes have made their own looms and are weaving small—but pretty and useful rugs. Their heavy work-aprons of blue denim are also the work of their own hands. At Pictou the boys carved match-safes, penracks, picture-frames and similar articles, samples of which form part of the sociological exhibit at the World's Fair at St. Louis.

The strike has made little difference in any of the club activities; and in the cases of the older boys thrown out of work, many have attended the afternoon clubs, thus swelling the enrollment.

Cooking

Classes in cooking have been conducted by several of the teachers as part of the work of the girls' clubs and in connection with the mothers' meetings. The sociological houses

Side Lights on the School Training in the Colorado Fuel & Iron Co.'s Mining Towns

were the centers of this work, and in each case the object was to teach simple cooking with ordinary utensils—the proper preparation of vegetables, meats, eggs and fruits. Lessons on the proper care of the cupboard, on housekeeping and on the duties of the housekeeper were also given. The "inner woman" has by no means been neglected.

Clubs for Adults

In addition to sewing and cooking classes for adults, flourishing clubs of women, for the study of child-life or for basket-making, have been maintained with especial success at Engleville, Sopris, Rouse, Primero and Tercio. The large ladies' basketry class at Rouse calls for special mention because of the superior excellence of the finished product. Some of these baskets were sent to the World's Fair with our exhibit, and those who made a careful comparison felt that they were quite as fine as any in the Educational Building.

Pueblo Normal and Industrial School

The normal course, under the direction of Prof. J. F. Keating, held at our industrial-school building during the summer of 1903, was highly successful. There were 67 teachers in attendance from Colorado and the adjoining states. In addition to the regular normal course, classes were conducted in sociology, domestic science, physical-culture, etc. Peculiarly attractive was the course in freehand drawing offered by Mrs. E. Scofield Wright, and her studio and exhibit of ceramics, water-colors and burnt-wood designs are a constant delight to visitors.

She it was who conceived and prepared the dainty green and gilt school pins which the normal students wear. A neat certificate of the work done was given at the conclusion of the course, and this was accepted by the public-school authorities in lieu of an examination in the branches covered. The dormitory capacity of the school building was taxed to the utmost. The efficiency of our camp school teachers was greatly increased by this special training, and now the employment of special teachers of domestic science is no longer needed.

The course for the summer of 1904 was given in St. Louis in the Educational and Social Economy Building at the Louisiana Purchase Exposition and has been referred to elsewhere in this report.

In the wintertime the normal school building is used as a dormitory and social center for steelworkers and others who desire to avail themselves of its privileges. A night school for steelworkers was conducted in the large rooms in the basement and was well patronized until the Christmas holidays.

Industrial Home

This feature of the work at the "old hospital building," while perhaps the most important that could engage the attention of the department, having for its object the care of employees who have been seriously injured or have grown old in the service of the company, is still in the experimental stage.

The manufacture of mattresses carried on during a part of the year has been given up, owing to the fact that the work has proved too heavy for the men now at the home. It is probable that several lines of work will have to be introduced adapted to men of different degrees of infirmity. Several forms of light occupation are now under consideration, and this fall one or two of them will be tried with the men now under our care.

Of course it is not expected that this branch of the work will be self-supporting, but enough will be realized to make the men feel that they are at least earning something and are not dependent on charity. The industrial school was represented at the State Fair by an interesting display of canned fruits and jellies and also by mattresses made by a blind man at the school.

Lectures and Entertainments

The need of popular lectures and entertainments in the camps was felt the past winter much more than usual, due to the fact that employees were compelled to remain in camp for fear of violence from strikers. They were thus shut off from outside entertainment in nearby towns. Fortunately the department was in a position to furnish the necessary social life in good measure. The lecture season opened with a series of stereopticon lectures given by Charles A. Payne, of Milwaukee, Wis., the first being entitled, "A Trip Half Way Round the World."

In addition to the lectures delivered monthly to the school children by the camp surgeons, several of these physicians have delivered evening lectures for adults, the most popular being those of Dr. T. D. Baird at Pictou. At the close of these lectures a social hour always followed, during which light refreshments were served. No entertainments in Pictou draw so well as Dr. Baird's popular evening lectures. We wish more of the local surgeons would adopt Dr. Baird's plan in this regard.

The department owns two stereopticon lanterns and has access to nearly two thousand lantern slides, covering a wide range of subjects, and these were in almost constant use all winter. Over forty lectures were delivered by members of the department in addition to those by the local surgeons in the camps in the southern part of Colorado.

Of a more popular nature were the socials, musicales, Washington's Birthday parties, Japanese festivals, drills, basketball contests and amateur theatricals given under the leadership of members of the department.

But doubtless the most popular entertainments given last winter were those at Primero, under the direction of Louis Smith, the mine clerk, and of Will Chamberlain, of the Denver office, in which only home talent took part. Under their able direction several original sketches were produced and some excellent talent developed. The schoolhouse theater was always taxed to the limit at these entertainments.

Dances were of course popular all winter, and of almost weekly occurrence. Perhaps nothing is so enjoyed in a mining camp as a good social dance, especially before people have begun to get wearied.

Some Other Studies in the Art of Living

Many are the activities in connection with the schools, which lack of room compels us to overlook or pass over hastily. At Tercio the children have been taught pyrography. In some of the schools housekeeping classes have been held, in which fire-building, table-setting, dishwashing, bedmaking, sweeping, dusting, scrubbing, washing and ironing and, more important yet, the care of the baby, have been taught. In connection with this the scholars have been instructed in the making of towels, dust cloths, caps, aprons, napkin rings and similar articles.

A large club of boys at Engle has been taught weaving, and they have made large rugs for the floor as well as their own looms and working aprons. Other boys at Sopris have been trained in the use of Indian clubs and roller skates. Other groups of boys have engaged in chorus singing, basketry and making Venetian ironwork. In the Rouse schoolhouse electric light and attractive stage scenery have been installed, and entertainments of an elaborate order are possible.

The night schools for teaching English to foreigners have not been very successful, but attempts to maintain these have been made everywhere.

The "Pueblo Idea"

The sociological department is continually endeavoring to raise the standard of the public-school buildings and is anxious to introduce what is known as the "Pueblo idea" in schoolhouses. Of course, facing the fact that most of the buildings were completed before the "idea" originated, the opportunity for such changes no longer presents itself frequently. At a new camp, however, known as Katchina, a commencement has been made.

The idea is to put each schoolroom in a building of its own instead of building all the elements into one common edifice. The introduction of such a scheme is the more feasible in a mine village where land is comparatively cheap. The reasons for the "Pueblo idea" are many.

Why Overcrowd in the Country?

1. The number of schoolrooms may be made always to meet the demand, which is not the case with a building of many rooms. The many-room building is usually ahead or behind the needs of the district. There are vacant rooms intended for future requirements, or crowded rooms, waiting for the schoolboard to build. The plan suggested admits of erecting a building or room when there is need for it, hence there is no room unused and none overcrowded.
2. When several districts are crying for more room and the school treasury is low, the school board can accommodate each district at least cost.
3. It is cheaper than any other plan.
4. There is less waste room as there are no halls or stairs.
5. There is less chance of fire.
6. In case of fire there is less probability of loss of life or property or damage by water.
7. There is no particular need of fire drill with its nervous strain on certain children.
8. The danger to pupils in case of fire is reduced to a minimum.
9. Light may be obtained from any direction. The object of universally diffused light in a schoolroom is especially for the purpose of giving the left-handed child a chance equal to one of more normal habit. The one-sided lighting of a room may be perfect for the right-handed child, but how about the 3, 5 or 8 per cent. of children who are left-handed? High windows allow space for blackboard drawings or pictures on all sides of the room. If the building is located so that there is objectionably strong light from the east or west at certain times of day, it can be easily overcome by frosting the windows through which the strong light enters. If the windows are hinged at the bottom and the top swung into the room, ventilation is made most satisfactory and causes no drafts.
10. Ventilation may be obtained from all directions. As one of the teachers remarked, "Fifty pupils scarcely vitiate the air in the least." Not only is the sanitation of the multiple-room building objectionable, but often criminal.
11. There are no large hallways to receive dirt from the shoes of all the pupils.
12. Less work for the janitor.
13. No sweeping of dust from one floor down upon another.
14. No steps or banisters to clean.
15. No stairs to climb up or fall down. This is a relief to the small child and of vital importance to the young girl.
16. No noise from the passing classes.
17. It is easier for the principal to supervise grounds and rooms on this plan.
18. The teacher finds the discipline of her class both in the room and on the playground easier.
19. There is greater field for individuality on the part of both teacher and pupil.
20. A five-minute recess may be taken outdoors at any time without disturbing other classes.
21. The homelike atmosphere which may pervade the one-room building is not possible in the larger structure.

Co-operation

We want to interest all of the readers of the sociological department of Coal Age in the special SUCCESS number of this paper, which will be published Apr. 3. Doubtless you have already read some of the brief announcements we have made with reference to this particular issue, but we are not certain that all of you understand that this SUCCESS number will cover every problem and every phase of coal mining concerning which a real SUCCESS story can be written. All kinds of sociological work, whether it pertains to training in first-aid or to night schools, or to miners' houses and gardens, or anything else of a similar nature, will come in for its share of public notice. Ever so many coal companies have accomplished welfare work of a most beneficial nature, and all such instances should be properly described in our SUCCESS issue. Get busy at once and send us the story of the particular work your company has carried on.

Discussion By Readers

Recognition of Bravery

Letter No. 3—The suggestion of COAL AGE, made in its issue of Jan. 16, p. 109, in reference to the adequate and tangible recognition of the heroic services of many mine workers who, in times of danger, are wont to rise to a supreme degree of courage in the attempt to rescue fellow workers, certainly deserves the hearty approval and support of all true-minded men.

While I heartily indorse such a movement, I cannot agree with the statement made by I. R. Packard, COAL AGE, Feb. 27, p. 383, to the effect that "such recognition would go far toward increasing the efficiency of rescue work," etc. I know too well the spirit of resolute self-sacrifice that animates the rescue worker to harbor, for a second, the idea that, in a moment of dire peril to his fellow worker, a miner would waste a thought on either the mercenary reward or the empty plaudits of hero worshipers that he might gain by his act.

To the mine worker whose every faculty is taxed to its capacity in time of peril, there is but one subconscious, unformulated thought that, perhaps, a human life may be saved or a human service rendered. It is not given to every man to be able, at will, to master his fear and screw up his courage to the sticking point that will enable him to save another's life at the risk of his own. To those who possess such masterful self-control, due recognition of their act should be awarded as a token that an appreciative people acknowledge their indebtedness to his bravery.

I feel that the bestowal of this recognition should be for no other reason than the all-sufficient one that it is eminently right and just that such heroic self-abnegation should be publicly recognized, not to say rewarded. It must be acknowledged, however, that human nature is so constituted that such recognition of a brave act would not be without its practical effect. The records of the early history of our own states as well as those of other countries prove that many acts of chivalry and heroism were prompted purely by the spirit of *noblesse oblige*, which interpreted is, "Upon a gentlemen certain things devolve." It is true, also, that in time of disaster a publicly recognized hero would feel it incumbent on him to act up to his acquired reputation for bravery.

I want to suggest that recognition of bravery should not be bestowed too freely, but only after the most careful investigation has revealed the merit of the act or service performed. Such a safeguard is necessary to avoid the cheapening of the award in the eyes of the public.

It is evident at once that the most difficult feature, in considering the means and methods to be employed in providing a recognition of bravery that will be void of ostentation, is the finding of someone willing to take the initiative and organize a suitable *foundation* devoted to that purpose. The thought comes to me, Why could not COAL AGE, as the leading American periodical devoted exclusively to coal mining, foster this movement, which it has had the honor to initiate by suggestion? The fund required as a foundation for the purpose need not be large—better that it should not be very large, as the most suitable recognition would probably take the form of an inexpensive medal. I would suggest that the fund set aside for such purpose could be known as the "Coal Age Hero Foundation," or some other appropriate title.

The administration of the fund and the granting of awards could be placed in the hands of a general committee, while advisory committees could be selected in each mining district. Such advisory committees could be composed of five members of high reputation and unquestioned integrity. It would be their duty to make recommendations for awards in their particular districts, to be acted upon and approved by the general committee.

I shall be most glad to read the opinions of the many COAL AGE readers in regard to these suggestions.

FLAT TOP ENGINEER.

Crumpler, W. Va.

*

The Formation of a Flame Cap

I was much interested in the inquiry of W. H. Moore that appeared in COAL AGE, Jan. 30, p. 220, and the reply appended by the editor. Mr. Moore draws attention to the flame cap formed in pure air containing no gas when a lamp burning gasoline or naphtha is used to make the test.

I might state that I have had quite an experience with lamps of this type, and have also noticed the same phenomenon. I have called this a "fuel cap." As I have observed it, the cap is hardly perceptible, except the lamp has become somewhat heated, when the fuel cap becomes very plainly discernible. This cap is of a much brighter color than one formed by the presence of marsh gas (CH_4) or the ordinary firedamp mixtures that occur in mines.

In this connection, I desire to relate, briefly, several experiences I have had with such false flame caps and to say that the observations made by myself in company with others have been such as to confirm my opinion that such caps have often been mistaken for gas caps.

In one instance, while superintendent of the International Coal & Coke Co.'s mines at Coleman, Alberta, Can., the fan ventilating the mine was stopped about 6:15 a.m., owing to a slight accident to the generator in the power house. The repairs were quickly made and the fan was again running, at 6:45 a.m. Although the firebosses had previously completed their work and reported the mine as safe, the stoppage of the fan for one-half hour made it necessary to repeat the inspection before permitting the workmen to enter the mine.

To expedite this work, I deputized a number of competent and certificated men to make this second examination, giving to each a small separate district to examine and report upon. As a result, all parts of the mine were soon reported clear of gas and safe, except the inside district of No. 2 seam, where the fireboss who made the inspection stated that he got a cap on the flame of his lamp, at a point possibly 1000 ft. from the face of the main-intake entry. He stated that he also found the same conditions on the counter-entry.

I was much surprised at this report, since the fireboss who examined the adjacent section on the return side had not reported any gas and stated that the air current was traveling normally. In view of this fact, I concluded that a trap door had been set open between the intake and return, thereby short-circuiting the air at that point. Further inquiry, however, showed that this was not the case and, as the mine was well timbered, it could not be supposed that a heavy fall of roof had occurred to create such a condition.

To solve the mystery, I took a safety lamp and, in company with the fireboss who had examined this section, hurried into the mine. We proceeded cautiously and inspected the air current at intervals, both on the intake and return air courses but found no trace of gas whatever. We concluded that the cap previously observed was a fuel cap caused by the evaporation of the gasoline in the lamp, which had become somewhat heated in the examination. A further examination of all the pitch workings of the two inside districts showed them to be absolutely free of gas. There were no roof falls and the mine was in perfect condition.

A similar instance occurred while I was developing a property for the Columbia Coal & Coke Co., at Coalmont, B. C., Can. Two practical coal-mining men paid a visit to the mine and were accompanied through the workings by the general manager and myself. At the face of the main-intake entry, one of the gentlemen raised his lamp (which was a naphtha-burning lamp of approved type) to the roof to test the place for gas. On carefully pulling down his flame as low as possible, he detected a small cap surmounting the flame and called my attention to it, remarking that there was a small percentage of gas present at that point. Being confident that there could be no gas in the place, I assured him that the cap he saw was a fuel cap and offered to prove this assertion by getting the same cap out in the main rock tunnel that formed the intake-air course for the mine and where no gas could possibly be present. This we did to the satisfaction of all.

I heartily agree with the opinion that has frequently been advanced by Coal Age that such a cap is formed on the flame of a naphtha-burning lamp in pure air, owing to the vaporization of the volatile oil. The heating of the lamp may slightly expand the wick tube, besides rapidly increasing the vaporization of the oil. The effect is greatly increased, also, by a small-sized wick. Again, the absorbent cotton in the oil vessel is sometimes allowed to get dirty and gummed in which condition it does not absorb the gasoline, which retains its liquid form and is vaporized more easily. The combustion chamber of the lamp then becomes filled with a mixture that will show a small percentage of gas. I have found that this fuel cap is always of a maximum size immediately after drawing down the flame from normal when preparing to make a test; but, after a few minutes, its size is gradually reduced. I shall be glad to hear from other readers, in reference to their experience in the same line.

Drying Washed Coal

Letter No. 6—Referring to the article by F. E. Butcher on the subject of Drying Washed Coal, Coal Age, Feb. 20, p. 325, in which he alludes to the four centrifugal driers his company installed at Steelton, I desire to offer the following notes on the performance of these machines. These are not, however, as complete as it will be possible to give some two or three months hence.

We have operated three of the driers almost continuously, 10 hr. per day, for just about one year. In that time we have made some radical alterations in the drier-accessory equipment as well as in the driers themselves. The original equipment was as follows: The primary-washing outfit consisted of three units, each unit being composed of two double-compartment jigs, one centrifugal drier and three settling cones, 11 ft. 10 in. in diameter and about 9 ft. in height. At the overflow of each jig is a dewatering screen over which the washed coal passes. A large amount of the water and a considerable amount of fine coal pass through the dewatering screens and are conducted to a pump sump, while the coarse coal and about an equal portion of the water pass over the screens and go directly to the drier. The water thrown off by the drier together with considerable fine coal that gets away through the screen plates in the driers is also conducted to the pump sump. All of the water and fine coal in this sump is delivered by a centrifugal pump to the three settling cones. The sludge coal is drawn off at the point of the cone and conducted to the drier, entering the same receiving hopper as the coarse coal from the jigs. The overflow water from the cones is returned to the jigs.

As the best coke-oven results are obtained when the moisture content of the coal is nearly constant, the attempt was made to draw the cone sludge constantly, as nearly as possible, and with the above arrangement we averaged about 10 per cent. of moisture in the product of the three driers. The overflow water from the cones carried from 5 to 9 per cent. of solids or coal, and this resulted in "hutch product" from the jigs. With no cone sludge delivered to the driers, the power consumption of each drier was from 20 to 25 hp. and the moisture content of the drier product averaged about 7.5 per cent. Upon delivery of the cone sludge, the power consumption varied from 40 to 55 hp. From six to ten 75-amp. fuses were frequently blown out in a day. The centrifugal pump handling the water and fine coal from the sump to the cones, in each unit, consumed 15 hp.

In regard to repairs, we now have drier screens that will handle from 10,000 to 15,000 tons of coal before requiring to be replaced. The eight scraper blades in each drier must be replaced about once a month, but the adjustable scrapers installed give a much longer life before entire replacement is necessary. The rotor casting supporting the scrapers requires replacement in about one year. The same is true of the cast-iron spider supporting the screen basket. We are making these replacements at the present time. Ball bearings and miter gears require replacement about every six months but we have altered the machines and are obtaining better results at present. The pump impellers require replacement in from 60 to 90 days; the pump casings every four to six months. The piping from the pump to the cones cuts through in about eight months. The control gates or valves on the cones had to be replaced in four months and the cone body cut through in spots, in six months. The loss of fine coal in the water leaving the plant averaged about 7 per cent. of the raw-coal input.

The cones and all of the dewatering screens on the jigs have been abandoned. By means of a system of settling tanks and dewatering elevators, the washed coal is delivered to the driers, without separating the fine from the coarse and with about 25 per cent. of moisture. The water from the driers carries about 40 per cent. of solids and is returned to the settling tanks. It requires 6 hp. per unit for the dewatering elevators and a constant power consumption of 27 hp. for each drier, and there are no "peak loads," as we had while using the cones. By means of the settling-tank system, a small tonnage of fine sludge is collected as secondary coal, and a pump requiring 35 hp. returns all the water to the jigs and does not have to handle water containing a high percentage of solids. It is expected eventually to reclaim the above mentioned sludge as primary coal. There will then be no water constantly flowing away from the plant and creating a continuous coal loss

One of these units has operated 39 days under the new system, another 12 days and the third 5 days. The average moisture content of the coal from all three driers, for the entire period, is 6.5 per cent. We have had nine days' operation of one machine in which the average moisture content was 4.5 per cent.

The result of this one year's experience, I believe, shows that a combination of dewatering elevators and centrifugal driers is essential for the successful use of the drier where the percentage of fine sludge coal is as high as what exists here. I am not as yet prepared to give conclusive data on the cost of this method but our experience to date strongly indicates a considerable saving over the original installation.

Mining Laws, Legislation and Mine Regulations

Letter No. 38—While the Pennsylvania bituminous mining laws (1911) seem to be generally good and sufficiently strong to insure the required protection of life and property, there are some portions deserving of criticism. For example, the last clause of Sec. 3, Art. 10, prohibiting the use of open lights on return airways reads:

> The provisions of this section shall not apply to any mine wherein explosive gas is generated only at the face of active entries.

Again, Sec. 2, Art. 28, reads:

> The provisions of this act as to mines or portions of a mine generating explosive gas in quantities sufficient to be detected by an approved safety lamp shall not apply to any mine wherein explosive gas is being generated only in live entries.

The last section quoted has reference to the entire bituminous law relating to the generation of gas in mines. From the reading of the two passages quoted, it would appear that the law applies only to entries that *are being driven* in mines—"live entries"—and does not apply to rooms and pillar work where explosive gas frequently accumulates in greater and more dangerous quantities than in live entries. In other words, these passages seem to annul or completely destroy the protection that would otherwise be afforded by the law in this respect.

Another seeming incongruity occurs in Sec. 1 and 2, Art. 10, and Sec. 1 and 2 of Art. 20, both of which provide for an appeal from the judgment of the mine inspector; and, not only this, but a further appeal from the joint decision of other inspectors called to investigate the case may be made to the courts if the parties interested are still dissatisfied.

The law thus makes it possible for a mine operator, superintendent or foreman to give the district inspector much trouble and cause him worry and annoyance, all of which has the effect to undermine the authority of an inspector. In my opinion, the repeal of these sections of the bituminous law to which I have referred would do much to improve the work of mine inspection in the state and assist to enforce the instructions and recommendations of the inspector in every district.

I want to mention briefly a few of the features that I believe should be incorporated in every mining law. They are as follows:

No person should be permitted to work inside of any mine who cannot speak and understand the English language.

No person shall be competent to act as mine superintendent until he has successfully passed an examination and obtained a first-grade mine-foreman's certificate.

In order to double the frequency of inspection visits in all mines, the law should provide for an assistant mine inspector in every district.

The law should regulate and control the company-store curse of some mining districts.

A workmen's compensation act providing needed assistance for disabled workmen and the support of their dependents, in case of fatal accidents, should be in force in every state.

The law should provide for an interchange of state certificates or for a universal certificate that would qualify the holder for filling the same position in any coal-mining state in the Union.

The law should prohibit the sale of intoxicating liquors in all mining towns and districts.

If these and similar provisions were made a part of our mining laws, the result would be to produce safer, cleaner and healthier conditions in and about the mine. In closing, I want to say that I fully believe that the appointment of mine inspectors by the governor of the state is the best method that can be adopted in order to secure competent men for the position.

H. R. K.

Curtisville, Penn.

Letter No. 39—In the discussion of needed mining laws and legislation, it seems to me it would be well to draw attention to the fact that, in many mining states, the assistant mine foreman is not required to pass an examination or to hold a certificate of competency, while he is often called upon to discharge the mine foreman's duties in the absence of the latter. This is the case in respect to the assistant mine foreman of nongaseous mines, in the bituminous districts of Pennsylvania. The bituminous-mine law of Pennsylvania (1911) does not appear to require the assistant mine foreman to pass an examination or to hold a certificate of competency.

Art. 4, Sec. 1, reads, in part, as follows:

> * * * If the mine is generating explosive gas in quantities sufficient to be detected by an approved safety lamp, the mine foreman must possess a first-grade mine foreman's certificate. If the mine is nongaseous, the mine foreman must possess either a first-grade mine foreman's certificate or a second-grade mine foreman's certificate.
>
> When the mine workings become so extensive that the mine foreman is unable personally to carry out the requirements of this act pertaining to his duties, he shall have the right to employ a sufficient number of competent persons to act as his assistants, who shall act under his instructions in carrying out the provisions of this act. If the mine is generating explosive gas in quantities sufficient to be detected by an approved safety lamp, the mine foreman's assistants must possess first-grade assistant mine foremen's certificates.
>
> In case of the necessary temporary absence of the mine foreman, he may deputize his work, for the time being, to his assistant, who shall perform all the duties of the mine foreman.

Sec. 24, of the same article, reads as follows:

> When assistant mine foremen are employed, their duty shall be to assist the mine foreman in complying with the provisions of this act; and, in the absence of the mine foreman, they shall perform the duties of the mine foreman and shall be liable to the same penalties as the mine foreman for any violation of this act.

Art. 24, Sec. 4, provides for mine foremen's certificates of two grades—the first requiring an average of 80 per cent. in examination and entitling its holder to perform the duties of mine foreman in *gaseous* mines; the second requiring the same average percentage in examination and entitling its holder to perform the duties of mine foreman in *nongaseous* mines. The law then concludes as follows, in reference to assistant foremen:

> Certificates of qualification as assistant mine foremen shall be granted to persons who have given to the board of examiners satisfactory evidence of their ability to perform the duties of assistant mine foremen in gaseous mines and who shall have received an average of at least 70 per cent. in the examination.
>
> All applicants for certificates as mine foremen and assistant mine foremen in gaseous mines must also undergo an oral examination in the presence of explosive gas.

It is clear, from the above quotations of the law, that the assistant mine foreman is not only required by law to perform the duties of the mine foreman, but is held responsible for such performance and made liable to the same penalties as the mine foreman, for any violation of the act. The question may well be asked, Can the law impose a penalty on an assistant mine foreman for any violation of the act when he is not required by that law to qualify for the position he holds? If the mine foreman in charge of a nongaseous mine has been required by law to qualify for that position, why should not all of his assistants be required to do the same if they are held liable, by law, for the discharge of his duties?

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

HAULAGE FORMULAS

The following formulas apply to all locomotive haulage, but care must be taken to give values to the several coefficients that will correspond closely to the conditions relating to track resistance and adhesion of the driving wheels to the rails. Assume the following symbols:

W_m = weight of locomotive resting on drivers (*tons*);
W_t = weight of loaded trip hauled (*tons*);
$T.E.$ = tractive effort of locomotive (*lb.*);
c = coefficient of adhesion of wheels to rails (0.15 to 0.35, *sanded rail*);
T_t = track resistance (*lb. per ton of moving load*);
R_g = grade resistance (*lb. per unit per cent. of grade*);
g = percentage of grade of track (*not exceeding* 10 *per cent.*);
S = speed of hauling (*mi. per hr.*);
$D.P.$ = drawbar pull (*lb.*).

Tractive Effort vs. Resistance—In locomotive haulage, there are two main factors; namely, the **tractive effort** of the locomotive acting to produce motion; and the resistances—**track resistance** and the **grade resistance** acting to oppose motion on upgrades. On downgrades, the grade resistance becomes an equal **grade factor** acting to produce motion.

The **tractive effort** of a locomotive is found by multiplying the weight on the driving wheels by the coefficient of adhesion (c) of the wheels to the rails or the **tractive coefficient.** The tractive effort per ton on the drivers is therefore 2000 c.

The **track resistance, grade resistance** and **grade factor,** as the case may be, are estimated, respectively, in pounds per ton of the entire moving load ($W_m + W_t$).

The following equations express the equality of the opposing factors in a moving train, on a level track and on ascending and descending grades, respectively:

Level track, $(2000\,c)\,W_m = R_t\,(W_m + W_t)$ (1)

Ascending grade, $(2000\,c)\,W_m = (R_t + 20\,g)(W_m + W_t)$ (2)

Descending grade, $(2000\,c)\,W_m = (R_t - 20\,g)(W_m + W_t)$ (3)

The **ratio of weight** on drivers to entire moving load, for each respective case is shown as follows:

Level track, $\dfrac{W_m}{W_m + W_t} = \dfrac{R_t}{2000\,c}$ (4)

Ascending grade, $\dfrac{W_m}{W_m + W_t} = \dfrac{R_t + 20\,g}{2000\,c}$ (5)

Descending grade, $\dfrac{W_m}{W_m + W_t} = \dfrac{R_t - 20\,g}{2000\,c}$ (6)

From the above ratios is easily obtained the following: ratios of load hauled to weight on drivers:

Level track, $\dfrac{W_t}{W_m} = \dfrac{2000\,c}{R_t} - 1$ (7)

Ascending grade, $\dfrac{W_t}{W_m} = \dfrac{2000\,c}{R_t + 20\,g} - 1$ (8)

Descending grade, $\dfrac{W_t}{W_m} = \dfrac{2000\,c}{R_t - 20\,g} - 1$ (9)

The Coal Age Pocket Book

Conditions of Hauling on Downgrades—It is important to observe that when descending a grade the grade resistance, as previously stated becomes a **grade factor** acting to produce motion. Hence, when the grade factor becomes equal to the track resistance, the necessary tractive effort of the locomotive becomes zero and the entire train gravitates down the plane at a uniform speed. This occurs when

$$20\,g = R_t; \quad \text{or } g = \frac{R_t}{20} \qquad (10)$$

Expressed as a rule, the grade of this **self-acting incline** is one-twentieth of the track resistance. For a track resistance of 30 lb. per ton, the self-acting grade is 30 ÷ 20 = 1.5 per cent. When a locomotive is operating on such a grade, no tractive effort is required on the part of the locomotive to maintain the speed of the descending train.

Drawbar Pull—The drawbar pull is the force required to move the trailing load or the load hauled (W_t). It is found, for a level road, by multiplying the track resistance in pounds per ton, by the weight of the trip hauled in tons; thus,

Drawbar pull (level road), $D.P. = R_t W_t$ (11)

When **hauling on an upgrade** the grade resistance must be added to the track resistance and their sum multiplied by the weight of the trip hauled, as before; thus,

Drawbar pull (upgrade), $D.P. = (R_t + 20\,g)\,W_t$ (12)

When **hauling on a downgrade** less than what is self-acting the grade resistance must be subtracted from the track resistance and the difference multiplied by the weight of the trip hauled in tons; thus

Drawbar pull (downgrade), $D.P. = (R_t - 20\,g)\,W_t$ (13)

Difference between Tractive Effort and Drawbar Pull—The tractive effort of a locomotive is the force it is able to exert to move the entire load including its own weight and as previously stated, this force depends only on the weight (W_m) resting on the drivers and the tractive coefficient (c), as express by the formula

$$T.E. = 2000\,c W_m \qquad (14)$$

Tractive effort is only a possible force which may or may not be wholly utilized in moving the train, depending on the load hauled and the track and grade resistances. The grade of a road may be so steep that the tractive effort is wholly consumed by the grade resistance of the locomotive, which can then only propel its own weight up the plane. Then,

$$20\,g W_m = 2000\,c W_m$$

and

$$g = 100\,c \qquad (15)$$

Or, assuming a tractive coefficient c = 0.16, the limiting grade is

$$g = 100 \times 0.16 = 16 \textit{ per cent.}$$

Drawbar pull, on the other hand, is a positive factor that is always determined by the net resistance of the trip hauled, which depends on the weight of the trailing load, and the track and grade resistances. The drawbar pull, under the varying conditions of haul is expressed by Formulas 11, 12, 13.

Inquiries of General Interest

Electric-Haulage Problem

(Concluded from last issue)

Having decided on the weight of the locomotive necessary to haul the desired number of loaded cars over the given grades, the next step is to determine the power of the motors that will be required to produce a given speed of haul, say from 6 to 8 mi. per hr. As a basis of this calculation, it is important to observe that the effective power, in foot-pounds per minute, is equal to the tractive effort in pounds, multiplied by the speed in feet per minute, as expressed by the formula

$$\underset{\text{(ft.-lb.p.m.)}}{Power} = \underset{\text{(lb.)}}{tractive\ effort} \times \underset{\text{(ft.p.m.)}}{speed.}$$

Now, estimating the horsepower required per ton on drivers, per mile-hour, assuming a tractive coefficient $c = 0.16$, we have

$$Tractive\ effort\ (per\ ton) = 0.16 \times 2000 = 320\ lb.$$

$$Speed\ (per\ mi.\text{-}hr.) = 5280 \div 60 = 88\ ft.p.m.$$

$$Horsepower\ (per\ ton\text{-}mi.\text{-}hr.) = \frac{320 \times 88}{33{,}000} = 0.85\ hp.$$

This is the effective horsepower per ton-mile-hour, or the power that must be available to produce a speed of 1 mi. per hr., for each ton of weight resting on the drivers. Assuming an efficiency of 85 per cent., the input to the motors should be 1 hp. per ton-mi.-hr.

Using a 25-ton locomotive for this haulage and assuming that the entire weight of the locomotive is on the drivers, the actual horsepower of the motors required for a speed of 6 mi. per hr. will be 25 × 6 = 150 hp., which corresponds to a wattage of 150 × 746 = 111,900 watts delivered to the motors.

It is interesting to note here that the effective wattage per mile-hour, in electric mine haulage, is practically twice the tractive effort of the locomotive, in pounds. This is shown by the following simple calculation, since a speed of 1 mi. per hr. is equal to 88 ft. per min. and 1 hp. is equivalent to 746 watts:

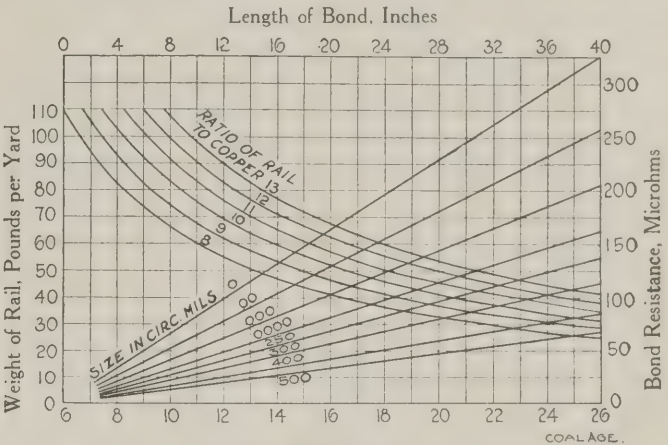
$$Effective\ watts (per\ mi.hr.) = 746\left(\frac{88 \times T.E.}{33{,}000}\right) = say\ 2\ T.E.$$

Under the assumed conditions, it was previously estimated that the total tractive effort when hauling up a 3-per-cent. grade is 110 lb. per ton of moving load, which makes the effective wattage required in that case 2 × 110 = 220 watts per ton-mi.-hr. In like manner, it was estimated that the total tractive effort when hauling up a 1½-per-cent. grade was 80 lb. per ton, which makes the effective wattage required to haul up that grade 2 × 80 = 160 watts per ton-mi.-hr.

In electric mine haulage, it is customary to estimate on hauling at a speed of, say from 6 to 8 mi. per hr. Taking the actual power of the motors at 1 hp. per ton-mi.-hr., to give an input of 111,900 watts on a 500-volt circuit will require a current of 111,900 ÷ 500 = say 224 amp.

The weight of rail in pounds per yard, in locomotive mine haulage, may be taken as twice the weight of the locomotive in tons, or, in this case, 2 × 25 = 50 lb. per yd. In estimating the size of wire required to transmit this current from the generator to the siding at the foot of the slope in the mine, we will assume a rail-return, using 50-lb. rails for the track, bonded with compressed-terminal bonds, 24 in. long. The length of track from the end of the siding at the foot of the slope to the tipple is about 5400 ft. The length of trolley wire extending to the power plant will be assumed as 5600 ft.

Referring now to the diagram shown in the accompanying figure, first find the resistance of 5200 ft. of the two 50-lb. rails in the track-return, including the resistance of the bonds, assuming a rail to copper ratio of 1 : 11 and rails 30 ft. long, making 5400 ÷ 30 = say 180 bonds in a single length of rail. Following the horizontal line marked 50 on the left of the diagram, to its intersection with the curved line indicating a rail-to-copper ratio of 1 : 11; and, from that point, following the vertical line to the scale at the bottom of the diagram, we find a resistance of 18 microhms per foot of rail or 30 × 18 = 540 microhms per rail. In like manner, for a 24-in., 4-0 bond, follow the vertical line marked 24 on the top scale down to its intersection with the diagonal 4-0; and, from this point, follow the horizontal line to the right-hand scale, which shows a bond-resistance of 100 microhms.



Resistance Diagram for Bonded Rails

The total resistance for 180 bonded rails is, therefore, 180 (540 + 100) = 115,200 microhms, or 0.1152 ohm. The resistance for a two-rail return is one-half this amount, or 0.0576 ohm. The voltage absorbed in the rail-return is $E = CR = 224 \times 0.0576 = 12.9$ volts. The line drop for 5600 ft. of T. B., 4-0, copper wire, carrying a current of 224 amp., as taken from wire tables, is 5.6 (224 × 0.0489) = 61.3 volts. The difference of potential at the generator is therefore 61.3 + 12.9 + 500 = 574 volts.

Finally, assuming an efficiency of 90 per cent., the power required to run the generator is:

Input to generator,

$$(574 \times 224) \div (0.90 \times 746) = say\ 190\ hp.$$

Boiler horsepower, efficiency of engine being 90 per cent.

$$190 \div 0.90 = say\ 210\ hp.$$

Examination Questions

Hoisting Engineers' Examination Held at Terre Haute, Ind., Sept. 10, 1914

(Selected Questions)

Ques.—(a) An engine cylinder is 12 in. in diameter and 18 in. long; what is its sectional area? (b) Find the cubical contents of this cylinder.

Ans.—(a) The sectional area of the cylinder is $0.7854 \times 12^2 = 113.1$ sq.in.

(b) The cubical contents of this cylinder is $113.1 \times 18 = 2035.8$ cu.in.

Ques.—What parts of a stationary engine should receive particular attention at the beginning of each shift?

Ans.—Before running the engine, all oil cups should be examined and filled; the engine guides and other bearings properly cleaned; the brake, cable-fastenings and all bolts and nuts carefully examined to see that they are secure. In addition to this, the engine should be operated for one or two hoists, after taking the precaution to first open the dripcocks to allow the expulsion of any water of condensation that may be in the cylinder.

Ques.—How may the water consumption of an engine be calculated?

Ans.—The water consumption, or water rate, depends on the style or type of engine in use, and may be calculated by a formula involving the mean-effective, steam-cylinder pressure, the dimensions of the steam cylinder and the percentage of clearance. Without these data at hand, a water rate of, say 40 lb. per hp. per hr., may be taken as a fair average weight of steam required for an ordinary slide-valve engine of the type commonly employed for hoisting in many mining districts. On this basis, the indicated horsepower of the engine multiplied by 40 will give the water consumption of the engine per hour.

Ques.—(a) Why are spring safety catches to be preferred to those operated by a weight and lever, on cages in a hoisting shaft? (b) How would you make a test of safety catches?

Ans.—(a) A safety catch dependent on the action of a weight attached to a lever would be practically inoperative in case of accident. When the cage started to fall the weight would fall with it, the two having practically the same velocity, except for the friction of the guides in the shaft, which would slightly retard the descent of the cage and cause the weight to act feebly with insufficient force to operate the catches, until the cage comes to rest at the bottom of the shaft. On the other hand, the action of the spring is not impeded by the fall of the cage, the force of the spring remaining unchanged at the time of the fall.

(b) The best method of proving safety catches is to put them to the actual practical test. For this purpose, the empty cage may be first raised a few feet above the landing and a fastening arranged that can be easily detached, allowing the cage to fall. If the catches prove sufficient, and the fall of the cage is arrested before it reaches the landing, the same test may be repeated with a loaded car of coal on the cage.

Ques.—How is the horsepower of an engine determined? Show the method by figures.

Ans.—In practice, the horsepower of a steam engine is calculated from an indicator card taken while the engine is in operation. This card shows the varying steam-cylinder pressure throughout each successive stroke of the engine. From the card, the mean-effective pressure in the cylinder is determined. To find the horsepower of the engine, multiply this mean-effective pressure by the area of the cylinder, in square inches, and that product by the piston speed, in feet per minute. Dividing this result by 33,000 will give the indicated horsepower of the engine.

For example, assume a single engine 10x12-in. cylinder, mean effective pressure 50 lb. per sq.in., running at a speed of 300 r.p.m., and find the horsepower developed. The diameter of this cylinder is 10 in. and its area $0.7854 \times 10^2 = 78.54$ sq.in. The length of stroke is 12 in. or 1 ft., and the engine makes $2 \times 300 = 600$ strokes per min. The horsepower of the engine is, then,

$$H = \frac{plan}{33{,}000} = \frac{50 \times 1 \times 78.54 \times 600}{33{,}000} = 71.4\ hp.$$

Ques.—What care should be taken of steam boilers to secure the best results from their use?

Ans.—Steam boilers should not be forced; that is to say required to generate more steam than what can normally be expected from the particular type of boiler and the area of its heating surface. For example, a return-tubular boiler will give, normally, an evaporation per hour, of from 2 to 2½ lb. of water from and at 212 deg. F., for each square foot of its heating surface; and a flue boiler about one-half again as much or, say from 2 to 3 lb. of water from and at 212 deg., per square-foot-hour. When, by a forced draft or overfiring, a boiler is made to generate a much greater quantity of steam there is danger of the fire-plates being burned and injured, especially if these plates are covered with scale.

Steam boilers should not be run continuously for too long a period; they should be blown off at regular intervals of time, say not to exceed one month; but when using a poor feed water that forms scale in the boiler, these periods should not exceed a week or ten days. Boilers should be thoroughly examined and cleaned regularly. If any repairs are needed or a leaky joint is discovered these should be given prompt attention.

Steam boilers should not be subjected to sudden changes of pressure or temperature; they should be evenly and regularly fired by an experienced fireman. Such sudden changes of pressure and temperature cause alternate contraction and expansion of the boiler sheets, which opens the joints and otherwise injures the boiler. The boiler foundation and settings should not be allowed to settle without immediate attention, as this settlement will throw undue strains on certain parts and weaken the boiler. The water level in the boiler should be kept as nearly uniform as possible.

Coal and Coke News

Washington, D. C.

The House of Representatives Committee on Mines which was directed to investigate the Colorado coal strike situation some months ago, rendered its report shortly before the adjournment of Congress and the document has just been published. It reviews the general conditions at the mines and makes some extremely vague and general recommendations for future Federal interference in controversies of a like sort but apparently has little or nothing to suggest with reference to the better adjustment or settlement of the present problem.

The report opens with an account of the work done by the investigators and then passes to a review of the general coal mining situation in the state which is sketched as follows:

> There are employed in normal times about 15,000 coal miners in the state. We beg to call attention to the evidence of Russell D. George, state geologist, as to the coal fields of the state, page 7, hearings. It should be remembered that in Colorado there are large coal deposits of anthracite, bituminous, and sub-bituminous coal. The seams range in thickness from 3½ to 14 feet. There are thousands of square miles of coal lands and estimated billions of tons. There is very little shaft mining in the state. The coal as a rule is easily mined. It must be remembered that a great deal of the coal lands is so situated that it is not practicable to mine the coal. In the cañons the mines on the edge have all the advantage, and where a company or individual owns the front as it is frequently impracticable to get to the coal which lies back of this so as to profitably mine it. There are many coal companies and persons operating in the state, but the three largest are the Colorado Fuel & Iron Co., which also operates steel mills at Pueblo; the Victor American Fuel Co., and the Rocky Mountain Fuel Co. The first of these companies owns and leases about 300,000 acres of coal and other lands.
>
> The Victor American Fuel Co. owns and controls in the Colorado fields about 50,000 acres, besides having under lease coal lands in New Mexico; the Rocky Mountain Fuel Co. owns and controls approximately about 31,000 acres, so that in dealing with the strike these three large companies seemed to dominate the coal-producing companies of the state and were the real power. There are a number of independent companies, but they acted with the larger ones and seemed to be under their control and protection at all times. A circular was issued during the strike signed by the officials of these three companies claiming they represented 95 per cent. of the coal production of the state, and they must have had authority to issue such a circular. Colorado has been unfortunate in having a strike in its coal mines each 10 years. They are usually fierce struggles and always attended with violence, and this one was no exception to the rule.

The document here narrates the history of the various conflicts in the mines, the arming of both sides in the struggle, arms and ammunition having been purchased and imported, and finally, the intervention of the militia and troops. Both sides are severely blamed for refusal to arbitrate and a general indisposition to regard the rights of others, although the companies are subjected to the sharpest criticism on account of the methods employed for the control of the mining communities, the maintenance of business at company stores, and other acts of the same kind.

The Majority Report

In summing up the situation the majority report says:

> In Colorado it appeared that men on either side seemed to lose the respect they should have had for the rights of others, and at one time in the course of the strike there seemed to be a condition of anarchy throughout the southern part of the state. It has been unfortunate for Colorado and its people that these strikes should occur at stated periods with apparently no way to settle them except by force. We can not too strongly urge arbitration as a means of settling these disputes between capital and labor, and the people of this country are rapidly reaching the conclusion that parties to such a dispute must not be permitted to embroil a state or states in a prolonged and bloody warfare that disturbs so disastrously the peace and welfare of the Nation. To this end the Congress has created a Commission on Industrial Relations and authorized it to thoroughly investigate and ascertain the underlying causes leading up to struggles such as the Colorado strike and similar disturbances, and if possible suggest an effective remedy.
>
> All concerned in the unfortunate situation that existed in Colorado for so many months are to be congratulated that at least a partial settlement has been reached. Many efforts have been made by various agencies other than those set in motion by the President and by the Congress to find a solution. In the end a proposal was made by President Wilson that all future difficulties be referred to a board of conciliation or arbitration, which should consist of three members of nation-wide reputation for ability and fairness. The miners accepted this proposal and called off the strike, but the operators have refused to accept this arrangement. It is yet to be seen whether the force of public sentiment will impress itself upon them in due time sufficiently to cause a thoroughly mutual acceptance of this principle of arbitration, which, while not wholly satisfactory to either party, is unquestionably for their best interests and the best interests of the public.
>
> By a gradual but sure development the coal business of the country is being conducted on a large scale and by frequent consolidations is largely being carried on by large companies. Next to the business of transportation the fuel business of the country touches the people and their business in an intimate and important way. If these strike troubles continue to break forth, it will plainly be necessary to consider seriously whether some measure of regulation shall not be adopted with reference to this business as carried on in interstate commerce, as is now done with reference to the business of transportation.

In a minority report, Representative Austin makes the following recommendations:

> That if the parties to a coal strike fail or are unable to come to an agreement, the matters in controversy be referred to the Chief Justice of the United States Supreme Court as an arbitrator, and in the event of his sickness or unwillingness to serve, he request one of the associate justices of the Supreme Court to act as arbitrator.
>
> As the importation into Colorado of alien or foreign labor has been largely responsible for the last two strikes, resulting in the loss of over 60 lives and property, business, and wages amounting to $18,000,000 in the recent strike, the passage of a law to restrict undesirable or foreign immigration is of the greatest importance in preventing a repetition of the recent deplorable trouble in that state, practically amounting to a civil war, and requiring, according to President Wilson's view, the presence of Federal troops for months. In the first strike 80 per cent. of the strike breakers were aliens. During the recent trouble 80 per cent. of the strikers were foreigners and 80 per cent. of the strike breakers were foreigners.
>
> We should keep out of the United States strike breakers who do not speak our language; do not enter our country to make it their permanent home, and put forth no effort to learn our language or to become naturalized American citizens. Such a wise and patriotic measure as would accomplish this purpose was recently passed by more than a two-thirds vote by both Houses of Congress, and although Samuel Gompers, president of the American Federation of Labor, and the officers of the United Mine Workers, and thousands of others, including myself, appealed in vain to President Wilson in the name of and in the interest of organized and unorganized labor to make this bill the law of the land by signing it, he refused to do so. As a result the United States will continue to receive every year perhaps more than a million idle foreigners, ready and anxious to take the place and crowd out of employment the honest and deserving native and naturalized American citizens, and not only in Colorado but in every state in the Union. Until such a law is passed we will continue to have alien or foreign strike breakers in Colorado and other states.

HARRISBURG, PENN.

Representative Myers has introduced a bill in the House for the creation and appointment of two assistant chiefs to the Department of Mines. One to be known as the "Assistant Chief of the Department of Mines for the Bituminous Region" and the other for the anthracite. The bill provides that the assistant chiefs shall be appointed by the Governor for a term of four years. It further provides that they shall have resided within the state for not less than 10 years immediately preceding their appointments. They shall be not less than 50 years of age and shall have had at least 15 years' practical experience in and around their respective classes of coal mines. They shall both have passed examinations given for inspectors in both regions respectively and shall hold certificates of competency qualifying them to act as such inspectors and they shall have had at least 8 years' active experience as mine inspectors under the Department of Mines immediately preceding their appointment as assistant chiefs, and shall be eligible for appointment without again being required to pass a written examination, but will have to stand an oral examination. The bill places the salary at $4500 per year. The chief of the department at $6000, inspectors at $4000 and deputies at $4000. The assistant chiefs are to be located at Scranton and Pittsburgh.

Representative Holleran has introduced two bills pertaining to the bituminous region, one of which calls for an inspection of the mines by a committee of miners, the other for uniformity in the size and weight of cars where coal is mined and paid for by weight.

The first bill provides that at every bituminous coal mine the miners employed therein shall have the right and authority at their option to select and appoint two or more of their number working at the mine as a miner's committee of inspection. The committee is to have the authority to inspect all sections of the mine with respect to its safety, ventilation and drainage, at least once every three months, and report their findings to the chief of the Department of Mines and to the mine inspector of the district. It also gives them the right to investigate all fatal accidents.

The second bill provides that at every bituminous coal mine where coal is mined by measurement all cars filled by miners, etc., shall be uniform in each mine, except where by reason of difference in the thickness of the vein or veins being mined to a common tipple, such uniformity of cars is not practicable in the judgment of the mine inspector of the district. The said mine inspector is made final arbitrator in case of dispute, where cars are not required to be uniform in size and weight, and each individual car shall be branded with the proper weight of the empty car.

A bill providing for the refund of the money collected by coal dealers by reason of the anthracite tax has been introduced in the House by Mr. Garner. The bill provides that all coal companies who have collected from the people of the state any moneys by way of an increase in the price of coal, etc., when such state tax upon coal is thereafter declared unconstitutional by the Supreme Court of the state shall refund to all persons the additional moneys with interest in the manner set forth in the bill.

The Governor's Child Labor Bill appeared in the House during the week, and provides that no child under 16 years of age shall be employed inside of any bituminous or anthracite mine. It also states that every child shall, between the ages of 14 and 15 if employed, spend one full day a week in a vocational school, and the child between 15 and 16 years of age shall spend one-half day per week in a vocational school. The Governor in his inaugural address said that no child under 16 should work in Pennsylvania. He should be in school.

Representative Powell has introduced a bill in the House providing for four new inspectors in the anthracite region, three in the first inspection district, which is Luzerne County, and one in the second district or Lackawanna County.

In the event of a code for safety and regulation of operations being adopted by the committee of quarry owners, operatives and employees, the Department of Labor and Industry and the State Industrial Board it is probable that no steps will be taken by the Department of Mines to draft rules. A resolution was adopted by the last Legislature for such rules, but the state board found that it had powers to adopt rules and meetings have been held here during the week, which will be continued later in the month. If the code is adopted by the board it will go into effect in the summer.

PENNSYLVANIA

Anthracite

Almedia—There is at present considerable activity among the coal dredgers here who are anxious to get their dredges in operation on the Susquehanna River. Unless the weather prevents, work will probably start in a few days. Four dredges will be put to work.

Hazleton—John C. White, national president of the United Mine Workers of America, on Mar. 6, issued a call for a meeting of the executive boards of the three anthracite districts to be held at Wilkes-Barre, on Apr. 5. A date will then be fixed for the convention at which the next demands to be made upon the operators will be formulated. The present agreement expires in about one year.

Summit Hill—The Citizens' Committee of Summit Hill forming itself into the Summit Hill Civic Association, is negotiating for the purchase of 5½ acres of land at the place where Philip Ginter, the hunter, discovered anthracite coal in 1791, and where the first anthracite mine in the world was opened, and the coal shipped to Philadelphia to market. This land will be converted into an athletic field, and will be known as the Ginter Memorial Athletic Field.

North Scranton—Employees at the Fairview colliery of the Peoples Coal Co. were recently notified by the officials that the plant would close down indefinitely. The miners were instructed to remove their working tools and other belongings from the mine.

Nanticoke—A stubborn fire in the Lee and Ross fan house of the Susquehanna Coal Co. recently, for a time threatened the safety of the 1000 men at work in the mines, but the timely arrival of an emergency fire fighting locomotive of the Pennsylvania R.R. quickly conquered the flames. A call was sent to the Honeypot yard of the Pennsylvania R.R. and an engine was quickly equipped with the emergency outfit. The engine has 150 lb. water pressure and quickly got the best of the blaze. A fan house on the same site was destroyed by fire several years ago.

Dunmore—The Pennsylvania Coal Co. and the Hillside Coal & Iron Co. issued orders on Mar. 4, that from henceforth district superintendents, mine foremen, assistant mine foremen, outside foremen, weighmasters and clerks must not use intoxicants. Otherwise they will have to seek employment elsewhere. Binding instructions also accompany the order and the rule will be strictly enforced.

Mauch Chunk—The Lehigh Coal & Navigation Co. is making arrangements to open boating on the Lehigh and Delaware divisions of its canal on Mar. 15. Many improvements are now being made.

Scranton—In the production of 8,388,126 tons of coal in the five inspection districts of Lackawanna County and parts of other counties during 1914, 128 lives were lost; 142 mines were in operation in the five districts and more than 41,000 men and boys were employed in the industry. The coal produced in the county during the year shows no material decrease from the production of other years.

Bituminous

Uniontown—Following the marked increase in coke production since the beginning of the present year, the H. C. Frick Coke Co. recently announced an increase in wages of 10 per cent. for practically all of its 17,000 employees.

Greensburg—John F. Bell, mine inspector for the 22nd bituminous district, in his recent report, showed that 5,169,332 tons of coal were mined during 1914. There were 25 mines in the district, most of them lying in Westmoreland County. Sixteen persons were killed while at work in the district. But little coke was made; the total output for the year being 29,743 tons.

Scottdale—The annual report of Mine Inspector B. R. Blower, for the 11th bituminous district, shows that the tonnage fell off in the past year to the extent of 1,068,096 tons, the production being 5,694,568 tons. There were 12 fatal accidents in and about the mines, 408,561 tons of coal being produced per fatality.

Carroltown—A large force of men has been made idle by the closing of the Buckwheat mine, acquired some time ago by the Peale interests. It is said there was some sort of a misunderstanding regarding royalty payments, but no statement of the trouble has yet been given out.

Marianna—The commission in charge of relief work at this place has been compelled to make another appeal to the people for funds to tide the needy over to Apr. 1, when it is expected the mines at Marianna will be put in operation. About five weeks ago part of the funds of the miners' union which was tied up in the failure of the Marianna bank were secured and this amount tided the needy over until this time.

WEST VIRGINIA

Wingrove—The store belonging to the New River Coal Co. was destroyed by fire recently. The building was valued at $3000 while the stock of goods was valued at $7000. It is not known how the fire originated.

Huntington—Geologists and mining engineers are preparing to urge the legislature to make an adequate appropriation for the continuation of the West Virginia Geological Survey. It is stated that the appropriation for this Bureau has been cut from $45,000 to $7500, and that unless provision is made for a continuation of the Survey's work, it must soon be discontinued.

Charleston—More than 15,000 miners in the New River coalfield threaten to strike unless a satisfactory wage agreement is reached before the present agreement expires. The conference committee representing miners and operators adjourned their session Mar. 6 without reaching such an agreement.

Fairmont—At a recent meeting of the operating officials and sales managers of the Consolidation Coal Co., it was announced that the mines in the Fairmont district would be operating on full time in the near future.

ALABAMA

Birmingham—Chief Mine Inspector C. H. Nesbitt states that the coal production for Alabama for 1914 will not exceed 15,000,000 tons, at least 2,000,000 tons less than during 1913. Mr. Nesbitt expects to have the 1914 annual report completed within the next week. There was only one fatal accident reported to the chief mine inspector in the coal mines in this district for the month of February. This is a record for this district.

KENTUCKY

Hazard—Mining operations by the different coal companies in the vicinity of Hazard have improved 50 per cent. within the past 10 days. Orders are said to be piling up at all the plants —sufficient, it is said, to guarantee the operation of the mines daily for the next 6 months. A number of the mines will also have to increase their output in order to fill the orders. The eastern Kentucky coal field is rapidly picking up to normal conditions.

The Kentucky Jewel Coal Co. recently secured a large order for coal to be shipped to the lake trade. This is the pioneer venture in getting the Hazard coal to the large markets around the Great Lakes and in the Northwest.

St. Charles—Owing to depression in the coal business the St. Bernard Mining Co. recently laid off 40 men at this place. The force was also considerably reduced at Shamrock and at all the mines at Earlington. The men were laid off indefinitely.

Prestonburg—Beginning with the first of March the Middle Creek Coal Co., which has been employing 200 miners, began on a new scale of all mine work and loading, which was a reduction of from 10 to 20 per cent.

The Beaver Pond Coal Co.'s mine here has been closed by the sheriff, as the result of claims which have been filed by the miners, who allege they have had only one payday in the last two months. The company is capitalized at $100,000. It has a contract with the city to supply electricity for the city lights and it is understood the power plant will be kept in operation.

OHIO

Hamden—The mines of the Starr-Hocking Coal Co. have been closed indefinitely because of lack of demand.

Columbus—The Ohio Senate on Mar. 4 passed the Gallagher bill with only 9 dissenting votes. This measure allows coal miners and operators to agree independently of the Mine-Run Law enacted two years ago. The bill will go to the house where it is said to be assured of favorable consideration. This measure was designed to afford a settlement of the coal strike in eastern Ohio.

INDIANA

Oakland City—Three men who were entombed in the Ayrshire coal mine near here Mar. 7 were found dead on Mar. 8 when the débris was cleared away. These men were placing props when they were crushed by a fall of slate.

Brazil—The leases of the Domestic Block Coal Co. on about 1300 acres of land which were allowed to lapse during the period of financial difficulty of the mining company are being renewed, and it is rumored that the mine will change hands shortly.

The American Coal Mining Co., made up of Brazil capitalists and representing $1,000,000 investment, has opened near Bicknell what is said to be the largest mine in Indiana, with a capacity of 4000 tons a day, from veins 5 and 6. The officers are: President, William M. Zeller; Vice-President, H. R. McClellan; Secretary-Treasurer, W. J. Snyder; Mine Manager, H. G. Conrad. Office headquarters have been established in Indianapolis.

Sullivan—Workmen have about cleaned up the Union mine of the Consolidated Coal Co., which recently shut down because of depressed trade conditions and higher freight rates than from competing mines. The rails will be pulled and the machinery transferred elsewhere.

ILLINOIS

Carlinville—The mine of the Carlinville Coal Co. will be shut down for several months, probably until early fall. It will be closed in order to make urgent and necesssary repairs, namely, the installation of two boilers. These boilers were condemned by the inspector several months ago, and their use was discontinued. However, the company placed a traction engine at the air shaft of the mine to operate the fan. The 24 mules now in the mine will be removed until the repairs are completed.

East St. Louis—Announcement has been made by officials of the United Mine Workers that the gang that has been operating throughout the 5th and 9th Districts, selling fraudulent mining certificates to miners has been broken up. Early in January some of the ring leaders of this gang were captured and warrants were sworn out for others, who were indicted by the Grand Jury for selling to miners at prices ranging from $25 to $40 each a certificate permitting the miner to work in any mine in the State of Illinois as required by the state law. These counterfeit certificates were so perfect, both in the workmanship and in the forging of the signatures that the state officers, as well as the mine officers had a hard time in satisfying themselves that something was wrong.

Pana—Eight hundred miners at the Witt mine, west of here, were recently notified to remove all their tools from the mine, as it was going to shut down for an indefinite length of time. Four hundred miners employed at the Taylor Springs mine, near Hillsboro, were also notified that that operation would shut down for an indefinite period. These mines are controlled by the Peabody Coal Co., of Chicago.

Panama—The tipple and top works of the Shoal Creek Coal Co. at this place were destroyed by fire a short time ago. This will shut the mine down for many months.

MISSOURI

Rich Hill—The shaft on the property controlled by the Atlas Coal Mining Co., near Rich Hill, where a disastrous explosion occurred last month, killing five miners, has been abandoned by order of the state coal mine inspector. The company is removing the machinery and equipment for use elsewhere. According to the owners of the land, another shaft will be put down near the old mine.

COLORADO

Denver—The Victor-American Fuel Co., J. C. Osgood, president, has purchased a large area of valuable coal land in Routt County, Colo., between Steamboat Springs and Hayden on the line of the Denver & Salt Lake R.R., also the mine of the Pinnacle Coal Co., in the Pinnacle vein of coal, near Oak Creek on the same railroad and likewise in Routt County. This mine has an output of about 1000 tons per day and is one of the best mines in that section. The coal is 12 ft. thick and a high-grade domestic and steam fuel.

PERSONALS

Andrew Fitzsimmons, a veteran employee of the Pennsylvania Coal Co., has been placed on the pension list. He served the company about 65 years.

Edward H. Coxe, of Knoxville, Tenn., is spending a couple of weeks in Wyoming, making an examination for the Union Pacific Coal Co. of its properties with reference to safety and welfare.

B. F. Riggs, chief of the construction department of the Consolidation Coal Co., has resigned his position, and in the future will devote all of his time to the management of the Fairmont Building & Investment Co.

Harry S. Bott, of Altoona, in company with J. P. Laughery and W. A. Elder, has leased an extensive tract of coal land bordering on Coal Pit Run near Ligonier, Penn., for the purpose of developing the upper Freeport vein of coal.

L. M. Dorsey, superintendent of the Piney Mining Co. at Riley, W. Va., for the past 11 years, has given up that position and moved to Winding Gulf, to become assistant superintendent of the operation of the Winding Gulf Colliery Co.

F. K. Day has been appointed division engineer in charge of the engineering works in West Virginia of the Consolidation Coal Co., in place of E. B. Moore, chief engineer resigned. Loman Riggs of the same company has been promoted to assistant division engineer.

Edward Cunningham, of Thurber, Texas, president of the United Mine Workers of Arkansas, Oklahoma and Texas, has resigned. William McLachlin, of Huntington, Ark., has been temporarily appointed to succeed Mr. Cunningham, who it is understood is to become state mine inspector in Texas.

Joseph Meister, president and general manager of the Meister Coal Co., together with Jacob Meister, secretary of the same firm, both of Flushing, Ohio, recently made a trip to West Virginia to look over some coal lands in the Kanawha County field. They are contemplating taking over a block of coal in that district and opening operations.

T. A. Bennett, who for the past 5 years has had charge of the conveyor and elevator belt sales of the B. F. Goodrich Co., Akron, Ohio, has severed his connection with the Goodrich company, to become the assistant to the general sales manager of the New Jersey Zinc Co., with offices in New York City. Mr. Bennett will be succeeded by J. D. Mooney, formerly special mining representative for the Goodrich company.

OBITUARY

Harvey S. Robins, a wealthy coal dealer, of Shamokin, Penn., died recently at Charleston, W. Va., where he had been spending the winter. The body was brought back to Shamokin and interred in the family plot at Reed Station Cemetery.

Edward F. Boyle, 41 years of age, died at the Uniontown Hospital Mar. 5 from the effects of injuries sustained through the bursting of a sheave wheel at the plant of the H. C. Frick

Coke Co., where he was mine foreman. Mr. Boyle has been employed at the mine for many years. He began at the Valley Works, but was later transferred to Leisenring No. 1 as fireboss. Mr. Boyle was born in Ireland and came to America about 20 years ago. He married Miss Sarah Walsh, sister of Mine Inspector Walsh at Scottdale. His widow and four children survive. Interment took place at Scottdale.

PUBLICATIONS RECEIVED

Department of the Interior, Bureau of Mines—"Hand Firing Soft Coal Under Power Plant Boilers," by Henry Kreisinger. Eighty-three pages, 6x9 in., illustrating and describing the best methods of hand firing boilers with soft coal.

Department of the Interior, Bureau of Mines—Miners' Circular 21, "What a Miner Can Do to Prevent Explosions of Gas and Coal Dust," by George S. Rice. Twenty-four pages, 6x9 in., unillustrated.

Department of the Interior, Bureau of Mines—"Procedure for Establishing a List of Permissible Miners' Safety Lamps, Character of tests, conditions under which lamps will be tested and fees." Ten pages, 6x9 in., unillustrated.

CONSTRUCTION NEWS

Hazard, Ky.—The Lexington & Eastern R.R. has announced its intention of building a 3-mile branch line of road up Buffalo Creek just above Hazard to reach a rich undeveloped coal field. Coal development work is to be started at once on Buffalo Creek.

Whitesburg, Ky.—It is said that an Eastern syndicate is purchasing coal lands in Knott County for the purpose of beginning early developments. A large part of the new purchase lies along Carr's Fork of Kentucky River. A new extension of the Lexington & Eastern will be necessary.

Cadiz, Ohio—The construction of a branch railroad from the Wheeling & Lake Erie at Adena, which will extend to this place, opening up a considerable territory heretofore inaccessible is assured by the filing of a mortgage in Cleveland for $600,000 by the Short Creek Coal Co. The new line is to be known as the Adena, Cadiz & New Athens Railroad.

Exeter, Penn.—The Pennsylvania Coal Co. will shortly begin the erection of a new pump house in the Muddy Brook Colliery. This structure will be in the 11-ft. coal bed and be built of solid concrete with steel reinforcing. The roof will be arched. An idea of the size of the proposed structure may be gained from the statement that it will cost upward of $10,000.

Kemmerer, Wyo.—The Lincoln-Kemmerer Coal Co., a recently formed corporation with a capital stock of $250,000, is opening a new mine near here and within a short distance of the main track of the Oregon Short Line. A slope is being sunk on a 12-ft. bed of coal of unusual quality, and the product of the new mine will be on the market within a few weeks.

Barbourville, Ky.—Pennsylvania owners of 30,000 acres of coal and timber land in Clay County, Ky., recently met with a delegation of Clay and Knox County land owners and went over plans for a proposed railroad extension from Barbourville to Manchester, a distance of 24 miles. Clay is one of the few remaining Kentucky counties without a railroad. It is understood that the Pennsylvania interests want a free right of way and a moderate bonus, which it is believed will be forthcoming.

Du Quoin, Ill.—On or about the first of April engineers will begin the surveying for a continuation of an electric line operating through the coal fields of Perry, Franklin, Williamson and Saline counties, with the objective point opposite Paducah on the Illinois shore. This line will open up an entirely new territory practically all the way through. From here it will go through Royalton, on to Herrin and Marion, then east through Williamson County to Carrier Mills in Saline County, and south through Hardin County to the Ohio River. It is understood that foreign capital is behind the road, and that it will be a continuation of what is now known as the Southern Traction Co. operating a short distance out of St. Louis, but which has a franchise to operate to this city.

Boston, Mass.—The trustees of the Boston City Hospital will receive proposals for a coal pocket and coal handling apparatus to be constructed at the Boston City Hospital until 12 o'clock noon Mar. 16, 1915, at which time these proposals will be publicly opened and read. All proposals must be made on blank forms obtainable at the office of the engineers of the work, Bensmore & LeClear, 88 Broad St., Boston. All bidders will be required to give the trustees satisfactory assurance of their competency, experience and responsibility. Proposals must be accompanied by a certified check on a Boston bank for $500, payable to the City of Boston. The right is reserved to reject any and all bids and to waive any defect or informality at the discretion of the trustees. John J. Dowling, M. D., is superintendent.

NEW INCORPORATIONS

Cleveland, Ohio—The Cambridge Colliery Co. has increased its capital stock from $1,600,000 to $2,000,000.

Nashville, Tenn.—The King-Harlan Coal Co. has been organized with a capital of $150,000. The incorporators are Tyler Calhoun, A. H. Wood, A. L. Childress, Harry Ward, and Harold C. Trabue.

Chicago, Ill.—The John A. Logan Co., of Chicago, was recently organized with a capital stock of $50,000 to mine, buy and deal in coal and other minerals. The incorporators are Andrew J. Ryan, James E. Condon and Thomas J. Condon.

Mullins, W. Va.—The Mead-Toliver Coal Co. and the Wood-Sullivan Coal Co. both of Mullins, were recently organized with a capitalization of $100,000 each. Both firms were organized with the same list of incorporators, namely, J. B. Sullivan, of Mullins, J. E. Toliver and Joe L. Smith, of Beckley, and H. P. Mead, of Maben.

Mullins, W. Va.—The Devils Fork Coal Co. was recently organized with chief works at Barkers Ridge in Wyoming County. The capital stock is placed at $100,000 and the incorporators are James Collins, of Bramwell, L. M. Franz, of Mullins, William Rezzonico, of Good Will, E. E. Hargsock, also of Good Will, and S. P. Franz, of Mullins.

INDUSTRIAL NEWS

Liverpool, England—The coal-heavers strike which tied up shipping at this port for some time has been settled. Some of the men returned to work Mar. 4 while the balance resumed work Mar. 5.

Huntington, W. Va.—Huntington will probably be the scene of the proposed gathering of West Virginia coal operators when the matter of organizing a self-defense league is taken up. Plans are now being made for the operators to organize an association which shall have for its purpose the protection of the coal mining industry of the state.

Charleston, W. Va.—State officials estimate that nearly $200,000 will be paid out of the workmen's compensation fund to the families of the men who lost their lives at the Layland mine of the New River and Pocahontas Consolidated Coal Co., where a recent explosion occurred. The widows of the men lost will receive $20 per month with $5 per month for each child under 15 years of age.

West Middletown, Penn.—It was recently learned that John A. Bell of Carnegie has renewed the options on 5000 acres of coal in the eastern part of Hopewell Township in the vicinity of Buffalo Village. The renewals are for 6 months, and it is generally believed throughout the district that the coal will be sold before the expiration of that time. The majority of the options are at $100 per acre while some are at $150 per acre.

Point Pleasant, W. Va.—Harold W. Poysell and Edwin Marmet, receivers of the Marmet Coal Co., recently filed a report for the year ending Feb. 1, 1915, showing that the business made a profit during only four months of the year. These four months showed a profit of $14,558.98 while the remaining 8 months footed up a total loss of $28,593.74, leaving a net loss of $14,034.75.

Washington, D. C.—A complaint against the rate on coke from the Connellsville region to the Buffalo district in New York, was recently filed with the Interstate Commerce Com mission by the Buffalo Union Furnace Co. and the Wickwire Steel Co., in which it is stated that the rate on coke from the Connellsville district to the Buffalo territory is $1.85 per ton, whereas the rate on coal from the same origin to the same destination is but $1.40 per ton.

Coal Trade Reviews

General Review

Anthracite shipments show a heavy decline. Outlook for April business rather unfavorable. Bituminous buyers forcing concessions on new contracts. Negotiations progressing slowly. Pessimistic outlook for the Lake trade.

Tangible evidence of the extremely adverse conditions prevailing in the anthracite market is seen in the current statement of shipments for the first two months of the year, which are the lightest in the modern history of the anthracite trade. This situation was fully anticipated, however, since all the collieries have been curtailing to a greater or less extent during this period—a most unusual condition in the mid-winter season. The low temperatures and storms at the beginning of the current week arrived too late to stimulate any important buying, and the agencies are now turning their attention to the outlook for April business. These minimum prices of the year invariably create a rush of orders, but this season finds the consumers less interested than usual, and conservative observers are beginning to anticipate a light month.

The bituminous agencies are still concentrating their entire attention on new contracts, the situation on which is generally unsatisfactory. Business is being closed with the greatest difficulty, and keen competition of the most aggressive kind is forcing the producers to make substantial concessions on old figures in many instances. In addition to this, the amount of business being closed is falling substantially behind previous records. The offshore movement from Hampton Roads has increased, but the accumulations continue large there, as well as at other Tidewater points, though prices are fairly well maintained, principally for the reason that there is little to be gained by cutting. Persistent rumors of a break in Coastwise freights was one of the features of the week.

The warm weather, the extreme conservatism on the part of the retail dealers, and a relapse in the manufacturing and industrial demands from which so much has been expected, has created a distinctly adverse sentiment in the Pittsburgh district. Bids are exceedingly low on what few contracts come up, operators appreciating that this will be necessary to land the business. Lake shippers are still showing little or no interest in purchases, while the market is glutted with even more coal than during the past several weeks, and prices are softer.

Ohio dealers are busily engaged in cleaning up stocks and manufacturing is not showing any increase, so that the demand is light in every direction. It is clear that the opening of the Lake trade will be slow. The Southern markets are heavily over-stocked, while the mines are running at half capacity, and some are even closed down entirely.

Summer conditions prevail in the Middle Western market, with prices at unprecedented low levels. On new contracts buyers are deferring definite action, and using every means to force concessions on last year's figures. Requisitions on current contracts have been restricted to the lowest minimum specified, and there are still large tonnages of consignment coal on track with more en route. The labor officials complain that there are more idle men than for a number of years.

ATLANTIC SEABOARD

BOSTON

What interest there is in Hampton Roads coals is confined to the freight market. Georges Creek shippers begin to enter market for season business. Anthracite orders accumulating for April delivery.

Bituminous—The market shows a very sluggish tone. On Hampton Roads coals there is very little doing; prices are more or less soft, and the outlook disappointing. The dullness has spread to water freights and there are persistent rumors that recent charters have been made at lower figures. This makes the buyers who have stayed out of the market all the more resolved to wait developments, and 5@10c. concessions no longer interest them. Most of the contracts already closed include a rather generous protection clause and at present writing it looks as if some of the early prices would have to be revised.

Meanwhile Pocahontas and New River are in heavy supply at the Virginia piers and occasionally low prices are made to free cars. At distributing points here stocks are still large and inquiry very light. Receipts here are mostly for contract application, only a fortnight or so remaining now for coal on the 1914 basis.

There are signs of the Georges Creek interests entering the market now for season business with delivered prices on a competitive basis. In a good many quarters buyers are partial to this coal, but it seems almost inevitable that this year its tonnage here will be materially reduced.

Shippers of the better grades from Pennsylvania continue active in this market but nothing significant as to tonnage can be reported. The prospect for a larger volume of these coals in New England is very much involved with the situation on water freights. If the latter are high it means a larger opening all-rail and by reason of the difference in price f.o.b. a more favorable prospect at tide-water.

Water freights are believed to be on the point of weakening; that is, for current charters. The $1 rate that has been held very firmly for several weeks has receded to 90c., Hampton Roads to Boston, and there are rumors, not yet confirmed, that an even lower rate has been named. The fact is, orders are so scarce that owners of coastwise transportation, barges in particular, are unable to place their tonnage.

Anthracite—The weather continues so mild that there is no current business. The only present interest is in April delivery at the anticipated 50c. reduction in the circular. These prices have been discounted by individual shippers for several weeks but New England buyers have heard rather less of such offers than if outside freights had been lower.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*..........	$0.90@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*.....	2.15@2.65	2.40@2.85	2.92@3.02	
New York*.......	2.45@2.95	2.70@3.15	3.22@3.32	
Baltimore*.......	....	....	2.85@2.95	
Hampton Roads*.	....	....	....	$2.70@2.80
Boston†........	....	....	....	3.70@3.90
Providence†.....	....	....	....	3.58@3.73

* F.o.b. †On cars.

NEW YORK

Buyers are forcing concessions on old contracts. Anthracite down to an irreducible minimum. Full April circulars prevail generally.

Bituminous—The salient feature of the bituminous market continues to be the extremely sharp competition on new contracts which is having the expected result of forcing concessions on last year's figures in many instances. This applies more particularly to those contracts where moderate advances were made last year; the reductions are back to the former level in most instances, but the agencies are meeting these figures only as a last resort, since they quite frequently mean the elimination of practically all their profit.

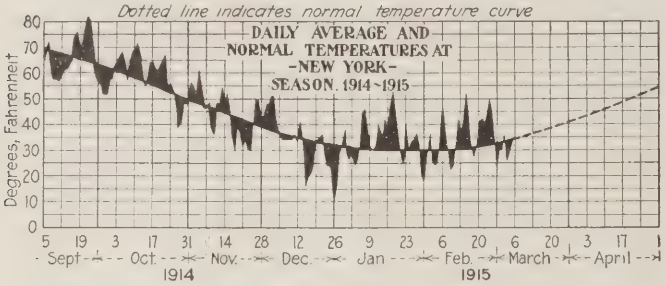
The spot market continues in a rut and prices are very uncertain. The supplies at Tidewater continue excessive and there is considerable coal reported on demurrage at different times which is accentuating the difficulties of the situation and causing a wide fluctuation in quotations. The bunkering trade so far for the current month has been somewhat above the average. We continue prices on the same basis as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15 Georges Creek, $3.15@3.25.

Anthracite—The local anthracite market has seldom, if ever, been so completely flat. The customary season's end slowing up characteristic of March, has been doubly accentuated this season by the exceedingly poor business throughout the year, and the unfavorable outlook over the future. The individuals are making no pretense of obtaining anything above the April circular, with the possible exception of egg coal, on which the very best qualities command a very slight advance on the Apr. 1 schedule. Stove coal is impossible to move except when a certain proportion of egg is offered as an inducement. Pea coal is very slow. A shortage of the steam grades is developing as would only be expected under the heavily curtailed mining operations.

Working schedules have seldom ever been so severely restricted; the Delaware & Hudson have closed down for a straight week, while the Delaware, Lackawanna & Western and the Jersey Central will work only three days and the Lehigh Valley two days. The Reading Co. worked only three days last week.

We quote the New York market on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	4.85@5.35	5.30	4.80@5.30
Stove	5.35	4.85@5.35	5.30	4.80@5.30
Chestnut	5.60	5.10@5.60	5.55	5.05@5.55
Pea	3.55	3.40@3.55	3.50	3.30@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.35@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.90@2.25
Barley	1.80	1.70@1.80	1.75	1.30@1.75



BUFFALO

Slight stir in bituminous, which seems likely to continue. Prices will remain low, as indicated by the bids for spring contracts. Consumers curtailing purchases to the minimum. Anthracite very quiet.

Bituminous—There is some increase in demand, but nothing to compare with what there should be at this time of the year, when so many contracts are to be made. Bidding is low, as otherwise there is little chance of getting the business. Competition apparently is not likely to be very sharp, as the chance of getting contracts depends so entirely on low bidding that many prefer to stay out entirely, in the hope that there will be small contracts and general orders enough to keep them going. It has often happened that when a spurt did come a great many operators and jobbers were without surplus and had to turn everything in on contracts, which had been taken at low prices.

There is some coal on track and some consumers are buying all their coal in this way, entirely at their own prices. Indications point to another season of prices made practically by the consumer. The mines still run at a slow rate and their capacity is so much greater than even a normal consumption, that any increase of demand would be quickly absorbed.

Pittsburgh operators have not signified that they will make a Buffalo price for spring and it may be that they will not do so at all, which leaves prices as per unofficial circular on the basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny Valley sizes about 25c. lower than Pittsburgh.

Anthracite—The demand is very light. Independent anthracite operators have been selling at April prices and even at such a reduction have not been able to stimulate much demand. March is always a slow selling month, however, unless it happens to be unusually cold, which has not been the case so far.

The mines are running about as slow as they ever do and still there is a surplus; some shippers report that two or three days a week is a good average with them. Both stove and chestnut are in excess of the demand but oddly enough there seems to be no more egg than is needed, though it was very plentiful last fall. There is now about 175,000 tons of anthracite afloat here, a third company having taken some tonnage. Vessels are scarce, though they will usually take coal cargoes as fast as they discharge their winter grain.

PHILADELPHIA

Snow fall early in week had little effect in increasing the anthracite demand. Steam sizes the only active department. Better inquiry in bituminous, but little business showing as yet.

Anthracite—Contrary to expectations, the snow storm late last week caused little or no increase in the anthracite demand. It is comparatively easy at the present time to fill up incomplete stocks with April-price coal, and interests maintaining the maximum circular, find themselves hard pressed to dispose of their heavily curtailed output. Even with the inducement of the low prices, dealers hesitate to take on additional supplies.

April offerings appear to be the rule rather than the exception among the individuals; pea coal sells as low as $2.10 at the mines, which is a flat concession of from 40 to 50c. from the circular. Steam sizes seem to be in fair demand, and the market is absorbing the curtailed production. Contracting on the broken and steam sizes has about been completed, and the prices realized compare favorably with last year, during the previous coal season, namely, $3.35 for broken, $2.35 for pea, $1.30 for buckwheat, and 90c. for rice.

Predictions as to the outlook for April and May are varied. While it is undoubtedly true that the dealers are well stocked, those still desiring to take on coal at the low prices will probably cause a demand which will be difficult to fill; most dealers feel that they should receive shipments on all the orders they place for April consignment. But there has never been a period when there was such an apparent lack of interest in April business.

Prices ruling at Tidewater are about as follows:

	Circular	Individuals
Broken	$4.75	$4.50
Egg	5.00	4.60@4.70
Stove	5.00	4.90@5.00
Chestnut	5.25	4.90@5.00

Bituminous—There seems to be a slightly better feeling in the trade, due to the fact that there appears to be a little more business in the market.

HAMPTON ROADS

Export shipments for the week show up well. Dumpings for month of February 880,075 tons. Still an excessive supply in the yards.

Dumpings over the Hampton Roads piers for the week have shown up satisfactorily under existing conditions. The export cargoes have gone forward by both schooner and steam vessels and there has probably been the largest number of schooners sailing from Hampton Roads during the week just closed, in the history of the port; it is also understood that several others are now in port loading and due to clear in the next few days. Some little coal has been taken by the government and the coastwise movement has been fair.

The railroad yards still have more than the normal supply of coal on hand but this has in no way affected prices as cutting does not seem to increase the demand for tidewater coal, especially on export business.

During the month of February just ended a total of 880,073 tons of coal was dumped over the Hampton Roads piers. While these figures show a decrease of 5460 tons below those of January, it is really an increase over January shipments as the former month had 31 days while February had but 28 days. During February the Norfolk & Western dumped 383,672 tons from Lamberts Point, the Chesapeake & Ohio 260,472 tons from Newport News and the Virginian Ry. 235,929 tons from Sewalls Point.

A total of 141 vessels, foreign and American, cleared for foreign ports and 14 of the American vessels were schooners.

The following cargoes cleared from Norfolk and Newport News, between Feb. 27 and Mar. 5, inclusive:

Norfolk			Newport News		
Vessel	Tons	Destination	Vessel	Tons	Destination
Copenhagen	2203	Salaverry	**Neugus**	3887	Port au Spain
Chiswick	4500	Canal Zone	**Anna**	1643	Santiago
Franklyn	7400	Genoa, Italy	Chas. Whittmore	1109	Cienfuegos
Margaret Haskell	3260	Montevideo	Edith	1791	Cienfuegos
Berwindvale	7901	Havana, Cuba	Margaret	1993	Cienfuegos
Singleton Palmer	4072	Rio	Matanzas	1525	Cadiz, Spain
Marcus L. Uran	2720	Rio			
Mary E. Palmer	1895	Rio			
Naugarland	6550	Genoa, Italy			
Addison E. Bullard	2500	Montevideo			
Hermod	4500	Curacao			
Beckenham	6100	Canal Zone			
Nellie W. Craig	709	Bermuda			

Note—Steamers are indicated by **bold face type**, all others being schooners.

BALTIMORE

Snow and sleet storm impedes traffic and movement was light. Outlook on contracts not favorable.

Export fuel and sample lots for contract tests have been delayed by the recent storms but not seriously as there was enough coal at Tide to meet the requirements generally. Contracting absorbs the attention of the bituminous trade. It seems likely from present outlook that the business closed by the middle of April will be less than last year. Prices remain about the same. West Virginia gas three-quarter is selling around 85 to 90c., with steam coal of low grade around 80 to 85c. and best fuels at $1.25. Pennsylvania lower grade coals sell at from 90c. to $1, and best fuels at from $1.25 to $1.35.

OCEAN FREIGHTS

Market continues to advance. Sugar freights to West Indies steady up.

There was a further advance in the freight market last week, owing to the continued demand for steamers for grain cargoes. Prompt boats are practically unobtainable. The British St. "Nora," about 5000 tons cargo, was chartered in London to load coal from Range to Montevideo at $9.60. A number of sailing vessels were chartered last week to Rio at $6 and $6.50; and also a vessel to the River Plate at about $7.25, free discharge. On above charters all foreign port charges are for the account of the charterers. There is a lull in sugar freights, and should same continue, it might be possible to shade the rates to West Indies quoted below:

To	Rate	To	Rate
Havana	**$3 00**	Guantanamo	**$3.75**
Cardenas or Sagua	**3 75**	Demerara	5.50@ 6.00
Cienfuegos	**3 50**	Bermuda	3.75@ 4.25
Port of Spain, Trinidad	**3 50**	Vera Cruz	**3 50**
St. Lucia	**3 50**	Tampico	**3 50**
St. Thomas	**3 50**	Rio	**10 20**
Barbados	**3 50**	Montevideo, Buenos Aires or La Plata	**9 60**
Kingston	3.50@4.00	Mediterranean	9.60@12.00
Curacao	**3 25**	Valparaiso	**8 40**

Note—Rates noted in **bold face** type are only approximate.
W. W. Battie & Co.'s Coal Trade Freight Report.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
(2 foreign steamers)		Atlantic range	Italy		$9.60
Baker Palmer		Baltimore	Boston	2240	
Helen W. Martin		Baltimore	Galveston	2029	
Sif	Norwegian	Norfolk	Martinique	1959	
The Josephine		Norfolk	Savannah	563	
Nora	British	Atlantic range	Montevideo	2537	9.60
Myrtle Leaf	British	Port Johnston	St. John, N. B.	336	1.35
Progress III	Norwegian	Baltimore	Mediterranean	2224	
Stella (ship)	Norwegian	Baltimore	Rosario	1818	8.00
Dorothy Palmer		Norfolk	Rio Janeiro	2315	6.00
Chas. A. Campbell		Norfolk	Rio Janeiro	1493	

Note—Steamers are indicated by **bold face** type, all others being schooners.

OHIO VALLEY

PITTSBURGH

Market has lost strength and is quotable 5c. lower. Contract demand light. Mines operating at 50 to 60% capacity and producing too much coal.

The Pittsburgh district coal market has lost in strength rather than gained in the past week or two. The domestic demand has been altogether unsatisfactory, on account of relatively warm weather and the extreme conservatism of retail dealers, while the demand from other quarters has experienced no further increase, and this has been a direct disappointment to coal operators, whose expectations were based upon a continuance of the improvement in manufacturers' demand that began two months or more ago. The market is more glutted with coal than at any time for many weeks, and prices are softer than ever.

Contract buyers and Lake shippers are showing no interest whatever. Normally there should be a large volume of contract business under negotiation now, for the twelvemonth beginning Apr. 1, but the activity is far below normal for the time of year, and this despite the fact that such contracts would run through the period just before the biennial wage adjustment, when if ever the market should be strong. It looks as though twelvemonth contracts would be made at close to present prices, with no stiffening due to that influence. There has been hardly any coal bought for the Lake trade and predictions of an improvement now have reference to late in the season. The Pittsburgh district is operating at between 50 and 60% of nominal capacity, and is evidently producing too much coal at that.

Prices quoted in recent reports as being practically nominal are now so generally departed from that we quote about 5c. per ton lower, and even these new prices are very frequently shaded: Slack, 90c.; nut and slack, $1; nut, $1.05; mine-run, $1.10; ¾-in., $1.20; 1¼-in., $1.30, per net ton at mine, Pittsburgh district.

COLUMBUS

Dulness characterizes the local coal industry. Domestic trade is dead and the same is true of steam business. Lake trade prospects not bright.

The coal trade has been quiet to the extreme. There has been little demand for domestic sizes, which coupled with weak steam business makes the tone of the market decidedly bad. There are no immediate hopes for the future until the arrival of the stocking season.

Dealers' stocks are sufficient for present needs and they are not inclined to order additional supplies at present. They are devoting their attention to "cleaning up" in order to avoid being caught with large stocks. The weather has been unfavorable and dealers are no longer looking for any cold spell which might stimulate trade.

Little is doing in steam sizes. Manufacturing is not increasing and as a result fuel requirements are light. Railroad fuel business shows a small increase but not sufficient to stimulate trade. Sales managers have considerable difficulty in renewing steam contracts, and many of them are being closed at low figures. Many steam users are content to buy in the open market. There is no disposition on the part of steam users to accumulate stocks at this time.

Retailers have not been having much business and their trade has been extremely spotty. Retail prices have been shaded to a certain extent and there has been cutting in order to get business. This is especially true of Hocking Valley and West Virginia grades. Pocahontas prices are still fairly well maintained.

Indications are not very bright for the Lake trade. Reports from the docks of the Northwest show that a considerable tonnage will be carried over unless severe weather appears. Since manufacturing is quiet, the usual consumption of coal in the Northwest has not been maintained and it is believed the Lake season will be slow in opening. Chartering of boats is not active. Some Lake coal has been loaded but not as much as usual at this time of the year.

Prices in the Ohio field are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.45	$1.50	.....
Inch and a quarter	1.30	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	0.60	0.65	0.55
Coarse slack	0.50	0.55	0.45

TOLEDO

Upper docks to be cleaned up before fresh supplies are purchased. Opening business will be slow.

Warm weather has deadened the demand in both the domestic and steam trades. Jobbers are booking some orders but practically everything is for immediate delivery. There is a difference of opinion among local dealers as to the beginning of a real trade in Lake coal. It is generally conceded that navigation will open earlier than usual but it is believed that trade will not open up with any briskness until after June. According to late reports there are now about four and one-half millions of tons of coal on the upper docks which is a million more than was left over last season. There seems to be a disposition on the part of those in charge of the docks to clean up what coal there is on hand before stocking up extensively. The bulk of the shipments will not begin until about the first of July, and may not be very active then.

TORONTO, CAN.

Prices unsettled and demand falling off all along the line on domestic grades.

Trade is fair with a decreasing call for coal for domestic uses. The yards are well stocked in all lines and but little coal is coming forward. Prices for bituminous are rather unsettled, some dealers having made small advances on account of the increased duty while others have made no change. Some lower grade anthracite is retailing at 50c. per ton less than prices quoted which are as follows: Retail anthracite egg, stove, and nut $8; grate $7.75; pea $6.75; bituminous steam $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $7.50. Wholesale f.o.b. cars three-quarter lump, $3.80; screenings, $2.96.

CLEVELAND

Slack has advanced 10c. due to the light receipts. Retail trade not taking much coal and domestic sizes are off.

Monday night of this week there were not to exceed thirty cars of fine coal on track as compared with a normal supply of 150 cars. The trade took all the available fine coal at an advance of 10c., making the spot price $1.70 to $1.80. On the other hand there was no demand for coarse coal. Many of the mines in Pennsylvania, West Virginia and Ohio only worked from one to three days the week before.

Lake coal will begin to arrive at Lake Erie ports the latter part of this month or early next, but this will not materially increase the amount of slack, as the Lake shipping season does not look very bright and operators do not expect to load much coal early. The Upper Lake stocks continue to drag and shipments are far from normal.

There has been no inquiry recently for Lake vessels and a number of the larger shippers do not expect to close for their Lake business until April.

The retail trade is taking so little coal that prices on domestic sizes are low. Pocahontas lump and egg prices for shipment are less than two dollars at the mines.

Anthracite—Hard-coal shipping at Buffalo has started and has increased the demand for boats. The Lackawanna has loaded all but one of the ships it will cargo before the opening of navigation. The Erie has two boats ready for loading within the next few days and the Reading is expected to take some tonnage the next few weeks. The curtailment of Canadian business has proved rather embarrassing to the anthracite shippers and caused a larger inquiry for boats to load coal.

Quotations for shipment are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8
Lump	$3.05	......	......	......	......
Lump, 6 in.	......	......	$2.30	......	......
Lump, 1¼ in.	......	$2.35	2.10	......	......
Lump, ¾ in.	......	2.20	2.00	$1.90	$1.90@2.00
Egg	3.15@3.20	......	......	......	......
Egg, 6 in.	......	......	1.95	......	......
Mine run	2.45@2.50	2.10	1.90	1.80	1.75@1.90
Slack	......	1.90	1.80	1.90	......

CINCINNATI

Contracting is proceeding slowly, consumers demanding lower prices than the trade will give. Prompt business somewhat improved.

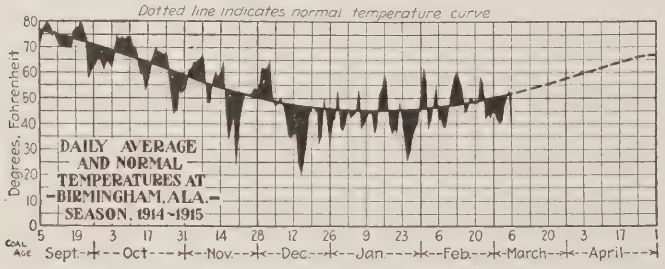
Spring contracting business and the approach of the Lake trade have steadied up the market slightly. Very little actual business is being done just now, however, as buying is naturally on an extremely light basis. Prices on the larger contracts are rather unsettled, and the tendency on the part of consumers is to hold off in view of the present slow state of business and the uncertainty of the future. It is reported that a number of the smaller industrial concerns in this vicinity have closed contracts on the usual basis.

Although a week of generally cold and disagreeable weather has helped the domestic trade, the retailer has not been forced into the market to any extent.

LOUISVILLE

Domestic market slightly improved by the colder weather, but the general outlook continues uniformly discouraging.

Though reports from the eastern part of Kentucky are to the effect that mining operations are being resumed on a more or less general scale, market conditions are not of a character to substantiate this. The domestic market has shown improvement, due to the return of colder weather, but the benefit is confined principally to the retailers. Industrial requirements are said to be somewhat better though prices are unchanged from a week ago. Prices, on block coal are ranging from $1.25 to $1.50, nut and slack, 55 to 70c. and are being maintained with some success, the stiffness of the steam grades being still due to the reduced output, rather than to any increased demand.



BIRMINGHAM, ALA.

Coal market very quiet. Demand light and operations much restricted.

The market on both lump and steam coal continues very quiet, with practically no improvement on either grade. The demand is small, and the mines in this district are running only about two or three days per week, while some are closed down entirely. The spring movement on lump coal has not yet started, but operators are not looking for very heavy bookings for spring and summer shipments, as nearly all of the retail yards are carrying over some stock.

COKE

CONNELLSVILLE

One merchant furnace inquires for coke; otherwise market stagnant. Increased production and shipments on part of steel interests.

The only new demand for merchant coke is an inquiry from the Perry Iron Co., Erie, for 10,000 to 12,000 tons a month over the second quarter or the balance of the year. The company has been quietly sounding the market for some time and is now out with a definite inquiry, expecting to put the furnace in blast about Apr. 1. The market for spot furnace coke is not well defined as there has been scarcely any buying. While there has been a very considerable increase in coke production in the past two months the increase is practically confined to the steel interests, the demand for merchant coke having experienced scarcely any improvement at all. We quote: Prompt furnace, $1.50@1.55; contract furnace, second quarter, $1.60; to Dec. 1 (nominal), $1.75; prompt foundry, $2@2.50; contract foundry, nominal, $2.20@2.30, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Feb. 27 at 274,935 tons, an increase of 3845 tons, and shipments at 278,461 tons, an increase of 8573 tons.

Buffalo—There is no one as yet prepared to champion the coke trade or even predict that it will soon come up to a greater activity. There is a steady sale as a fair number of the local furnaces are running and the demand for their output keeps up about as usual. Prices remain steady on the former basis of $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

Birmingham—With several of the furnaces out of blast, many of the coke ovens in the district are idle, and will not be put back into blast until the furnaces resume operations.

Chicago—Prices in the coke market show some change. Competition has caused April prices to become general for domestic sizes, and there has been increased absorption at these reduced figures. Furnace and foundry coke remain practically unchanged from last week. Prices are as follows: Byproduct, $4.75@4.95; Connellsville, $4.60@4.80; Wise County 72-hr. (select), $4.50@4.75; gas coke, $4@4.25; furnace, $4.50@4.65.

THE STEEL INDUSTRY

Steel Corporation working 67% capacity. Satisfactory increase in tonnage of unfilled orders. Purchases by consuming interests light.

Negotiations closed in the past week bring the Illinois Central's purchase of open-hearth rails from the Algoma Steel Co.'s mill in Ontario up to 35,000 tons. There are sidelights on this transaction which will not be publicly discussed, but it may yet have its value as an object lesson in the effects of free access to this market for Canadian rails, wire and other products, while on many American steel products going to Canada the duties, already high, have just been increased 7½%. The Algoma rail mill has now booked 60,000 tons of rails on this side and 80,000 tons from the Canadian Pacific. Chicago rail sales of the week include 11,000 tons for the Lake Shore and 9000 tons for a line the Keystone Construction Co. is building in Kansas. The B. & O. placed 7000 tons at Pittsburgh; the Terminal Railway of St. Louis bought 3000 tons and the United Railways of St. Louis 1400 tons. An export order from Colombia calls for 1200 tons.

While buying by manufacturing consumers of iron and steel has been light this month, the expectation is that the present rate of operations will hold through March and there is the hope that spring demand will be a factor by April. The Steel Corporation's steel works are running this week at 67% of ingot capacity. The Homestead plant is not supplied with orders insuring full output for several months, as widely published. Just now 85% of its steel capacity is active, but this is due to special plate orders for pipe work. The Steel Corporation's statement of Mar. 10 showing 96,803 tons gain in unfilled orders last month, against 412,000 tons in January, is favorable in the light of the large inroads made in February by the heaviest mill shipments in months.—"The Iron Age."

MIDDLE WESTERN

CHICAGO

Domestic coals still weak. Screenings buoyant at higher prices. Smokeless coals lifeless. Anthracite soft.

Screenings have sold as high as $1 per ton this week, showing an average gain of 25c. to 30c. over last week. Otherwise the market is spiritless. The domestic situation is a weather proposition entirely, and there is no encouragement in the outlook. Prices are about as low as could be expected, and operators have been obliged to make unheard of concessions to move coal. The limited lump production has been an important factor in maintaining the screenings market. Contracts are coming to the front, but most buyers are withholding definite action to ascertain if concessions on last year's prices can be obtained.

The Gary steel mills are operating on a minimum scale, and railroad buying continues at the minimum quantities specified in the contracts. Unbilled domestic coal on hand at some mines is so great that shippers find it difficult to meet the demand for the small sizes. The consignment coal on tracks in Chicago is excessive and too much for the market to absorb. As a result, all kinds of coal and grades are being sold at unheard of prices.

Mine run from the Indiana district has been selling below $1 per ton in a number of instances; it is reported that some of the Indiana operators show a disposition to move coal at any price in order to secure funds to meet their payrolls, the mines not even averaging half time. Screenings and steam sizes have been short of the demand, and as a consequence prices have moved up.

Franklin and Williamson County screenings have been much stronger, and the smaller sizes of washed coal have shown betterment. The domestic grades made some improvement earlier in the week, but have again slumped.

Screenings have also been very strong in the Springfield district but the domestic demand is not improved.

There has been some Kentucky consignment coal, particularly egg size, moved at sacrifice prices, and on the whole the demand is of a negligible quantity.

On Hocking the situation is improved, the operators having evidently made up their minds to keep free coal off the market but it may be said that there is no betterment in the situation.

There is still gloom and general demoralization in smokeless sizes. Coal is selling at 30c. to 40c. under list and few contracts, if any, have been let.

Anthracite is very quiet, and some shipments have already been made at April list while there are reports of concessions under the April list in order to secure a tonnage.

Splint coals are in bad shape, and it is reported there is considerable quantities on track and en route which will have to be sold at ridiculous figures.

Prevailing prices are as follows:

	Williamson and Franklin Cos.	Springfield	Sullivan	Clinton	Carterville
Lump......	$1.25@1.50	$1.25@1.40	$1.35@1.60	$1.35@1.60	$1.35@1.75

ST. LOUIS

Summer conditions prevail and there are no indications of any improvement in sight. Scarcely any demand at all.

In the Williamson-Franklin County field lump and egg has been quoted as low as $1.10, and nut at 95c. Inability to move these sizes has curtailed the tonnage in the district, and screenings are coming into their own; the latter part of the past week screenings were quoted at 85c., but it was impossible to buy any at that figure. No. 5 washed was quoted at 75 to 80c., though no one has any to sell. There is no indication that conditions will change, unless it might be that the prices on steam coal will advance. The washed market on Nos. 1, 2 and 3 is weak, but on Nos. 4 and 5 it is strong and will continue so.

In the Standard district lump has sold as low as 82½c. and 85c., with a maximum of $1 for 2-in. lump. Screenings have gone to 75c., and indications are that they will continue to advance. There is no domestic demand at all to speak of, and very little steam. No inquiries are received from the country, excepting on the cheapest grades of coal, and this tonnage is remarkably light for this season of the year.

No anthracite is reported moving in, but there is a heavy tonnage of smokeless egg coal at East St. Louis, rejected on account of weather conditions.

INDIANAPOLIS

Some slight improvement due to short spell of old-fashioned March weather. Mines making better time. Prices generally unchanged. Domestic coal season about ended.

There is some improvement in operations at the Indiana mines, due to the colder weather; it appeared as if for a time domestic sales were about over for the season but the mines are now experiencing another little spurt. Operators, however, are not counting on much further business in this direction, as their customers will buy only for current needs from now to the end of the season.

Prices remain generally unchanged, though mine-run ranges from $1 to $1.20; sales are reported even less than $1 but the coal thus offered either comes from some new development, or is of relatively poor quality. Slack prices are stiff, owing to the curtailment in production, due to the restricted call for domestic grades. Mines of the state are probably making a little better than half time. The industrial demand continues to increase slowly and the railroad consumption is not larger than usual.

KANSAS CITY

Colder weather stimulates market. Steam grades also active.

March has begun with a week of cold weather and the retail business holds up well. The wholesale trade has settled down to a summer basis, the steam-coal movement being close to the normal summer consumption just at present. A reduction of domestic tonnage has stimulated the steam-coal market somewhat and steadier prices, ranging about 10c. higher than ten days ago, are the rule. The production in the southern Kansas fields has been about three to four thousand tons in the last fortnight, and has done much toward overcoming the shaky condition of both domestic and steam markets, but especially the steam grades.

Prices are as follows:

	At Mines	Freight		At Mines	Freight
Cherokee lump .	$1.85@2.00	$0.80	Waverly nut......	$1.75	$0.40
Cherokee mine-run..........	1.40@1.60	0.80	Novinger No. 1 lump..........	2.00	0.60
Cherokee nut...	1.85@2.00	0.70	Novinger coarse...	2.00	0.60

PRODUCTION AND TRANSPORTATION STATISTICS

ANTHRACITE SHIPMENTS

Anthracite shipments for February and the first two months of 1914-15 were as follows:

	February		2 Months	
	1915	1914	1915	1914
Phila. & Reading........	693,743	746,793	1,454,500	1,761,919
Lehigh Valley..........	887,267	681,844	1,841,339	1,492,432
Cent. R.R. N.J.	473,928	563,650	1,082,224	1,268,141
Del. Lack. & West.......	630,246	573,553	1,205,784	1,192,491
Del. & Hudson..........	544,325	442,378	1,168,272	1,029,271
Pennsylvania	372,374	426,100	823,574	962,218
Erie..................	535,883	533,307	1,112,890	1,239,610
Ont. & Western.........	137,341	153,826	321,059	351,101
Total.............	4,275,107	4,121,451	9,009,642	9,297,183

Stocks at Tidewater Jan. 31 were 798,125 tons as compared with 782,581 tons, Feb. 28.

FOREIGN MARKETS

The British reports usually printed under this heading have failed to arrive this week, due to the strike of the Liverpool dockmen.

Financial Department

Philadelphia & Reading Coal & Iron Co.

President W. J. Richards of this company reported for the fiscal year ended June 30, 1914, as follows:

The total production of anthracite coal from the lands owned, leased and controlled by The Philadelphia & Reading Coal & Iron Co. for the year ended June 30, 1914, was 10,271,669.04 tons, as compared with 12,807,996.06 tons mined during the previous year, a decrease of 2,536,327.02 tons, or 19.8%.

During the year the company mined 8,992,494.04 tons, a decrease of 2,097,248.12 tons, or 18.91%; purchased 218,957.08 tons and sold 8,747,643.19 tons, a decrease of 2,000,959.01 tons, or 18.62%, as compared with the previous year.

The percentage of sizes above pea produced from the mining operations was 59.35% as compared with 59.92% the previous year.

The decrease of receipts from the sale of anthracite as compared with last year was $8,131,818.30, this decrease resulting almost entirely from the fact that we sold 2,000-959.01 tons less in 1914; the decrease in receipts from sale of bituminous and from other sources was $147,262.66, the bituminous sales falling off 31,991.05 tons and $70,915.96, and other sources $76,346.70, making a total decrease in gross receipts of $8,279,080.96 as compared with previous year.

The decrease in expenses, excluding the amount expended for improvements was $5,292,844.31, resulting from the decreased production of 2,097,248.12 tons.

Cost of transportation of coal by rail and water during the year was $7,768,236.60, as compared with $10,093,802.65 for the previous year, owing to the falling off in our sales of 2,000,959.01 tons.

The cost of maintenance and repairs decreased $370,098.95 and the cost of mining decreased $2,049,042.30 as compared with the previous year.

The total sum expended for improvements during the year and charged to expenses was $1,193,385.43, as against $1,241,070.64 the previous year.

Thirty-one collieries were operated a total of 7313 days during the year ended June 30, 1914, as compared with a total of 8770 days during the previous year. None of the washeries was in operation during the year. The collieries have a capacity in excess of the maximum amount that they may be called on to produce.

The funded indebtedness of the Coal & Iron Co. has been reduced by the following payment: Philadelphia & Reading Collateral Sinking Fund Loan, $30,000. This company has been reimbursed by Reading company for the payment of these bonds; the amount of this loan now outstanding is $1,050,000.

On June 27, 1913, the Commonwealth of Pennsylvania passed an act laying a tax on anthracite coal of 2½% of the value thereof when prepared for market, the law taking effect on June 28, 1913. The tax due by this company for the period from June 28 to Dec. 31, 1913, amounted to about $320,000.

It is with feelings of profound regret that the board records the sudden death on Apr. 26, 1914, of George F. Baer, president of the company.

At a special meeting of the board of directors, held on May 8, 1914, the office of chairman of the board was created, and Edward T. Stotesbury, a member of board, was elected to fill that position.

W. J. Richards, vice-president and general manager, was elected president of the company to fill the vacancy caused by Mr. Baer's death.

INCOME ACCOUNT FOR THE YEAR ENDED JUNE 30, 1914, COMPARED WITH THE YEAR 1913

Receipts	1914-1913 Amount	1913-1912 Amount
Coal sales (anthracite)	$30,946,264.63	$39,078,082.93

⁂

The O'Gara Coal Co. has announced that the interest coupons on its bonds, due Mar. 1 of the current year, will be paid on presentation at the office of the company in the Marquette Building, Chicago, Ill.

Coal Contracts Pending

It has been found impossible to eradicate all inaccuracies from this department; since its inception 2.5 per cent, of the items listed have been reported as incorrect, in spite of the fact that we are paying a higher average scale of remuneration for this matter than has ever been paid by this, or any other coal journal. In the collection of this information the customary sources of inquiry, such as clipping bureaus, press reports, etc., were rejected because of their unreliability. Only information obtained directly from the source of the proposed business, or a seemingly reliable connection, is accepted, and much of this is drawn through our affiliations with other leading technical journals. In justice to ourselves and our readers, we believe this brief statement to be warranted. It is only through the close cooperation of all concerned that this department can attain a lasting success and be of real benefit to the coal trade. We will, therefore, appreciate any and all information relative to inaccuracies of contracts listed below.

No. 97—Baltimore, Md.—The following are the bidders on this contract (p. 356), which calls for an annual supply of about 240,000 tons of soft coal: Shaw Bros.; Baker Whitley Co.; Castner, Curran & Bullitt; W. H. Bradford; Coale & Co. Address Pur. Agt. & Gen. Mgr. W. P. Coria, Merchants & Miners' Transportation Co., Baltimore, Md.

No. 131—Rochester, N. Y.—Bids on this contract (p. 357) which involves 6000 tons of anthracite and 6000 tons of semi-bituminous coal will be opened Mar. 19. Address Secy. J. S. Mullen, Municipal Bldg., Rochester, N. Y.

No. 133—St. Louis, Mo.—Bids will be received by the government engineers here until noon, Mar. 15, for furnishing 25,200 tons of coal in barges (p. 357). Address Maj. Clarke S. Smith, Mississippi River Commission, International Life Bldg., St. Louis, Mo.

No. 137—Ellensburg, Wash.—The bids on this contract (p. 398) which provides for furnishing steam coal for Kittitas County were as follows: Roslyn Fuel Co. (special steam coal), $3.40, (washed steam coal) $3.60; Carter Transfer Co. (special steam coal), $3.50. Address County Audr. W. G. Damerow, Ellensburg, Wash.

No. 143—Buffalo, N. Y.—The lowest bids on this contract (p. 398) were: Bituminous, C. A. & M. Kaiser (Buffalo), mine-run, $2.65; screened nut, $2.60; slack, $2.45; screenings, $2.15; smokeless, $2.70. Anthracite, Connell Anthracite Mining Co., grate, $5.10; egg, $5.30; pea, $4.25. Address Col. Francis G. Ward, Dept. of Public Works, Buffalo, N. Y.

No. 144—Oswego, N. Y.—The Board of Education will be in the market during the latter part of March for about 600 tons of anthracite coal in egg, stove, nut and pea sizes (p. 358). Address Chief Clerk, Dept. of Education, City Hall, Oswego, New York.

No. 183—Shawano, Wis.—This contract (p. 399) calls for 1500 tons instead of 2000 tons of bituminous coal as previously stated. This business is usually done on a competitive basis, and is awarded on an evaporative test of the coal. Address Paul E. Caprano, City Water & Light Plant, Shawano, Wis.

No. 192—Rockville Center, N. Y.—The local city government will be in the market for about 2500 tons of bituminous coal during the latter part of March (p. 399). This business is customarily done at $3.53 per ton. Address Village Clk. George S. Utter, Rockville Center, N. Y.

No. 211—St. Albans, Vt.—We are advised by the Central Vermont Co. that they are not at the present time in the market for 190,000 tons of anthracite and bituminous coal, as stated in a previous issue (p. 400). Address Pur. Agt. J. W. Wardlaw, Central Vermont Ry. Co., St. Albans, Vt.

No. 222—Bayonne, N. J.—Sealed proposals will be received by the Board of Education until 8 p.m., Mar. 18, for furnishing about 2500 tons of coal, the amount to be made up of 1500 tons, more or less, of egg, stove, or nut coal, and 1000 tons, more or less, of pea coal (p. 446). Address Secy. W. J. Tomlin, Board of Education, Ave. C and 26th St., Bayonne, N. J.

No. 241—Fall River, Mass.—The Stafford Mills advises that they are not in the market for coal as noted in a previous issue (p. 447). Address Treas. Charles B. Luther, Stafford Mills, Fall River, Mass.

No. 255—Taunton, Mass.—Concerning this contract (p. 447), we have been advised by Reed & Barton that Pur. Agt. L. A. Hodges is no longer connected with this firm. Address E. R. Mitchell, Reed & Barton, Taunton, Mass.

No. 268—Buffalo, N. Y.—Sealed proposals will be received until 2 p.m., Mar. 15, for furnishing anthracite and bituminous coal as required by the Police Department and Patrol Boat for the year beginning Apr. 10. Bids are to be accompanied by a certified check for $500 and a bond of not less than $5000 is required (p. 448). Address Board of Police Comrs., Headquarters Bldg., Franklin and Seneca St., Buffalo, New York.

No. 276—Bennington, Vt.—The Twin State Gas & Electric Co. advise that they purchase their coal in the local market (p. 448). Address Mgr. E. E. Larabee, Bennington Division-Twin State Gas & Electric Co., Bennington, Vt.

No. 279—Windsor Locks, Conn.—The Northern Connecticut Light & Power Co. report that they are not in the market for coal at the present time (p. 448). Address Northern Connecticut Light & Power Co., Windsor Locks, Conn.

No. 285—Lynchburg, Va.—The Board of Education will soon be in the market for approximately 800 tons of mine-run coal, the present contract being closed at $3.45 per ton. Address City Clk. J. M. Otey, Board of Education, Lynchburg, Virginia.

No. 286—Boston, Mass.—Proposals may be submitted until Mar. 15 for furnishing the New York, New Haven & Hartford R.R. with approximately 15,500 tons of anthracite coal, divided as follows: 9800 tons of stove, 5000 tons of egg, 300 tons of chestnut, 400 tons of broken. Prices should be per gross ton f.o.b. cars at the mine. For further information on this contract refer to Inquiry No. 6044. Address Manager of Purchases and Supplies, N. Y., N. H. & Hartford R.R., Boston, Mass.

No. 287—Chambersburg, Penn.—Chambersburg Electric Light Department will be in the market during April for approximately 2000 tons of bituminous "Jerome" coal. The present contract was closed at $2.90 per ton f.o.b., and was awarded on a test basis. Address Supt. J. H. Mowrey, Chambersburg Electric Light Dept., Chambersburg, Penn.

No. 288—Troy, N. Y.—The Board of Public Works will contract during April or May for about 1200 tons of egg and stove coal, to be used by the city schools. The present contract was closed at about $6.47 per ton. Address Commissioner of Public Works, Troy, N. Y.

No. 289—Chicopee, Mass.—The Board of Education at this place usually contracts in April for about 1000 tons of Lackawanna egg coal, the present contract price being from $6.80 to $7 per ton. Address Committee on Supplies, Chicopee, Mass.

No. 290—East Orange, N. J.—The Board of Education will be in the market during April or May for about 1800 gross tons of anthracite coal. Address Secy. Warren A. Clapp, Board of Education, East Orange, N. J.

No. 291—Guantanamo Bay, Cuba—Telegraphic bids were received up to noon, Mar. 11, for either transportation of coal or coal and transportation, for delivery at the Naval Station, Guantanamo Bay, Cuba. The quantity required is about 10,000 tons, and delivery is to be made by Apr. 30. A daily discharge rate of 300 tons is guaranteed at Guantanamo Bay. Address Paymaster Gen. of the Navy Samuel McGowan, Bureau of Supplies & Accounts, Navy Department, Washington, D. C.

No. 292—West Point, N. Y.—Sealed proposals in triplicate will be received until noon, Apr. 15, for furnishing and delivering charcoal, smithing and gas coal, as required at this post for the fiscal year 1916. Address Depot Quartermaster Maj. E. J. Timberlake, West Point, N. Y.

No. 293—Boston, Mass.—Proposals will be received by the Union Freight R.R. Co. for furnishing approximately 1800 gross tons of broken anthracite coal, shipments to be made in carload lots to Boston in equal weekly deliveries for a period of one year beginning Apr. 1. In corresponding with this company refer to Inquiry No. 6040. Address Mgr. H. A. Fabian, Department of Purchases and Supplies, Union Freight R.R. Co., Boston, Mass.

No. 294—Meriden, Conn.—Bids were received up to 11 a.m., Mar. 2, for supplying the Connecticut School for Boys with about 1300 tons of coal. Address Supt. Chas. M. Williams, Executive Committee, Connecticut School for Boys, Meriden, Connecticut.

No. 295—Danville, Penn.—Bids will be received until Mar. 20 for furnishing the State Hospital for the Insane with 10,000 tons of No. 1 buckwheat, 500 tons of egg, and 100 tons of chestnut. Deliveries are to be made as ordered at the hospital coal dump, between Apr. 1, 1915 and Mar. 31, 1916, and the coal must be free from slate and dirt, freshly mined and of the best quality. Address Steward H. B. Schultz, State Hospital for the Insane, Danville, Penn.

No. 296—Leavenworth, Kan.—Bids will be received until noon, Mar. 20, for furnishing coal for the county court house, county jail, county hospital, and for the poor of the county. Address County Clk. J. E. Voorhees, County Clerk's Office, Leavenworth, Kan.

No. 297—Northampton, Mass.—The Northampton Gas Light Co. will be in the market about Apr. 1 for 3500 tons of gas coal, delivery via N. Y., N. H. & H. R.R. Address Light, Heat & Power Corporation, Boston, Mass.

No. 298—Clarendon, Ark.—The Clarendon Electric Light & Ice Co. will be in the market during April for about 2400 tons of pea and slack coal. The approximate cost per ton is $3.50. Address Cont. Agt. J. T. Bateman, Clarendon Electric Light & Ice Co., Clarendon, Ark.

No. 299—Hartford, Conn.—The Hartford Machine Screw Co. will be in the market about Apr. 1 for 2500 tons of anthracite and bituminous coal, deliveries via N. Y., N. H. & H. R.R. and C. N. E. R.R. and teams. Address Pur. Agt. H. R. Grant, Hartford Machine Screw Co., Hartford, Conn.

No. 300—Stoughton, Wis.—The contract with the Moline Plow Co. for furnishing various sizes of coal for steam purposes will expire on Apr. 1. Address Mandt Wagon Branch of the Moline Plow Co., Stoughton, Wis.

No. 301—Housatonic, Mass.—The Monument Mills will be in the market for 2000 tons of bituminous coal about Apr. 1, delivery via N. Y., N. H. & H. R.R. Address H. C. Church, Great Barrington, Mass.

No. 302—East Moline, Ill.—The contract with the Union Malleable Iron Co. for from four to eight cars of lump and egg coal per week expires on Apr. 1. Address Purchasing Agent, Union Malleable Iron Co., East Moline, Ill.

No. 303—New York, N. Y.—The following are the bids opened on Mar. 5 for furnishing 350 tons of No. 1 buckwheat coal for Bellevue Hospital: Robert Gordon & Son, $3.35; John S. Conabeer, $3.35; M. L. Bird, $3.41; Burns Bros., $3.39; Meyer-Denker-Sinram Co., $3.72; Chas. D. Norton Co., $3.34; S. Trimmer & Son, $3.75; John W. Peale, $3.11; Gavin Rowe, $3.29; Meeker & Co., $3.07. Address Contract Clk. Geo. D. White, Bellevue Hospital, 400 East 29th St., New York, N. Y.

No. 304—Wilmington, Del.—Bids were received up to 10:30 a.m., Mar. 1, for supplying the Water Department with approximately 3700 tons of bituminous coal for a period of one year beginning Apr. 1. Address Ch. Engr. Edgar M. Hoopes, Jr., Board of Water Commissioners, Wilmington, Del.

No. 305—Atlantic, Iowa—The Municipal Electric Light Works will contract in April for about 4300 tons of Iowa steam coal, the present contract being closed at $2.10 delivered in bin. Address Mgr. T. E. Nichols, Municipal Electric Light Works, Atlantic, Iowa.

No. 306—Algoma, Wis.—The City Water & Light plant will be in the market in April for a supply of mine-run Youghiogheny coal. This company consumes approximately 900 tons per year, the present contract price being $3.70 per ton, delivered in bin. Address Supt. J. O. Posson, City Water & Light Plant, Algoma, Wis.

No. 307—Logansport, Ind.—The Logansport Electric Light Co. will soon be in the market for about 14,000 tons of 1¼-in. screenings. This plant is located alongside the Vandalia R.R. Address Purchasing Agent, Logansport Electric Light Co., Logansport, Ind.

No. 308—Waterbury, Conn.—The Benedict & Burnham Co. will be in the market about Apr. 1 for 22,000 tons of anthracite and bituminous coal, delivery via N. Y., N. H. & H. R.R. Address Benedict & Burnham Co., Waterbury, Conn.

No. 309—Kalamazoo, Mich.—The Kalamazoo Corset Co. at this place will be in the market about Apr. 1 for a supply of lump coal for steam purposes. Address Purchasing Agent, Kalamazoo Corset Co., Kalamazoo, Mich.

No. 310—Griswoldville, Mass.—The Griswoldville Mfg. Co. will be in the market about Apr. 1 for 3500 to 4000 tons of anthracite and bituminous coal. Address Pur. Agt. J. W. Ballard, Griswoldville Mfg. Co., Griswoldville, Mass.

No. 311—Chaska, Minn.—The Municipal Electric Light & Power Plant of this place will be in the market during April for approximately 800 tons of coal. The present contract was closed at $3.35 per ton. Address Mgr. & Supt. E. F. Strong, Municipal Electric Light & Power Plant, Chaska, Minn.

No. 312—Chicago, Ill.—Sealed proposals will be received until 11 a.m., Mar. 15, for furnishing and delivering coal for the following departments in various sections of the city. Each division, as listed in the following, is a separate contract, and the deposit required to accompany each bid is given:

	Department			
	Fire	Health	Street	Police
District No. 1	$500	$100	$100	$100
District No. 2	500	100	100	100
District No. 3	600	200	100	100
District No. 4	800	100	100	100
District No. 5	500		100	100

Address Comr. of Pub. Wks. L. E. McGann, Room 406, City Hall, Chicago, Ill.

No. 313—Providence, R. I.—Sealed proposals will be received until Apr. 1 for furnishing anthracite coal required by the Federal Departments of the State of Rhode Island. Deliveries are to be made as specified, and each bid must be accompanied by a certified check for 5% of the bid. Address Chn. William A. Schofield, Board of Control and Supply, Room 18, State House, Providence, R. I.

No. 314—South Bend, Ind.—Bids will be received for furnishing the Singer Mfg. Co., Factory No. 3, 10,000 to 15,000 tons of screenings, deliveries to be made in equal amounts throughout the year. Shipments are to be at the rate of 10 to 18 cars per week during the winter and five to six cars during the summer, the contract to go into effect Apr. 1. The coal from the mines in Pike and Sullivan Counties, Ind., or Franklin and Williamson Counties, Ill., is preferred. Address Purchasing Agent, Singer Mfg. Co., South Bend, Ind.

No. 315—Arlington, Mass.—The Arlington Gas Light Co. will be in the market about Apr. 1 for about 1500 tons of anthracite and bituminous coal, delivery via water and B. & M. R.R. Address H. L. Ogden, 131 State St., Boston, Mass.

No. 316—Wyandotte, Mich.—The Municipal Light & Water Plant will be in the market during April for 5000 tons of West Virginia mine-run coal. Address Supt. A. S. McClenehan, Municipal Light & Water Plant, Wyandotte, Mich.

No. 317—Putnam, Conn.—The Morse, Powhattan & Nightingale Mills will be in the market about Apr. 1 for 2000 tons of bituminous coal, delivery all rail via N. Y., N. H. & H. R.R. Address Pur. Agt. Augustus Morse, Morse, Powhattan & Nightingale Mills, Putnam, Conn.

No. 318—Sullivan, Ind.—The present contract with the Sullivan Electric Co. for two or three cars of screenings per week will expire on Apr. 1. Address Purchasing Agent, Sullivan Electric Co., Sullivan, Ind.

CONTRACTS AWARDED

No. 93—Jersey City, N. J.—This contract (pp. 356 and 436) has been awarded to Behrens Bros., Paterson Plank Road, Secaucus, N. J., at $4.19 per ton; contract provides for 2500 gross tons of best quality pea coal. Address Clk. of the Bd. John T. Sweeney, Boulevard Commissioners, County Court House, Jersey City, N. J.

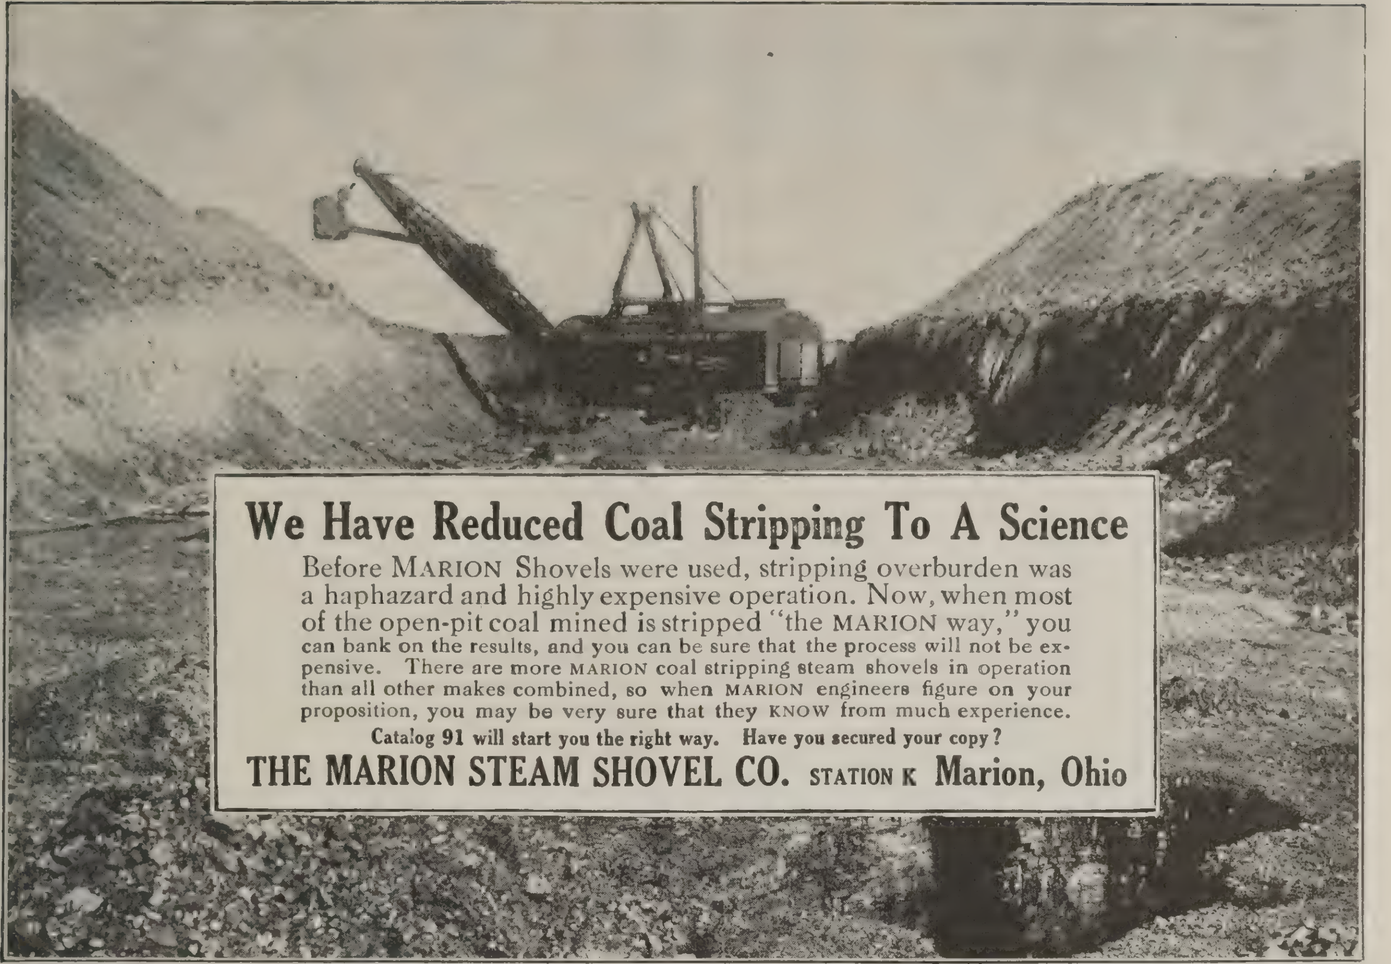
No. 119—New York, N. Y.—Bids on this contract (p. 357), which provides for furnishing and delivering about 4,000,000 lb. of No. 2 buckwheat coal alongside of dock at the asphalt plant, 90th and 91st St., East River, were as follows: Gavin Rowe, $4080 (awarded contract); William Farrell & Son, $4320; Pattison & Bowns, $4232.14; Chas. D. Norton Co., $4280; John W. Peale, $4380. Address Pres. Marcus M. Marks, 21st floor, Municipal Bldg., New York.

No. 166—Concord, N. H.—The Board of Education has awarded this contract for about 1000 tons of anthracite coal (p. 399) to the E. S. Tenney Coal Co. The contract price is $6.80 per ton of small broken coal. Address Secy. Board of Education, Concord, N. H.

No. 247—Montpelier, Vt.—This contract (p. 447) which provides for furnishing 2000 tons of gas coal has been awarded to the Pittsburgh Coal Co. Address Capital City Gas Co., Montpelier, Vt.

No. 256, Ludlow, Vt.—This contract (p. 447) which provides for furnishing 1000 to 1500 tons of bituminous coal to the Black River Woolen Co. has been closed. No details are available. Address Pur. Agt. George P. Levey, Black River Woolen Co., Ludlow, Vt.

For the official advertisements of bids wanted see the Contracts to Be Let section on the second page following.



We Have Reduced Coal Stripping To A Science

Before MARION Shovels were used, stripping overburden was a haphazard and highly expensive operation. Now, when most of the open-pit coal mined is stripped "the MARION way," you can bank on the results, and you can be sure that the process will not be expensive. There are more MARION coal stripping steam shovels in operation than all other makes combined, so when MARION engineers figure on your proposition, you may be very sure that they KNOW from much experience.

Catalog 91 will start you the right way. Have you secured your copy?

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

I HAVE on my desk three letters which give a little example in cause and effect that will interest both readers and advertisers.

First I'm going to quote from a letter from H. C. Cooney, Manager of the Bell-Union Coal and Mining Company, of Curlew, Ky.:

"We read the advertisements very carefully, as we find many new ideas advanced and many new machines advertised therein, and are thoroughly enabled to keep up with the latest developments of the market. We have made various purchases through advertisements in Coal Age and are so well satisfied with it that we are today subscribing for it for our foreman."

* * *

NEXT a letter from G. E. Lyman, Mining Engineer of the Madison Coal Corporation, at Glen Carbon, Ill.:

"I find the advertising pages of Coal Age as interesting as the editorials and constantly refer to them to keep posted on the advance in coal mining and mechanical equipment, and to keep our catalog file up to date. We have purchased a very large amount of material and equipment advertised in your paper."

NOW with the readers talking like that about the advertising pages, surely the advertisers should have something to say.

Surely the *effect* of the readers reading the ads should be felt by the advertisers—so now I'll quote from the third letter, from H. H. Hirsch, President of the Hirsch Electric Mine Lamp Co., of Philadelphia, Pa.:

"You will be interested to know that the results obtained from advertising in Coal Age have far exceeded any other journal in which we have advertised. Our records show 6 inquiries from Coal Age to 1 inquiry from any other paper. Such results have clearly demonstrated to us that Coal Age reaches the coal mine officials better than any other medium we know of."

* * *

COULD there be any stronger proof of the value of your paper as a connecting link between the mine and the manufacturer?

It is this sort of service—this making the technical paper the forum or meeting place for all who are interested in and dependent on coal mining—that makes us *all* winners.

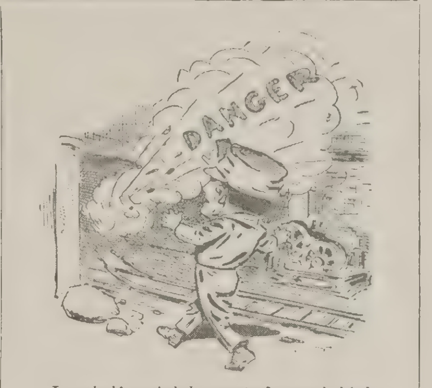
For it's highly profitable to all three sides of that modern triangle — reader, advertiser and publisher.

COAL AGE

Vol. 7 NEW YORK, MARCH 20, 1915 No. 12

The Peril

IT'S a hazardous undertaking,
  This probing the depths for coal,
And the risks that lurk in the inky murk
  Strike fear to the bravest soul;
For a miner may guide his actions
  By the strictest of safety's creeds,
Yet be stricken low by a luckless blow
  Through another man's misdeeds.



In a half a wink he must plan and think

WHEN a danger leaps out upon him
  As swift as a flash of light,
In a half a wink he must plan and think,
  And he's got to do it right;
Then his muscles must do his bidding
  And his mind must be clear to choose;
But he's sure to fail if they've both gone stale
  In the deadening grip of booze.

IT'S a murderous combination,
  Is the mixing of booze and brain,
Which, as sure as fate, either soon or late,
  Brings calamities in its train;
For a miner who grows so groggy
  That he doesn't know up from down
Can raise more hell than a lyddite shell
  Dropped into a busy town.

Puts a stringent ban on booze

IN the running of railway systems
  Old Alcohol stands accursed,
And he has no place in this year of grace,
  When the slogan is "Safety First!"
So the chances are all for gaining,
  And there's nothing at all to lose,
If the mining clan puts a stringent ban
  On the fellow who clings to booze.

Written Especially for COAL AGE *by Michael Bernard*

Determination of the Equipment for Mine Locomotives

By Graham Bright*

SYNOPSIS—After the weight of a locomotive has been determined, the motors, control equipment, resistance and brake mechanism require careful attention. Motors should be so chosen that dangerous heating will not develop under normal conditions.

In order to determine the proper equipment for a mine locomotive it is necessary to have the following information:

Plan and profile of the road.
Number of cars to be handled per trip.
Number of cars to be handled per hour.
Weight of empty cars.
Length of cars.
Weight of load.
Frictional resistance of cars.
Time of layover, including switching and making up trip.
Voltage of circuit.
Gage of track.
Weight of rail.
Radius and length of minimum curve.
Spread of track on minimum curve.
Limiting dimensions which locomotive can have.
Position and range of trolley wire.

It is seldom that all of the above information can be obtained, and in many cases it is necessary to make certain assumptions to supply the missing data. This can only be done by one having considerable experience in working out mining problems.

Motors for mine locomotives are rated on the one-hour basis with a 75-deg. C. rise in temperature. This rating does not indicate the capacity of the motor for all-day service, and is not used in determining its ability to meet with a certain set of conditions.

The capacity of a motor for all-day service depends upon the temperature which the windings will attain. This in turn depends upon the average heating value of the current. Since the heat generated by an electric current is proportional to the square of the current value, the average heating for all-day service must depend upon the square root of the mean square of the current.

Two motors may have the same one-hour rating, but one may have a much larger continuous capacity than the other, due to better design and the proper distribution of the losses. A poorly ventilated motor will in some cases have "hot spots," and since "a chain is no stronger than its weakest link," these hot spots will lower the capacity of the machine. This is due to the fact that, in order to keep these spots within a safe temperature rise, the average temperature of the windings must be kept much lower than would be necessary if such spots were eliminated by proper design.

That the real capacity of a motor is its continuous capacity for all-day service and not the rating for one hour is apparently not generally appreciated among mine operators. The one-hour rating depends largely upon the thermal capacity of the motor, while the continuous rating depends on the ventilation, distribution of the losses and the capacity of the machine to radiate heat.

The one-hour capacity is not a fair rating of a motor for the foregoing reason and also because the speed of the motor is not taken into account. A fairer way would be to rate the machine on the pounds tractive effort at the wheels, irrespective of the speed, provided it is not considered essential for commercial reasons to capitalize the increased horsepower ratings due to increase in speed.

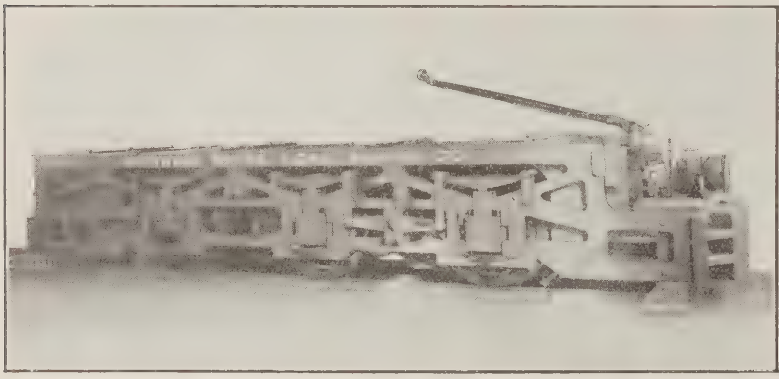


Fig. 1. A Heavy Mine Locomotive with Three Motors and Three Sets of Drivers

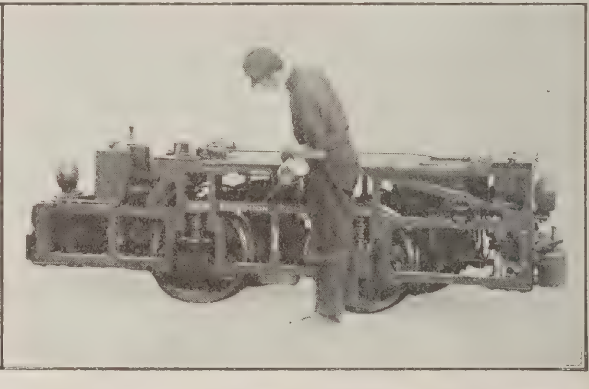

Fig. 2. A Locomotive with Bar-Steel Frame Facilitating Ventilation

If the length of haul, the grade, curve, running time and time of layover are known, the current for each part of the run can be computed. In most main-haulage cases the locomotive will have a definite cycle to go through, this cycle being repeated throughout the working day. If the square root of the mean square current for one cycle can be found, this will, of course, determine the suitability of the motor selected for the all-day service as regards heating capacity.

Motors Are Selected To Suit the Weight of the Locomotive

After the locomotive weight is determined, the motor equipment is selected. By means of the motor curve the current and speed can be obtained for each part of the cycle. Each current value is then squared and multiplied by the time that it lasts. By adding these time-current-squared values and dividing by the total time, including layover, the average squared value of the current is obtained. The square root of this quantity will give the root mean squared value of the current for a complete cycle. If the continuous capacity of the motor is above the root mean squared value the machine is of sufficient capacity; if below, it is not large enough and a larger motor should be selected.

---

*Engineer, Westinghouse Electric & Mfg. Co., East Pittsburg, Penn.

The continuous-current capacity of mine motors is generally given at two voltages. If the service is main haulage and the distances traversed are fairly long with good line voltage, the value at the higher potential should be used. If the service is gathering and switching or if the line voltage is poor, the value at the lower pressure should be employed. The increased iron loss of the motor at the higher voltage is responsible for the lower current capacity.

When the locomotive is accelerating, the current is considerably greater than when running at constant speed. This, together with the switching and making up of trips at the ends of the run, produces extra heating, and actual calculations show that this can be allowed for by adding 10 per cent. to the sum of the time-current-squared values for fairly long runs and 15 per cent. for short runs. The exact heating value of the accelerating currents can be calculated closely, but as a rule this is not necessary and can be taken care of by the above method of adding from 10 to 15 per cent. to the time-current-squared values.

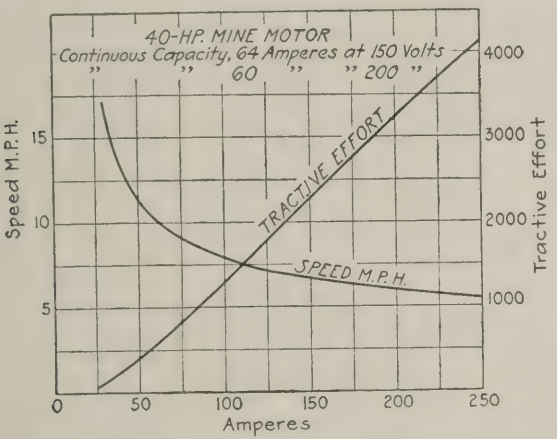

FIG. 3. CHARACTERISTIC CURVES OF A 40-HP. MINE LOCOMOTIVE MOTOR

Since the actual all-day capacity of a mine motor is determined by its ability to get rid of heat by radiation and convection, any construction that will facilitate the ventilation of the machine will add to the all-day capacity. In the past, nine locomotives have as a rule been built with box-type frames of cast iron, rolled steel or structural steel. In all cases the frame was really an inverted box closed at the top and sides and nearly closed at the ends.

As considerable heat is generated by the motors, resistance grids and brake shoes, the temperature of the air around the motor will become considerably higher than the outside atmosphere. Where much sand is used the air inside of the frame will be constantly full of grit which will work its way into the bearings.

One of the recent improvements in locomotives is the "bar-steel" type of frame, which is an open frame made of steel casting. This frame being open on the sides permits of free circulation of air across the motors and resistance. This will increase the capacity of the equipment, since the rise in temperature will be much lessened by this ventilation.

There are a number of other features about the "bar-steel" frame that make it desirable. The amount of inspection and attention a locomotive receives depends largely upon the accessibility of its parts. This type of frame lends itself admirably to this feature by providing ample openings through which inspection and repairs can be made. This frame can be made amply strong to meet the severe conditions that exist in mines, and in event of a collision it may be bent; it has never been broken. A bent frame can be easily straightened by a blacksmith.

AN ASSUMED CASE

To illustrate the working out of the above principles. the following conditions may be assumed to exist at a mine which desires to install electric haulage:

Locomotive required	1
Profile as follows:	
1300 ft. 2 per cent. grade against load.	
1400 ft. 1 per cent. grade against load.	
2200 ft. level.	
Number of cars to be handled per trip	20
Number of cars to be handled per hour	50
Weight of empty car	2000 lb.
Weight of load	4500 lb.
Total weight of loaded car	6500 lb.
Frictional resistance of cars	30 lb. per ton
Time of layover, including switching and making up trip	5 min. each end
Voltage of circuit	250
Gage of track	36 in.
Weight of rail	30 lb. per yd.
Radius of minimum curve	25 ft.
Length of minimum curve	20 ft.
Spread of gage on curve	¼ in.

Limiting dimensions of locomotive, 5 ft. wide, 4 ft. high.

Trolley wire 6 in. outside of rail; height above rail, 4 ft. 6 in. to 6 ft.

The total weight of the trip will be 65 tons.

The limiting condition in regard to weight is, of course, on the 2 per cent. grade. The weight of the locomotive will be found as follows, applying the formula given in COAL AGE of Mar. 6, 1915:

$$30 \times 65 + 20 \times 2 \times 65 + 20 \times 2 \times W = 400\,W$$

$W = 12.6$ tons if cast-iron wheels are used;

$W = 9.88$ tons if steel wheels are used.

It would, therefore, be necessary to use a 13-ton locomotive with cast-iron wheels or a 10-ton locomotive with steel wheels. Steel wheels should be used unless the customer specifies cast iron. A locomotive to negotiate a 25-ft. curve should have a wheel base not more than 55 in. with 33-in. wheels or 65 in. with 30-in. wheels. With motors tandem hung no trouble will be experienced in keeping below 55 in. or 65 in. for a 10-ton locomotive.

The number of cars to be handled per hour being 50, the trips per hour will be $50 \div 20 = 2\frac{1}{2}$. The total time per trip, including layover at each end, will therefore be $60 \div 2\frac{1}{2} = 24$ min. Allowing 5 min. layover at each end will make the actual running time 14 min.

For a locomotive of a given weight there are, as a rule, two or more motors to choose from. For a 10-ton machine these motors range from 40 to 50 hp. in capacity, although larger ones are sometimes required for special cases. A 40-hp. motor is selected for the first trial. The locomotive will have 30-in. wheels with a gear ratio of 4.78 to 1. The highest gear reduction is always selected unless a greater speed is required and can be obtained without overloading the motors. The characteristics of this motor are shown by the curves in Fig. 3.

This curve is made from an actual test, and the tractive effort given includes gear losses, so that to obtain the draw-bar pull only the locomotive friction should be deducted. A table of data covering the case, such as shown in Table 1 or 2, should be prepared, the values inserted being calculated from the motor curves and weights to be handled. Since the curves give values for one motor, the locomotive and trailing weight should be divided by two to give the weight each motor will be required to handle.

TABLE I

Speed Miles per Hr.	Amp.	Total Tr. Eff.	Loco. Res.	Train Res.	Grade Res.	Distance, Ft.	Time, Sec.	Amp.^{2}	Amp.^{2} × Time
8.5	87	1050	75	975	0	2200	177	7,569	1,340,000
6.5	165	2550	75	975	1500	1300	136	27,225	3,700,000
7.2	125	1800	75	975	750	1400	133	15,625	2,080,000
Returning with Empty Trip									
10	25	75	75	300	—300	1400	96	625	60,000
10	0	—225	75	300	—600	1300	89		
10	45	375	75	300	0	2200	150	2,025	303,000

Amp.^{2} × time = 7,483,000
Plus 10% for accelerating, switching, etc 748,300

Total amp.^{2} × time 8,231,300
Total running time, sec. 781
Total time at both ends, sec. 659

Total time including layover, sec. 1440
8,231,300 ÷ 1440 = 5700 = mean squared current.
The square root of 5700 = 75.5 = square root of mean square current.
Capacity of 40-hp. motor is 60 amp.

THE WEIGHTS PER MOTOR ARE FOUND

For the above project the weight of locomotive is five tons per motor; the loaded trailing weight, 32½ tons per motor, and the light trailing weight, 10 tons per motor. Assume that the locomotive starts with a load on a level track and runs 2200 ft., when it encounters a 2 per cent. grade. After ascending this grade for 1300 ft. the grade changes to 1 per cent. for 1400 ft. The return trip will be with empty cars.

Starting with the loaded trip on the level, the locomotive resistance per motor will be 5 × 15 = 75 lb. This value is placed under "locomotive resistance" in the table. The train resistance will be 32.5 × 30 = 975 lb. The grade resistance will be zero. The total tractive effort will be 1050 lb.

Consulting the motor curves of Fig. 3 the current for a tractive effort of 1050 lb. is 87 amp. and the speed 8.5 miles per hour. The time to cover 2200 ft. at 8.5 miles per hour will be 177 sec. The amperes squared will be 7569 and the amperes squared multiplied by time will be 1,340,000. These values should be recorded in their proper place in the table.

When the 2 per cent. grade is reached, the train and locomotive resistance will remain the same, while the grade resistance will be 40 × (32.5 + 5) = 1500 lb. The total tractive effort will be 2550 lb., which corresponds to a motor current of 165 amp. and a speed of 6.5 miles per hour. At this speed it will require 143 sec. to travel 1300 ft. By the same process the values for the 1 per cent. grade are calculated and filled in the table.

On the return trip with the empty cars the locomotive resistance will be the same, the train resistance 300 lb. for 10 tons, and the down-grade resistance —300 lb. for the 1 per cent. and —600 lb. for the 2 per cent. grade. It will be noted that, running down the 2 per cent. grade, the net tractive effort is —225 lb., which means that the brakes must be applied in descending this grade.

TEN MILES PER HOUR WILL PROBABLY NOT BE EXCEEDED

On the 1 per cent. grade and on the level the speeds shown on the curve of Fig. 3 are too high for most mines unless the track is in good shape. It is likely that the operator will not care to run faster than 10 miles per hour, which he can do by operating the motors in series on low notches, or by cutting off the power and coasting before the speed becomes too high.

The total running time is 781 sec., or 13 min. 1 sec. The actual running time will be close to 14 min., due to time taken to start and stop the trip and for possible slowing down at cross-overs. As the total time for a round trip is 24 min., a layover of five minutes is obtained at each end.

The product of the total current squared by the time is 7,483,000. To this, 10 per cent. should be added to allow for acceleration and switching when making up trips, making a total of 8,231,300. The total time for making a round trip, including layover, is 1440 sec. Dividing 8,231,300 by 1440 = 5700 as the mean square of the current. The square root of 5700 is 75.5 amp., which is the square root of the mean square current for one trip or cycle.

The continuous capacity of the motor is 68 amp. at 150 volts and 64 amp. at 200 volts. The class of service is such that the average voltage applied to the motor will be near 200, so that the rating of the motor is about 65 amp., which shows that it is not of sufficient capacity for the service.

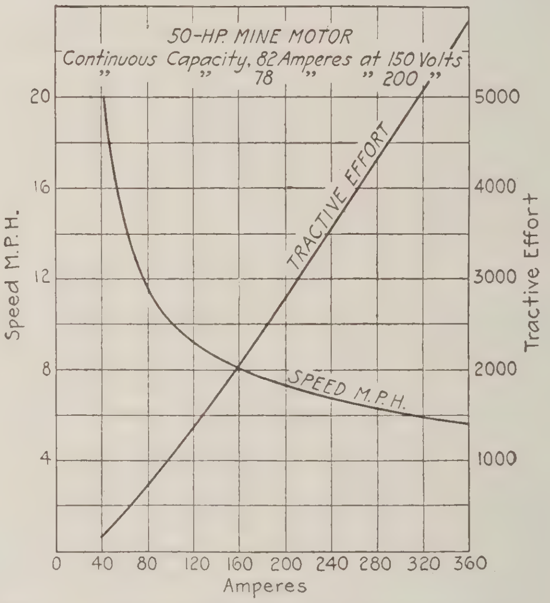

FIG. 4. CHARACTERISTIC CURVES OF A 50-HP. LOCOMOTIVE MOTOR

TABLE II

Speed Miles per Hr.	Amp.	Total Tr. Eff.	Loco. Res.	Train Res.	Grade Res.	Distance, Ft.	Time, Sec.	Amp.^{2}	Amp.^{2} × Time
10.1	100	1050	75	975	0	2200	149	10,000	1,490,000
7.6	187	2550	75	975	1500	1300	117	34,970	4,090,000
8.5	146	1800	75	975	750	1400	113	21,316	2,410,000
Returning with Empty Trip									
10	35	75	75	300	—300	1400	96	1,225	117,500
10	0	—225	75	300	—600	1300	89		
10	56	375	75	300	0	2200	150	3,136	470,400

Amp.^{2} × time = 8,577,900
Plus 10% for accelerating, switching, etc 857,790

Total amp.^{2} × time 9,435,690
Total running time, sec. 714
Total time at both ends, sec. 726

Total time including layover, sec. 1440
9,435,690 ÷ 1440 = 6550 = mean squared current.
The square root of 6550 = 81 = square root of mean square current.
Capacity of 50 hp. motor is 80 amp. at 150 v.

Care should be taken that a motor is not selected in which the commutating limit is exceeded when the wheels are slipped while using sand. The motor curves are generally stopped at the commutating limit, although with the modern commutating-pole motor it is rather difficult to find the commutating limit.

A larger motor should be selected, and Table II shows the results of the calculation using two 50-hp. motors. The curves of Fig. 4 show the characteristics of this motor. The total calculated running time is 714 sec., or 11 min. 54 sec. The square root of the mean square current is found to be 80 amp. The capacity of the motor at 200 volts is 78 amp. and 82 amp. at 150 volts, so that this motor will be of just about the proper capacity to meet the conditions. The actual running time will be about 12 to 14 min., allowing 5 to 6 min. at each end for switching and making-up trips. The higher root mean square current obtained for the 50-hp. motor is due to the fact that it is a higher-speed machine than the 40-hp. This shows the importance of having a low-speed motor.

It is not safe to figure on a short layover, as in many cases the average line voltage is much less than 500 or 250 volts, which means that the speed will be less than is figured on. A low line voltage signifies that a given current will be required for a much longer time than with the normal voltage, which in turn means additional heating. Where the voltage is likely to be poor, a margin should be allowed in the motor capacity, since the value of the square root of mean square current will be greater than that calculated.

IN SOME MINES THE GRADES FAVOR THE LOADS

The conditions outlined above in regard to profile are typical of what may be expected in mines. Sometimes it is possible to lay out a mine so that all of the main haulage will be with the grades; other mines will have mixed grades—that is, some inclinations in favor of the load and some against it; while too often a mine will be found with little or no level track and all grades against the load. If the profile instead of that given above were 2 per cent. against load 300 ft., level track 2300 ft., 1 per cent. in favor of load 2300 ft., the same weight of locomotive would be required, but the heating would be much less. Table III shows that the root mean square current is only 51.7 amp., which gives a large margin of safety when using the 40-hp. motor.

TABLE III

Speed Miles per Hr.	Amp.	Total Tr. Eff.	Loco. Res.	Train Res.	Grade Res.	Distance, Ft.	Time, Sec.	Amp.²	Amp.² × Time
6.5	165	2550	75	975	1500	300	31.5	27,225	870,000
10	40	300	75	975	—750	2300	157	1,600	251,200
8.5	87	1050	75	975	0	2300	184.5	7,569	1,395,000
Returning with Empty Trip									
10	45	375	75	300	0	2300	157	2,025	318,000
10	65	675	75	300	300	2300	157	4,225	664,000
10	0	—225	75	300	—600	300	20		
Amp.² × time =									3,498,200
Plus 10% for accelerating, switching, etc.									349,820
Total amp.² × time									3,848,020
Total running time, sec.								707	
Total time at both ends, sec.								733	
Total time including layover, sec.								1440	

3,848,020 ÷ 1440 = 2670 = mean squared current.
The square root of 2670 = 51.7 amp. = square root of mean square current.

On the other hand, the grade may be 2 per cent. for the entire distance against the load. In this case the root mean square current would be about 105 amp., corresponding to a motor having an hour rating of 75 to 80 hp. As it would not be practical to put two such large motors on a well designed 10-ton locomotive, it would be necessary to go to a 12- or 13-ton machine.

When a locomotive is to be used for gathering it is difficult to determine the proper capacity by the above method, since the service consists largely of starting and stopping with varying loads. From experience it has been found that if the horsepower per ton of weight of locomotive ranges from 6 to 10, the motors will have ample capacity.

This scheme is much of a makeshift and has little real reason behind its use. Locomotives have been in successful operation for years with but 6 hp. per ton and the motors were not overloaded. On the other hand, cases sometimes arise where 12 to 14 hp. per ton would be entirely inadequate. A high horsepower per ton is often obtained by using a high-speed motor and either allowing the locomotive to run fast or to use a pinion which is entirely too small for safe operation.

The placing of too large an equipment on a locomotive is a detriment instead of an advantage. It is somewhat similar to hitching a heavy dray horse to a light express wagon. The horse cannot work up to anything like his capacity and is likely to injure the wagon in attempting to perform his normal work.

Where the motor is too large the speeds will be high and the motor-man is often tempted to use an excess of sand and to hold the brakes on during acceleration to prevent slipping. This kind of operation results not only in a rise in power consumption but also a large increase in mechanical wear. The saving in electrical repairs may be more than balanced by the increase in mechanical repairs.

When reels are desired they can be furnished either of the traction or electrical type. The traction reel is used where steep grades are encountered and it is not desirable to have the locomotive enter the rooms. The capacity of the motor for a traction reel should be from 4 to 8 hp., depending upon the conditions. A small resistance type of controller should be used.

Of electrical reels two general types are used—the mechanically and the electrically driven. The mechanically driven reel is geared to one of the axles or to one of the main gears. This reel has the disadvantage that if the wheels are locked by the brake when coming out of a room the cable will be run over and cut in two.

The electrically driven reel consists of a horizontal or vertical axle reel equipped with a small motor, which acts as an electrical spring, always keeping tension on the cable. The motor is generally less than 1 hp. in capacity and is so wound that it can remain connected across the line continuously without danger of being burned out. The horizontal reel has the advantage that it does not interfere with access to the main motor and can be mounted low down in front without increasing the height of the locomotive.

SELECTING THE CONTROL APPARATUS

The resistance type of controller is generally employed for mine locomotives. This controller contains a combination series-parallel and reversing switch so that the motors can be operated either in series or parallel. This controller has two advantages over the standard series-parallel type used for railway service in which the motors are always started in series—first, it is much shorter, which permits it to be used in an upright position on locomotives which must be built to a minimum height; second, it is often necessary to start in parallel, since a greater and more even draw-bar pull is thus obtained.

The reason for this is that when the motors are in series and one pair of wheels starts to slip, the counter electromotive force of the slipping motor rises and cuts down the current so that the other motor is robbed of a large portion of its torque. When in parallel each motor receives its current independent of the other and the slipping of one pair of wheels does not reduce the torque of the motor driving the other pair.

Controllers for mine locomotives are designed for 500-volt service, so that any given controller has twice the capacity in horsepower on 500 volts that it has on 250. Mine-locomotive equipment, like railway equipment, is becoming heavier each year and considerable difficulty is sometimes experienced in providing a controller to handle the heavy currents. Most of the controller trouble occurs when throwing the controller "off" while pulling heavy loads.

In railway practice this trouble has been taken care of by supplying an auxiliary switch, operated by compressed air or magnetically, to open the trolley circuit when the control hand starts to move to the "off" position. It would be necessary to use a magnetic contactor with a mine locomotive, since, with a few exceptions, mine locomotives are not equipped with compressed air.

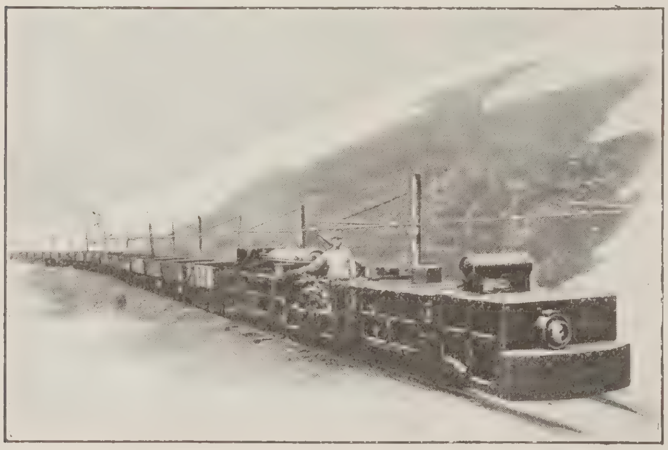

Fig. 5. Two Locomotives Arranged in Tandem for Heavy Hauls

With a locomotive built for minimum height and width, some difficulty would be experienced in finding a suitable location for the contactor. This scheme will no doubt be tried out in the near future. At present, when the motorman thinks he may blow up his controller by throwing it off, he pulls down his trolley and breaks the arc on the trolley wheel.

Care should be taken in selecting the resistance that ample capacity is provided for the type of service to be met. An alloy grid has been found to be the most satisfactory, since straight cast iron is too brittle to stand the constant jarring and vibration incident to mine operation.

Sometimes continuous running on notches is specified. This will greatly increase the number of grids required, and where continuous operation is necessary on every notch the number of grids will be about doubled. In most cases it would be difficult to find room for so much resistance on a locomotive.

Gathering locomotives will require more capacity in resistance than main haulage units, since the number of starts in a given time is greater. It is, therefore, important to supply ample current-carrying capacity as well as the correct ohmic value in the resistance.

Circuit-Breakers Are Seldom Used Except on Large Machines

Circuit-breakers are, as a rule, used only on locomotives of 10 tons and over. Many large machines of 20 to 30 tons are, however, equipped with fuses, and in some cases no protection at all is provided. If a circuit-breaker is of ample capacity and is properly maintained it should give excellent service. Such a device should be set a little above the slipping point of the wheels so that it is not likely to open during the starting of a heavy trip. This setting should correspond to the current in both motors that will produce a tractive effort of about 40 per cent. of the weight on the drivers.

A fuse should be selected in the same way. The railway type of fuse box using an aluminum or copper wire or ribbon is preferable, since a motorman can always find a piece of wire of somewhere near the right size, while the likelihood of his having extra fuses of the inclosed type is not great.

Sometimes a locomotive is desired of such a capacity and weight that the rails will not safely carry it. In this case a tandem unit may be resorted to. This combination generally consists of a leading unit equipped with a four-motor controller and a trailing unit equipped with a two-motor controller. The locomotives are electrically connected by jumpers and mechanically through the draw bars and brake system.

This combination is arranged so that it can be separated and each unit operated independently of the other. The braking becomes a serious consideration when the units are large, and in some cases air brakes are resorted to. Fig. 5 illustrates two 15-ton units operating in tandem and using an air-brake equipment.

Another method of reducing the weight and horsepower per axle is to supply a three-motor locomotive. This renders possible a locomotive one-third larger without increasing the wheel load. The series position on the controller gives rather slow speed with all three motors in series, but heavy pulls can be obtained with a small expenditure of power. Fig. 1 illustrates a 24-ton locomotive equipped with three 85-hp. motors. Particular attention is called to the equalization scheme used on these locomotives. Two pairs of drivers are equalized on the sides, while the third pair is cross-equalized. This insures good tracking, especially at high speeds.

⁂

Success

Articles of all descriptions and kinds are coming in for our April 3 SUCCESS number. Our readers located at different mines in various fields are picking up ideas covering practical installations and systems already being successfully used. In some cases large plants are described, while in other instances practical wrinkles of a saving nature are written about. It is this kind of coöperation that has made Coal Age so very interesting, and we much appreciate such support on the part of our friends. It is not yet too late to send in your SUCCESS story; however, the time is growing short, and all those who have an article under way for this special number are urged to hurry along its completion.

Coal Washer for No. 8 Mine, Tennessee Coal, Iron & Railroad Co.

By O. H. Bohm*

SYNOPSIS—Some of the details of the crushing screening, picking and washing machinery are here described. This plant is peculiar in that a reversible picking table is employed.

The article by Mr. Butcher in Coal Age under date of Feb. 20 prompts a few additional remarks regarding the installation mentioned. Too much praise can not be given Robert Hamilton, consulting engineer for the Tennessee Coal, Iron & R.R. Co., for the careful study which he made of general conditions surrounding the plant.

The coal is brought to the tipple and dumped onto shaking screens set lengthwise over the slack track. The undersize from the shaker may be dropped into a car beneath or spouted to the crushing plant. The oversize or lump coal is fed onto a reversible pan conveyor discharging to a railroad car on the lump track, the speed of the conveyor being such that hand picking is resorted to for the removal of occasional pieces of slate. Running in the opposite direction this conveyor discharges to the crushing plant.

To facilitate the handling of coal from other mines of the company, a foreign-coal track hopper and conveyor were installed at a point up the track from the tipple. This was for the purpose of utilizing the screening, crushing and washing facilities which were to be provided at the mine, either at night or in case an unforseen accident at No. 8 mine might hamper operations at that point during the day. The coal from other points is delivered and stored on the tracks in large hopper-bottom cars. During operation this foreign-coal conveyor discharges onto the shaking screens, the coal being treated the same as the run-of-mine coal from No. 8.

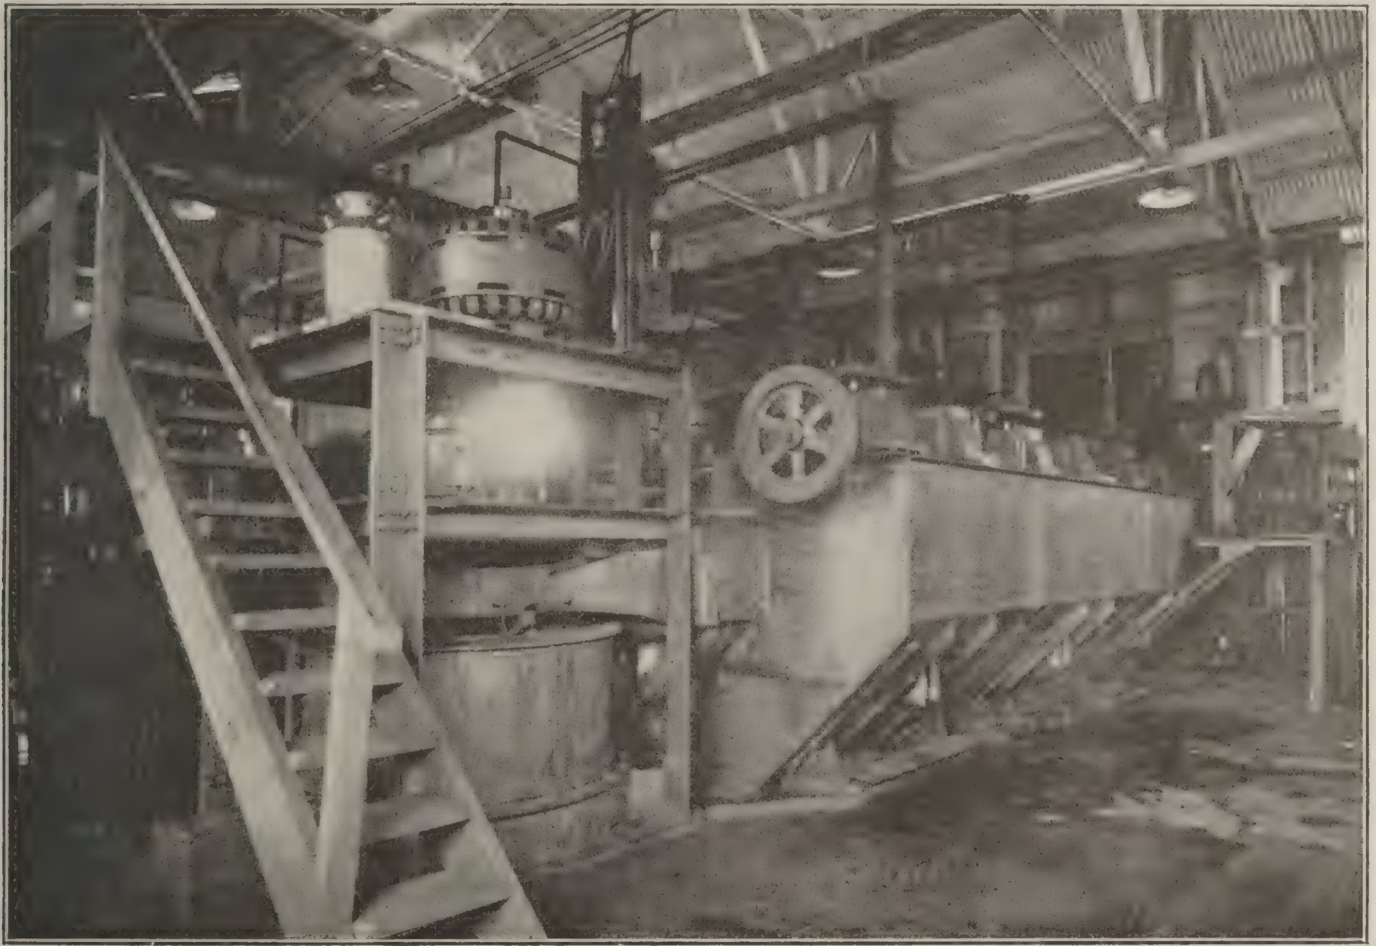

Fig. 1. Interior of Washery, Showing Jigs and Dryers

The crushing plant was installed immediately under the tipple. It consists of one set of toothed rolls for primary reduction of the lump coal and feeding directly to a set of corrugated rolls for the final reduction of the slack product from the shakers, as well as that coming from the primary lump breaker. Both sets of crushers are of heavy design, with parts as nearly interchangeable as possible, and are supported on steel frames carried on walls surrounding the crushers.

To obviate crowding as well as wear and tear incident to an elevator of great height and also to secure capacity sufficient to be able to keep the washing plant in better condition and independent from the tipple operations a belt conveyor was installed to carry the reduced product of the crushing plant to the raw-coal storage bin of 200 tons' capacity, which is located about 200 ft. from the tipple. This bin is placed at a sufficient elevation to feed direct to the jigs through special revolving feeders of wide face, it having been determined that an opening narrow vertically and wide horizontally would permit a more uniform flow of the fine coal than was otherwise possible. As two jigs of approximately 50 tons' hourly capacity each were intended, only two feeders were required, these being driven by chains from the jig shafts.

---

*Mining engineer, Canton, Ohio.

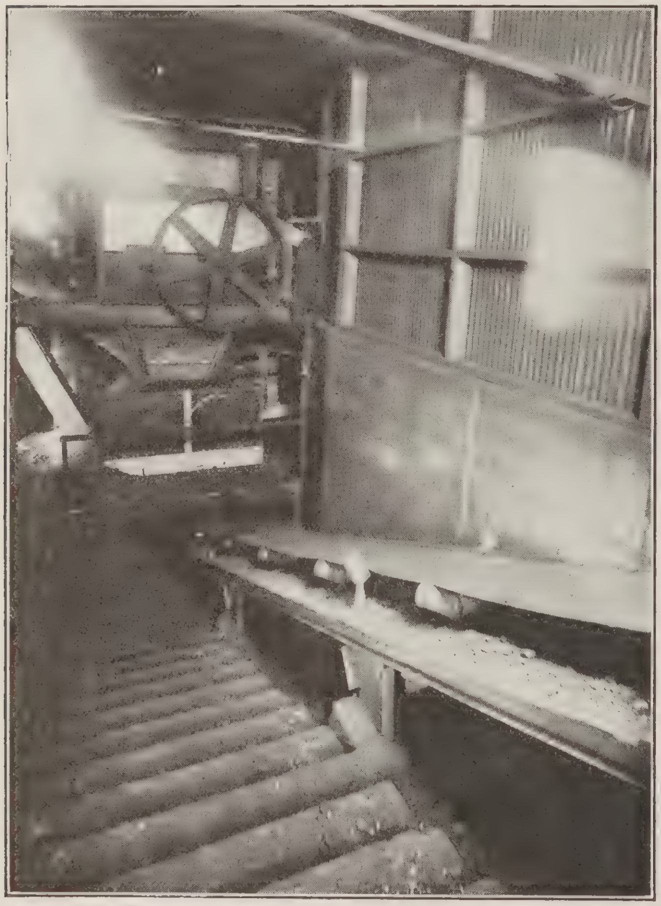

FIG. 2. CRUSHER AND INCLINED CONVEYOR BELT

It was decided that the jigs for the plant would consist of two direct-connected units, each consisting of three tandem sieves 6 ft. wide and 6 ft. long, with plungers on each side thereof. Each sieve was provided with rotary valves of special construction for the removal of slate, bone and boiler coal. The equipment operating these valves is of such design that great variations in speed and capacity are possible, while uniform products can be obtained from the bed of the jigs by their operation. The jig tanks are of steel, double hoppered, and provided with manholes in the bottom for the sake of accessibility, as well as gates for drawing off the product coming through the sieves.

To insure neatness and economy in the matter of lubrication and to reduce power consumption, ring oiling bearings with large oil reservoirs are used on the jig shafts throughout.

The plungers are approximately 3 ft. wide and 3 ft. long, two being used on either side of each sieve. They are of steel construction, equipped with rubber flap valves, and each is actuated by its own eccentric. The reduction of the size of the plungers assures greater ease in handling as well as allowing a variation in stroke at the feed end of each compartment from what might be found necessary at the discharge end of the same.

The eccentrics of the jigs are of special design, adjustable from zero to 2-in. stroke and equipped with automatic oilers and traveling oil reservoirs. The yokes are of cast steel, bushed with brass at the connecting pin. No water or grit can enter the housings or come in contact with the eccentrics. This obviates much wear and tear and the incidental cost of frequent renewals.

The coal passes from the jigs to the driers direct, the water being removed for the purpose of settling out the slimes which are returned to the driers and entrained with the coal as described in Mr. Butcher's article mentioned above. The dried coal is collected on a conveyor underneath the driers and then elevated to a shipping bin of 300 tons' capacity. The refuse and boiler coal are handled in dewatering elevator pits and discharged to bins of 50 tons' capacity each.

The raw-coal, refuse and boiler-coal elevators are of heavy design to insure durability and are double strand throughout. The entire mechanical equipment was designed with high safety factors and with the idea of ample capacity in case a rush had to be handled, as well as economy in operation. Many of the devices used throughout the plant are of special design and protected by patents.

A few words regarding the materials entering into the buildings comprising the completed plant should be permissible here. The crushing plant is of concrete and steel, covered with corrugated iron. The conveyor gallery for the raw coal is also of steel with concrete floors. As the inclination of this gallery is 21 deg. the floors are provided with safety treads.

The washer building proper is concrete up to the washer floor, the superstructure being of steel covered with corrugated iron. The large settling cone mentioned in Mr. Butcher's article is also of steel. The raw-coal bin, as well as the washed-coal, boiler-coal, and refuse bins, are of timber construction throughout, lined with steel and provided with suitable gates for the discharge of materials. The washer building is amply provided with windows and is well ventilated, insuring good working conditions.

The performance of the plant from the standpoint of efficiency and economy has been previously mentioned. Its simplicity is one of its great redeeming features. The writer was identified in an engineering capacity with the design, construction and starting of the plant.

⁂

A Recognition of Deserving Service

No industry can boast bigger and better men than coal mining. There are a number among us who have labored faithfully and efficiently in the mining business, without any recognition other than that of a purely local nature. Pick out a man of this type and send us immediately a short story about him, including if possible a photo of the person himself. The man, his friends and family will much appreciate such a tribute to high character and superior ability. The article will go in our SUCCESS number and must be sent to us within three or four days.

The Labor Situation

SYNOPSIS—The eastern Ohio miners exhibit the firmest determination not to arbitrate or concede anything to the operators. A strike in eastern Kentucky is threatening, a cut of 20 per cent. having been made by the Middle Creek Coal Co.

The storm center is still Ohio. The union reluctantly finds that it cannot finance more than one such center; in fact the Ohio difficulty is a terrible strain on a limited purse. The union has already paid over $1,380,000 in Ohio to the strikers, and the payments still being made amount to $40,000 a week. In addition to these union contributions, 75 carloads of clothing, food and other supplies have been shipped in from the cities in which these goods were solicited.

Carried Almost Unanimously

But what can be done to end a strike where the men are such a unit in their determination! At the recent referendum 118 voted for arbitration and 14,280 against such action. Three small locals at Flushing, a large one at Crescent and a small one at Warnock, all in Belmont County favored arbitration by a small majority. But out of 79 locals, only the 5 mentioned voted for arbitration, 10 (which were working) did not vote, and 62 stood out for the 47c. basis. From two others the returns have not yet been received.

The operators declare that those men who were opposed to arbitration were the only persons notified of the proposed vote, but the number of votes cast, which is not far from 100 per cent. of the possible ballot, makes this complaint feeble. The sentiment is, of course, not so strong as the vote. Majorities tend always to unanimities. Few men wish to oppose their convictions to a strong body of contrary opinion.

The Operators Who Have Received Concessions Favor the Green Act

The Gallagher amendment to the Green anti-screen bill has been certified to the state house of representatives. It is now in the committee on mines and mining, and sentiment seems to favor its passage. The miners' leaders are starting a vigorous campaign through the state for the defeat of the amendment.

In order to prevent the miners from permitting any amendment to the Green Antiscreen Act, J. S. Jones, president of the Sunday Creek Co., which is one of the largest producers in the state of Ohio and has no mines in the eastern Ohio district has notified Percy Tetlow, the miners' legislative agent, that in case the house adopts the Gallagher amendment and it becomes law with the emergency clause attached, he will close down his mines unless his men will accept a reduction of 2.39c. on the wage scale adopted last August.

It is evident that the Sunday Creek Co. recognizes that the 47c. rate in the eastern Ohio field would be an increase of 2.39c. over the old screen rate. It realizes that such an increase gives the companies in other parts of the state an advantage, which it regards as already secured and which it desires not to lose by the repeal of legislation.

Rumored Defections of Operators

There appears to be considerable doubt as to the intentions of Arthur T. Morgan at the Edgehill mine. It is stated that no contract has been signed and that all the operations of the 15 men at this mine constitute merely cleaning work, such as was commenced some time ago at the Big Run and the Fort Pitt mines and was stopped later by the union.

Now the Blyth Coal Co., at Salt Run, is similarly reported to be about to sign a contract on the 47c. basis. It employs about 100 employees. C. J. Albasin, the president of the subdistrict, says that yet another coal company has asked for a form of contract.

To prove that the miners are supporting their leaders, the vote for president, vice-president and secretary-treasurer of the subdistrict in which the strike is centered may be quoted. C. J. Albasin, William Roy and William Applegarth who respectively filled the positions mentioned for the past term have been reëlected, meeting absolutely no opposition, though the vote was not large, being only 6059 out of a membership of about 17,000.

The Eastern Kentucky Strife

The Middle Creek Coal Co., the largest concern in Floyd County, eastern Kentucky, has decided on a 20 per cent. reduction in wages. The Colonial Coal & Coke Co., the next largest operator in that county, has made the same reduction and a strike has resulted. The men in that district are mostly American and non-union. If, as has been expected, other companies make an equal reduction in wages, a widespread strike may result.

An Agreement Sought in New River District

The directors of the New River Co., and the New River & Pocahontas Consolidated Coal Co. desired Thomas Haggerty and Joseph Vasey, members of the international executive board of the United Mine Workers to come to New York City for the purpose of discussing the terms of an agreement. The meetings at Cincinnati, Ohio, and Charleston, W. Va., had been a failure. The two labor leaders left Charleston on Mar. 9. The result of their deliberations has not been announced.

Convention in Arkansas

A convention is proposed in District 21, comprising Arkansas, Oklahoma and Texas. This convention is to consider the purchase of the Bache-Denman property. Five locals near Hartford have voted in favor of the purchase, and others are expected to do so shortly.

Several unions are voting to assess their members from 25 to 50c. per month for the benefit of the families of the men who were sent to jail in the government's conspiracy cases. The sentences imposed on these men were for violence and contempt of court arising out of the attempt of the Bache-Denman Coal Co. to run an open-shop mine.

An agreement has to be signed with the Blue Ridge Coal Co., which intends operating the mines of the old San Bois Coal Co., which had, as our readers will remember, a terrible explosion at its Chant mine, which appears to have been the cause of its troubles. This agreement will probably be elaborated at the convention proposed.

⁂

The Rocky Mountain Coal Mining Institute Will Hold Summer Meeting

The Rocky Mountain Coal Mining Institute will resume its meetings, holding the next one in Trinidad, Colo., June 8, 9 and 10, 1915. The following committees have been appointed: Program and entertainment—W. F. Murray, J. P. Thomas and M. O. Danford, all of Trinidad, Colo. Transportation—Wyoming, Frank Manley and P. J. Quealy; Utah, W. C. Ferguson and A. C. Watts; New Mexico, G. A. Kaseman and T. H. O'Brien; Colorado, W. J. Murray and C. W. Babcock. F. W. Whiteside, Denver, Colo., is secretary-treasurer.

Recent Legal Decisions

Scope of Mine Safety Law—A law, such as is in force in Missouri, making coal operators liable for injuries to employees, caused by negligence of coemployees, does not extend to men engaged in sinking prospect holes. (Kansas City Court of Appeals, Allen vs. Leach, 171 "Southwestern Reporter," 9.)

Personal Injury Verdict Not Excessive—Seven thousand three hundred and thirty-four dollars cannot be deemed excessive recovery for injury to a miner caused by a fall of slate, if he was thereby incapacitated for work through hardening of the muscles of his back, partial paralysis of his legs and disarrangement of his internal organs, he having previously earned $4 or $5 a day. (Kentucky Court of Appeals; New Bell Jellico Coal Co. vs. Sowders, 172 Southwestern Reporter, 914.)

Misunderstanding as to Price of Coal—When the parties to a contract for a sale of coal or other commodity really misunderstand the price at which the sale is made, the same not being expressed in writing, and the buyer receives and uses the property, after ascertaining from invoices that the seller claims a larger price than the buyer understood was fixed, he becomes liable for the invoice price, according to the decision of the Kentucky Court of Appeals, announced in the case of Caldwell & Drake vs. Cunningham, 172 "Southwestern Reporter," 498. But where it appears that a certain price was mutually agreed upon, the buyer's acceptance of shipments under invoices calling for a higher price does not render the buyer liable for more than the contract price.

"A Statement of Facts" from the Operators of the Middle West

SYNOPSIS—The operators of Indiana and Illinois state that the present competitive system produces a series of public and private ills, and they advocate some manner of regulation, the nature of which, however, is not specified.

The coal operators of the States of Indiana and Illinois present herewith to the American nation some facts about the condition of their business. The normal state of the coal industry for some years has been such as to endanger the lives of the miners, to waste the coal reserve which now insures the continued prosperity of the eastern part of the country and to deprive these operators of any hope of profit. The recent general business depression has intensified this dangerous condition. The near future contains nothing but disaster unless some relief is extended. What follows summarizes the facts.

The coal produced in Illinois and Indiana sells in an interstate market embracing 18 states. For that reason, the operators who produce it are amenable to the antitrust laws which, they believe, forbid any coöperation among them. Because they cannot coöperate, they cannot simplify their selling methods or reduce their selling and operating costs.

Their mines are within the two states mentioned and cannot be removed therefrom. These states will continue therefore to regulate their operating methods.

COST INCREASES WHILE PRICE DECLINES

The effect of the nation's anti-trust laws is to cause the operators to compete without restraint. This unrestricted competition has resulted in a decreasing selling price. On the other hand, the states' laws, which were enacted to assure the safety and the social welfare of the miners, have resulted in a rising production cost and in increased expenditures for equipment. In obedience to the states' laws, the mines have been fireproofed and expensive safety appliances have been added. These things have enlarged the requisite investment in plant and equipment by 1000 per cent. in the last 20 years.

The effects of these two sets of laws have moved in opposite directions. The rising cost of production and the falling selling price have long since made profit impossible and now threaten the integrity of the whole business structure as well as the safety of the miners and the welfare of the public.

One of the refinements of competition in which these operators have indulged has been the erection of elaborate plants with which to prepare and clean carefully nine standard sizes of coal.

Another effect of enforced competition has been intense individualism. In consequence, three mines have been opened where only two were needed, and three men have been employed where only two were necessary. These mines and men can find productive work only during 175 instead of a possible 300 days in a year.

THE MARGIN BETWEEN SELLING AND LABOR COSTS

Because the operators can give their miners work only a part of the time, these operators must pay higher daily wages than are warranted by the current selling prices. Their labor cost is 92.44c. per ton, whereas the selling price is but $1.14 and $1.11 respectively for the States of Illinois and Indiana.

From the resulting narrow margin these operators must pay administrative salaries and expenses, selling cost, royalty or land-depletion charge, depreciation on plant and equipment, the cost of all materials used in the mines and some eight or ten other major items of expense. The margin is clearly wiped out by these expenditures, and thus the business is left with no possible net revenue.

Still, these operators are morally or legally obligated to pay the cost of any great or dire emergencies, to educate their miners in ways which will assure greater safety, to educate the users in methods by which coal can be burned with greater efficiency, to expand their sales into the foreign markets, to experiment with and undertake the manufacture of byproducts and to do those hundreds of little things which make for greater safety and for true conservation.

WASTE OF COAL

One obligation resting upon these operators is to recover the pillar and top coal that the loss to the country may be lessened. Because this involves an additional expense, it cannot be undertaken. Still, for every two acres of coal land which the operations exhaust they leave one acre of coal unrecovered and unrecoverable in the ground. This means that in Illinois each year 12,000 acres of coal land are exhausted, whereas the exhaustion should be but 8000 acres. In Indiana the depletion is 3000 acres, whereas it should not be more than 2000. In the whole country 100,000 acres are exhausted, whereas not more than 65,000 or 70,000 acres should have been thus made of no mineral value.

The operators of Illinois and Indiana, caught between the conflicting regulations of the states and the nation, yet under compulsion to obey both, are powerless to prevent this waste. Only the nation can reverse this tendency and provide against it. This statement is made in the hope that some suggestion will be made which will bring the relief needed.

PROSPERITY OF FARMERS AND MANUFACTURERS

It has been said that the normal condition of the coal-mining industry is one of dangerous financial exhaustion. Since the end of the depression in 1897 the farms and factories have enjoyed increasing prosperity. This has not been shared at any time or in any degree by the coal industry. Regardless of the regular and substantial annual increase in tonnage produced, the returns from investments in the coal trade have been steadily diminishing. Coal has supplied the power which made every business rich, yet the author of all this wealth remains poor.

In fact, in the last dozen years there have been but a few brief periods in which the coal trade has enjoyed any prosperity. These prevailed in each instance for not to exceed two or three months. They were due to wholly unnatural causes and in no manner indicated that the business had, at last, become master in its own house.

For example, the operators of Illinois and Indiana received remunerative prices during the anthracite strike of 1902 when they profited by the misfortunes of others. For short periods during car shortage in the winters of 1903 and 1904, this experience was duplicated. Once or twice since that time, strikes or other temporary labor difficulties in one state gave the other states business to which they had no natural right. Except in such times, the trade has been unprofitable or actually showed a loss.

Why Costs of Production Have Risen

Meanwhile there has been a steady increase in operating and administrative expense due to repeated advances in labor cost; to the increased cost of material, such as rails, timber, cement and machinery; to the passage of laws in behalf of the workers such as the safety measures and the Workmen's Compensation Act in Illinois, and to the increased cost of making sales, arising from unrestricted competition.

The Cost of Production

According to the figures compiled by the Bureau of the Census, the amount paid in wages was, in 1909, above 80 per cent. of the total selling value of coal at the mine mouth. Since 1909 there have been granted two wage increases—one in 1910 of 5.55 per cent. and another in 1912 of 5.26 per cent. These increases have brought the wage cost per ton of coal produced to 92.44c. in 1913.

DISTRIBUTED COST AND SELLING PRICE OF COAL WITH OTHER DETAILS, UNITED STATES CENSUS OF ILLINOIS AND INDIANA 1909

State	Number of Operators		Gross Capital and Capital per Ton of Product	Expenses						Number of Wage Earners	Coal Produced, Including Coal Coked at Mines	
				Total	Salaries	Wages	Supplies	Royalties	Miscellaneous Expenses		Value Including Minor Products	Tons (2,000 lb.)
Illinois......	470		$75,257,667	$51,697,504	$2,083,668	$41,991,246	$4,944,371	$744,860	$1,933,359	74,445	$53,030,545	50,570,503
		per ton	$1.488	$1.024	$0.041	$0.832	$0.0977	$0.014	$0.038		$1.05	
Indiana......	223		35,937,961	14,906,831	604,111	12,273,544	1,198,974	240,494	589,708	22,357	15,018,123	14,723,231
		per ton	$2.441	$1.012	$0.041	$0.834	$0.0815	$0.0163	$0.040		$1.02	

COMPARATIVE DISTRIBUTED COST AND SELLING PRICE OF COAL IN 1889 AND 1909 IN ILLINOIS AND INDIANA

State	Census		Gross Capital and Capital per Ton of Product	Expenses				Value at Mines	Tons (2,000 lb.)	Wage Ratio to Value
				Total	Wages	Supplies	Contract Work			
Illinois......	1909		$75,257,667	$51,697,504	$41,991,246	$4,944,371	$51,480	$52,999,918	50,570,503	79%
		per ton	$1.488	$1.024	$0.832	$0.0977	$0.0001	$1.048		
	1889		17,630,351	10,366,069	8,111,253	966,927	26,662	11,755,203	12,104,272	69%
		per ton	$1.457	$0.856	$0.670	$0.0799	$0.002	$0.097		
Indiana......	1909		35,937,961	14,906,831	12,273,544	1,198,974	10,674	14,984,616	14,723,231	81%
		per ton	$2.441	$1.012	$0.834	$0.0815	$0.0007	$1.018		
	1889		3,435,703	2,581,669	2,045,641	241,094	5,807	2,887,852	2,845,057	70%
		per ton	$1.207	$0.906	$0.718	$0.0847	$0.0002	$1.015		

In 1913 the average selling price of coal at the mines in Illinois was $1.14 and in Indiana $1.11 per ton. This leaves a margin of only 21.6c. in Illinois and 18.6c. in Indiana. Out of this must be paid the cost of material used at the mines; the cost of making sales; all officers' salaries; general expenses; insurance (liability, fire, storm, etc.): taxes (including tax on plant and mineral rights); interest on the investment; depreciation of plant; royalties or charges for the exhaustion of coal.

Three Cents or Less for Interest and Amortization

The last report of the Bureau of the Census (1909) showed that, without allowing for any interest charge on the investment or for amortization of property, the so called net returns in Illinois and Indiana were only 3c. per ton in Illinois and less than 1c. per ton in Indiana.

The average royalty paid, however, in these two states on coal recovered under lease is 5c. per ton, and the average present valuation of coal land is such as to require a minimum amortization charge of 3c. per ton to recover such land value within the period of the mine's life. It will therefore be seen that in even so good a year as 1913 an actual profit return was impossible. As existing facts show, the industry sustained a substantial deficit in these two states.

A considerable addition to the cost of production is caused by the idle time of the mines, during which all overhead and some labor costs must be paid. The average number of productive days worked per annum in these two states is only about 175 out of a possible 300 or more. This idle time of the miners is not confined to one season or period during which they can find employment elsewhere. The men are always subject to call, for which reason they urge a greater daily wage so that their annual income may be sufficient for their needs. This causes these operators to grant abnormal wage advances, which are directly reflected in coal cost.

A Mining Year Has Only 1400 Hours

Many industrial plants which produce standard or basic commodities find it possible to operate 24 hr. per day by using different shifts of men. They work also for 310 or more days a year, or a total of 7440 hr. per annum. Still other industries, on two 8- or 10-hr. shifts per 24 hr. work 300 to 310 days per year, thus operating 5000 to 6000 hr. every 12 months.

Even one 8-hr. shift in each 24-hr. period with 310 days per year gives 2480 working hours in every 12 months. Because of the unrestricted competition the mine operators of Illinois and Indiana have built more plants than are needed and can only operate for 8 hr. out of every 24, and for 175 days per year, or 1400 hours.

It will be seen, therefore, that as against 100-per cent. plant utilization (24 hr. for 310 days or 7440 hr. per annum) possible in some industries, and as against an average by all industries of 33 per cent. to 45 per cent. (one 8- or 10-hr. shift per 24-hr. period for 310 days), a coal plant is in actual productive use only about 18 per cent. of the time. This makes plant, interest and depreciation charges six times as heavy as for some other industries.

Miners Lose $371 per Year

In addition to ruining the operators, this distresses the miners. For example, the 97,000 miners of Illinois and Indiana who are prevented from working 125 days per year might at the present wage have earned an additional $36,400,000, or $371 per man per year, had their employers been able to give them work or had their efforts been expended in other directions.

The present markets for Illinois and Indiana coal can be supplied by 60 per cent. of the mines now being operated. The interest on the surplus capital invested in these unnecessary mines adds to the cost of production in each.

That labor concurs in this point of view is shown by testimony given by Duncan McDonald, secretary-treasurer of the United Mine Workers of America, in Illinois at a hearing held in Chicago in the latter part of July, 1914, before the U. S. Commission on Industrial Relations.

The Consequences of This Waste

Having shown the cost of mining coal and having compared it with the revenue from its sale, it remains to measure the consequences of the present low prices.

In Bulletin 47 of the United States Bureau of Mines, Dr. J. A. Holmes, Director of the Bureau, states:

> During the past year (1911) in producing 500,000,000 tons of coal we wasted or left underground in such a condition that it will probably not be recovered in the future 250,000,000 tons of coal. In a higher way, our mineral resources should be regarded as property to be held in trust with regard to both the present and future needs of the country. Neither human labor nor human agency has contributed to their intrinsic value and whatever rights the individual may possess have been derived from the general government. The government does not surrender its right, and should not neglect its duty to safeguard the welfare of its future citizens by preventing the waste of these resources.

It is customary to say that the mining of coal is an extractive industry. The phraseology is too weak; it must be considered as a destructive industry. That is to say, each ton of coal removed destroys by just that much the value of the plant engaged in producing it. Also, it destroys by that much the country's coal reserve. Coal once mined or lost can never be replaced. With the life of several of the large coal deposits well defined and with the end not extremely remote, the deliberate waste of coal by the mining methods now in use constitutes an immediate menace. When these operators have under the best market conditions no margin above cost they can work only the choicest areas, and the removal of thinner or inferior parts which must be effected at a much higher cost per ton is out of question. This will be explained briefly.

Why Coal Is Lost

The major portion of the thick-seam coal in Illinois and Indiana is recovered by the so called room-and-pillar method, the work advancing toward the boundaries of the controlled area from the shaft bottom. By such method pillars of coal of sufficient size to sustain the overlying weight are left standing 25 to 40 ft. apart. Also all coal above certain well-defined lines of parting in the seam is left up to protect the roof until the boundaries of the acreage have been reached.

These pillars and the so called top coal are supposed to be recovered as the work is carried back to the bottom of the shaft. In actual practice, however, this is seldom or never done. Thus the actual coal recovery from any given acreage seldom exceeds 50 per cent. of the total amount in the seam out of a possible 90 to 95 per cent. available by proper mining practice, and for this reason: As the distance from the shaft increases, the expense of haulage and road maintenance becomes also greater. Also the hazard from gas and the loss from mine falls increase. Likewise, in working backward to the shaft the quality of the coal secured is impaired by reason of its becoming mixed with the accumulated refuse of earlier work. Therefore, all these valuable areas are simply abandoned, because the operator cannot afford to pay the extra cost of reclaiming this coal.

It also occurs at various places that substantial bodies of coal lie between the boundary lines of two approximately adjoining mines. The extra haulage cost to either shaft, for the removal of this intermediate coal (although only a few cents), cannot be borne without operating loss. Such areas are therefore entirely neglected and cannot later be recovered because the amount of coal available would not justify the development of a new mine to reach them.

Taxation as Another Cause of Loss

Although not strictly germane to the subject in hand, mineral-land taxation is an indirect cause of waste. Many operating companies hesitate to secure as large areas as might be economically available to their shafts because they wish to avoid unwarranted tax payments through a long period of years. They prefer to let title to such additional acreage rest with the farmer or other owner who uses only the surface and who, while so using it, does not pay any tax on the underlying coal. Later, it frequently occurs that such an original owner, with an unreasonable notion of the value of his coal rights, makes purchase impossible through his demands for an excessive price. This coal also is abandoned along with the adjoining worked-out area.

This waste of coal should concern the Eastern and Central States sufficiently to cause some relief to be extended to these operators. It is to the country's interest to see that they get enough money to make recovery reasonably complete.

Social Consequences of Loss

Aside from the economic waste mentioned herein, the loss of revenue has serious social consequences. The continuous and prolonged lack of any profit in the coal industry makes it impossible for these operators to furnish, in all instances, the necessary safeguards to make mining even a relatively safe occupation.

It has also occasioned the rejection by many of the provisions of the Illinois Workmen's Compensation Act. That is to say, coal companies without current net earnings or any sort of reserve resources are not willing to assume such additional definite obligations as the law proposes, to make provision for the injured workman and his family or even to obligate themselves to make incidental payments of any kind.

Necessity compels them to rest their hope on the throw of chance in a judicial hearing. They rely on a court's decree to leave them something of their capital, whereas if they worked under this law they might as well have no capital for all the return they can hope to get upon it.

For this reason, the anticipated value and beneficent purpose of such legislation are clearly nullified. And until, by common consent, the conditions detailed in this statement of fact have been ameliorated, further effort taking the form of additional legislation, however worthy, rational or desirable, will prove similarly abortive and futile.

Coal and Regulation of Business

For a part of the present disastrous condition of their industry the coal operators are, perhaps, themselves responsible. They have not organized their business as many other industries have done. However, with the stringent anti-trust laws of the states and the Sherman Act confronting them, much uncertainty has existed and still exists as to what the various laws permit. Because of this doubt no concerted action has been taken. During the period of waiting for some new light on the laws, many operators have hoped that some solution would come and that they might survive until the dawn, while competitors would fail.

They have been discouraged by the severity of judicial rebuke which has, throughout the last several years, followed many community efforts in other industries. These operators have, therefore, done nothing, but are now prepared to defend their claim to just consideration and a fair return. They do this not alone for selfish reasons but because they want to make appropriate provisions for conserving natural resources and to grant their workers physical and social comforts beyond those now possible.

The recent passage of certain acts, which may with propriety be called enabling laws, encourages these operators to believe that public sentiment has so changed that a possible opportunity to secure relief presents itself. They therefore submit this statement.

Hope in the Trades Commission

Their hope is that the Trades Commission may be the governmental means through which the nation will ultimately be thoroughly enlightened regarding the absolute equities of their industry. They further believe that, on account of its extent and importance, they are warranted in urging as a first consideration that one of the members of this Trades Commission shall be a capable, experienced man, who is familiar with mining conditions and requirements, is acceptable to the coal industry and who can bring to the commission sound judgment on all matters affecting these interests.

They also hope that through this commission, or upon the sanctioned initiative of the operators themselves, the remedy for present conditions which is evidently necessary may be immediately applied. The propriety of such a remedial plan should be determined later by an appropriate agency of the Federal Government.

Two Kinds of Collective Bargaining

There is no desire now or hereafter to establish a coal monopoly. Much less is there a desire among these operators to extort unreasonable profits. But they consider it vitally essential to stabilize the industry for the benefit alike of the workmen, the consumers and investors. It is, they believe, reasonable to assume that as long as the Government sustains and encourages the principle of collective action—as evidenced by the exemption of labor unions from anti-trust measures—it would also sanction a plan enabling coal operators to coöperate in a similarly legitimate way. Particularly do they hope this might be permitted if appropriate and definite governmental control were included to the extent, at least, of permitting all such activities to be known to the public and provided that sufficient and ample penalties be imposed for the violation of all such rules, agreements or laws as may be devised to regulate such collective actions.

Coal operators would not object to, but on the contrary would invite, such publicity and supervision.

The Purchasers Combine and the Sellers Must

This suggestion is particularly pertinent for this reason. On every hand these coal operators are confronted by combined purchasing agencies to which they sell their coal and by unionized workmen from whom they buy their labor. Thus situated, these operators are obviously at a disadvantage, for while they are disorganized as herein stated, both their buying and their selling are done with collective or coöperating units.

Other industries enjoy a degree of encouragement and protection by the Government which is denied the coal-mining industry. In volume of business, mining is approximately one-half that of agriculture; these major industries are alike in that both work the land in recovering vital necessities for the public use. Yet, regardless of the fact that the exhaustion of the mineral deposits is irremediable, while the loss of soil fertility and productiveness can be overcome, the United States spends only one twenty-fourth as much to promote the mining industry as to help agriculture. Intimately affecting, as it does, the lives and welfare of all our citizens, the coal industry deserves and should receive at the hands of our lawmakers attention proportionate to its importance.

Farmers Are Aided and Coal Men Restrained

The publications of the United States Geological Survey and the Bureau of Mines, while helpful in the physical operation of properties, do not contain statistics such as are furnished by the Agricultural Department dealing with costs, values and distribution. The appropriations are entirely too small.

When the Southern cotton growers suddenly found their market demoralized by the European war, prompt investigations were made and assistance rendered. Whatever the major sentiment or opinion may be with reference to the propriety and warrant of such help so extended, the fact remains that, however bad and unfortunate this situation may be, it is still not so serious, except perhaps as to the number of persons immediately involved, as the present coal-producing situation. Nor is it as threatening to the general welfare. For even though all the present cotton crop be lost and return no value whatever, the land remains and later crops are possible. With coal removal or waste, the land is exhausted of such value permanently, and the serviceability and use of a coal-mining plant is not, as with the land, perennial.

Coöperation would not only greatly benefit the workmen and investors in the coal business, but would encourage the establishment of other industries now sorely needed in this country.

Without Capital Industry Cannot Progress

For example, the necessity for the establishment of byproduct and coking plants is evident. The utilization of sulphate of ammonia for fertilizer, creosote oil for timber treatment and the products of coal tar for industrial and pharmaceutical purposes is too well known to require further reference. Over $12,000,000 was paid last year for coal-tar products imported from abroad. Of the 95,000,000 gal. of creosote oil consumed in the treatment of ties and timber, 60,000,000 gal. were imported. Of the 44,000,000 tons of coke manufactured in the United States in 1912, 33,000,000 tons were made in beehive ovens and the waste in smoke was over $50,000,000.

It is only through coöperation that the coal operators can get together the money needed to establish the coking and byproduct industry on a proper basis in this country. That is to say, the coal man is the proper producer of these byproducts, but he cannot make them because he has not the capital and cannot get it because his business is so disorganized that he has no longer any credit.

Combined Pitot Tube and Multiplying Manometer

Much interest has recently attached to the measurement of the velocities and pressures of air currents circulating in airways and conduits; and in this connection the following brief description of a combined Pitot tube of improved pattern and a multiplying manometer having a direct-reading dial will be of interest to both mining and mechanical engineers who have occasion to take such measurements.

The original form of this instrument, which was designed by the engineers of the Davis Instrument Manufacturing Co., Inc., of Baltimore, Md., is shown in Fig. 1, together with the bracket attachment that can be made in any desired form and of any required dimensions and which enables the observer to make any desired adjustment of the tube in the airway, conduit or draft pipe. The dial shown in Fig. 1, requiring the gage reading to be multiplied a specified number of times, according to the inclination of the gage, will soon be replaced by a direct-reading dial, the design of J. T. Beard, Jr., a mechanical engineer.

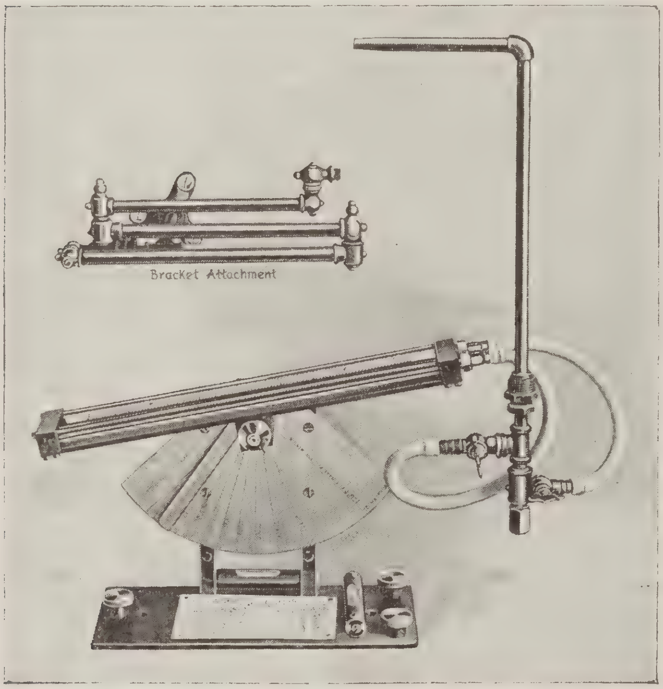

Fig. 1. The Davis Combined Pitot Tube and Multiplying Manometer

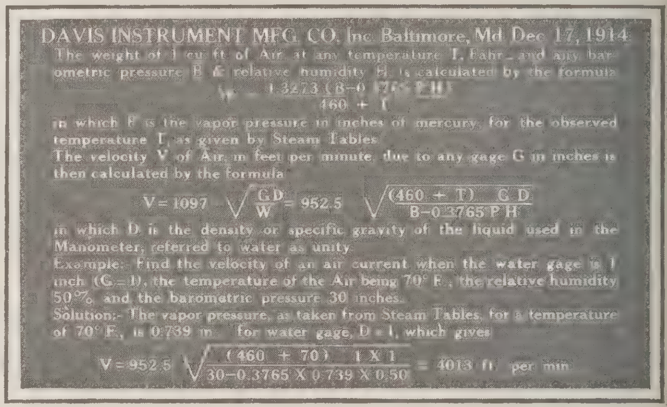
After a careful study of the different forms of the well known Pitot tube, the manufacturers of this instrument selected that form of tube which yielded, by experiment, the most uniform and reliable results in the measurement of both pressure and velocity of circulating air currents. Neither time nor money has been spared in the endeavor to produce an instrument that would give accurate and reliable readings and preserve the most serviceable and compact form of the instrument. For this purpose, the form of gage adopted was that known as the multiplying draft gage, in which the reading scale is multiplied any number of times according to the inclination of the gage. By the use of liquids of different densities, also, it is possible to still further increase the accuracy of the gage reading.

To enable the ready calculation of the velocity of the air current from the observed gage reading, a brass plate, Fig. 2, was especially prepared and attached to each instrument, giving the formulas for the calculation of the weight in pounds per cubic foot, for different barometric pressures, temperatures and degrees of humidity of the air, and the corresponding velocity of the air current for different gage readings and liquids of different densities used in the gage. By the use of these formulas, the calculation of the velocity of the current for varying conditions is made quite simple.



DAVIS INSTRUMENT MFG. CO. Inc. Baltimore, Md. Dec. 17, 1914

The weight of 1 cu. ft. of Air at any temperature T, Fahr., and any barometric pressure B & relative humidity H, is calculated by the formula

$$W = \frac{1.3273\,(B - 0.3765\,P\,H)}{460 + T}$$

in which P is the vapor pressure in inches of mercury, for the observed temperature T, as given by Steam Tables.

The velocity V of Air in feet per minute, due to any gage G in inches is then calculated by the formula

$$V = 1097\sqrt{\frac{G\,D}{W}} = 952.5\sqrt{\frac{(460 + T)\quad G\,D}{B - 0.3765\,P\,H}}$$

in which D is the density or specific gravity of the liquid used in the Manometer, referred to water as unity.

Example: Find the velocity of an air current when the water gage is 1 inch (G = 1), the temperature of the Air being 70° F., the relative humidity 50%, and the barometric pressure 30 inches.

Solution:- The vapor pressure, as taken from Steam Tables, for a temperature of 70° F., is 0.739 in. For water gage, D = 1, which gives

$$V = 952.5\sqrt{\frac{(460 + 70)\quad 1 \times 1}{30 - 0.3765 \times 0.739 \times 0.50}} = 4013 \text{ ft. per min.}$$

Fig. 2. Plate Attached to the Instrument for Calculating the Velocity of the Current

The direct-reading dial designed by J. T. Beard, Jr., is shown in Fig. 3, and will need but a brief explanation. Referring to the diagram shown on the left of the figure, the line *Aa* indicates the position of the vertical gage, which may here be supposed to be calibrated for a length of 10 in. and pivoted at its center, corresponding to *O* in the diagram. It is evident that if the gage now be inclined to the position indicated by the line *Bb,* the 10 in. of the inclined-gage scale would correspond to a head of 8 in., indicated by the vertical line *Bx.* In other words, for this inclination, the true gage is 8/10 of the reading on the gage scale.

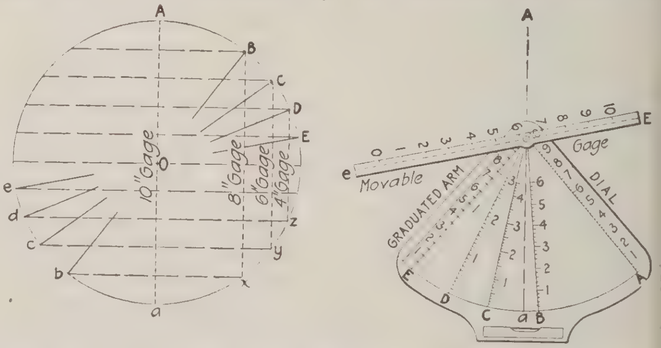


Fig. 3. Diagram Explaining the Direct-Reading Dial

In like manner, when the gage is inclined to the position indicated by the line *Cc,* the true gage is 6/10 of the reading of the gage scale; and, for the position indicated by the line *Dd,* the true gage is 4/10 of the reading of the gage scale. To illustrate, suppose that the gage is inclined to the position indicated by the line *Cc,* and the reading on the gage scale is 5 in. In this case, the true head or gage is only 0.6 × 5 = 3 in.

Now, utilizing this principle, it is possible to construct a dial, as shown on the right in Fig. 3, such that the graduated arm attached to the gage and moving with it can be read on different scales marked on the dial and graduated to correspond to the different inclinations of the gage. The letters in the right-hand figure correspond to those in the left-hand diagram. It is important to notice, however, that the gage on the right of the figure, which is shown in the position *Ee*, is not necessarily pivoted at its center but can be swung at any convenient point of its length. Also, the length of the graduated arm fixed to the gage and the radial length of the dial can be anything desired, provided the graduations correspond in number to those on the gage scale. While the gage scale is made to read exact inches of gage, it is only necessary that the graduations of the fixed arm and those of the dial should be proportional.

In the figure, the dial is shown as having five graduated scales, *A*, *B*, *C*, *D* and *E*. When the gage is in a vertical position corresponding to the line *Aa*, the graduated arm will correspond to the dial scale *A*, the graduations of which are equal to those on the arm. The graduations of the dial scale *B* are 8/10 in number of those on the arm; those on the scale *C*, 6/10 of those on the arm; those on the scale *D*, 4/10; and those on the scale *E*, 2/10 in number of the graduations on the arm.

It will be observed from this that an actual gage reading of 5 in. on the gage scale when the gage is in the position *Ee* reads, on the dial scale *E*, simply 1 in., which is therefore the true gage. In like manner, the true gage for any observed gage reading and any inclination of the gage marked on the dial can be read directly from the corresponding dial scale. This makes the most convenient direct-reading, multiplying manometer that has yet been designed.

The instrument must be seen and used to be fully appreciated, as its fine workmanship and delicate adjustments recommend it to the engineer engaged in making accurate fan tests or running boiler tests requiring the careful determination of the velocity of flue gases, and in all determinations of the velocity of air or gas in conduits or airways. The manufacturers are working to produce a dial that will read at once the velocity of the current in feet per second and the pressure in pounds per square foot or ounces per square inch, for all probable atmospheric conditions of temperature, pressure and humidity and for a liquid of any specific gravity.

Effects of the European War on Our Export Trade--II

By J. S. Burrows[*]

SYNOPSIS—The second installment of this article makes a critical analysis of conditions in Great Britain as regards production, consumption and exports. As the predominating figure in the world's coal markets, the situation in that country will be a controlling factor in the future trade. The author points out the fact that even should we obtain the entire South American business the tonnage involved is not great enough to influence our markets as a whole.

It is quite generally known that England, the second largest coal producer in the world, is the principal coal-exporting country, about 50 per cent. of the world's export coal coming from her mines. Naturally, therefore, she is the pacemaker in international competition, and to a large extent the export trade of other countries depends upon what England is or is not able to do. Through her virtual control of merchant shipping, ownership of extensive and varied industrial enterprises all over the world, and her dominance of international finance and banking she holds her trade by more than one means.

Some Problems of the British Coal Industry

Those who write or talk on the export question needs must look to English experience and statistics for their data, and the subject of the English export trade has been of late thoroughly covered in the press. Occasionally a writer appears who tells us that the British coal production has reached its maximum and must now decline, giving America the long-looked-for opportunity to take her rightful place as the dominant coal exporter of the world. Such a view only amuses the Englishman who, with his more intimate knowledge of the subject, sees other sides to the question than the mere matter of output curves. It should be evident that the English coal fields are nearer exhaustion than those of the United States, but to advance this fact as an argument for increased coal exports from this country is to deal in distant futures that do not affect the current situation in any way.

The real problem in British coal mining is the increasing cost of labor, which, after all, is only one of the items that combine to make up the selling price of coal. We have ample evidence at home, as well as elsewhere, that in considering export prices, the burden of an extra expense can be taken off the product and placed elsewhere to gain a needed advantage.

Great Britain's normal coal production is indicated by the following outputs for the four years preceding 1914:

TABLE 6—ANNUAL PRODUCTION OF COAL IN GREAT BRITAIN

Year	Gross Tons	Year	Gross Tons
1910	264,433,000	1912	260,398,000
1911	271,892,000	1913	287,412,000

In the general table of the world's coal production, her annual output is given as 287 million tons. It is now of interest to estimate to what extent this production is likely to be affected by the war, in which we are fortunate in having some figures already made by Messrs. Davies & Hailey, of Cardiff.

These statisticians estimate that about one million men are engaged in coal mining in the United Kingdom, and that they represent 9 per cent. of all the industrial workers. They further estimate that fully one and one-half million laborers have answered the call to the colors.

---

[*] Fuel expert, Castner, Curran & Bullitt, Norfolk, Va.

and that the proportion of these men already taken from the mines, as well as those who will enlist during the year, will result in a reduction of 20 per cent. of the total mine labor. It is estimated that this will decrease the British production about 53 million tons, making the available supply 214 million tons per annum instead of the normal 267 tons.*

British Exports and Consumption

About one-fourth of the total British coal production is shipped to foreign markets; the actual exports for the past two years and for the first six months of 1914 were as follows:

TABLE 7—TOTAL EXPORTS OF COAL FROM GREAT BRITAIN

Year	Gross Tons	Year	Gross Tons
1912	64,445,000	1913*	35,526,000
1913	73,400,000	1914*	34,586,000

*Six months to June 30.

Great Britain, it will be seen, requires normally about 75 per cent. of her total production for home consumption, leaving a surplus for export of 25 per cent. The extent to which this surplus will be affected by her reduced output will, of course, depend on the home demand during the war. To again quote Messrs. Davies & Hailey, they estimate the home requirements and the reduction in the same as follows, in gross tons:

TABLE 8—CONSUMPTION OF COAL IN GREAT BRITAIN

Industry	Normal Consumption	%	Consumption for War Period	Reduction, %
Iron, steel, etc.	55,000,000	29	44,000,000	20
Manufacturing	55,000,000	29	44,000,000	20
Railways	13,000,000	7	11,700,000	10
Gas making	16,000,000	9	16,000,000	nil
Domestic	30,000,000	15	30,000,000	nil
Bunkers	21,000,000	11	17,500,000	16
Total	190,000,000	100	163,200,000	..

According to these figures, the reduction in home needs will be something in the neighborhood of 27 million tons. If we deduct the estimated war consumption from the reduced war production of coal (214 million) we have a surplus of 51 million tons, which is about two-thirds of the normal supply of British export coal. The possible disposition of this surplus will be taken up under heading, "The World Demand for Coal."

Chart No. 2 summarizes graphically the exports of British coal, showing the first months of the war compared with two normal years and 1912, the year of the last British strike.

The chart showing monthly exports of British coal from 1911 to 1914 is constructed on a base line which represents the normal average monthly shipments, allowing for the natural increase in tonnage as indicated during the past five years. The black areas above and below this base line represent the tonnage shipped each month above or below normal. The total shipments for any month may be ascertained by reading up from the bottom of the chart, and the excesses or shortages noted, by reading up or down from the normal base line.

The years 1911 and 1913 represent normal conditions, while 1912 is a wonderful illustration of the recuperation of the industry following the miners' strike in March of that year, which is seen in the excess tonnages handled the last half. The year 1914 started out below normal as will be seen from the black areas below the base line, and was just beginning the corresponding excess area above normal in July when interrupted by the war, the full effect of which may be seen in the large black area from August to November, 1914. This shortage represents a falling off in shipments of nearly 50 per cent. and a total of about 11 million tons. We know, however, that the falling off in shipments during the first months of the war was not occasioned by any lack of coal, but was due to an embargo established by the government on certain varieties of coal, which, however, was soon lifted. Later, the shortage is attributable to financial conditions and a decreased demand from all quarters. British exports to various countries are shown herewith in tabular form.

Summary of Conditions in Great Britain

To summarize the supply for the war period, it would appear that while Great Britain will suffer a curtailment in production of about 20 per cent., due to the enlistment of the miners, her decreased consumption will leave available for export purposes at least two-thirds of her normal supply, or about 51 million tons. Out of this surplus, however, must be taken the extra coal, above normal requirements, needed by the allies' fleets. Admiralty shipments in the early stages of the war would indicate that about 10 million tons will be required for this purpose, according to Messrs. Davies & Hailey. In this connection it is well to remember that this tonnage affects only certain mines and will probably take out of the market altogether a large amount of the very best grades of Admiralty Welsh coal.

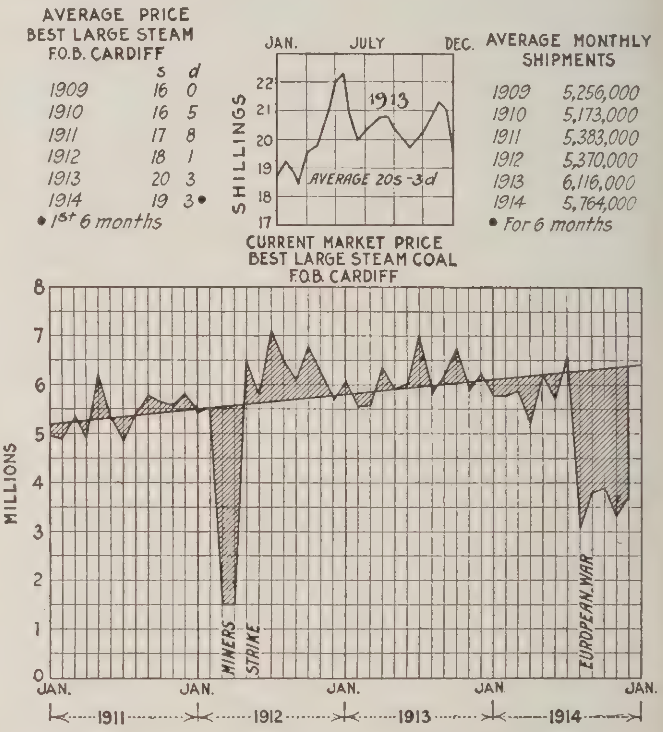

Chart II. British Exports by Months and Market Price of Best Large Coal

Less naval requirements, the surplus of coal available for export purposes appears to be 41 million tons. Thus, so far as Great Britain is concerned, the problem is one of demand and to what extent she will have to care for her allies before having coal available for shipment to neutral markets.

The World Demand for Coal

As before stated, the world's normal coal consumption is about one and one-third billion tons per annum, of

---

*After deducting coal used at mines.

TABLE 9. COAL EXPORT MARKETS OF THE WORLD

(Geographical Groups)

According to Usual British Classification

Trade Group	Normal Demand Foreign Coal Estimated	Loss during War Period	Foreign Suppliers under Normal Conditions	Source of Supply for War Period
North Atlantic:				
Canada, etc., Bermudas, West Indies, Mexico, Central America, Colombia and Venezuela.	20,000,000	20%	Naturally the principal export market of the United States, in which foreign competition is rapidly vanishing.	No interruption to normal source of supply.
South Atlantic Coast: South America, Brazil, Uruguay, Argentine.	6,500,000	25%	Practically a British market which has been repeatedly assailed by American shippers with some success.	A shortage of British coal and, or, interruptions and war risks to British shipping would turn this market entirely to U. S.
Pacific Coast:				
South America, Peru, Ecuador, Chile, Bolivia, North America.	1,250,000	25%	Australian and British coals compete. Some progress made with American coal.	Australian and American coals will compete.
Mexico, U. S. A., Br. Columbia, Alaska.	1,000,000	20%	Australian, British Columbia, Japanese and some English coal compete. A small tonnage of American coal also taken.	No change in source of supply. Probably increase in American shipments due to opening of Panama Canal.
European:				
Russia, Sweden, Iceland, Whale Fisheries, Norway, Denmark, Germany, Holland, Belgium.	55,000,000	50%	British coal competes with German, the latter having lately made great progress against the superior English tonnage at seaboard.	England and Germany will make every effort to supply their allies and neutral countries may have to depend on U. S.
Mediterranean:				
France, Portugal and Azores, Madeira, Spain and Canaries, Gibraltar, Italy, Switzerland, Malta, Egypt, Austria, Hungary, Greece, Bulgaria, Roumania, Turkey, Tripoli, Tunis, Algeria, Morocco, etc.	42,000,000	50%	British coal has virtually held a monopoly on seaboard, although meeting with increasing German competition within recent years. It has been open to American coals at various times and each year sees an increase in shipments from this country.	England and Germany will make every effort to supply their allies and neutral countries on seaboard will have to depend on the U, S.
Africa:				
West Coast, Ascension and St. Helena.	1,000,000	20%	British market opened lately to American coal.	Probable curtailment of British shipments will increase American tonnage.
South Africa:				
East Coast.	250,000	20%	British coal competes under favorable conditions with Natal coal.	Little or no interruption to normal source of supply.
Mauritius, etc., Bourbon, Arabia, Persia, Aden, etc.	250,000	nil	So. Africa and Indian coals compete with comparatively small tonnage British coal.	Little or no interruption to normal source of supply.
Indian Continent	250,000	nil	Australian and Japanese coals compete with Indian coal.	India and Australia can meet all demands.
Far East:				
Ceylon, Straits Settlements, Java, etc., Philippines, Siam, Hong Kong, China, Japan, Australasia, Pacific Islands.	6,000,000	20%	British, Japanese, Australian, and Indian coals compete.	Japan can amply supply and will probably dominate this market.

which about 140 million, or a little more than 10 per cent., is export coal. We have already reviewed the origin of this export coal and we will now examine the markets to which it is shipped and see how they are affected by the war. To do so intelligently necessitates an investigation of both normal times and the extraordinary conditions which obtain during the present abnormal situation.

TABLE 10. COMBINED EXPORTS OF GREAT BRITAIN AND GERMANY

To Neutral Countries

	From Great Britain, Gross Tons	Germany All Fuel, Gross Tons	Total, Tons
Sweden	4,563,000	177,000	4,740,000
Norway	2,298,000	19,000	2,317,000
Denmark	3,034,000	370,000	3,404,000
Netherlands	2,018,000	7,650,000	9,668,000
Portugal (Azores, Madeira)	1,356,000		1,356,000
Spain and Canaries	3,648,000	279,000	3,927,000
Italy	9,647,000	1,197,000	10,844,000
Greece	727,000		727,000
Egypt	3,162,000	90,000	3,252,000
Algeria	1,281,000		1,281,000
Gibraltar	354,000		354,000
Malta	700,000		700,000
South Africa	65,000		65,000
India	179,000		179,000
Straits Settlements	31,000		31,000
Ceylon	239,000		239,000
Chili	588,000	46,000	6,936,000
Brazil	1,886,000		
Uruguay	723,000		
Argentine	3,693,000	2,501,000	2,501,000
Switzerland			
Other countries	2,008,000		
	42,219,000	12,632,000	54,851,000
To English Allies			
Russia	5,998,000	2,103,000	8,101,000
Japan	small		
France	12,775,000	3,626,000	16,401,000
Total	18,773,000	5,729,000	24,502,000
To German Allies			
Germany	8,952,000		8,952,000
Austro-Hungary	1,056,000	12,308,000	13,364,000
Turkey	369,000		369,000
Belgium (a)	2,031,000	7,174,000	9,205,000
Total	12,408,000	19,482,000	31,890,000
RECAPITULATION			
English Allies	18,773,000	5,729,000	24,502,000
German Allies	12,408,000	19,482,000	31,890,000
Total Belligerents	31,181,000	25,211,000	56,392,000
Total Neutrals	42,219,000	12,632,000	54,851,000
Grand total	73,400,000	37,843,000	111,243,000

(a) Now German territory.

Table 9 has been compiled to show the principal coal-importing markets of the world. Both the normal demand and the estimated reduction in percentages are shown, also the usual source of supply, together with the probable source for the war period. A careful reading of the table will make further comment unnecessary.

Table 10 embraces the detailed and combined shipments of coal from the two leading international traders, Great Britain and Germany. This table is based on the returns for 1913. A careful study of this table will also prove valuable.

Under existing conditions it is reasonable to assume that Great Britain and Germany will first of all look out for the requirements of their respective allies. Whatever the demand may be from these quarters, we may as well eliminate from our calculations the fuel requirements of the belligerents. Their combined needs represent a normal demand for 56 million tons, or more than half of the total export trade of Great Britain and Germany. The neutral countries represent a normal demand for British and German coal of nearly 55 million tons. With the allies' fleet in command of the high seas the possibility of Germany supplying any oversea markets is very remote; furthermore, it is believed, with her neighboring markets, she will have all of the trade that can be cared for. The problem of demand therefore narrows down to determining, as well as possible, the effect of the war on coal consumption in neutral countries and Great Britain's ability to hold her position in these markets.

The slowing down of trade and manufacturing generally throughout the world has resulted in a decreased demand for coal in neutral countries, as well as those at war. Of the total exports of the world (140 million tons) it is said that 46 million tons finds its way to ships' bunkers at foreign coaling stations, Great Britain's shipments to coaling stations for British ships alone amounting to from 35 to 40 million tons annually. Any reduction in the amount of steamship tonnage engaged has a serious effect on the export demand for coal, so that in the present condition of shipping we are able to account for a large part of the decreased demand. Add to this a decrease in manufacturing and its effect on railway transportation in neutral countries, and we may assume a reduction to the extent of at least 20 per cent. for the neutral countries, which figure is borne out by the export movement of coal in the early stages of the war.

The Position of Great Britain

When considering Great Britain's ability to meet the reduced demand for coal in neutral countries, in our review of her probable supplies for the war period, we estimated her surplus over home and naval needs at 41 million tons. Her first duty is to her allies, of which France will need the most coal, both on account of the condition of her mining industry and the loss of German coal. The normal consumption of coal in France is placed at about 61 million tons, of which the greater part is used in the Paris district. Messrs. Hailey & Davies estimate the war consumption of France at 30 million tons, of which her mines will be able to furnish only six million. The remainder for this country's use, including military purposes will therefore have to be shipped by England. This would take 24 million tons of British coal, leaving 17 million tons with which to supply the comparatively small needs (say five million tons) of her other ally, Russia, and the neutral markets of the world.

TABLE 11. PRICES OF BRITISH COAL*

Description of Fuel	Jan. 1, 1914	July 1, 1914	Jan. 1, 1915
Best Northumbrian steam coals f.o.b. Tyne	$3.36@3.48	$3.24@3.30	$2.94@3.00
Best Northumbrian steam smalls f.o.b. Tyne	1.68@1.80	2.04	1.68@1.74

Comparing the normal exports of Great Britain with this war period surplus of 17 million tons, it will be seen that there is a very great difference in the figures. The Hailey & Davies estimates show an actual shortage of British coal to the extent of 27 million tons, which, as the present conditions are unprecedented, can only be confirmed or disproved by actual experience. Making generous allowances for error in the above estimates, however, there would still seem to be room for either a considerable shortage of the British product or extraordinarily high prices, due to a scarcity.

In this connection, Tables 11 and 12 are of interest as showing the prices of British coals and freights to certain selected points as of Jan. 1, 1915, compared with the month before the war and the corresponding time of the previous year. These prices would indicate that there was a strong demand for British coal and that the expected shortage had already set in as might be inferred from what has been said. The answer, however, may be seen in Table 12 giving the freights to various destinations. No one is able to say what the freight market will be, but it is believed that when the South American crops are harvested and the tide of shipping has set in toward Europe, more vessels will be available for return cargoes of British coal, and it is then that the scarcity of the product may become manifest.

TABLE 12—FREIGHTS*

The Prospects of America

It remains for us to examine carefully our own prospects in the present situation and to learn the extent of our own preparedness to meet an extraordinary demand for coal in the foreign markets. We have always shown great interest in the South American and Mediterranean trade. Before the war started we had even made substantial progress in these quarters; for years past we have shipped coal there under favorable conditions, and made additions of new business there as well as in Europe and Africa.

While our exports overseas are hardly to be compared with those of Great Britain and Germany, yet considering our handicap in the lack of shipping and banking facilities, the growth has been very creditable. Certain of our shippers have engaged in this business for twenty years and know the game thoroughly and the limitations imposed by foreign conditions; others are just breaking into the export trade and assume that is is an entirely new line of business. The propaganda for increased export business which we started in this country at the beginning of the war has proved a bitter disappointment to many embryo coal exporters. Independent of financial and other business considerations, which at present and for some time previous to the war have been of critical importance in selling anything in South America, the answer lies in the fact that South America is not a large coal consumer, the total imports for the entire continent being normally about seven million tons. It would not be a difficult matter for four or five of the larger companies already engaged in this trade to take care of the entire South American requirements, even should Australia and Great Britain, which have the lead in these markets, be forced to withdraw.

Under the influence of favorable crop reports, conditions will undoubtedly improve and our exports will increase, but even with a shortage of British coal, Australia, our strongest competitor on the West Coast, will remain with unimpaired supplies and prices.

---

*From the "Colliery Guardian," London, England.

Further concerning this export propaganda, the following pertinent editorial from the *Colliery Guardian* of London will be of interest:

> Some indication of the extent of the mineral wealth of the United States is given in a bulletin which has just been published by the U. S. Geological Survey. But this bulletin, which is written by George Otis Smith, the Director of the Survey, and possesses the somewhat grandiose title, "Our Mineral Reserves: How to Make America Industrially Independent," does something to explain the comparative failure of the United States up to now to live up to her predictions of commercial conquest. This may have been due to unreadiness, but there is also a suggestion that the government has no thorough grasp of the problems to be assailed. Taking the section on coal, Mr. Smith says:
>
>> The exportation of coal to South American countries must be of advantage both in establishing trade relations and in insuring a balance of trade in our favor. Already shipments to European and South American ports have begun.
>
> To us it is incomprehensible that the simple postulate expressed in the first sentence should require a war to enforce it; as to the second, the shipment of American coals both to South America and Europe was started over 15 years ago. The whole passage, therefore, is supererogatory.
>
> Apparently this message is intended for the American producer, for there is a little homily on the groundlessness of any fears that exportation on a considerable scale will be dangerous from the standpoint of the country's resources —which, by the way, seems to show an incapacity to appreciate the commercial attributes of the whole question, which demands more than mere academic discussion. But whether intended for the American coal operator or the potential customer abroad, the bulletin contains some statements that are not well calculated to inspire confidence in either. Thus it is stated "until the present war broke out, Great Britain was the only country that exported coal in considerable quantity"—what of Germany?—"but Great Britain is already beginning to feel the pinch of poverty in her coal supplies, and it is probable that when peace is once more established she will place restrictions upon her exports of coal." This is truly a strange observation, unless the author is looking far into the misty future; there is no indication that we have suffered any such poverty of supplies, and we do not know upon what grounds Otis Smith contemplates a reimposition of the coal tax. There is nothing in the industrial or political situation to warrant such an assumption. * * *
>
> Up to the present very little has come of the attack upon our markets in South America; on the other hand, our own shipments to this quarter are steadily recovering lost ground. We cannot say that we are surprised. The United States has got the coal and the energy, and, as we have always predicted in these columns, the day must arrive when it would recognize the value of these markets; at the barest reckoning the opening of the Panama Canal must make a difference. But Rome was not built in a day, and, on taking stock, it has been discovered that the ships and business organization are lacking, the fiscal system is embarrassing and the British export trade is still a factor to be reckoned with.

As we attempt to look forward, we must conclude that for the present at least our prospects are quite problematical, depending purely and simply on the movement of ships. No one has yet had the temerity to predict what the freight market is going to do, but it must be evident that *if* there is an actual shortage of coal and the supply of British coal is going to be inadequate, neutral coal-importing countries will have to depend on the United States regardless of the freight market.

Extracts from a Superintendent's Diary

It is considered quite the thing these days to criticize directors of corporations for trying to direct at too great a distance from the base of operations.

If our directors are typical of all directors, then today's experience leads me to believe that such criticism is not well taken, because directors are not competent to form conclusions even after making personal inspections, and if they did make such inspections they might feel tempted to "butt in" indiscriminately.

For two years now we have been looking forward to a visit from our directors, but only today was the great event consummated.

On several occasions during that two-year period word came down the line that we might expect the inspection party in a few weeks, but always before we completed our house cleaning the rumor would be discredited and our improvised whitewash squad would be dismissed. But about two weeks ago positive instructions were issued from our general manager's office to prepare for today's inspection, and the wording of the order made it clear that this time there would be no change of plans.

As a consequence the past two weeks has been a busy time for the floating gangs. All scrap iron has been gathered up and classified, mud holes in our roadways have been filled in, grease and oil spots on engine-house floors have been sanded and scrubbed, and two crews with whitewash mixtures have transformed trees, fences and outbuildings into veritable snowdrifts.

In the party were six directors, the company's chief engineer and the general manager. They were making the trip in a private car and were accompanied by a chef, a waiter, a porter, choice eatables, etc.

They spent, all told, some three hours with us. Two hours were spent in wandering about the camp and one hour at dinner in their car. They seemed to regret the fact that they could not remain until the men began to come from work, but the train schedule did not permit.

Not one of the directors was familiar with mining, except in a very general way. This was very evident from the questions which they asked and the criticisms that they volunteered.

At each of the points of interest, such as the commissary, the supply house, the timekeeper's office, the blacksmith shop, the carpenter's shop, the powerhouse, the hoisting-engine room and the fanhouse, they felt called upon to ask for information and to relieve themselves of impressions. Each one of them had a different viewpoint, easily accounted for, as each one of them obtained a directorship in the company for a different reason.

In the commissary they were given opportunity to scrutinize at close range a miner's family, as several miners' wives, accompanied by their entire brood, came in to make their daily purchases while the directors were there. Strange to say, all of the comments were concerned with the size of the families and the general appearance of the children; not one took any interest in the articles purchased or the prices paid.

In the office, the emergency cabinet with its helmets and safety lamps entirely overshadowed the payroll files with their valuable testimony on average earnings and idle days.

Often during the day I caught myself wondering as to the kind of working agreement our miners might be able to obtain if the directors should decide to take such matters out of the hands of their managers and decide them as they saw fit. Editorial writers have insisted that such a change is to be desired; I haven't been able to follow their arguments with any degree of conviction.

⁂

Don't forget the SUCCESS number of COAL AGE, *April 3. Have you sent in your story? THIS IS THE LAST CALL.*

Rescue Work at Layland Explosion

By George S. Rice*

SYNOPSIS—At the Layland mine, seven men were saved in the preliminary rescue work. Five men walked out after four days' entombment, and then the rescuers succeeded in reaching 42 other men who had barricaded themselves in under the direction of a veteran of 72 years of age.

Great interest has been manifested in the rescue operations, following the explosion of Mar. 2 at the mine of the New River & Pocahontas Coal Co., near Layland, W. Va. Many inquiries have come to the Director of the Bureau of Mines regarding the rescue of 47 entombed men and the following statement has, therefore, been prepared, based on reports submitted by members of the bureau's rescue corps, and from general information obtained during a visit to the mine.

The recovery of the entombed men furnishes a splendid illustration that it is wise for men who have escaped the direct violence of an explosion to brattice themselves in, when the exits are filled with afterdamp. It also shows the importance of their keeping calm and collected under the trying conditions which prevail after an explosion.

The Layland disaster killed or imprisoned over 160 men, and also one man on the outside of the mine. He was killed while passing the main entrance, when the force of the explosion burst out at the mouth of the mine.

Seven Men Are Saved

Steps for the recovery of those entombed were at once taken by the local management, H. M. Bertolet, general manager, taking charge after his arrival at Layland. The main exit or haulageway was partly blocked, consequently entrance was made through the air course. The fan doors had been blown away, but in less than half an hour emergency repairs had been made, and the fan was forcing air into the outer part of the mine. Most of the ventilation stoppings had been blown down, and in order to advance, brattices had to be placed in the crosscuts, because, at this time, there was no oxygen rescue apparatus at hand.

After these repairs to the fan, ventilation was restored along the outer part of the main air course, and this made it possible for seven miners, with the assistance of the advance rescue party, to escape from an entry which had not been penetrated by the explosion.

State Inspectors L. B. Holliday and J. I. Absalom were soon upon the scene, followed by Chief Inspector E. A. Henry and Inspectors R. B. Cobb, L. Blenkinsopp, I. Murray and E. C. Lambert. They worked untiringly searching for survivors and bodies. The work of recovery was conducted with the utmost system and care by the state inspectors and mine management, and the latter saw to it that nothing in the way of supplies should be lacking.

The Rescue Car Made a Record Trip

Thanks to the officials of the Norfolk & Western and the Chesapeake & Ohio Ry., a record-breaking run to the Layland mine was made by Bureau of Mines Car No. 8. When the notice of the explosion was received by the officials in charge the car was on a branch road three miles from Glenalum, W. Va. The officials of the Norfolk & Western Ry. were at once informed of the need for a speedy transfer of the car to Layland. With remarkable promptness, they arranged to dispatch it to Kenova. It left Glenalum at 12:50 p.m. and reached Kenova, 104 miles away, in three hours. This was only accomplished by side-tracking several trains.

At Kenova, the car was turned over to the Chesapeake & Ohio Ry., which had prepared a clear track for it and hitched on what is said to be the second largest passenger engine in the world. The train fairly flew over the sharp turns in the New River Cañon and reached Quinnimont with only one stop at Thurmond for water. The 133 miles were covered in 3 hr. 16 min., which is said to be record time on this mountain road. The car was then pushed up the steep 6-mile grade to Layland, reaching there at 9:37 p.m., after a journey of only about 8¾ hr. from Glenalum.

Rescue apparatus was hastily flung into waiting cars which took the party up the incline and two miles beyond to the mine mouth. At 10:30 p.m. the crew, consisting of D. J. Parker, mining engineer, Dr. W. A. Lynott, surgeon, H. D. Jones, foreman miner, R. H. Seip, first-aid miner, and Edwin Staley, clerk, was placed under the orders of the state inspectors and entered the mine for exploration work.

The Gary Rescue Crew

The oxygen-apparatus crew of 11 men of the Gary, W. Va., mines gallantly volunteered their assistance when the disaster was announced by General Manager E. O'Toole. They started about the same time as Car 8, but having to come by regular trains they did not reach the Layland mine until the next afternoon. The Gary crew, which did valiant service, was in charge of the chemist, Vitus Klier, and had the following members: Andy Toshie, John Christian, H. K. Payne, Julius Kovacs, Nick Sharkey, Richard Haynes, Mike Skipiczky, James Thirtle, Louis Toth and H. L. Ross. J. W. Paul, the bureau's chief of rescue operations, with his assistant, H. D. Mason, arrived from the Pittsburgh station on the same train with the Gary crew and W. J. German, foreman miner from Car 6 followed on the next train.

The 11 men from Gary and the nine from the Bureau made up three rescue crews thoroughly trained in the use of oxygen-rescue apparatus. Under the direction of the state inspectors and Mr. Paul and the general direction of Mr. Bertolet, they worked in successive 2- to 6-hr. shifts, exploring in advance of the rescue men who, being without apparatus, were engaged in bratticing and the recovery of the bodies. The advance exploration was to insure that there were no smoldering fires which might start up with restored ventilation and thus cause explosions by the ignition of any firedamp which might have collected. The apparatus work also expedited the rescue of the men and the locating of bodies.

The exploration continued from Tuesday till Friday night, by which time Mines 4 and 5, which were turned off Mine 3 and not independently connected to the surface, had been thoroughly explored and most of the bodies taken out.

---

*Chief mining engineer of the United States Bureau of Mines, Pittsburgh, Penn.

One of the oxygen-apparatus crews then made an exploration in the main haulage entry of No. 3 mine, as far as the 6th left entry. This proved that the main entry had few falls and little wreckage and led Earl Henry, the chief mine inspector of West Virginia, to plan the reversal of the air current. This change in ventilation would permit the use of the haulage road, since meantime the blockage at the mouth of the mine had been largely cleared away. To reverse the fan involved repairs; so that night all the men were withdrawn in order that the fan might be stopped.

On the following Saturday morning, while these repairs were still being made, Mr. Paul, who happened to be in the mouth of the main entry, was astonished to see five men come out of the mine. They stated that they were from the 9th left entry, in which they had bratticed themselves following the explosion. It appeared that the shutting down of the fan the previous night had caused the atmosphere to clear somewhat in the No. 3 haulage road.

The men were in good condition, having had plenty to drink and enough food to sustain them. They had collected twenty buckets of water before they bratticed themselves in. In the brattice they left a small opening, and kept a guard there to watch for the clearing of the air, and finally when this occurred they came out. As it developed later, however, the air was even then not entirely normal in the 9th left.

Naturally the most intense excitement prevailed, and it at once awakened hope that others might be alive in the mine, although these men stated to Mr. Paul that there were no others alive in the 9th left. It was thought, however, that there might be other men in other cross entries; accordingly the oxygen-rescue apparatus men were called, and one of the crews and part of another were told to go to the 10th left, the other rescue-apparatus men being held in reserve at the entrance of the mine. Meantime inspectors and other rescue men hurried in, but decided to search the 9th left first.

Rescuers Find a Notice on Haulage Road

The oxygen-rescue crews from Gary and the Bureau of Mines, on reaching the mouth of the 10th left, found a written notice, "Mar. 4, 42 live men in 10th left." The rescue men pushed on in the direction indicated and found a strongly built gob stopping of rock, coal and fine dirt, which they immediately attacked and broke through. The canary which was being carried showed no ill effects from the atmosphere, and, accordingly, a messenger was sent out to notify Chief Henry and Mr. Paul that there were live men in the 10th left, that the rescue crew had got through a barricade, that the air was all right and that blankets and stretchers should be brought in.

The party then proceeded and found another barricade 200 ft. beyond the first, which they started to break through. Meantime, Mr. Klier, of Gary, the messenger, found Inspector Holliday and four men at the 9th left, and told Mr. Holliday of the message. On arrival at the inner barricade one of the unhelmeted men was sent to the outside to carry a requisition for blankets and stretchers, and the unhelmeted men finished breaking through the stoppings, disclosing the group of entombed miners who had gathered around the inside of the barricade. Mr. Holliday and the rescue men then entered and helped the men one by one through the hole in the stopping. It was found that all the 42 men who had been inclosed were alive, and in fair shape, considering that they had been confined for four days, with only the food from five dinner pails and a very little bad water. They were then lined up along the entry, the rescue men were placed at intervals, and the procession slowly moved outward.

Mr. Bertolet and Chief Henry, who had entered the mine on receiving the message, had sent for blankets and stretchers, which were hurried in. Some of the rescued men were quite weak, and finally two of them had to be carried out on the stretchers. All the men were carefully wrapped up and taken to a detention station so as to insure them proper medical attention.

The experience of the 42 men was strikingly set forth in a newspaper interview with one of them, Thomas Whalen, when he passed through Charleston a few days later. This appeared in the *Charleston Gazette* of Mar. 9, and the substance of it is worthy of repetition, although I cannot vouch for the accuracy of the detail. The bracketed statements of known facts have been inserted to make the meaning clear. The interview is as follows:

> Thomas Whalen, the oldest survivor, who, with his son, John, worked in Room 24 of the 9th entry, heard a rumbling sound. They ran down to the main entry, but the heat was so great that it took their breath; they made a hasty retreat inby on the main entry, seeing on their way the dead bodies of four men who had worked on the motor. These bodies were stretched face downward with their hands outstretched at their full length. Whalen states that the one thing he can remember best was the awful feeling that the top of his head was being lifted off, a sensation giving him terrible agony. The son was using a carbide lamp, while that which his father carried was fed with oil. The latter was extinguished by the force of the explosion, but the other remained burning.
>
> The Whalens ran back into No. 10 entry, where they found 40 other miners, mostly foreigners, who were crazed almost beyond control. By persistent begging they were made to go back beyond the trap door and to work building good walls (across the 10th left entry and air course) whereby to barricade themselves against the afterdamp.
>
> Some of the foreigners wanted to smoke cigarettes. This would have endangered all the entombed men, and it was necessary to use force to prevent it. The men in the 10th entry suffered greater hardship than the five in the 9th left as nearly all dinner pails were left in the main entry, and the only water available was polluted. Only once did Whalen moisten his lips. So great was the hunger of the entombed men that they dug into the coal dust to get crumbs and eggshells which had been thrown away at some meal probably several days or weeks before.
>
> While they were expecting the rescue men, for whom every man waited with implicit faith, they would take turns at watching. Many broke down entirely, and but for the leadership of young John Whalen they would, doubtless, have broken down the wall. (On Friday it was decided to try to send out a man and a hole was made through the walls for that purpose. He carried out the written notice of the 42 men being in the 10th entry, and left it at the mouth of the heading where it was found by the rescue crew. On his way back he was overcome by the afterdamp, but two others ran out and dragged him in through the barricades, which were again sealed.) The rescue party was not heard until they were half way through the inner wall, and then young Whalen gave the order to start meeting them, and, according to Dad Whalen's testimony, little time was lost in complying with the order, despite the terribly weakened condition of the men. When asked how he felt when reached by the helmet men, Dad replied: "I can hardly remember anything because I was so weak and nervous and the awful sight of my dead friends on every hand completely took my memory away from everything else in the world." Dad Whalen is 72 years old, hale and healthy, and gave his interviewer to understand that it was owing to his weakened condition and not to old age that he was the last to leave the mine. He further stated that he expects to be digging coal again within two weeks.

Editorials

The Unforeseen in Mining Legislation

It is easy to be inept in language, and even well meaning lawyers and legislators are not exempt from failures to express themselves plainly. When the Pennsylvania Mining Laws were passed, it was purposed to require that safety lamps used by the workmen should be supplied and maintained by the coal companies. The idea was that the miner should not be obliged to buy a lamp, nor should its care be left to his tender mercies. If each miner owned his lamp the inspection of the lighting equipment of a mine would be difficult, and as many men in the mines are not competent workmen the upkeep would be, in many cases, defective.

But the intention was surely not to require the operator to buy his lamps outright when he might just as satisfactorily lease them from a manufacturing company which would know far better how to keep them in repair and proper working order. Inspection surely would not be less easy, nor would the burden to the miner be any greater under such an arrangement. Surely it was only an oversight which inserted this clause into the Pennsylvania Mine Anthracite Law of 1907:

> Whenever safety lamps are required in any mine they shall be the property of the owner of said mine. Art. 3, Sec. 15.

And it was probably a similar inadvertance which caused the following unfortunate requirement to slip into the Pennsylvania Bituminous Coal Mine Law:

> All safety lamps for examining mines or for working therein shall be the property of the operator. Art. 4, Sec. 5.

The Virginia Law of 1912 is equally unfortunate:

> Safety lamps used for examining any mine or which may be used therein shall be furnished by, and be the property of, the owner of the mine. Chapter 178, Sec. 12.

In West Virginia under the code of 1914 the wording of the law is indentical. In the Colorado Session Laws of 1913, Sec. 133 reads:

> After the first day of October, only electric lamps shall be used in the coal mines, except in cases generating explosive gas or noxious gases, where an approved safety lamp shall be supplied for each working place for distinct purposes; and all lamps shall be the property of the owner.

Ohio, in its general code of 1910, has a better worded provision. It requires:

> Safety lamps used for examining coal mines or which are used in a coal mine shall be provided by the owner of the mine and be under the charge of the agent thereof.

Amendments are needed permitting the companies to lease lamps. If thought desirable, the coal companies could be made just as responsible for their condition as if they owned them. As it is, however, the manufacturing company which is ready to enter into a leasing contract is estopped from doing so because the contract to participate in an illegal act is null and void.

Even if the company, confident in the support of a department of mines, were to be willing to contract with a leasing company, that lamp corporation would have to refuse because the agreement would not be binding.

It has been repeatedly found that manufacturing concerns can and will keep their own supplies in better service than a purchasing corporation. The Galena Signal Oil Co., for instance, often affords better service to the operator when it contracts to keep bearings in condition than when it supplies the oil and lets the operator figure out as best he may how it should be used.

The Gas in Anthracite

Because anthracite contains only a small amount of volatile matter, it is always a matter of surprise that, at least in the United States, it gives out abnormal quantities of gas. Not only are the emanations of gas large, but such as is formed is mostly methane and consequently highly inflammable.

Bituminous coals produce, not only methane, but large quantities of water and carbon dioxide. It is anthracite coal which specializes so markedly on methane. But here it should be stated that we believe there is no available knowledge of the relative gas emanation of anthracite and of bituminous coal, because Chamberlain and other investigators, so far as we know, in making their records regarding such emission of gas, excluded water, which may be truly as gaseous an emanation as methane, carbon dioxide or carbon monoxide.

The paraffins emitted in vacuum by Mansfield coal from Carnegie, Penn., formed roughly 80 per cent. of the whole gas content *as measured* by Chamberlain. It must be remembered that he has nothing to say about the water product. If he had considered it, the percentage of paraffins would probably have been considerably reduced. This Mansfield coal is still bituminous; and consequently it may be asked how, in face of Chamberlain's testimony, it is deduced that water and carbon dioxide are so important as products of metamorphosis up to and including the bituminous stage. The argument is simple. If the assumption just made were not true, we would not find any coal in nature, for peat would progressively gain in oxygen percentage by the elimination of the other elements, the carbon and hydrogen would pass off as methane, and the outcome would be mainly an unburnable body of carbon, oxygen and ash. Despite the fact that coal seems to have an avidity for oxygen, nevertheless coal continues to lose that element as it rises in the scale of its metamorphosis, and this disposition to diminish the percentage of oxygen does not show an appreciable slackening till the element is nearly all gone.

The substance of lignite, when the moisture and sulphurless ash are excluded, contains from 4 to 5 per cent. of hydrogen. The fuel loses some of this in the long course of centuries, but it parts with so much more of its oxygen that in the extended series of metamorphoses from lignite to sub-bituminous and bituminous coal the percentage of hydrogen increases rather than diminishes.

Though the sub-bituminous coal usually contains about 5 per cent. of hydrogen, one sample from Hanna, Wyo., had 6.18 per cent. In Ohio the bituminous coal appears invariably to have over 5 and may even have over 6 per cent.

The reason for this increased hydrogen percentage, which makes for the betterment of the fuel even more than the increase in the carbon percentage, is that for every pound of hydrogen lost as water, 8 lb. are lost as oxygen. For every 12 parts by weight of carbon passing away as dioxide, 32 of the oxygen disappear. That element is abducted by both hydrogen and carbon and so suffers greatly in percentage; for not only is it lost in greater quantity than the carbon and hydrogen, but also the combined weight of these elements far outbalances the weight of the oxygen and can therefore better sustain the continued drain.

We have seen, therefore, that the hydrogen, having an ally in carbon in all its attacks on the oxygen supply of the coal and losing only one part by weight for every eight of oxygen it carries away, comes out of the earlier centuries of stress in relative triumph. Would it be amiss to add that like many other allies, having subdued and destroyed the common enemy, these allies—carbon and hydrogen—after some irregular skirmishes proceed to destroy each other?

The semibituminous coal—that of Cambria County, Pennsylvania, for instance—contains, despite its losses, between 4.37 and 5.36 per cent. of hydrogen in the coaly matter when freed from moisture and sulphurless ash. The trend is evidently toward a reduction in the amount of hydrogen. The oxygen has dropped to a percentage between 1.72 and 5.50, so that it becomes less possible for the hydrogen or carbon to pass off by self-oxidation.

Perhaps that is the reason why the hydrogen now begins to pass off mostly in combination with carbon, three parts by weight of carbon passing away in the methane for every part by weight of hydrogen. Were the coal to consist of 75 parts by weight of carbon and 25 parts of hydrogen, the loss of methane might go on indefinitely without a change in the percentage composition of the coal, but the carbon is in somewhat larger proportion and the hydrogen is in much less. Still it is really a remarkable change in the weight of the coal which must take place in order that a semibituminous coal like that in Cambria County may be converted into an anthracite such as is mined in the Schuylkill region.

Let us take a coal from Patton, Penn., with carbon 88.12, hydrogen 5.24, oxygen 3.39 and sulphur and nitrogen together 3.25 per cent. We will assume that the hydrogen is reduced to 2 per cent. and the oxygen to 2.2 per cent., which are about the percentages in the Schuylkill anthracite field. Furthermore, we will make the assumption, which may be overbold, that all the oxygen lost passes away as water vapor and all the rest of the hydrogen not thus spirited away is lost as methane. The nitrogen and sulphur are assumed to be unchanged in actual quantity.

An interesting but simple calculation will then show that 100 lb. of the first coal will lose 1.52 lb. of oxygen, 3.54 lb. of hydrogen and no less than 10.05 lb. of carbon, leaving carbon 91.96 per cent., oxygen 2.2, hydrogen 2 and sulphur and nitrogen 3.84 per cent.

So to make the hydrogen lower only 3.24 per cent. and the oxygen 1.19 per cent., 15.11 per cent. of the coal substance must pass away as gas. This is an important consideration and throws light on the extremely gaseous nature of the deeper mines in the anthracite region.

It is interesting to note that as coal is about 812 times as heavy as methane and as it loses in the instance given 13.4 per cent. to form that gas, the amount of methane evolved will occupy about 109 times as large a volume as the coal from which it is derived. This latter figure is extremely rough, being based on the assumption that the coal substance in question has a specific gravity of 1.19—an assumption which is hard to deny or to prove.

N. H. Darton stated on Jan. 16 of last year at a meeting of the American Institute of Mining Engineers that the Dorrance mine in Wilkes-Barre, Penn., produced 3390 cu.ft. of gas per min. and that in that neighborhood, 1500 cu.ft. of gas was liberated per ton of coal mined. Very roughly, then, we deduce from the latter statement that the measures contain only about 7 per cent. of the methane generated between the metamorphosis of the coal from semibituminous as typified at Patton, Penn., and the anthracite stage as exemplified at Wilkes-Barre, in the same state.

⁂

The Outlook on Apr. 1 Contracts

EASTERN

In New England the outlook is anything but encouraging. A large share of what season business has already been entered was undertaken early in the year under the pressure of high coastwise freights, most of it, however, in the same channels as in 1913 and 1914. Buyers who have hitherto bought of agencies that rely on what transportation can be had in the open market have been encouraged all along to wait for the market to "settle down," a process that seems to be well on its way at this writing. There is, therefore, quite a volume of business that is yet to be closed and it will require careful handling to avoid a demoralized market, particularly on Pocahontas and New River coals. While the "asking price" is still $2.85 f.o.b. Hampton Roads everybody knows the spot price is around $2.70 or less, and buyers are likely to postpone purchases just as long as they possibly can.

The business outlook is not improved over last year. In scattered instances factories and mills are working on better time, but on analysis these are found to be in special lines and not indications of any improvement that is general. There is no inducement, therefore, to bring buyers into the market for future supplies under present conditions.

Most of the contracts already closed were subject to correction in case freight or prices f.o.b. declined, and that is a further reason for the West Virginia operators to refrain from mining coal that must ultimately be sold at a loss. If these interests would show less rivalry for tonnage and more disposition to mine coal with some respect for the market that must absorb it, there would be much less anxiety over prices later. The senseless over-production of recent years with "market cargoes" and "distress coals" at New England points has been the bane of the market and is the reason why each year so many buyers withhold placing contracts until late in the season. A large number have now, for the past few years, made their contracts from July 1 rather than from Apr. 1, so pronounced has been their experience in this respect. In August, 1914, "distress coal" sold as low as $3.15 on cars Boston and this for choice grades of Pocahontas and New River.

With such situations in mind, and present tendencies toward weakness in price, it is hard to see how there can be any snap to the spring market. The export trade under present conditions can hardly be better than spasmodic and cannot be relied upon to move coal in any regular volume. The burden, therefore, will fall on the coastwise trade. In that case a better spirit of coöperation is needed among the West Virginia interests before New England buyers can have much faith in the season's outlook. If the example of Georges Creek operators throughout so dull a year as 1914 could be followed in West Virginia in 1915, it is possible the spring of 1916 would show less skepticism on the part of Yankee consumers.

Pittsburgh District

A leading Pittsburgh district coal interest states that since Jan. 1 they have booked more contract tonnage than in the same period a year ago. In this instance, however, they admit that a similar comparison to Apr. 15 will not look at all as favorable for the reason that a year ago they were holding off from contracting because the wage scale was not settled.

Buyers are extremely apathetic in the matter of placing contracts. Much less than half the annual contracting has been done, and it even looks as though a considerable proportion of buyers would not contract at all at this time, presumably depending on the spot market until such a time as it may be desirable to get under cover with contracts. In business closed, the going prices on contracts at all desirable have not been over $1.10 to $1.15 (say 15c. under a year ago) on mine-run and 80 to 90c. on slack. Lower prices than 80c. and $1.10 have been done, though there are no specific instances of these. On mine-run, prompt lots can be picked up at say 10c. a ton less than these figures, and doubtless sometimes at under $1.

The contracting as a rule is being done on requirement contracts, intended to represent the full requirements the buyer may have during the twelvemonth, with a tonnage stated in the contract as representing the probable requirements. Operators profess confidence that buyers will not try to beat the contracts by purchasing outside prompt lots when they can be had at well under the contract prices, as is the case at present; but as to this, one naturally has his doubts.

There should be an incentive to buyers to contract for the twelvemonth at present low prices on account of both anthracite and bituminous scales expiring Apr. 1, 1916, so that the contracts will run into the period preceding the suspension, when there is always stocking of coal and a relatively high prompt market. There is also the incentive of present prices being low, but the deterrent influence that prompt prices are materially lower than contract prices, say to the extent of 10 or 15c. a ton.

No prices have yet been named to lake shippers, but there is a possibility that the Pittsburgh Coal Co. may undertake to name prices in a week or so. Inasmuch as there has been practically no inquiry for lake coal it is improbable that such prices, if named, would be anything but nominal. Early in the year there was a lone contract closed for a round tonnage of lake coal, said to be at an unmentionably low price, probably under $1.15 for ¾-in. Ordinary quotations, like $1.15 for mine-run, $1.25 for ¾-in., $1.35 for 1¼-in. are understood to be to "consumers," with 10c. off to dealers.

The real prices on lake coal will probably not be made for two or three months, perhaps not until July. It is the universal opinion that lake shipments will be very light in the fore part of the season and confined to the shippers who own mines or have long-term arrangements, while late in the season the Northwest may become disposed to stock up on a suspension scare.

Middle Western

The trend in some quarters is to withhold action in the matter of contracts for another season effective Apr. 1, because of the new alignment presaged in the sale of Indiana and Illinois coal, but most of the operators and wholesalers are now submitting bids on railroad, municipal and dealers' needs at the old figures. The major portion of contracts for Indiana and Illinois coals expires on Mar. 31. Some tendency is observable on the part of consumers to ask for concessions from prices prevailing during the last contract year, but on the whole producers and wholesalers evince no disposition to meet this view.

The agreements with the miners covering wages and tonnage rates extend until Apr. 1, 1916, so that no changes of this nature need be considered in figuring contract prices. It is quite apparent that the increased production of eastern Kentucky mines and the activity displayed by their representatives in the Western markets, will necessarily increase competition found by Indiana and Illinois coals, and may have the effect of reducing revenue on some contract business.

The creation of a selling organization to market 80 per cent. of the Indiana production, which is imminent, is causing some of the Indiana operators to await developments. In Illinois the same hesitancy is indicated, and it is reported that the Franklin County operators, who have a coöperative organization, are going to keep their contract quotations on a parity in territory where competition has existed between them in the past; on the other hand, where their coal is competitive with foreign production, it is stated the Franklin County operators will endeavor to meet competition. In other Illinois fields the operators will likely renew their contracts on the present basis.

Business generally has been so dull since the holidays that most of the operators are unwilling to commit themselves to business for a year's time which will not show remunerative returns, and there is a general disposition not to go below the contract figures of the past year. Some shippers do not intend to enter into contract arrangements, feeling from past experience that contracts are nothing more or less than an option on their product, with no corresponding advantage to the seller. If a dealer has a contract for domestic lump at $1.60 and the market price is lower during the winter season, he is very likely not to take his contract tonnage.

It is very likely that new contracts will eliminate to a large extent the sale of coal on destination weights, which has been one of the unfavorable features of past contracts with large consumers like the public-service corporations. There is also an evident disposition to curtail the sale of coal on a delivered basis and to quote mine prices only.

Discussion By Readers

Recognition of Bravery

Letter No. 4—I want to say that the editor's brief comments appended to Letter No. 2, Coal Age, Feb. 27, p. 383, expressing the desire of Coal Age to obtain the full and frank opinion of its readers in respect to what would be the most suitable recognition of acts of bravery performed by mine workers, will be much appreciated by all interested in this worthy question.

I noted, also, the two suggestions made by "Bykem" on the same page—first, in regard to setting a "standard of degrees of courage"; and, second, as to whether the award should be entirely honorary or otherwise. It seems to me that the words in the editor's comments to which I have referred above, namely, "Deeds of heroism are too costly to be purchased," make it clear that to standardize courage and set degrees of merit on such acts is not within the scope of mortal regulation. Such an attempt would show a great diversity of opinion as to what constitutes "degrees of courage," and, as a result, the award would not be satisfactory to all.

Mine Inspector Rose, p. 385, says, "Train and discipline every mine worker to detect dangerous conditions and to know how to avoid or escape them." Following these instructions, it is possible to establish *degrees of efficiency*, but, I think, we cannot establish similar *degrees of courage*. In the words of another, "Courage can sometimes be carried to the extreme, when it develops into foolhardiness, and no good then results."

In reference to the second suggestion, I would say that a life active-membership in the American Mine Safety Association and a gold medal commemorating the event and service performed would be a suitable award. In case the brave would-be rescuer met his death in the attempt, a suitable memorial could be drafted and presented to his family in proper form. I hope much good will be accomplished as a result of this timely suggestion.

I. R. Packard.

Bates, Ark.

Letter No. 5—In considering the matter of a suitable award in recognition of the brave and self-sacrificing work of mine rescuers, the first and most important question that presents itself is, as suggested in "Bykem's" Letter No. 1, Coal Age, Feb. 27, p. 383, Should the award be of a kind that will *compensate* the rescuer for the service he has rendered and, perhaps, help to partially amend for the injury or loss he may have sustained? My answer to this question is, Yes, by all means he should be compensated in proportion to the sacrifice he has made.

The next question that arises is, How or by what means shall a *lasting* award be made? Before answering this question, let us consider for a moment that, usually, the man who makes the sacrifice is one from among the working classes, on whose daily labor depends the support of a family. If this man is injured or incapacitated for further work as the result of his unselfish and self-sacrificing act of rescue, is it too much to expect that his future support and that of his family should, in some way, be provided for in the award it is proposed to make as a recognition of his deed? I would ask, Of what permanent value will an "honorable mention" or the presentation of a suitably inscribed medal be to such a one in his helpless condition?

Recalling that the nation makes adequate provision for the pensioning of its sons who have been disabled in their country's service, which called for the *killing* of their fellowmen, I would ask, Why is not the self-sacrificing effort for the *rescue* of a fellowman an even more worthy object for such a provision by law? In my opinion, a law should be enacted providing for the compensation or life pension of one injured or the support of the family of one killed in such service given freely for the rescue of a fellow-worker. It may be argued that the surviving dependents, in this case, are no worse off than those who are the victims of other accidents, but the case differs in being a self-sacrificing, heroic deed. The sufferer is not a victim of an accident.

It is evident to all, on reflection, that it must be a question of great concern to the members of mine-rescue corps as to what would become of their families or dependents in case of their own failure to return alive from the seething hole of foul air and poisonous gases into which they enter. These men are, without exception, volunteers in the work for which they train in the hope that they may be able to render efficient service to their fellows in time of danger. Their ambition is to save life—not to win an "iron cross" or other medal.

In considering this problem we must face and answer the question, What provision is to be made for the future support of a disabled rescuer and his dependents? Such things as honorable mention, iron crosses and suitably inscribed medals will not help to support a family deprived of their natural means of sustenance.

Geo. S. Stewart.

Reynoldsville, Penn.

Longwall in the Pittsburgh Seam

Letter No. 3—In reading the interesting letter of G. R. Waddell, favoring the general adoption of the longwall method of mining in the working of the Pittsburgh seam of coal, Coal Age, Feb. 13, p. 303, I observe that his chief argument in support of his contention was that "the extra expense for the building of packwalls in longwall work is offset by the reduction in other expenses."

The "other expenses" to which Mr. Waddell refers, in respect to room-and-pillar work, as stated in his letter, are: The turning of a large number of rooms, requiring the payment of yardage for driving the narrow room-necks and the crosscuts; the delay and cost of taking the cutting machines from one room to another; the laying of tracks and switches for each room turned off the entry; the increased cost of gathering the coal at the face of the rooms; and the large percentage of coal lost in pillars.

While I am not familiar with the Ohio field, I am well acquainted with the West-Virginia field and have had much experience in the longwall method of mining in England. Judging from this knowledge and experience, I fail to see how it would be profitable to work the Pittsburgh seam by the longwall-advancing system of mining.

Remembering that the thickness of this seam varies from 4 to 9 ft., I would like to ask Mr. Waddell where he proposes to get his rock or dirt with which to build the necessary packwalls that are required for the successful operation of longwall work. Even assuming that he only builds packwalls on one side of his roadways and trusting alone to the post timbers set at the working face for supporting the roof over the miners, he would still lack sufficient material for building purposes in this thickness of seam.

I fully agree with Mr. Waddell that the longwall method of mining is the best plan to adopt wherever the conditions are suitable for its use. This is particularly the case in the working of thin seams where it is necessary to brush the roof over the roadways or to lift bottom on the roads in order to maintain sufficient headroom for the movement of the cars to and from the face. This work, which is necessary in the mining of thin seams of coal, gives sufficient material for the building of the packwalls and gobbing the space between. Also, sufficient building material is often taken from the partings of bone or rock that occur in many seams. All this material that must be disposed of can be used to advantage in the longwall method of mining.

In closing, permit me to say that I am of the opinion that the retreating method of longwall would be more suitable than the advancing method in the working of the Pittsburgh seam, assuming that it were practicable to adopt this method.

J. Oldroyd.

Farmington, W. Va.

Letter No. 4—I have been much interested in the discussion of whether or not the longwall system can be successfully used in working the No. 8 seam, in eastern Ohio or the Panhandle district. Permit me to express my opinion on this subject and to say that the mine of the Labelle Iron Co., of Steubenville, which is working the No. 6 seam of coal, is now being successfully operated on the longwall system. In that mine, they are working a 1600-ft. breast, in the shape of a half-moon.

The operation has been so far very successful, for the reason that the natural conditions in respect to the bottom and top are favorable to longwall work. The bottom underlying the coal is of a hard nature and, so far, has not caused any trouble by heaving in the roadways. The coal is about 3½ ft. thick and the roof overlying the seam is a solid and hard gray stone. Packwalls are built between the roadways, which are 42 ft. apart. The material used for these packwalls is obtained by brushing the roadways to a height of about 6 ft. A longwall machine is used for undercutting the coal, and this requires 4 ft. of clear space along the face of the coal. After the coal is mined out, the roof gradually settles down on the packwalls, leaving a space of only about 15 in. between the roof and the bottom.

While the longwall system of mining has been a success in this seam of coal, however, I do not believe that it could be tried to any advantage in the No. 8 seam of eastern Ohio. The roof overlying the No. 8 seam consists, first, of a drawslate, which averages from 8 to 10 in. in thickness. Above this is the roof coal, from 2 to 18 in. in thickness, and then comes a gray soapstone from 4 to 6 ft. thick, which is very often of a soft nature and necessitates much timbering whenever a break has extended through the roof coal. Finally, the overlying limestone is very thick and hard to break.

If the No. 8 seam were to be mined on the longwall system the soft strata lying between the coal and limerock would not permit the gradual settlement of this hard stone. Furthermore it would be very expensive and almost impossible to build packwalls for the reason that they must be built to a height of about 6 ft., or the thickness of the coal and drawslate together. Then, what would happen if the heavy limerock should start to squeeze?

All men familiar with a squeeze in this seam of coal will agree with me that if it once started to sag or squeeze it would be impossible to keep sufficient posts at the working face to successfully undercut or load any more coal. It would also be impossible to keep the roadways open, because the squeeze would force the strata between the coal and limerock down on the roadways and it would be impossible to haul any coal. So far as the bottom is concerned I believe that, in a majority of the mines, it would be favorable to the longwall system, as the bottom is of a limestone nature. I have heard miners coming from England say that this seam could be worked on the longwall system, but I would have to see it tried before I could believe it can be done successfully.

W. H. Werker,
Deputy Mine Inspector.

Rayland, Ohio.

Mining Laws, Legislation and Mine Regulations

Letter No. 40—I noticed in Coal Age, Feb. 27, p. 384, Mr. Lantz's criticism of Mr. Weigle's suggestion that mine foremen should be state officials. I am of the opinion that Mr. Weigle is on the right track in attempting to reduce accidents in our mines, and for this reason I will attempt briefly to sustain his contention, which Mr. Lantz regarded with disfavor.

In the State of Pennsylvania, the mine foreman is required by law, in all mines employing 10 or more persons, to look after the safety of the workmen employed therein. He cannot do this successfully when the burden of "coal getting" is placed on his shoulders. He will naturally try to please the coal company first, because he receives his compensation from them and is under a greater obligation to them than to the state or the workmen of whom he has charge. Mr. Weigle is trying, here, to relieve the foreman of his obligation to the company by suggesting that the companies be taxed, so that instead of paying the mine foreman they would pay him indirectly through the state.

In regard to the mine foreman not having anything to say in the operation of the mine, as to laying it out, system employed, etc., will say that the mine foreman is seldom consulted in regard to laying out a mine or the system on which it shall be worked, which questions are left to the mining engineer to decide. Yet the mine foreman is held responsible for the safety of the workmen in the mine, regardless of what system is adopted. It is true that the state's interest only relates to safety, and if the foreman is held responsible by the state, why should he be burdened with any duty except to look after the safety features and the enforcement of the mine laws?

It appears by recent court decisions that the company is not liable for accidents in the mines when a mine foreman is held responsible by the law of the state, and damage cannot be collected for injury to workmen unless some defect causing the injury had been brought to the superintendent's notice. Then, why should the coal company dictate the policy of the foreman when he is the responsible person and undoubtedly neglects his duty when he devotes a portion of his time to increasing the output of the mine or performs clerical work and numerous other tasks aside from his legal duties?

I believe the state should dictate or control the selection of the mine foreman, assuming that he is to perform these legal duties; but not to interfere with the company's business when that does not encroach upon safety or hamper him in fulfilling his duties as required by law. However, there should be nothing to interfere with the coal company's placing a man in the mine in charge of getting out the coal; but he should be under the mine foreman and work under his orders, so far as safety is concerned. Additional men, who should act as assistants to the mine foreman, could be employed by the coal company when the state mine foreman is unable to examine all places as required by law; but these assistant mine foremen should be paid by the company.

A schedule of wages could be arranged, according to the class of the mine, gaseous or nongaseous, the extent of the workings and the number of workmen employed. I might say that where the law now requires a certified foreman at all mines employing 10 or more men inside, one state foreman could attend to at least three mines, where the total number of workmen did not exceed, say 50, and the three mines were not too far apart so as to prevent him having plenty of time to legally attend to his duties. I am firmly of the opinion that the difficulties presented by Mr. Lantz could be easily eliminated, should a bill be drawn along these lines and presented to the legislature for action.

I am agreeing with Mr. Weigle because I believe he is working along the right line, as proved by my own experience in the mines during the last 25 years, in which time I have been officially connected with over 350 coal mines. I have observed that the mine foreman devotes entirely too much of his time to the coal companies' interests; and I am convinced that if he were compelled to drop part of his work there would be a great reduction in mine accidents.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

CARBON MONOXIDE

This gas, formerly known in mining textbooks as "carbonic oxide," or "whitedamp," is the product of the combustion of carbon in a limited supply of pure air. Because the supply of oxygen is limited the combustion of the carbon is incomplete and the **monoxide** is formed instead of the **dioxide.**

Carbon monoxide is a **colorless** gas. It is extremely **poisonous,** owing to its being absorbed very rapidly by the hæmoglobin or red coloring matter of the blood, from which it is separated slowly and with difficulty. The effect on the system is therefore **cumulative** when exposed to the smallest percentage of this gas in the atmosphere breathed. The affinity of carbon monoxide for the hæmoglobin is from 250 to 400 times as great as that of oxygen, so that the blood corpuscles are quickly rendered inert and **death** is the sure result. The gas is not displaced by the oxygen employed in treatment, but is eliminated slowly by natural processes that take place in the system, unless the latter is too weak or the percentage of the gas absorbed is too great for such result to take place.

The **treatment** for carbon-monoxide poisoning is the enforced inhalation of pure oxygen, by the use of the **pulmotor.** This is a device that consists essentially of a small portable tank containing compressed oxygen, which is pumped into the lungs by a bellows, while another bellows withdraws the same from the lungs after use. The pressure of the gas in the oxygen tank automatically operates the bellows at a rate of 16 strokes per minute as in normal breathing. A face mask completes the equipment. It is important to draw the tongue forward with tongs provided for that purpose, and to close the gullet leading to the stomach, by a gentle pressure of the thumb on the throat, in order to avoid the gas filling the stomach.

The presence of the smallest percentage of carbon monoxide in the atmosphere breathed is **dangerous** to health and life because of its cumulative tendency, its possible toxic effect on the nervous system and the impairment of the vital organs of the body. The **fatal percentage** of this gas cannot be definitely stated because of numerous other factors that together determine a fatal effect. The more important of these are the following: The depletion of the oxygen of the air breathed; the length of the time of exposure to the poisonous atmosphere; the energy expended in physical work in such atmosphere; the state of health and the normal physical condition of the person.

Some persons are more sensitive to gas poisoning than others, owing to a less vigorous constitution, a temporarily weakened condition, a more nervous temperament, or previous exposure to gas poisoning, the baneful effects being hard to eradicate from the system. For these reasons, what would prove a fatal percentage in some instances of less purity of atmosphere, longer exposure, more difficult work, or physical ailment of any nature, would not necessarily produce fatal results under better conditions and more robust health of the individual exposed to the gas.

The Coal Age Pocket Book

Relative Rate of Absorption by Blood—The experiments of Dr. J. S. Haldane and others have shown that 0.02 per cent. of carbon monoxide in otherwise pure air produces about 20 per cent. of saturation in a brief period of time (20 min.?). Since pure air contains 20.9 per cent. of oxygen, the ratio of carbon monoxide to oxygen, in the air breathed, is 2 : 2090, or 1 : 1045. But the ratio of absorption, carbon monoxide to oxygen, in this case, is 20 : 80, or 1 : 4, the blood showing only 20 per cent. carbon monoxide and 80 per cent. oxygen. Hence, the relative **rate of absorption** by the blood, carbon monoxide to oxygen, is about 260 : 1, since 1045 ÷ 4 = say 260. In other words, the blood in this experiment absorbed carbon monoxide about 260 times as rapidly as it absorbed oxygen, under the same conditions.

Another **experiment** showed 50 per cent. saturation in the blood when the air breathed contained 0.08 per cent. of carbon monoxide. In this case, the ratio of carbon monoxide to oxygen in the air breathed is 8 : 2090, or 1 : 260. But the corresponding ratio of absorption is 1 : 1, the blood showing 50 per cent. of saturation, or equal quantities of these two gases. Hence, in this case also, the relative **rate of absorption** of carbon monoxide and oxygen is the same as before, namely, 260 : 1.

Another **experiment** showed 50 per cent. saturation in the blood when the air breathed contained 0.05 per cent. of carbon monoxide. Here the ratio of carbon monoxide to oxygen in the air breathed being 5 : 2090, or 1 : 418, and the ratio of absorption, as before, 1 : 1, the relative **rate of absorption** is 418 : 1, showing that the blood absorbed carbon monoxide, in this case, about 400 times as rapidly as it absorbed oxygen, under like conditions, in the two previous experiments.

The experiments suggest not only the variation in the rapidity of the absorption of carbon monoxide by the blood of different individuals, with varying constitutions and degrees of health; but show clearly the great affinity of the hæmoglobin of the blood for carbon monoxide as compared with oxygen. These facts demonstrate forcibly the danger of working in a mine atmosphere containing the smallest possible percentage of this gas even when the worker is in robust health.

Production of Carbon Monoxide in Mines—Carbon monoxide does not occur naturally in mines, but may be and often is produced in dangerous quantities under the practically unavoidable conditions and occurrences incident to coal mining.

This gas is produced in considerable quantities by any combustion, on a large scale, commonly occurring in the limited confines of mine workings. Examples of this are mine fires and explosions of gas or dust. This gas is also produced by the explosion of powder in blasting. It is produced in dangerous quantities by the slow combustion of fine coal and slack thrown in the waste, in poorly ventilated places and abandoned areas void of circulation. Carbon monoxide is the deadly component of afterdamp, which renders the latter so quickly fatal to life, as shown by the fatal results that follow many mine explosions.

Inquiries of General Interest

The Bituminous Mine Law

Will you kindly explain two statements made in the electrical division of the bituminous mine law of Pennsylvania (1911)? These statements both occur in Art. 11, which is entitled "Special Rules for the Installation of Electricity." This article is introduced by the statement, "The following rules shall be observed, as far as is reasonably practicable, in the mines."

The first statement occurs in Sec. 1, Rule 2, and restricts the normal capacity of a transformer to 5 kw. and that of a motor to 15 b.hp. It would be of interest to know the meaning of this provision of the mining law. The rule reads as follows:

> For work underground, when supplied with current at a voltage higher than medium voltage, no transformer shall have a normal capacity of less than 5 kw.; nor shall a motor have a normal capacity of less than 15 b.hp.

The second statement occurs in Sec. 7, Rule 83, which provides for the protection by gas-tight fittings of strong glass, for all incandescent lamps used in gaseous portions of a mine, except lamps not exceeding 8 cp. and without tips and requiring a voltage of not less than 220 volts.

I would like to ask, Why is it necessary to protect lamps of less than 220 volts, while it is not necessary to protect them when they are of a higher voltage?

Greenwich Coal & Coke Co.

Saxman, Penn.

Inquiry among mining and electrical engineers has failed to reveal any reasonable explanation for the requirements of these rules to which correspondent has well drawn attention. We understand that the entire electrical section of the bituminous mine law was drafted by an experienced electrical engineer thoroughly familiar with mining conditions. It is impossble to state what he may have had in mind when writing these two rules. As a matter of fact, a number of motors are in use in mines in Pennsylvania, having a less capacity than 15 b.hp.

Without knowing the particular phase or conditions that Rule 83 is intended to cover, the reading of the rule as it appears in the bituminous law and as quoted above is seemingly absurd.

We are glad correspondent has drawn attention to these unexplained points and hope that the same will receive the prompt attention of the Department of Mines at Harrisburg; and that an effort will be made to explain the real meaning of these rules or to have them eliminated from the statutes. We hope that other correspondents will draw attention to similar incongruities in the mining laws of their states.

Formula for Weight of Air

Kindly state if the following formula is correct for finding the weight of 1 cu.ft. of air, at any temperature t and barometer B. Some textbooks give the constants 1.3253 and 459.

$$w = \frac{1.3273 \times B}{460 + t}$$

Peoria, Ill. STUDENT.

The above formula is correct; the absolute zero being now taken as —460° F., the constant 1.3253 is changed to 1.3273.

Oil from Coal

Can you inform me what percentage of oil can be obtained from 1 ton of cannel coal? Also, what percentage of oil can probably be obtained from Blue Gem coal? The analyses of these coals are as follows:

ANALYSIS OF CANNEL COAL

	Percentage
Fixed carbon	51.10
Volatile combustible matter	40.00
Ash	8.10
Sulphur	0.80
Total	100.00

ANALYSIS OF BLUE GEM COAL

	Percentage
Fixed carbon	56.55
Volatile combustible matter	39.07
Ash	1.28
Sulphur	0.63
Moisture	2.47
Total	100.00

Any information you can give or obtain from the readers of COAL AGE, on this subject, will be much appreciated.

JOE GRAEF.

Newcomb, Tenn.

It is impossible to calculate from the analysis of a coal its possible yield of oil. In this respect, the distillation of oil from coal is very much like the coking of coal. The results can only be determined by an actual trial or test.

There will appear in COAL AGE, shortly, an interesting and valuable article on this subject, prepared by F. R. Wadleigh, whose experience and acquaintance with the matter bespeak for his article a careful reading by all who are interested in the future of the coal industry.

After referring to the extraction of oil from the cannel coals and bituminous shales of Scotland, where the industry originated, and describing briefly its later development in the production of fuel oils in Great Britain, Mr. Wadleigh gives some of the results obtained. In one instance, 58.5 gal. of crude oil beside other products were obtained from a cannel that was not a high-grade coal. He mentions, also, the continuous operation of a plant on a commercial scale which is yielding at present as high as 130 gal. of oil per ton of coal.

The subject is one of the greatest interest at the present time and is being thoroughly investigated with a view to ascertaining its possibilities. An interesting point to which the article mentioned above draws special attention is the fact that the distillation of the oil from the coal should be conducted at low temperatures, in order to prevent, as far as possible, the production of gas and to increase the yield of oil.

Examination Questions

Miscellaneous Questions

(Answered by Request)

Ques.—In what proportion will gas be expanded, owing to a rise in its temperature from 70 to 95 deg. F.?

Ans.—Assuming a constant pressure, the volume of air or gas varies directly as the absolute temperature, or, in this case, the volume is increased in the ratio (460 + 70) : (460 + 95), or the ratio 530 : 555. The value of this ratio is 1 : 1.047; that is to say, the volume of the gas will be increased 1.047 times, owing to this rise of temperature.

Ques.—Find the force of a blownout shot when 8 lb. of powder has been used in the hole and 6 lb. of this has expended its force on the air current. The shot was fired in the intake at a point 4500 ft. from the fan. The intake airway is 8x10 ft.; the velocity of the air current, 700 ft. per min.; the temperature of the mine air, 60 deg F., and the barometric pressure, 30 in.

Ans.—It is impossible to give any answer to this question. The question is incapable of solution on any intelligent basis.

Ques.—What weight will break a steel I-beam that is ½x12 in. in section and 16 ft. between supports? The beam is equally loaded along its entire length. Assume the tensile strength of the steel as 50,000 lb. per sq.in.

Ans.—This is not a fair question to be asked in a general examination, unless textbooks are allowed or the moment of inertia of the beam is given. From the handbooks of manufacturers of steel I-beams, the moment of inertia of this beam may be found and is practically 312.3. The breaking load of the beam is then found by multiplying this moment of inertia by the ultimate fiber stress (50,000 lb. per sq.in.) and dividing 4/3 of that product by the distance between the supports in feet times the depth of the beam in inches. This gives for the breaking load, in this case,

$$L = \frac{4/3\, f I}{l d} = \frac{4/3 \times 50{,}000 \times 312.3}{16 \times 12} = \textit{say 54 tons}$$

Ques.—What grade would be necessary for a self-acting incline whose length is 1500 ft., in order to operate eight cars in each empty and loaded trip? Each car weighs 800 lb. and carries 2000 lb. of coal. A ¾-in. steel rope is used. Assume the friction of the load as $^1/_{50}$ of its weight, and the friction of the rollers as $^1/_{25}$ of the weight of the rope resting on them.

Ans.—Taking the friction as $^1/_{50}$ of the weight of the coal and cars, the total amount for 8 loads and 8 empties is given by the formula

$$\frac{n}{50}(W_c + 2W) = \frac{8}{50}(2000 + 2 \times 800) = 576\ lb.$$

Again, taking the friction of the rope resting on the rollers as $^1/_{25}$ of its weight, assuming a ¾-in. rope weighs 0.89 lb. per ft., the rope friction is

$$\frac{1}{25}(1500 \times 0.89) = 53.4\ lb.$$

This makes the total friction 576 + 53.4 = 629.4 lb. There being the same number of cars on each end of the rope, the weight of the cars is balanced. The weight of the coal is partly balanced by the weight of the rope when the load begins to descend the plane. The net weight acting to produce motion down the plane is, therefore, the weight of the coal less that of the rope; or,

$$8 \times 2000 - 1500 \times 0.89 = 14{,}665\ lb.$$

Finally, dividing the total frictional resistance by this net weight acting to produce motion down the plane gives the required tangent of the angle of inclination. Thus,

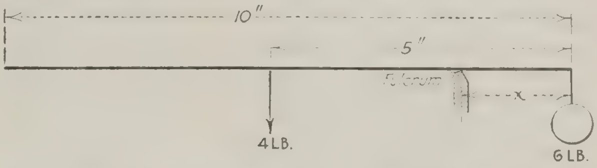
$$Tan\ a = \frac{629.4}{14{,}665} = 0.0429$$

and

$$a = 2° 27'$$

Therefore, under the assumed conditions, an inclination of 2° 27′ will be required to produce a self-acting incline, operating eight cars in a trip.

Ques.—An iron bar of uniform section, 10 in. long, weighs 4 lb. If a weight of 6 lb. is suspended from one end, at what point of its length will the weight of the bar balance the weight suspended at the end?



Ans.—Referring to the accompanying figure, the weight of the bar (4 lb.) acts through its center of gravity at the middle of the bar, 5 in. from either end. Let x equal the distance of the fulcrum from the end of the bar where the weight is suspended; then, $5 - x$ is the lever arm of the weight of the bar itself. When the weight of the bar balances the suspended weight, the moments of the two weights referred to the fulcrum as a center will be equal. Therefore,

$$6x = 4(5 - x); \text{ or } 10x = 20$$

and

$$x = 2\ in.$$

The point at which the weight of the bar will balance the suspended weight is, therefore, 2 in. from that end.

Ques.—What is the reason that firedamp found in wet places in mines is generally more pure and dangerous than that found in dry places?

Ans.—It is very probable that there is less carbon dioxide present in wet places than would naturally be found in the dry workings of the same mine, for the reason that slow combustion producing blackdamp is more liable to be taking place in the dry workings than in wet places. The presence of the blackdamp, as is well known, decreases the explosiveness of firedamp mixtures.

As a matter of fact, however, the conditions cited in the question are not always true, as dry workings are very liable to contain much fine dust suspended in the air, which increases the explosiveness of firedamp mixtures. This is not the case, to the same extent, in wet or damp places in mines.

Coal and Coke News

Washington, D. C.

The Supreme Court of the U. S. has made public the full text of its opinion in the so called North Dakota coal rate cases (Northern Pacific Ry. Co. vs. State of North Dakota, etc.) which involved the constitutionality of the special low rate on coal made by the state commission in intra-state business for the transportation of coal in car-load lots. This rate was made in order to favor the development of the North Dakota coal mining industry.

The opinion of the court is interesting not only from the standpoint of transportation but also from that of the coal business. In a word, the view of the court is that the desire to develop local industries does not warrant public authorities in compelling the carriage of products of those industries at less than cost. The opinion of the court says in summing up the case:

> It is presumed—but the presumption is a rebuttable one—that the rates which the state fixes for intrastate traffic are reasonable and just. When the question is as to the profitableness of the intrastate business as a whole under a general scheme of rates, the carrier must satisfactorily prove the fair value of the property employed in its intrastate business and show that it has been denied a fair return upon that value. With respect to particular rates, it is recognized that there is a wide field of legislative discretion, permitting variety and classification, and hence the mere details of what appears to be a reasonable scheme of rates, or a tariff or schedule affording substantial compensation, are not subject to judicial review. But this legislative power cannot be regarded as being without limit. The constitutional guaranty protects the carrier from arbitrary action and from the appropriation of its property to public purposes outside the undertaking assumed; and where it is established that a commodity, or a class of traffic, has been segregated and a rate imposed which would compel the carrier to transport it for less than the proper cost of transportation, or virtually at cost, and thus the carrier would be denied a reasonable reward for its service after taking into account the entire traffic to which the rate applies, it must be concluded that the state has exceeded its authority.

With reference to the North Dakota coal situation itself, which gave rise to the question of low rates in the first place, the court takes the view that, however important the industry, the state was not warranted in fixing an unduly low rate.

On this point, the opinion states:

> The state insists that the enactment of the statute may be justified as a "declaration of public policy." In substance, the argument is that the rate was imposed to aid in the development of a local industry and thus to confer a benefit upon the people of the state. The importance to the community of its deposits of lignite coal, the infancy of the industry, and the advantages to be gained by increasing the consumption of this coal and making the community less dependent upon fuel supplies imported into the state, are emphasized. But, while local interests serve as a motive for enforcing reasonable rates, it would be a very different matter to say that the state may compel the carrier to maintain a rate upon a particular commodity that is less than reasonable, or—as might equally well be asserted—to carry gratuitously, in order to build up a local enterprise. That would be to go outside the carrier's undertaking, and outside the field of reasonable supervision of the conduct of its business, and would be equivalent to an appropriation of the property to public uses upon terms to which the carrier had in no way agreed. It does not aid the argument to urge that the state may permit the carrier to make good its loss by charges for other transportation. If other rates are exorbitant, they may be reduced. Certainly, it could not be said that the carrier may be required to charge excessive rates to some in order that others might be served at a rate unreasonably low. That would be but arbitrary action. We cannot reach the conclusion that the rate in question is to be supported upon the ground of public policy if, upon the facts found, it should be deemed to be less than reasonable

One other point likely to be of considerable importance as a precedent in the fixing of coal rates elsewhere is made by the court in affording an analysis of the question what "cost" of transportation really is. The view is taken that such cost includes not only actual expense but also a fair share of general transportation expenses duly apportioned. The opinion says on that point that:

> We entertain no doubt that, in determining the cost of the transportation of a particular commodity, all the outlays which pertain to it must be considered. We find no basis for distinguishing in this respect between so called "out-of-pocket costs," or "actual" expenses, and other outlays which are none the less actually made because they are applicable to all traffic, instead of being exclusively incurred in the traffic in question.

Secretary Lane has submitted to the President the report of the Alaskan engineering commission on surveys of various routes for the new government road. The principal question to be determined is whether the line shall run to the east or to the west of Prince William Sound, and the decision depends largely on which part of the coal fields it will be thought best to develop first, as well as on the relative cost of constructing and maintaining the two routes. Negotiations are also understood to be in progress with the owners of the Copper River & Northwestern, and the Alaskan Northern railroads as to whether one of these lines shall be bought and used as a link in the new route.

HARRISBURG

When the Neville bill relating to the powers and duties of coroners was reached on the third reading calendar in the House, a motion was made to recommit it on the ground that a "snaky" amendment directed against coal miners had been inserted in the measure while it was in committee. This bill gave the coroner added powers in the investigation of deaths and the amendment to which objections were made, read as follows: "Provided also that such death did not occur in or by reason of an accident in any of the anthracite or bituminous mines of this Commonwealth." The amendment will now be dropped from the bill.

Senator Thompson, chairman of the Mines and Mining Committee of the Senate, stated that his committee will report out the Catlin bill (160) sometime during the week of Mar. 15. It will carry two amendments, one favorable to the operators and the other in the interest of the miners. The operators' amendment will reduce the time a man must work as a miner before becoming a foreman from five to two years. This will not be entirely satisfactory to the companies as they wanted no time at all specified.

The miners' amendment brings anthracite workers under the compensation act even more plainly than stated in the bill in its original shape. The modification in the wording is slight, but is thought to be highly important.

Representatives of the miners and operators have been battling for several days with the committee to get action favorable to their respective sides. Chairman Thompson has admitted that he is a nervous wreck, for he has been pushed harder, fought harder and besought harder than all the other senators combined on the Catlin bill.

The governor has suggested that all the revenue derived from the new tax on anthracite coal be turned over to the State Highway Department for road purposes. It will be two years at least until any of the revenue will be released, in case the act is finally declared constitutional, of which there is grave doubt.

The suggestion, however, reveals possibilities that cause anxiety in the anthracite region. The present act apportions a large part of the coal-tax revenue to the counties from which it is derived. The Legislature has the power to rearrange this apportionment and take all of the revenue, or most of it, from these localities, and the increasing demands for state projects might induce the Legislature to commit such an act.

The only excuse for singling out the anthracite coal as a revenue producer was the fact that the deposits are being exhausted and they cannot be replenished—that while the deposits last the producers or consumers should contribute more to the cost of permanent improvements. The argument applies more forcibly to the needs of the localities from which the coal was taken than to those of the state in general. If a special tax on anthracite is justified at all, the greater justification lies in giving the producing localities part, at least, of the revenue to guard against the time when it will vanish altogether.

In order to jeopardize local option, it is thought that orders will be issued to torpedo the governor's workmen's compensation bill and probably to strew a few floating mines in the channel of the governor's child labor bill. These provisions eliminate the common law defense in the workmen's compensation cases incorporated in the administration bill which Senator Crow requested Attorney-General Brown to change but which will stand as outlined when the bill is introduced in the Senate.

The refusal of the governor to free the employer from liability in cases where the accident is caused by the negligence of another employee or when the employee enters the employ of any corporation, knowing that the position in which he serves is dangerous, may mark the first disagreement between some senators on fundamental issues.

The common law defenses, as these provisions now effective are known, would be eliminated by the Governor's bill, and whether or not the employer agrees to abide by the provisions of the bill which are only elective he will be liable for compensation for that kind of accident. In another provision Senator Crow requested that compensation for permanent injury be decerased from 500 to 400 weeks. The governor will likely reduce the maximum payment from $10 to $8 a week and from $5000 to $4000. It has been found that out of 21,000 cases in one state only seven were totally disability.

Representative McClure introduced a bill in the house, to provide for the health and safety of persons employed in clay, ore and graphite mines and stone, slate, marble and granite quarries and that they shall be operated under the supervision of the State Department of Mines and shall be subject to such rules and methods of operation as may be recommended by the chief of the Department of Mines in accordance with such provisions of the coal-mine laws of the state as may be found applicable to the supervision of above quarries and mines.

The bill provides that inspections of the mines and quarries shall be made by certain district state coal-mine inspectors who shall be designated for the work by the Chief of the Department of Mines.

Representative Horton has introduced a bill in the house to amend section 6, of the Act of 1911 to read as follows: The superintendent shall provide a safety catch or other device to act on the rear end of the rear car of full trips that are being hoisted up slopes, and he shall also provide suitable signals to be placed on the rear end of the rear car of all trips hauled in the mines by locomotives of any kind.

Senator Kline has asked for an appropriation of $1,275,000 for the trustees of the University of Pittsburgh, $125,000 of this amount to be used for an addition to the School of Mines, which has been doing good work among the miners in the bituminous region.

PENNSYLVANIA

Anthracite

Nesquehoning—Owing to the decrease in business experienced during the winter, the Nesquehoning colliery, property of the Lehigh Coal & Navigation Co., has suspended operation until further notice.

Scranton—An announcement of General Manager C. E. Toby, of the Delaware, Lackawanna & Western R.R. Coal Department is to the effect that eight collieries of his company will remain idle until Apr. 1. Nearly 10,000 men and boys will be idle. The reason given, for the suspension, is the over-supply of coal and the poor demand, but it is hoped that things will pick up before the three weeks' suspension. The collieries closed are the Loomis, and Avondale in the Kingston district, Cayuga, Brisbin, Continental, Sloan, Dodge and Halstead in the Scranton district. Other collieries of the Lackawanna company are being operated only three days a week and indications are that the operation of these mines will also be further restricted.

Plymouth—Dodson No. 12 colliery, Plymouth Coal Co., is to be abandoned and allowed to flood. A force of men are at work removing pumps, machinery, etc. The Red Ash vein has already been flooded. For a time it was thought that the Kingston Coal Co. might purchase this and the Black Diamond Colliery at Luzerne, but negotiations fell through, the deal was called off and the old colliery, which in its time has sent millions of tons to market, employing about 500 men and boys, is evidently a thing of the past. The injunction secured by this borough against the operator, the late John C. Haddock, for damaging highways put a quietus to its further working as to take out any more coal would, it is alleged, do more and worse damage to the highways of the borough.

Wilkes-Barre—The coroner's inquest into the Oakwood shaft disaster at Prospect colliery of the Lehigh Valley Coal Co., Feb. 17, 1914, in which 13 men met death, resulted in finding the company negligent in permitting the use of naked lights where safety lamps were thought to be imperative. This was brought out by the testimony of mine foremen, explaining that the men would rather work with naked lights, as the roof at this place was 22 ft. high, and with safety lamps the men were unable to detect bad roof. They would sooner take a chance with the gas than with the roof, which was very faulty at this place. The jury recommended that hereafter safety lamps be used, and furthermore recommended the use of the new electric safety lamp recently approved by the Federal Bureau of Mines, for in their opinion men working in a vein 16 to 20 ft. high should have ample light.

Lattimer—Upon entering a smoke filled tunnel in the mine of the Pardee Coal Co. recently, after setting off a charge of dynamite, five men were overcome by the fumes. All were rescued, and all but one resuscitated.

Bituminous

Cecil—T. D. Gladden was awarded a verdict for damages of $750 against the Pittsburgh Coal Co. The litigation arose out of damage done to crops on his farm and to timber land by noxious gases and fumes that came from a burning gob pile of the defendant company. The pile is on land of the coal company adjoining the Gladden farm. The refuse that makes up the pile comes from the Jumbo mine of the coal company. In 1913 the gob got on fire and burned for many months. The coal company contended they were not responsible for the fire, and could not avoid the noxious gases.

Somerset—Coal operators and fishermen of the state are watching closely the case of the Commonwealth against Archbald Miller of the Loyalhanna Coal Co. Mr. Miller is charged with having turned mine drainage into Shade Creek to such an extent that the stream is no longer fit for fish. It was testified that the mine water had killed all the fish in the stream. The case has an important bearing on the authority of the state to protect streams from pollution when stocked from state hatcheries.

Pittsburgh—The movement of coke throughout the Pittsburgh district is slowly increasing, showing somewhat renewed activities in mills and plants using this fuel. This is regarded as the forerunner of increases in tonnage of other commodities. For the first 11 days of March the coke loading on roads in the Pittsburgh district increased between 6 and 7 per cent. as compared with the similar period the preceding month. A revival in coal traffic is not anticipated until the opening of navigation on the Lakes.

WEST VIRGINIA

Charleston—Suit was recently instituted in the Circuit Court of Raleigh County, by R. L. Milam, to recover from the New River Collieries Co. $93,000, principal and interest, alleged to be due on a contract between Milam and S. M. Miller, acting as the authorized agent and general manager of the New River Collieries Co. The contract which is said to have been made May 31, 1906, provided that Milam should turn over to the agent of the Collieries Co. options which he held on about 5000 acres of land in Raleigh County, adjoining the first coal operations of the New River Collieries Co. at Eccles.

Tunnelton—The Austen Coal & Coke Co. recently fired a part of its equipment of coke ovens, and it is believed that shortly 100 of them will be burning. This firm is said to have contracts enabling it to work practically its entire force of men, who were thrown out of employment by the destruction of the plant by fire about a year ago. About 300 men will be put to work in a short time, while others will be employed later.

Fairmont—A fire recently occurred in the tipple of the Consolidation Coal Co. at Montana, which for some time threatened to destroy the entire structure. A hose line was quickly gotten into operation, and a bucket brigade formed, and in about an hour the fire was under control. Two tipples occupying the same site as this one have been burned in former years.

Thomas—Hiram Haskell, boss driver at the Thomas No. 25 mine, was recently fined $50 and costs making $52.80 in all, after being prosecuted by District Mine Inspector, W. B. Plaster, for running a mine motor loaded with pipe for a pump line past a fire-boss' danger signal. The inspector while presenting the case to the justice remarked that he was glad to get his man while the result of his action would tend to secure the lives of men and not to avenge their loss.

KENTUCKY

Jenkins—The Consolidation Coal Co. in the Jenkins-McRoberts field reports continued improvement in the mining conditions with the announcement also that all the mines will resume full time Apr. 1. A large number of miners idle for several months are to be given work.

Henderson—H. F. Torry, of New York, is making a personal investigation of the Union coal basin, comprising 125,000 acres of coal and mineral rights in Union and Webster counties. Mr. Torry, an expert mining engineer, is said to be representing New York and English capitalists and is reported to be favorably impressed with the field.

Pineville—The spring meeting of the Kentucky State Mining Institute, which has heretofore been held in Lexington, will be held in Pineville this year on May 14 and 15. A state-wide first aid contest between teams from various mines is to be a feature of the meeting. This is to be the first meeting of the institute in the mining district and a larger degree of interest is looked for on that account. Miners in the eastern Kentucky field are already preparing to participate.

OHIO

Bridgeport—The Edge Hill Coal Co. and the Blyth Coal Co., of Salt Run, Ohio, have agreed to pay the 47-cent rate demanded by the miners, as a result of which demand the strike has been prolonged. The two companies employ several hundred men, and are preparing to reopen their mines for the immediate resumption of work. The miners are jubilant, declaring that the strike has been won and that other operators will fall in line.

INDIANA

Indianapolis—The bill introduced by Senator J. C. Kolsem, coal operator, Terre Haute, for the codification of the mining laws of Indiana, recently passed both houses of the Indiana legislature and was signed by the Governor.

The United Mine Workers of America will celebrate the 17th anniversary of the establishment of the eight-hour day by observing Apr. 1 as a holiday.

Vincennes—The new Oliphant-Wasson coal mine, near Bruceville, Ind., has begun operations.

ILLINOIS

Mount Vernon—It is stated that A. C. Snively, of Pittsburgh, recently closed a deal with George Thretkeld and W. H. Green, for the purchase of 10,000 acres of Jefferson County coal land.

Princeton—There was recently called in the Circuit Court a case in which the village of Dalzell sued for the condemnation of a piece of property owned by the Spring Valley Coal Co. This property is wanted for use as a street, and the village is pushing the matter of condemnation.

Pana—The Peabody mine broke the record recently when 4800 tons of coal were hoisted in 8 hours. This is an average of 600 tons per hour, or 10 tons per minute.

Freeburg—For the second time within a week, the leasehold of the Missouri & Illinois Coal Co., used in the operation of the St. Clair coal mine at Freeburg, was recently sold at public sale. The first sale was made by the sheriff to satisfy a judgment, and William J. Reichert was the purchaser. The same property was then sold again, a few days later, by the Master in Chancery, under a mechanic's lein held by the Southern Boiler Works, of Belleville, for $470.50. L. D. Turner was the second purchaser.

Carbondale—The Illinois Central R.R. makes announcement of a new branch line, extending east from Johnston City, Illinois, to Hanaford on the Eldorado Branch. This cuts through virgin coal fields, a large portion of which are owned by the United States Steel Corporation. Several new mines are contemplated in this district in the next year or so.

KANSAS

Ottawa—The coal mines at Ransomville are being dismantled, after having been in operation continuously since 1879. These mines were established by the late Capt. J. H. Ransom. Several years ago they competed with mines in southeastern Kansas. Recently the workings had reached so great a depth that profitable operation was impossible; 14,000 ft. of track will be removed.

ARKANSAS

Fort Smith—Judge Frank A. Youmans, of the United States Court, on Mar. 10, instructed A. S. Dowd, receiver for the Bache-Denman Coal Co., and nine of its subsidiaries, to dispose of the property at his discretion. It was agreed that the leases which the Bache-Denman Co., and others, held on three mines of the Sebastian County Coal & Mining Co. of Philadelphia, would be cancelled in consideration of the Sebastian company cancelling $20,000 debt against the corporation.

PERSONALS

T. J. Hoffman, who has been the central Ohio representative of the William J. Hamilton Co., has resigned to accept a position with the Elmer Miller Coal Co., of Toledo.

Carlton R. Mabley, for the past five years general manager of the R. I. V. Ball Bearing Co., has joined the selling organization of the S. K. F. Ball Bearing Co.

J. E. Hibbs was recently reëlected president of the Strange Creek Coal Co., which operates at Strange Creek, W. Va. F. L. Masten was elected secretary, and F. E. Truesdale, treasurer.

John M. Stauffer was recently elected president of the Stauffer-Quemahoning Coal Co. Walter S. Stauffer was elected vice-president, D. D. Martin, treasurer, and J. S. Braddock, secretary.

Edwin Husband, formerly superintendent of the Wadsworth Red Ash Coal Co., at Birmingham, Ala., has been appointed general superintendent of the National Coal Co.'s mines near Cumberland, Washington.

Stephen H. Green, formerly general manager of the Wadsworth Red Ash Coal Co. at Birmingham, Ala., has recently been elected president and general manager of the National Coal Co., Inc., with head offices at Seattle, Washington.

Thomas Sneddon has severed his connection as general superintendent of the Amalgamated Copper Co.'s coal mines at Diamondville, Wyo. Mr. Sneddon has been in charge of these mines ever since the amalgamated company acquired the property.

The body of William Hale, aged five, and his companion, Albert Tomlinson, aged ten, still living, were found on Mar. 13 in an abandoned mine near Banksville, Penn. The boys had been missing for a week, having wandered into the abandoned mine at play and become lost. The older boy was almost exhausted from exposure and hunger when the searching party arrived.

T. R. Johns, for a number of years general superintendent of the Edensburg Coal Co.'s operations at Colver, Penn., has sent in his resignation to take effect April 1. His successor has not yet been named. Mr. Johns is widely known among coal men of Pennsylvania. The mine at Colver is now producing in excess of 4000 tons daily, and under Mr. Johns' direction this plant has gained wide prominence.

J. H. Carlton, one of the best known mine foremen in the state, was fatally injured Mar. 11 by a fall of rock at the Palos mine of the Republic Iron & Steel Co. Mr. Carlton was about 40 years old and leaves a widow and four children. He was formerly mine foreman for the Tennessee Coal, Iron & R.R. Co. and had held similar positions with the Bessemer Coal, Iron & R.R. Co. at Belle Ellen, and the Sloss-Sheffield Steel & Iron Co. at Flat Top.

A. H. Woodward, vice-president and general manager of the Woodward Iron Co., it is rumored, is to become chairman of the board, and that R. H. Bannister, secretary, will become president, also retaining his duties as secretary. Mr. Woodward has grown up in the iron making business. He is at present head of the operations and has been actively in charge for some time. He is considered one of the best informed iron makers in the district. Mr. Bannister has been associated with the Woodward Iron Co. for a number of years.

OBITUARY

Alexander Hamilton, 72 years old, president of the Gartside Coal Co., of St. Louis, operating mines at Murphysboro, Illinois, also president of the Odd Fellows Building Co., died at his home, 2329 St. Louis Ave. on Mar. 9, after a short illness. Mr. Hamilton was born in Illinois and came to St. Louis at the age of five, and has been a resident of the city ever since. At the age of 15 or 16 years he entered the employ of the Gartside Coal Co., and for a period of over 50 years has been in active service in the coal trade, both operating and retail. Until a few days before his death he was at his office regularly. He is survived by two sons and two daughters.

John S. Atcheson, veteran coal and coke operator, recently died of apoplexy in Pittsburgh. About a year ago, Mr. Atcheson suffered a stroke of paralysis, and at the time of his death had just returned from a trip to the Isle of Pines. Mr. Atcheson was 51 years of age and was born in Allegheny. Since 1880 he had been engaged in the coal and coke business, and in company with J. W. Moore, H. C. Frick, Gilbert Rafferty, and Col. James M. Shoonmaker, he organized the Coal Association in 1884 and became its secretary. He was alone in his room, 614 Curry Building, at the time of his death. His body was discovered by A. M. Blattenberger, a business associate.

CONSTRUCTION NEWS

Harlan, Ky.—The Harlan Gas Coal Co., recently organized, is beginning the initial work on a coal development on the Wasiota & Black Mountain R.R. This will have, it is said, a daily capacity of 1000 tons to begin with.

Jeff, Ky.—It is announced here that the Lexington & Eastern R.R. Co. is making plans for the building of a 20-mile branch railroad line into the Cass' Fork section where an Eastern syndicate has just purchased a large area of coal lands for early development.

Cumberland, Wash.—The National Coal Co. has acquired a 25-year lease on two sections adjoining the present holdings and is opening three new mines and sinking a new slope. In addition it is building a new railroad tipple, bunkers and washery to handle 1000 tons daily.

Della, Va.—The coal operation here, which has been working every day for some time, will be closed down for about 90 days in order to remodel the tipple and lay additional tracks. Enough contracts have already been secured to keep the mine running every day for some time.

Clarksburg, W. Va.—The appearance of a large corps of Baltimore & Ohio R.R. engineers and their survey of a route on the Lowndes Hill and in the Romines Mills section have given rise to the belief that the company is preparing to build a line from Grafton to Weston. Immense coal deposits lie along this route.

Canonsburg, Penn.—Following the recent purchase by H. A. Davis, at Pittsburgh, of 200 acres of coal land, contractors are at work sinking two shafts preparatory to active operations on the property by May 1. The capacity of the new mine will be 800 to 1000 tons per day and about 200 men will be employed. The output of the mine will be used to supply the Standard Tin Plate Co., and the coal will be hauled directly to the Tin Plate company's plant in the mine cars and dumped into bins at the boiler house.

NEW INCORPORATIONS

Springfield, Ill.—The Gilmore & Solomon Coal Mining Co. has increased its capital stock from $5000 to $25,000.

Krypton, Ky.—The Krypton Coal Co. has been incorporated with $1000 capital by Clark Eversole, I. B. Richie and J. A. Collins.

Madisonville, Ky.—The Gordon Mining Company, with a mine in this (Hopkins) county, has filed an amendment to its charter, increasing its authorized capital from $1000 to $3000.

Pittsburgh, Penn.—J. Bert Ross, of Buffalo, with several friends, is incorporator of the Fairview Mining Co. of Pittsburgh; capital stock, $25,000. Mr. Ross was formerly owner of the Glenora mine in the Allegheny Valley.

Cincinnati, Ohio—The Luhrig Coal Co. has filed amended articles of incorporation reducing its capital stock from $700,000 to $52,500. The reduction indicates no change in the company's operations, it is announced, but is made for economical reasons.

INDUSTRIAL NEWS

Buffalo, N. Y.—There are now about 30 coal cargoes in Buffalo harbor, waiting for the opening of navigation. The Delaware, Lackawanna & Western dock, which has loaded most of the cargoes, has suspended operations for the present.

Buffalo, N. Y.—The Delaware, Lackawanna & Western Coal Co. has signed a lease for four offices on the ninth floor of the Prudential Building, Buffalo, and will remove there late in April. For some time the company has been located in the White Building.

Elkins, W. Va.—It it rumored that the Baltimore & Ohio Ry. will buy the Coal & Coke R.R. shortly. The Coal & Coke R.R. now runs into Belington, and should it be purchased, it would give the B. & O. a route from Elkins to Pittsburgh and Wheeling.

Geneva, Switzerland—It is stated that the largest coal depot upon the Rhine located at Strassburg was recently set on fire by a bomb dropped by a French aviator and is still burning. Four thousand tons of coal have been destroyed and 20,000 more are in danger.

Juneau, Alaska—The Juneau Land Office has rendered a decision canceling on fraud charges the applications for patents on 41 coal claims in the various coalfields comprising the McKenzie Anthracite Coal Co., the Carbon Mountain Anthracite Coal Co., and the Alaska Smokeless Anthracite Co. claims.

Washington, D. C.—A charge imposed by the Norfolk & Western and other railroads for dumping coal from piers into boats at Norfolk and Newport News in addition to the regular transportation freight was recently upheld by the Interstate Commerce Commission. Complaint made by the New England Coal & Coke Co. was dismissed.

Whitesburg, Ky.—An Eastern syndicate, composed of New York and Philadelphia capitalists, is said to be represented by a party of prospectors going along Carr's Fork and Troublesome Creek, in Knott County closing deals on a large boundary of timber and coal lands. Knott County has no railroad line but this development would mean a branch extension of the Lexington & Eastern.

Bristol, Tenn.-Va.—The Stonega Coal & Coke Co., one of the largest in the Virginia fields, has contracted for the entire power output of the Electric Transmission Co. of Lee County, with a power house in the Black Mountains. The Electric company's plant has a capacity for 3000 hp. but this will be increased to 12,000 hp., making it one of the largest steam power plants south of the Mason and Dixon line.

Marshfield, Ore.—Fred L. Wilson, a mining engineer and expert of Los Angeles Calif., who has been making an extensive study of coal deposits and possibilities of this section states that his anticipations are far exceeded by the results of the investigation. Coal mining is an industry that has never been extensive here, but Mr. Wilson prophesies that development will bring many eastern factories to this bay.

Scranton, Penn.—Shipments of anthracite during February were 4,275,107 tons as compared with 4,121,451 tons during the corresponding months of 1914, or an increase of 153,656 tons. The Lehigh Valley R.R. led in tonnage for the month with 887,267 tons; the Philadelphia & Reading was second with 692,743 tons, and Delaware, Lackawanna & Western, third, with 630,246 tons.

Philadelphia, Penn.—The proposed increase in freight charges on bituminous coal brought into this city has been forbidden by the Interstate Commerce Commission. The Commission ordered cancellation of increased railroad rates established on bituminous coal from Pennsylvania, Maryland and West Virginia mines to this city and Baltimore for transshipment to points inside the Delaware and Chesapeake Bay capes.

Philadelphia, Penn.—The Federal Grand Jury recently indicted the Pennsylvania R.R. for granting rebates to the Glen White Coal & Lumber Co. on the transportation of bituminous coal and coke from Kittanning Point, Penn., to points in New Jersey and New York. Two bills were returned. the first charging "the granting of concessions with respect to transportation of property in interstate commerce," and the second that the railroad willfully failed to strictly observe tariffs.

Harrisburg, Penn.—There were 600 men and boys killed in the anthracite mines during 1914, being a reduction of 24 as compared with 1913. Four hundred and thirteen men lost their lives in the bituminous regions, being a decrease of 198 as compared with the previous 12 months. The total production of coal was 237,221,835 tons. The anthracite output amounted to 91,367,305 tons, or a decrease of 259,659 tons as compared with 1913. The bituminous production was 145,884,530 tons, or a decrease of 24,081,829 tons as compared with 1913. The number of persons employed in and about the mines was 346,831.

Seattle, Wash.—Andrew Christianson, chief of the field division of the Interior Department for Alaska, whose headquarters were recently transferred from Seattle to Juneau announces regulations from Washington providing for the free use of coal upon public lands in Alaska, thereby permitting cannery, sawmill, and other operators all the coal they need free of charge with which to conduct their business. The new regulation, if taken advantage of, is not only expected to save considerable money for these concerns, but is also expected to provide employment for a number of people who are now in that territory.

Trenton, N. J.—The jury of the United States District Court on Mar. 11 rendered a verdict of guilty against the Central R.R. Co. of New Jersey, on charges of rebating. The indictment against the company charging 185 violations and the jury sustained the indictment. The rebating charge consisted of granting special rates to the Lehigh Coal & Navigation Co. for the shipment of coal from Nesquehoning in the anthracite fields of Pennsylvania to various points in Pennsylvania, New Jersey and New York. The minimum penalty for each count is a fine of $1000 and a maximum fine of $20,000. The court deferred sentence.

Coal Trade Reviews

General Review

Full effects of the usual pre-spring dullness are now felt and the hard coalers have made a drastic cut in working schedules. Bituminous consumers feeling out the contract market cautiously and competition keen. Favorable interpretation placed on developments to date. Shortage of steam sizes at interior points.

The large distributing centers are choked with anthracite coal and drastic curtailment policies have been instituted, one of the large hard-coalers having suspended operations at eight of its collieries for a period of three weeks. Although the dullness is perhaps somewhat accentuated, this general slowing down all along the line is characteristic of this period of the year, just preceding the heavy April cut in the circulars down to the summer level. As a result of the light working schedules, the consumption of the steam sizes is outstripping the production; many of the companies have been forced to draw heavily on their storage supplies, which are in some instances now almost depleted.

The bituminous agencies are completely absorbed in negotiations on new contracts. With consumers feeling out the market very carefully for concessions, and extremely cautious about closing, the sellers are generally more anxious than usual, though they express themselves as satisfied with the trend of conditions, considering the general depression in all lines. Operators are fighting aggressively for business, particularly where their old contracts are at issue, and in most instances they are willing to concede moderate reductions on old prices.

The prompt market is fairly well maintained, the producers holding coal more closely at the mines. The weakening in prices is less general than has been the case, and the market seems to be settling down into a situation more nearly on a par with that of a year ago. However, there is still a distinct feeling of depression throughout the trade, and all hopes for a rapid improvement have about disappeared.

The situation in the Pittsburgh district is more discouraging, buyers being firmly in control of prices. Retail buying in Ohio has practically ceased, and the demand is lighter all along the line, with the possible exception of the railroads which are taking a fair tonnage. The curtailed demand for the domestic grades has created a shortage in the steam sizes, which are now moderately active. Production is at the lowest point yet reached, and the outlook in the Lake trade is uncertain and far from satisfactory.

The Southern market is slowing down into one of the worst situations in the history of the trade. There is no activity whatever on domestic grades, a considerable tonnage of which is on demurrage, and mine operations are down to an average of one or two days a week, with a good many mines closed down entirely.

A rather strenuous demand for the steam sizes and a complete lethargy on the domestic grades are the salient characteristics of the Middle Western market. Even offers of April prices for March shipments are failing to stimulate any business, and with the exception of screenings, it is difficult to move coal at any price. This shortage of the steam grades is creating some interest in contracts among buyers. An increased number of mines are closing down which may have a beneficial effect later in the season.

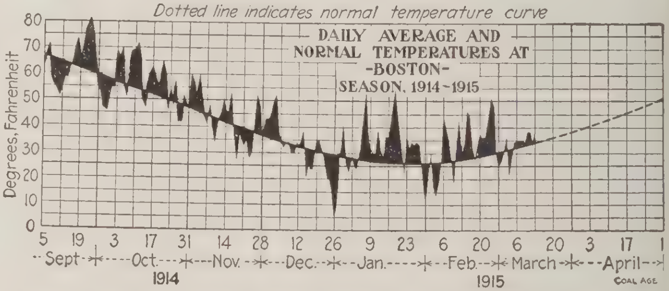
ATLANTIC SEABOARD

BOSTON

Market conditions ragged. Indications of Pocahontas and New River weakening. Inquiry very light. Georges Creek now competing for season business. Pennsylvania grades practically unchanged. Anthracite beginning to come forward for spring delivery.

Bituminous—Prices on Pocahontas and New River are still uneven, but perhaps less so than last reported. In other words, a weakening in prices, especially delivered prices, is less general than a week ago. The market is "settling down"; season figures have been made within a week that are about on a par with those of a year ago. Any firmness in water freights has now been discounted in practically all quarters and those shippers who entered contracts early in the season on the strength of "panic freights" will probably have to scale down their prices to something nearer the present level. For those shippers just entering the market the going is rather hard but the fact that transportation people realize that freights are almost certain to recede materially makes it less hard than was feared. If freights go back to 70@75c. the shippers without transportation of their own will not be at such a disadvantage.

The Georges Creek shippers are competing strongly for the contracts now coming into the market. In some cases business has been lost by these interests to those shipping from Hampton Roads but in other cases tonnage has been taken from the latter, so for the time being at least, the Georges Creek shippers are as strong a factor as usual in the New England market.



There are no new developments here in the position of the Pennsylvania grades. The outlook is not so favorable as when water freights were high from Hampton Roads but it is probable the shippers can hold the ground already gained unless there is a serious break in Pocahontas and New River. All-rail prices are fairly firm but the movement is not heavy. Stocks are ample and inquiry light. Anthracite barges are being withdrawn from the bituminous trade coastwise and that has a tendency to diminish receipts at this end.

Water Freights show further signs of weakening. If 75c. has not yet been named on large vessels, Hampton Roads to Boston, for spot leading, the feeling is that it will be very soon. Steamers are now on the way back from European voyages and it is understood that practically all of them will resume their regular runs as coastwise colliers, for the present at least. Less is heard of South American charters, although it may be only a temporary lull. Forty-five cents is once more the rate on barges from New York to Fall River and New Bedford.

Anthracite—Clear weather for some weeks allowed barges to move on schedule and the impending shipments on April prices are likely to be very large. The retailers have been able to get their stocks well worked down. Up the Maine rivers, stocks are very light and now that navigation has opened the dealers there are eager for early shipments. With some of the shippers, individuals in particular, cargoes have already begun to come forward on the reduced spring basis.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*..........	$0.90@1.40	$1.15@1.60	$1.67@1.77

NEW YORK

Negotiations on new contracts taking definite form. Moderate concessions on old prices the rule but agencies regard the situation as satisfactory. Drastic curtailment in the anthracite production.

Bituminous—Competition of the most aggressive kind still marks the negotiations on new contracts, but conditions are now beginning to assume some definite form, and agencies express themselves as satisfied with the outlook, considering the prevailing adverse conditions in all lines. Consumers are feeling out the market carefully before closing, and in most cases are insistent upon a moderate concession on old prices; as a rule the seller is willing to meet this demand, in order to close with satisfactory customers. The conservative agencies are devoting little time toward getting any new business; they are fighting aggressively to retain their old business, but, as a rule, they do not show any disposition to create any abnormally competitive situation by trying to land their rivals' tonnage.

In the prompt market the trade is just holding its own. The old optimism as to the future still prevails, even among the most conservative observers, but it still fails to take any tangible form. The producers are reducing shipments by drastic cuts, a notable example being that of the Pittsburgh Coal Co., which is now outputting at the rate of only about 1,000,000 tons per month, as compared with 2,000,000 normally. This is having a decidedly favorable effect at the distributing centers, where consignment coal is being kept so low that some shippers are even moderately embarrassed for sufficient supply at times. The bunker business continues fair, and in fact is running somewhat ahead of normal. Prices continue on the following basis: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—Evidence of the extreme apathy in the anthracite trade is seen in the heavily curtailed working schedules which have gone into effect at the anthracite collieries. The storage facilities of the Delaware & Hudson Co. have been so heavily overloaded that eight collieries have been closed down for a period of three weeks. The Lehigh Valley has worked only two days a week during each of the past two weeks. The Reading did somewhat better last week, having operated three days.

A result of these heavy curtailment policies has been to reduce the output of steam sizes to considerably under requirements. Most of the companies have therefore been drawing on their storage supplies heavily, and in many instances these have been practically all picked up. With the possible exception of buckwheat No. 2, and broken coal, there are excessive supplies in every direction.

The market is not quotably changed, and we continue it on the same basis as last week as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	4.85@5.35	5.30	4.80@5.30
Stove	5.35	4.85@5.35	5.30	4.80@5.30
Chestnut	5.60	5.10@5.60	5.55	5.05@5.55
Pea	3.55	3.40@3.55	3.50	3.30@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.35@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.90@2.25
Barley	1.80	1.70@1.80	1.75	1.30@1.75

BUFFALO

Bituminous improving very slowly. As a rule all contracts are taken at lower figures than last year. No prospect of early improvement. Anthracite season practically closed. Orders for April are light.

Bituminous—Some of the members of the trade report the demand improving moderately, but even they concede that they have, in some instances, been obliged to accept contract prices 5c. or so below last year. It is difficult to see how the mines are going to run on such prices, but it appears that they are preparing to, for no contract would in these days be taken without a mine somewhere to stand behind it. There is a feeling of the utmost depression in the entire trade, except in the case of a few jobbers who are able to proceed on a profit of 5 to 10c. a ton; they are usually situated so that their running expenses can be reduced to very low terms.

A month or two ago there was expectation of a stir in general business at some time not far distant, but that has about disappeared now. But on the other hand there is no money stress and none is looked for; business is merely very dull and quite likely to remain so for some time. The activity expected from the European war has not appeared.

Prices continue at the bottom, $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny Valley sizes about 25c. lower than Pittsburgh.

Anthracite—The demand is light as is usual during March, but shippers now report that even the April orders are light. As a rule the jobbers have more coal on hand than they reckoned on. The anthracite mines are running only about half time and stocking and loading into Lake vessels have been resorted to rather more than usual to take care of the surplus. If the Western trade should demand an early supply it would be easy to furnish it. The prospect is not encouraging.

PHILADELPHIA

Anthracite continues inactive. Movement at prevailing circular small. Bituminous on about parity with last week, the market indicating little change either in demand or prices.

Anthracite—Shaping conditions for the opening of the new coal year are now absorbing the attention of the anthracite operators. Contrary to expectation, it is not believed that there will be any change in the circular of prices compared with last year. The differential of 25c. per ton at Tidewater and 15c. on the line between stove and chestnut will still obtain. The individuals, of course, if the market warrants it, will exact as much as they can above the so-called circular, and vice versa, will concede enough from their prices to move their output, when necessary; they use the basis of the printed circulars, but suit themselves about maintaining it.

There is no difficulty whatever at the present time in securing all the coal required, at the opening or spring prices. Quite a tonnage is being moved by individuals, and it is alleged that one or more of the large companies are announcing prompt shipments on orders at the April figures. This condition however, is no different from normal years, excepting that possibly the market broke a little earlier, owing to the open weather which has prevailed most of the winter season.

Production continues on about a 50 per cent. basis, and it is understood some of the larger companies are disposing of part of their output by forwarding it to the Lakes for transshipment. Vessels have been chartered to load this coal, holding it until navigation opens. In this way, it is possible to operate a greater length of time than the local and tidewater demand would warrant.

Broken and buckwheat still continue short.

Bituminous—There is little to be said regarding bituminous. The market shows no disposition to improve, either in demand or prices, and the efforts of salesmen are concentrated on renewing old contracts.

BALTIMORE

Winter's close is marked by extreme dullness. No longer any doubt as to cutting on contracts.

A period of great dullness marks the closing days of winter. The demand for coal in the mining districts is at a minimum and prices are very poor on what spot business develops. Through western Maryland and in West Virginia there are offerings of low grade steam coals down as low as 80c., and much of this is at less than actual production cost. Even the high grade fuels are offering at from $1.15 to $1.25. The situation in Pennsylvania is about the same on the best coals, although the lower grades as a rule hold ten cents higher than the same grades from neighboring states.

In some cases there has been a cut of five and ten cents on new contracts, even on good fuels. Producers are showing more than usual anxiety to get under cover but there are some who say that there will be regrets later when business is more brisk. It must be admitted, however, that the early summer will be dull from an industrial viewpoint.

The foreign business is the only thing to hold up well at this port. Six more export charters were announced closed the past week for loading here.

HAMPTON ROADS

Dumpings continue fair. Number of small cargoes move to South American and West Indian ports. Supply at the piers still above normal.

Dumpings over the tidewater piers for the week may be called about fair. There have been some large shipments coastwise to New England and some few small ones south but the movement has not been as heavy as under normal conditions. Export cargoes have been made to a number of different ports in South America and West Indies and although the number of vessels has been fair the cargoes, with one or two exceptions, have been very small and the total coal exported was not large. The number of bunker steamers has not been as heavy as anticipated although this business has held up remarkably well when the war conditions are taken into consideration.

The supply of coal at all piers is still somewhat in excess of normal. It is expected that a considerable part of this will be shipped during the coming week as a number of coastwise vessels are due for cargoes and the government will probably take some coal. Practically no high volatile coal was moved during the week, although there have been some small shipments of nut and slack New River and Pocahontas in addition to the mine-run.

There appears to be no change in prices at tidewater on the grades of coal shipped through here, although it is understood that April contract prices are now being quoted on March business.

The following cargoes cleared from Hampton Roads ports, between Mar. 5 and Mar. 12, inclusive:

Norfolk			Newport News		
Vessel	Tons	Destination	Vessel	Tons	Destination
Talisman	2400	Port au Spain	**Sif**	4637	Fort de France
Josey	3378	Havana	**Hamborn**	1550	Georgetown
Tabor	5400	Canal Zone	**Josef Frerick**	2940	Cienfuegos
Magnus Manson	2399	Pernambuco	**Nora**	5169	Montevideo
Frankrig	2181	Barbados	**Parana**	5800	Brazilian ports
A. M. Davenport	1718	Para			
Falk	1169	Manzanillo			
Denis	2050	Para			
Tottenham	4579	Curacao			
Barque Ortrud	2186	Genoa			

Note—Steamers are indicated by **bold face type**, all other being schooners.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Ubbergen	Dutch	Baltimore	Tela and Truxillo	1150	
Camilla	Norwegian	Baltimore	Bocas del Toro	1530	
Ruth B. Cobb		Baltimore	Kingston	530	$3.10
Lydia M. Deering		Philadelphia	Porto Rico	1063	
William H. Clifford		Philadelphia	Porto Rico	1378	2.60
Bilbster	British	Baltimore	Savona	2790	
Rebecca Palmer		Norfolk	Rio Janeiro	2125	6.50
Dorothy Palmer		Norfolk	Rio Janeiro	2315	
Andreta (ship)	Italian	Philadelphia	Italy	1619	
Doris (bark)	Italian	Philadelphia	Italy	1296	
Chas. Noble Simmons		Baltimore	Kingston	716	
Elizabeth T. Doyle		Norfolk	Para	660	5.50
Orleans		Norfolk	Brazil	605	
Edw. J. Lawrence		Philadelphia	Guantanamo	2483	2.50
Antinoe	British	Baltimore	Marseilles	1477	10.32
Henry S. Little		Atlantic range	Guantanamo	984	2.75
F. & T. Lupton		Atlantic range	Guantanamo	797	

Note—Steamers are indicated by **bold face type**, all others being schooners.

OCEAN FREIGHTS

Some new record high rates quoted. Heavy tonnage moving to Italy. Steamers scarce and owners showing little interest in coal charters.

The market has again advanced. A British steamer of 6500 tons coal capacity, has been chartered for three trips from Virginia to the West Coast of Italy, at or about $10.54, steamer to load the first cargo in April; $13.44 is bid on grain to the West Coast of Italy for March loading and $12.72 for April loading, and owners are not inclined to take coal at much less than these figures, as the cost and dispatch for loading and discharging grain are about the same as coal and the charters are cleaner

A large amount of coal is being moved to Italian and other Mediterranean ports, but shippers have been obliged to charter steamers on time charter to transport same, either for round voyages or for periods.

Rates from the Plate are easier and consequently outward rates firmer. Very few steamers are available for Cuban and West Indian trades as the bulk of these boats have been absorbed for other business.

Coal freights by steamers are about as follows:

To	Rate	To	Rate
Havana	$2.50@2.75	Guantanamo	$3.00@3.25
Cardenas or Sagua	3.25@3.50	Demerara	5.50@6.00
Cienfuegos	**3.00**	Bermuda	3.00@3.75
Port au Spain, Trinidad	**3.50**	Vera Cruz	**3.50**
St. Lucia	**3.50**	Tampico	**3.50**
St. Thomas	**3.25**	Rio	**10.80**
Barbados	**3.50**	Montevideo, Buenos Aires or La Plata	**10.20**
Kingston	3.00@3.25	Mediterranean	**12.48**
Curacao	**3.25**	Valparaiso	8.40@9.60
Santiago	3.00@3.25		

Note—Rates noted in **bold face** type are only approximate.
W. W. Battie & Co.'s Coal Trade Freight Report.

OHIO VALLEY

PITTSBURGH

Supplies far in excess of demand and prompt market softer than ever, affecting the annual contracting movement, which is proceeding very slowly and at prices 10@15c. below those of a year ago.

The situation as to the volume of free coal offered and prices is the worst for many weeks. Perhaps on account of the sharp decrease in domestic demand, or perhaps on account of operators having expected altogether too much in the way of general demand, the relation between supply and demand is more out of balance than for a long time. Production is at the rate of 60% of capacity, perhaps a trifle more, while the demand is 10 or 20% under this and the natural result is price demoralization.

As a temporary condition, to be righted by the action of natural trade laws, the situation need not be considered so extremely regrettable, but it chances that this is the annual contracting period, and the influence of the spot market upon contracting has been disastrous. Sellers as well as buyers realize that this is strictly a buyers' market. The result is that what contracting is done, is on a basis 10 to 15c. lower than a year ago and some buyers are so affected that they do not take advantage of the fact that it is a buyers' market, and refrain from participating at all. Their policy apparently is to buy in the prompt market for a time, expecting to take to cover under contracts should appearances of returning strength develop. On contracts for the twelvemonth to Apr. 1, 1916, the usual asking prices are 80@90c. for slack and $1.10 @1.15 on mine-run, but some desirable contracts have been closed at less than these figures.

While the situation is on the whole unsatisfactory from all viewpoints, one large interest reports that since Jan. 1 it has booked a slightly larger volume of contract business than in the same period a year ago. Prompt prices are scarcely quotable. Slack, of course, is higher for prompt than on contract, as contracts would run through the Lake shipping season, when slack is particularly plentiful. Free mine-run is readily offered at $1.05 and $1.10, but has sold at considerably less, and probably in a number of instances at under a dollar. We quote the following as about the higher prices obtainable for free coal, under favorable conditions: Slack, 90c@$1; nut and slack, 95c.@$1.05; nut, $1.05@1.10; mine-run, $1.05@1.10; ¾-in., $1.15@1.20; 1¼-in., $1.25@1.30, per net ton at mine, Pittsburgh district.

No prices for Lake coal for the season have been named, but some of the operators may make a start at naming quotations within a week or ten days. It is the universal opinion that shipments will be light in the fore part of the season, but there are many who expect a fairly large movement late in the season, based upon stocking up against a mining suspension a year hence when both the anthracite and bituminous scales expire. One prediction is made that Lake shipments will be 25,000,000 tons, against 23,000,000 tons a year ago, but such an estimate would not be sanctioned in all quarters.

TOLEDO

Betterment in the rural demand for anthracite and Pocahontas coal. Slack is strengthening. Navigation to open early.

A slight strengthening in slack market is the only change noticeable in the Toledo coal market. Prices are down to bed-rock with little prospect of improvement until conditions change. There has been some activity during the past week or ten days in the Pocahontas and anthracite demand from the rural districts. Prospects are good for an early opening of navigation. Railroads are buying but little coal. Considerable interest is being expressed in the coal rate problem which is now before the Ohio legislators.

COLUMBUS

Trade still quiet in the extreme. Both the domestic and steam trade are slow. Uncertainty surrounds the Lake trade. Prices are rather low all along the line.

Domestic demand is weaker than a week ago, which coupled with a slack demand for steam sizes caused a quiet market all around. There is little hope for immediate improvement and future prospects are not encouraging. Dealers are reducing their stocks and not buying any more than is necessary to tide them through. Retail business is necessarily slow because of the warm weather. Reports from traveling salesmen show that retail stocks are rather low. Pocahontas and West Virginia splints appear to be in the best demand from the retail trade.

Steam business is still slow and there are no signs of improvement. Railroads are taking a fair amount of fuel but manufacturing establishments are not buying to any extent. Contracts are not being renewed as most of the factories are purchasing in the open market. What few contracts have been closed have been at a sacrifice of profits generally. Production is at the lowest point in weeks. It is estimated that the Hocking Valley only produced about 20% of normal and the same figures are given for Crooksville, Cambridge and Jackson fields. In the Pomeroy Bend field the output is estimated at 35% or lower.

The Lake trade is a thing of considerable uncertainty. Docks of the Upper Lake ports apparently have a good surplus and it is believed the season will be late in opening. Chartering of boats is not active and only a small amount of coal has been loaded.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.45	$1.50	.....
Inch and a quarter	1.30	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	0.65	0.70	0.60
Coarse slack	0.55	0.60	0.50

CLEVELAND

Coarse coals have been cleaned up for the first time in several weeks and the market is generally stronger. The retail trade is doing a fair spring business, filling out domestic stocks for spring use.

Operators who have been sending a large tonnage of three-quarter coal into the Cleveland market on consignment have very much curtailed their shipments the last week and the local market is without coarse coal except that brought in on contract. One of the worst offenders has announced that henceforth its mines will be closed two to three days a week until there is a real demand for three-quarter coal. The smaller shipments of the last two weeks and the fact that all spot stocks have been cleaned up, sent the price of West Virginia No. 8 three-quarter to $1.85 to $1.90 on track for immediate delivery. The undertone of the coarse coal market is weak, but it will continue strong enough to bring these prices if consignment coal is kept off the market.

Fine coal also is in better shape. There is very little free coal coming into this market and brokers are able to get a fair price. Middle district slack has been selling for $1.70 to $1.75 and Fairmount at $1.80 on the spot market.

Only 230 cars of coal came in over Sunday and the trade was in position to take this without difficulty. This seems to be about the absorbing power of the trade at the present time. Although the market is very narrow shipments of the last week have been light enough to keep prices on a profitable basis, at which they will continue unless something breaks loose as has so often happened the last few months.

The weather has been against the retail trade, but not warm enough to do without furnace fires. Domestic consumers are running low and orders for half-ton to two-ton deliveries are rather plentiful; but it takes a good many to make a day's business, and there are not enough such orders to help the wholesale market for domestic coals.

Quotations for shipment are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8
Lump	$3.05	......	......	......	......
Lump, 6 in.	......	......	$2.30	......	......
Lump, 1¼ in.	......	$2.35	2.10	......	......
Lump, ¾ in.	......	2.20	2.00	$1.90	$1.90@2.00
Egg	3.15@3.20	......	......	......	......
Egg, 6 in.	......	......	1.95	......	......
Mine run	2.45@2.50	2.10	1.90	1.80	1.75@1.90
Slack	......	1.90	1.80	1.90	......

CINCINNATI

Business on a summer basis, though there is a better demand for steam grades. Domestic coal is not moving at all.

With the cessation in the demand for the prepared grades a stimulation of the steam market has resulted, forming the only factor of an encouraging nature in the trade. This is due to the small production of screenings, and the resulting scarcity of that grade. Mine-run has also participated in the rise, although it is not at a premium. A slight improvement in the demand, caused by a better feeling in manufacturing and industrial circles, has accentuated this phase of the situation.

BIRMINGHAM

Steam coal practically the same, with no evidence of immediate improvement. Lump coal very quiet.

Steam coal has about held its own, though no great improvement has been noted; prices remain the same and inquiries are few and far apart. Shipments this month are about the same as last month. Lump coal shows no life whatever, and many mines have coal on demurrage which they are selling at far less than the regular price. No improvement is now anticipated in this branch, until later on in the summer and early fall, unless conditions change unexpectedly. Blacksmith coal, while falling off slightly in tonnage, continues at the same price, and producers have little cause for complaint.

LOUISVILLE

Situation developing into the worst in years. Operations heavily curtailed with many mines closed entirely.

Operators and dealers in touch with the Kentucky coal market use such words as "desperate" and phrases such as "worst since '93" to describe the state of affairs. Operations at the rate of one and two days a week are the rule, with a few exceptions, while there are many mines, in both the Eastern and Western fields, which have closed down altogether.

Domestic sizes are very heavy, due to the balmy weather, large overstocks in retailers' hands and an enormous amount of coal on the river. Steam coals are somewhat firmer. Prices asked for block coals range from $1.25 to $1.50, while nut and slack is offered at from 60 to 75c. These are for the best grades of coal f.o.b. mines.

COKE

CONNELLSVILLE

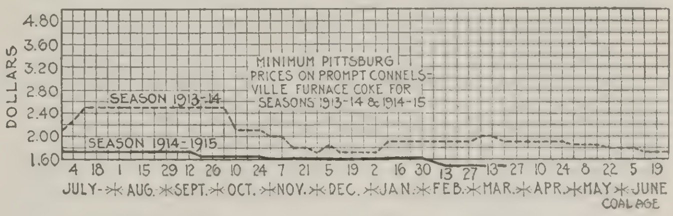
Market stagnant and prices largely nominal. Consumption increased of late, but no increase in production and shipments in the week.

There are no new features in the situation. Consumption of coke in general has increased further, but merely by the blowing in of blast furnaces by steel interests and thus not increasing the demand for merchant coke. Prices quoted are necessarily largely nominal, but there is practically no doubt that coke of standard brand could be bought at the figures named: Prompt furnace, $1.50; contract furnace to July 1, $1.60; contract furnace to Jan. 1, $1.75; prompt foundry, $2@2.20; contract foundry, $2.15@2.30, per net ton at oven.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Mar. 6 at 274,652 tons, a decrease of 283 tons, and shipments at 274,104 tons, a decrease of 4357 tons.

Buffalo—There is no stir in the trade. Iron furnaces are running at a moderate rate, with not much prospect of an early increase of output. There is more building in iron and steel than formerly and with a fair activity in that line alone the furnaces will soon need to run stronger. All prediction as to what will be needed in Europe has been dropped. Prices are still very low, on the basis of $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

Chicago—Furnace and foundry coke remain unchanged with slow demand. Domestic coke is being quoted freely at April prices. Prices are as follows: Byproduct, $4.45@4.75; Connellsville, $4.65@4.80; Wise County 72-hr. (select), $4.50@4.75; gas coke, $4@4.10; furnace, $4.40@4.65.



THE STEEL INDUSTRY

Situation quiet but generally encouraging. Buying far ahead on war orders.

While March thus far has put new business on the books of most steel companies at a somewhat less rate than that of February, the scale of mill operations has been encouraging. For the whole industry it is around 60% and for a part of last week the Steel Corporation's steel ingot output was above 69%.

On certain products it is evident that the buying since the first of the year was in compensation for the remarkable stagnation in the closing months of 1914, but elsewhere there are indications of activity of a broader and more hopeful character. This is noticeable in construction lines and in the unusual business on hand at shipyards.

Trade due to the war is increasing and some of the European governments, in their negotiations here, appear to be looking months ahead. France must get much of her steel from the United States. There may be some exaggeration of the extent to which iron and steel and metal-working operations are based upon war demand; but in machine tools, particularly lathes and all turning machines, the purchases for Europe have turned depression into prosperity for many concerns. Six months' orders in these lines have run into many millions of dollars.

The signs of new buying in view of the approach of the open season are not numerous, but structural work is growing and the implement works are making larger demands upon bar mills.—"The Iron Age."

MIDDLE WESTERN

CHICAGO

Demand for domestic coal stagnant. Screenings high priced with output limited. Smokeless and splint coals weak.

There is but little stir in the markets at present, and conditions are fully as depressed as they have been for a number of weeks past. With the exception of screenings, it is difficult to move coal at any price, and in numerous cases the trade is quoting April figures for March shipment. This is particularly true of smokeless, splint and independent anthracite shippers and even these quotations have not stimulated business. There is some lessening of coal on tracks.

Screenings from all districts still continue their upward trend. Very little fine coal is left at the mines, and the general reduction in output causes a corresponding decline in the production of screenings. As a result, the supply is hardly equal to the demand, and predictions are made that still higher prices will prevail, because there is no prospect of any betterment in the demand for the coarser sizes in the immediate future. Steam users have been little inclined to renew contracts, but now that screenings are stronger, they may evince more of a disposition to commit themselves.

An increased number of Indiana and Illinois mines have been closed down for the summer months, and this action should have a stimulating effect later. The dealers still continue to carry minimum stocks, and the retail demand is quite light.

Smokeless coals are quite dull, and little business is being placed with contracts hardly being considered. It is felt that Lake business will not be inaugurated until some time in July.

In splints there has been some recovery, the demurrage coal having been absorbed.

Eastern Kentucky fuels are in a bad way, and a considerable tonnage has been sold at sacrifice prices.

The coarser sizes from Franklin and Williamson County are steady, in view of general market conditions, although shipments are light; screenings from these districts have advanced very rapidly, having sold as high as $1.05 per ton.

The situation in the Springfield district is dull except in screenings, which show a marked bullish tendency.

The curtailment in production of the Indiana mines is notable. Screenings from this section have not advanced so rapidly as from other districts, but are held at fairly good figures.

Prevailing prices are as follows:

	Williamson and Franklin Cos.	Springfield	Sullivan	Clinton	Carterville
Lump......	$1.25@1.50	$1.30@1.40	....	$1.30@1.40	$1.40@1.75

Knox and Greene County 5-in. lump, $1.35@1.50; 3-in. lump, $1.20@1.30; 5-in. egg, $1.20@1.30; 3-in. egg, $1.15@1.25; mine-run, $1@1.10; screenings, 80@95c.

ST. LOUIS

Longest mid-winter season of low prices in the history of the trade. Shortage of steam sizes. Mine operations heavily restricted. Manufacturing demand slowing up.

The past week has been another of unparalleled depression, making one of the longest low-priced periods for the mid-winter season in the history of the local coal trade. The only demand at the present time is for steam coal, which is strong for the smaller sizes from all fields; this is due to the fact that the tonnage of coal produced has fallen off remarkably in the last few weeks because of the light demand for the larger sizes. Thus, in spite of an unusually small demand for steam coal the price for screenings is at the top notch. With very little indication of any colder weather coming from now on, a strong steam market can be anticipated for the coming few months.

In the southern Illinois field, mines are working two days a week, with a maximum of three, and in some instances several mines have suspended operations altogether.

In the washed sizes, Nos. 3, 4 and 5 are in good demand, while Nos. 1 and 2 are heavy. Lump and egg from the high grade fields are going at the buyer's figure, and in Standard field there is no difference in the price of 2-in. lump and mine-run. The country demand for all grades of coal is remarkably light, and there has been a general falling off in manufacturing lines for the past few weeks that has been quite noticeable.

There is no anthracite moving in at all to speak of, and an unusual tonnage of West Virginia smokeless is under demurrage at East St. Louis, rejected on account of weather conditions.

INDIANAPOLIS

Screenings decidedly stiffer because of the curtailed supply. Otherwise the market is heavy and operations severely restricted.

March weather continues spring-like and the coal industry lags. The only feature of interest is the stiffer prices on screenings, 90c. being obtainable for good grades. Yards are buying domestic grades as they need the coal and will follow that policy until the end of the season, as they carry no Indiana coal during the spring and summer months. There continues to be a slight improvement in industrial conditions, which makes a better movement of steam grades, though this is so small that it takes the accumulation of several weeks to show there is material advance. Mines are making half-time or a little better. Consumers will expect the usual price reductions Apr. 1, but it is doubtful if there will be any at the mines.

PRODUCTION AND TRANSPORTATION STATISTICS

NORFOLK & WESTERN RY.

The following is a statement of coal handled by the N. & W. Ry. during February and the past four months in short tons:

	November	December	January	February
Pocahontas Field........	837,577	798,182	912,682	835,826
Tug River District......	253,975	227,944	298,766	243,910
Thacker District........	235,080	227,938	257,580	195,557
Kenova District.........	90,772	90,030	98,422	67,667
Clinch Valley District....	237,831	135,362	169,581	129,193
Other N. & W. Territory	3,849	1,686	3,769	1,785
Total N. & W. Fields..	1,659,084	1,481,142	1,740,800	1,473,938
Williamson & Pond Creek R.R..................	62,505	62,271	58,296	58,101
All other railroads......	131,269	97,752	87,842	88,982
Grand total...........	1,852,858	1,641,165	1,886,938	1,621,021

FOREIGN MARKETS

GREAT BRITAIN

Exports restricted because of the acute shortage in the local markets. Efforts to keep prices down.

London, Mar. 5—The coal industry remains in the abnormal condition which the effects of the war have brought about. Despite the restricted exports, the demand on every hand is now exceeding the supply, and prices of nearly all qualities are at a very high level, while some are still advancing. Considerable interest has been aroused by the remarks of Sir Arthur Markham in the House of Commons concerning the increase in the cost of production, and the subsequent undertaking of the Yorkshire collieries with which he is connected to charge no more than $3.60 per ton at the pit. Meanwhile the report of the Retail Coal Inquiry, which has just commenced its proceedings, is expected to be issued with as little delay as possible, and is awaited with interest.—"The Iron & Coal Trade Review."

Mar. 4—The situation grows worse. Holders of free coal (and there is very little available) can practically make their own price. For April shipment no business is being done, buyers holding for cheaper prices, and sellers anticipating a further rise. Quotations are approximately as follows:

Best Welsh steam.... ..	$7.20	Best Monmouthshires.......	$6.00
Best seconds...........	6.72	Seconds..................	5.76
Seconds................	6.24	Best Cardiff smalls..........	4.80
Best dry coals..........	5.25	Cargo smalls..............	4.32

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport both net, exclusive of wharfage.

Freights—Tonnage is in great demand, and is very scarce, owing mainly to Admiralty requirements. Rates are approximately as follows:

Gibraltar.........	$5.28	Naples..........	$8.16	Las Palmas......	$5.04
Malta............	....	Venice, Ancona...	10.20	St. Vincent.......	5.28
Marseilles........	6.19	Alexandria.......	8.16	Rio Janeiro......	7.80
Algiers...........	7.20	Port Said........	7.20	Monte Video.....	6.96
Genoa............	7.92			River Plate......	7.20

Note—These quotations are based on an exchange rate of one shilling equals 24 cents.

Coal Contracts Pending

As the result of an investigation into numerous complaints regarding a number of contract items emanating from a certain apparently authoritative source, it has been found that many of these were grossly misleading and others only partially correct. This particular source of information has been eliminated and a more rigid censorship established throughout the department to avoid a recurrence of such an incident.

We wish to take this occasion to extend thanks for the many kindly criticisms which led up to this disclosure, and also to remind our readers that in a number of specific cases, the information printed in these columns was entirely correct even though an energetic denial was made by the prospective purchaser. All coal salesmen are familiar with certain types of negotiations, conducted through underground channels and shrouded in an impenetrable mystery which will not stand the light of publicity. It is to be expected that the announcement of such transactions will be regarded with a certain disfavor, if not open resentment. We do not believe this to be in accord with the accepted business principles of today—a conclusion in which we have been sustained by the more thoughtful and conservative members of the coal industry.

We propose to build this department into one of the most authentic and valuable features of our paper. Your kindly coöperation is invited.

No. 189—Bristol, Conn.—The Bristol & Plainsville Ry. Co. states that it is not in the market for any coal at the present time (p. 399). Address Agt. E. Cockings, Bristol & Plainsville Ry. Co., Bristol, Conn.

No. 226—Portland, Ore.—Bids on this contract (p. 446) involving 2000 tons of steam coal will be received until Mar. 31 and awards made Apr. 15 or May 6. Address Chief Clerk, Board of Education, 401 Court House, Portland, Ore.

No. 242—Rutland, Vt.—This contract (p. 447) provides for an annual tonnage of 150,000 to 200,000 gross tons of bituminous coal, delivery of approximately one-half to be made at Norwood, N. Y., and the balance at Rotterdam Junction, N. Y. For shipment beyond, the Rutland R.R. Co. is to have the privilege of accepting its requirements for delivery at either point without accepting the proposition as a whole. The car supply for at least the tonnage to be shipped to Rotterdam Junction to be furnished by the Rutland R.R. Co. Should the bidder not wish to quote for delivery at Rotterdam Junction and Norwood, the proposition will be accepted for delivery f.o.b. mine; but should the proposition be made on this basis, the bidder should give the freight rate from the mine to Norwood and Rotterdam. Address Pur. Agt. James E. Kilborn, Rutland R.R. Co., Rutland, Vt.

No. 258—Albany, N. Y.—Sealed proposals will be received until noon, Mar. 24, for supplying various state institutions with coal for one year beginning Apr. 1, 1915 (p. 447). Address Agt. and Warden Thomas Mott Osborne, Sing Sing Prison, Ossining, N. Y.; Agt. and Warden Charles F. Rattigan, Auburn Prison, Auburn, N. Y.; Agt. and Warden William J. Homer, Great Meadow Prison, Comstock, N. Y.; Agt. and Warden John B. Trombly, Clinton Prison, Dannemora, N. Y.; Medical Supt. R. F. C. Kieb, Matteawan State Hospital, Beacon, N. Y.; Medical Supt. Charles H. North, Dannemora State Hospital, Dannemora, N. Y.

No. 268—Buffalo, N. Y.—Bids on this contract (p. 448) were not opened until Mar. 19 instead of Mar. 15 as previously announced. Address Clerk of the Board, Board of Police Commissioners, Headquarters Bldg., Franklin and Seneca St., Buffalo, N. Y.

No. 295—Danville, Penn.—Bids will be received until Mar. 20 for furnishing the State Hospital for the Insane with 10,000 tons of No. 1 buckwheat, 500 tons of egg, and 100 tons of chestnut (p. 487). Deliveries are to be made as ordered at the hospital coal dump, between Apr. 1, 1915 and Mar. 31, 1916, and the coal must be free from slate and dirt, freshly mined and of the best quality. Address Steward H. B. Schultz, State Hospital for the Insane, Danville, Penn.

No. 296—Leavenworth, Kan.—Bids will be received until noon, Mar. 20, for furnishing coal for the county court house, county jail, county hospital, and for the poor of the county (p. 488). Address County Clk. J. E. Voorhees, County Clerk's Office, Leavenworth, Kan.

No. 301—Housatonic, Mass.—The Monument Mills Co. advises that it is not in the market for coal as noted in a previous issue (p. 488). Address Treas. Jno. H. C. Church, Monument Mills, Housatonic, Mass.

No. 319—Lowell, Mass.—The Lowell Hosiery Co. will be in the market for 1100 tons of bituminous coal about Apr. 1, delivery via B. & M. R.R. Address Pur. Agt. E. A. Thissell, Lowell Hosiery Co., Lowell, Mass.

No. 320—Clarion, Iowa—The Clarion Light Plant will be in the market during April for 1000 tons of ¾-in. Christopher Illinois screenings, the present contract price being $3.26, delivered in bin. Address G. Mack, Clarion Light Plant, Clarion, Iowa.

No. 321—Indiana and Ohio—The Cincinnati, Hamilton & Dayton R.R. Co. is in the market for coal for its different coaling stations at Morefield, Montezuma, and Connersville, Ind., and Hamilton, Ohio. This company requires approximately 200 tons of mine-run lump or other grades of coal suitable for locomotives per day. Address Fuel Agt. E. E. Foos, Cincinnati, Hamilton & Dayton R.R. Co., Baltimore, Md.

No. 322—Providence, R. I.—The Brown & Sharpe Mfg. Co. will be in the market about Apr. 1 for 10,000 tons of anthracite and bituminous coal. Address Brown & Sharpe Mfg. Co., Providence, R. I.

No. 323—Indianapolis, Ind.—The Artificial Ice & Cold Storage Co. at this place will contract about Apr. 1 for their coal supply. This company generally consumes about 150 tons of No. 6 Indiana screenings for steam purposes per week. Address Treasurer, Artificial Ice & Cold Storage Co., Indianapolis, Ind.

No. 324—Buffalo, N. Y.—Bids were received until noon, Mar. 16, for furnishing 2000 tons of anthracite and bituminous coal for the 65th Regiment, National Guard. Address County Treasurer's Office, Buffalo, N. Y.

No. 325—South Whitley, Ind.—The Grip Nut Co. at this place is in the market for 1500 to 2000 tons of mine-run coal per year, the previous contract having expired Dec. 1, 1914. Quotations for this supply should be made f.o.b. South Bend, Ind. Address Purchasing Agent, Grip Nut Co., South Bend, Ind.

No. 326—Cheboygan, Mich.—Sealed bids will be received until Apr. 6, for furnishing about 1700 tons of Pennsylvania lump and Michigan 1¼-in. steam lump coal at the Water Works. Address City Clerk, Cheyboygan, Mich.

No. 327—Pine Bluff, Ark.—The Pine Bluff Co. at this place will soon be in the market for about 11,000 tons of Arkansas slack coal, the usual price being $2.10 per ton. Address the Pine Bluff Co., Pine Bluff, Ark.

No. 328—Vinton, Iowa—The Municipal Electric Light & Power Plant at this place will soon be in the market for about 3500 tons of washed nut southern Illinois coal, the present contract being closed at $3.19 per ton. Address Supt. W. E. Klingam, Vinton, Iowa.

No. 329—New Castle, Ind.—The contract with the Maxwell New Castle Mfg. Co. for screenings for steam purposes will expire on Apr. 1. Address Gen. Mgr. W. G. Jameson, Maxwell New Castle Mfg. Co., New Castle, Ind.

No. 330—Moline, Ill.—The Republic Iron & Steel Co. will be in the market for approximately 600 tons of screenings, 100 tons of 1¼-in. lump, and 100 tons of nut coal per week, about Apr. 1. Address Purchasing Agent, Moline Iron & Steel Co., Moline, Ill.

No. 331—Springfield, Mass.—The City of Springfield will contract for from 8000 to 10,000 tons of anthracite and bituminous coal about Apr. 1, deliveries via B. & A. R.R. and N. Y.

N. H. & H. R.R. and by wagon. Address Municipal Department, Springfield, Mass.

No. 332—Buffalo, N. Y.—Sealed proposals will be received until noon, Mar. 20, for supplying 35,000 tons of ¾-in. slack coal and 1000 tons of mine-run coal for the Hamburg-Canal Pumping Station. Address Comr. Col. Francis G. Ward, Department of Public Works, Buffalo, N. Y.

No. 333—Loudonville, Ohio—Bids were received up to noon Mar. 15 for furnishing 1200 tons of mine-run coal to the local light plant. Address Clk. John Deyarmon, Board of Trustees of Public Affairs, Loudonville, Ohio.

No. 334—Jersey City, N. J.—Bids were received up to 8 p.m. Mar. 17 for supplying the public schools with anthracite coal for a period beginning Apr. 1, 1915, and ending Mar. 31, 1916. Address the Secretary, Board of Education, Jersey City, N. J.

No. 335—Terre Haute, Ind.—The Board of Education at this place will be in the market probably during April for approximately 4500 tons of 1¼-in. No. 4 vein soft coal. The present contract price is $2.08 per ton. Address Board of Trustees, Terre Haute, Ind.

No. 336—Albany, N. Y.—The Board of Education will contract either in April or May for about 5000 tons of egg, chestnut and stove coal, the usual cost per ton being about $5.55. Address Board of Contract & Supply, City Hall, Albany, N. Y.

No. 337—Cedartown, Ga.—The Water & Light Department will soon be in the market for about 2400 tons of bituminous coal. This contract is awarded on a test basis as well as by cost per ton. Address Supt. W. T. Hardy, Water & Light Dept., Cedartown, Ga.

No. 338—Central City, Neb.—The Central City Light & Water Works will be in the market about Apr. 1 for approximately 1800 tons of Rock Springs slack coal, the present contract price being $3.71 per ton. Address Leonard Anderson, Central City Light & Water Works, Central City, Neb.

No. 339—Warsaw, Ind.—The Winona Electric Co. will soon be in the market for next season's supply of screenings. Address Pres. W. B. Frazer, Winona Electric Co., Warsaw, Ind.

No. 340—Rochester, N. Y.—Bids will be received until noon, Mar. 19, for furnishing the public schools with coal. Address Secy. J. S. Mullan, Board of Education, Municipal Bldg., Rochester, N. Y.

No. 341—Anderson, Ind.—The Patent Vulcanite Roofing Co. will be in the market about Apr. 1 for its coal supply for next season. Address Patent Vulcanite Roofing Co., Anderson, Ind.

No. 342—Albany, N. Y.—Sealed proposals will be received until 2:30 p.m., Mar. 23, for furnishing the various state charitable institutions with coal for a year beginning Apr. 1. The following are the quantities involved:

	Bituminous		Anthracite	
Institution	Grade	Tons	Grade	Tons
Albion	Mine-run	1800	Chestnut	140
Batavia	Mine-run	1200	Stove	35
Bath	Slack	4000[1]	Stove	400
			Chestnut	100
			Buckwheat No. 3	14,000[2]
Bedford	Mine-run	2000	Stove	690
			Chestnut	350
Elmira	Mine-run	6000	Egg	125
			Stove	125
			Chestnut	125
Hudson	Mine-run	3000	Pea	700
Industry	Mine-run	375	Stove	1,720
			Chestnut	455
Iroquois	Mine-run	1400	Chestnut	30
Napanock	Mine-run	1300	Stove	150
Newark	Mine-run	4000	Stove	225
			Chestnut	35
Oxford			Stove	60
			Chestnut	40
			Buckwheat No. 1	1,640
Randalls Island	Gas	400	Stove	100
	Slack	900	Pea	300
			Buckwheat No. 3	3,000
Ray Brook	Mine-run	2300	Stove	150
Rome			Stove	350
			Buckwheat No. 1	5,500
Sonyea	Mine-run	2500	Egg	900
			Stove	500
			Chestnut	1,500

Syracuse	Mine-run	500	Stove	200
			Buckwheat No. 1	2,000
Thiells			Chestnut	500
West Haverstraw			Stove	300
			Chestnut	30
Yorktown Heights			Stove	30
			Chestnut	30

[1] Or 14,000 gross tons Buckwheat No. 3 (no slack).

[2] Or 10,000 gross tons Buckwheat No. 3 and 4000 gross tons slack.

Address Purchasing Committee, Rooms 602 and 603, Capitol, Albany, N. Y.

No. 343—Chicago, Ill.—Bids will be received until Mar. 22 for furnishing the Rock Island Lines with its supply of coal, the contract to expire Mar. 31, 1916. The amount required is from 200 to 400 tons of mine-run and lump coal per day. In submitting bids, the following information is requested: Name and location of mine; name of railroad located on; name or number of vein of coal on which bid is based; screen area and size of openings and whether shaker or bar screen; whether coal can be loaded on closed cars; whether bidder has track scales for weighing all grades of coal produced and whether scales are so arranged that empty cars may be weighed. Copy of coal analysis should accompany bid, stating whether taken from face or car sample; also name of person making the analysis and date. Address Fuel Agt. D. B. Sebastian, Rock Island Lines, Chicago, Ill.

No. 344—Attleboro, Mass.—Sealed proposals will be received until noon Mar. 24 for furnishing the city government with coal as follows: No. 1—450 tons of bituminous, delivered in two shipments of 225 tons each, on cars at Attleboro. No. 2—450 tons, delivered in two shipments of 225 tons each in the coal sheds of the Attleboro Water Works Pumping Station. Address Supt. of Pub. Wks. H. J. Goodale, Room 9, Sturdy Block, Attleboro, Mass.

No. 345—Salem, Ohio—Bids were received up to noon Mar. 5 for supplying coal to the water works pumping station for one year, beginning Apr. 1. Bidders were to state whether coal was to be delivered at pumping station or f.o.b. cars Salem, and each bid was to be accompanied with an analysis of the coal proposed and by a certified check for $200. Address Dir. of Pub. Ser., I. N. Russell, Salem, Ohio.

No. 346—Chicago, Ill.—Sealed proposals will be received until Mar. 20, for supplying steam coal f.o.b. the power house of the Sears, Roebuck & Co., which is located on Homan Ave. alongside the B. & O. C. T. tracks. During the past year this company consumed approximately 45,000 tons of steam coal, and in general it maintains a supply of 3000 tons. Address Pur. Agt. J. H. Westrich, Sears, Roebuck & Co., 925 Homan Ave., Chicago, Ill.

No. 347—Burlington, Iowa—Sealed bids will be received until Mar. 29 for furnishing the municipality with coal for the fiscal year ending Mar. 31, 1916. Address City Clk. Robert Kroppach, Burlington, Iowa.

CONTRACTS AWARDED

Note—Successful bidders are noted in **bold face** type.

No. 170—Pontiac, Mich.—This contract (p. 399), which provides for furnishing the Pontiac State Hospital with a supply of coal for one year, has been awarded to the **Ohio & Michigan Coal Co.,** Detroit, Mich. The quantity required is as follows: 8000 tons of Pocahontas mine-run; 500 tons of anthracite grate coal; 500 tons of stove coal. Address Steward E. H. Halsey, Pontiac State Hospital, Pontiac, Mich

No. 214—Grand Junction, Colo.—This contract (p. 446), which provides for furnishing about 7500 tons of bituminous coal, has been awarded to the **Grand Junction Mining & Fuel Co.** Address Gen. Mgr. E. A. Sunderlin, Grand Junction Electric, Gas & Mfg. Co., Grand Junction, Colo.

No. 229—Bennettsville, S. C.—The Bennettsville Electric & Water Plant advises that it has closed its contract (p. 447). Address Mgr. E. C. Morrison, Bennettsville Electric & Water Plant, Bennettsville, S. C.

No. 291—Guantanamo Bay, Cuba—The bids on this contract (p. 487), which provides for furnishing and delivering 10,000 gross tons of navy standard coal at the U. S. Naval Station, Guantanamo, were as follows:

Name of Bidder	Bid	Coal
American Coal Exporting Co.	$5.61	Pocahontas New River
William C. Atwater	5.82[1] 6.00[2]	Pocahontas
C. G. Blake	5.83	New River
Berwind-White Coal Mining Co.	5.65	New River
Castner, Curran & Bullitt, Inc.	5.82	Pocahontas
	5.32[3]	New River
Chesapeake & Ohio Coal & Coke Co.	6.25	Admiralty Navy Standard
Dexter & Carpenter	6.15	Pocahontas
Archibald McNeil & Sons Co.	5.90	New River
Maryland Coal & Coke Co.	5.70	New River
Northern Coal Co.	5.55	New River
New River Coal Co.	6.27	New River
Pocahontas Fuel Co.	5.795	Pocahontas
Smokeless Fuel Co.	6.04	Pocahontas New River
Willett & Martin Co.	5.70	New River
Willard Bros.	6.35	New River

[1] Loading in foreign vessels. [2] Loading in American vessels. [3] Awarded contract for 5000 tons, delivery by schooner.

SUCCESS
in the
Rocky Mountain Region

That the pre-eminent standing of the Wico Safety Electric Mine Lamp is not confined to the East is strongly emphasized by its adoption as regular equipment in the mines of the

Colorado Fuel & Iron Co.
and the
Union Pacific Coal Co.

Once more we wish to point out that the Wico Safety Electric Mine Lamp is the only one with a successful "commercial" past. ¶ Claims for other lamps are speculations at best. When they have stood the acid test of time under service conditions, operators can put more confidence in them But the "*safe*" course is to adopt the tried product. ¶ Send for our literature,—a booklet of interesting facts. Address the Witherbee Igniter Co., Springfield, Mass., or the Rivenburg-Blackwood Co., 5085 Jenkins Arcade, Pittsburgh, Pa., Coal Exchange Building, Scranton, Pa., or the Western Sales and Supply Co., 370 Gas and Electric Building, Denver, Colorado. ¶ The Wico Lamp is approved by the U. S. Bureau of Mines, for use in gaseous mines.

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

THIS is the Success Number of Coal Age. In it you will find many stories of machines or methods that have been successful in doing things at the mines in a better, quicker, cheaper way.

And here, on this page, I want to call your attention to the successful results *advertising* has obtained for a very large number of men and firms in our industry.

The man who becomes acquainted with a machine or piece of equipment through reading the ads, and who buys and installs it, and thereby obtains an increase in tonnage, or a decrease in costs or labor, or a greater degree of safety—

For that man advertising has won a success.

On this page you have read of a great many such instances, in the past few weeks.

The manufacturer who advertises a machine which will save money or get better results at the mines and who sells his product to you by reason of your having read about it in the ads—

For that manufacturer advertising has won a success—and you have read of such instances on this page, too.

In fact, from the many sources of information on this subject, which I have, I know that the great majority of you readers are getting a real, practical benefit from the advertising section of Coal Age each week.

And I know, beyond possibility of doubt, that the advertisers are profiting tangibly by the interest you men at the mines are taking in the printed stories about their products in Coal Age's *Buying Section.*

So right here, at the beginning of the Success Number, I want to say that advertising—the kind you and I believe in—must be rated as one of the real successes of our industry.

YOU remember the good advice a father gave his son, to make him sure of winning Success—

Early to bed,
Early to rise,
Hustle like Hell—
And advertise.

COAL AGE

Vol. 7 NEW YORK, APRIL 3, 1915 No. 14

EVERY thought, every effort, of every human being is aimed at the accomplishment of something. That something may be good, bad or indifferent, but whatever it is, we one and all earnestly desire that the outcome be successful.

* * *

IT IS FOR THIS REASON, and because the word SUCCESS has such a universal appeal, that coal-mining people have responded so generally to our invitation for co-operation in getting out this special issue of Coal Age. We hope the ethical contributions that follow will furnish much inspiration to our readers, and we sincerely trust that the technical articles appearing this week will increase the sum total of engineering knowledge as it applies to coal mining.

* * *

ABOUT 100 ARTICLES were submitted to us for publication in this SUCCESS issue. A great many were returned as not complying with the rules laid down. Quite a few articles were interesting and valuable, but not adapted for this number, so these will be published in succeeding issues. Enough material was received to fill two or three papers the size of this one; so instead of one SUCCESS issue, we will in reality have a series bearing largely on this most interesting subject. Therefore, if your article isn't among those on the following pages and has not been returned to you, it is being saved for a subsequent number.

* * *

PERHAPS THE MOST COMMON and yet the most important point on which the writers in this issue agree is that success is a relative term; that is, a man may succeed and be a success without having accumulated a great fortune, or without having risen to a position of great power and influence. The critical or turning point in a man's life often hinges upon his individual answer to the query—what constitutes success?

* * *

IT IS A LONG STEP on the road to success if one's philosophy can be reduced to a simple definite form. Shooting at random is a waste of ammunition; we must know what we are aiming to do before we can do it. A man is not a man unless he stands for certain fixed principles, and a fellow is foolish to seek to accomplish that which conflicts with these principles.

* * *

THE ENGINEER ON $200 a month, in the view of many people, is a success if he contributes to the world of knowledge or ideas. These same individuals would view the man of money, whose attainments are mostly of a material or physical order, and who employs the engineer, as less of a success, notwithstanding his wealth. As in most matters of such diverse opinion, the average point of view is perhaps best, and the average man happiest.

* * *

AT ANY RATE, it is a wise Providence that has created different men with contrary ideas. It would be a sad world if we all sought the same goal in the same way. Therefore, it is good that some men overvalue the intellectual, while others overvalue the physical and emotional.

* * *

ONE WRITER HAS SAID that "*success is the product of a man's personality.*" There is no doubt that the measure of success depends on the degree to which we make our personality a factor in human affairs. Expressed in another way, our success is in proportion to the responsibilities we shoulder. Hence, if we would be successful, we should seek responsibility rather than attempt to avoid it. The moment we refuse to carry responsibility, we have taken a strangle-hold on ambition. If ambition is dead how can we find success?

The Meaning of Success

By Berton Braley

Success doesn't consist alone in making money, though the successful man ought to make money. Neither does it consist alone in accomplishing ambition, though the successful man should realize his ambition. Success does not consist wholly of the acquirement of fame, though fame should come to the successful man. Success is a combination of all these requisites, with others.

The mine operator who produces the biggest dividends may not be the most successful operator, because he may be getting his results by gutting a mine, by grinding and gouging his labor and by stinting on replacements and repairs, thus laying up trouble that will wipe away the profits in years to come.

Yet such a man may well acquire temporarily the reputation of success; and that is wrong, because there is nothing temporary about true success. It is too big, too comprehensive, too real to be obliterated from the scheme of things in a day or two or in a year or two.

The truly successful operator or the truly successful executive in any line will make money for his stockholders and himself and add to the world's supply of available wealth, but he will do this with justice to his labor, benefit to his properties and with clear recognition of the fact that in this human world the first duty of a man is to be a decent human being.

After all, that man is the most successful who occupies the biggest place in the hearts of his fellow-men; and it is true that in time this confidence, this trust, this liking of men pays dividends, not alone of peace and comradeship, but of gold. Dispute and contention are the costliest things in the world, and where there is understanding and affection they rarely occur—or last long when they do.

So the success which is rightly won is an enduring comfort and happiness. It is only the success which is wrung from the suffering and the blighted hopes of others that turns to dust and ashes in the mouth.

* *

An Alabama Success

By Henry S. Geismer*

SYNOPSIS—How a seam of coal averaging less than 36 in. in thickness was quickly and successfully developed. Economy in coal consumption. All pumps are eliminated.

In Alabama there is a mine that loaded its first ton of coal on Aug. 6, 1913. Exactly 366 days later it had reached a daily output of 1100 tons, and by November of that year a daily average of 1223 tons.

There is nothing startling about that until you are told that the seam of coal runs from 32 to 36 in. in thickness, and every employee required to produce that tonnage had to be recruited from camps that had long since passed the experimental stage.

By name it is the Sipsey mine of the Maryland Coal & Coke Co., and it is the only mine owned by this corporation. When it is considered that the organizers of the Maryland Coal & Coke Co. took possession of a tract of land six miles from a railroad, in a veritable wilderness, and across a river at that, and then discovered that it held a thin seam of coal, it seems remarkable that it has a mine at all.

Possibly the fact that Henry T. DeBardeleben and Milton H. Fies were the moving spirits behind the Maryland Coal & Coke Co. is sufficient explanation of its remarkable accomplishments. The first is a son of the most famous

mineral developer in Southern history and a son who was not willing to be known to posterity simply as a great man's son. The second is a Columbia School of Mines graduate who was not afraid to work as a rodman a year or so just for experience, notwithstanding that his father was well able to keep him in spending money.

A Real Accomplishment

If you should ask these two very young men to explain to you how they have been able to develop a mine (the first mine they have been financially interested in together) in a wilderness and keep it running at a maximum output to a minimum of five working days a week during such a winter as we have just passed through, they would in all probability shake their heads, but if by chance they should invite you to go out to the mine and judge for yourself, this is what you would see: A drift mine in which all of the cutting is done by Sullivan electric chain machines, all of the hauling done by electric locomotives, all of the ventilating done by means of motor-driven fans, all slack coal washed in an electric driven washer and all of the necessary power for the entire operation furnished by two 175-hp. boilers.

They burn only 0.9 ton of coal for their own use in producing each 100 tons of coal. Can you beat that? Wait! There isn't an inside pump on the job. That's what these men have done for themselves.

And while they have been doing all this, Uncle Sam has been busy also, and now in less than one year the terrible river that frightened all of the previous investigators will be made navigable, and the Maryland Coal & Coke Co. will be able to load coal upon its own barges and start them off to the Gulf of Mexico.

If you want to observe Mr. DeBardeleben and Mr. Fies overflowing with gratitude just ask them why they were so determined to risk their future in such an apparently unpromising field.

"Did you ever burn any Sipsey coal?" they will say, and then if you reply in the negative they will add, "Well just burn some and you will understand."

This is a pretty good illustration of the possibilities of David Crockett's favorite proverb, "Be sure you're right, then go ahead."

But just a word of warning to those who are inclined to jump at conclusions and who might be tempted to take Mr. DeBardeleben and Mr. Fies at their word. There are several mines in Alabama on this same Black Creek seam of coal the write-up of which would appear ridiculous in a Success number of any paper other than a comic weekly, and that in spite of the fact that they were not six miles from a railroad when they were discovered.

Perhaps their workings have not been as carefully planned in advance, their mechanical equipment not as wisely chosen, their coal not as well prepared at their tipples and their product not as intelligently marketed; at any rate, they were sure they were right, but they didn't go ahead.

* *

The Way to Success

By Ernest Marshall*

It is through the working of a law that success comes in any business or undertaking. Chance plays no part whatever, for in the operation of nature's laws there is no such thing as chance or accident. Man and his fortunes are no more the things of chance than is the tree from its earliest growth. He is the product of the elements and is produced through the working of a law.

First, then, we will state that your thought, or spirit, is your real self and not your body. Thought is an invisible substance and acts apart from your body, moving and influencing others. This thought acts at all times, whether sleeping or waking. Therefore, thought is your real power, and as you learn how it acts, how to hold it, use and control it, you will become successful in that you will be able to accomplish what you set out to do.

Self-control, concentration and clear thinking are the elements that make for success. Your prevailing mood or your frame of mind has to a great extent a direct influence and effect on your success or failure in any undertaking. Whatever of thought you think or receive you send from you again as an invisible substance to act on others. Therefore, it is the kind of thoughts which you create and which you send out that produce a favorable or unfavorable effect on others. Thus it can be said that when determined thought meets determined thought and unites on a similar purpose, a double power for success comes of such union.

Further, carrying out this idea, we can say that thoughts attract thoughts of like kind. By keeping any certain thought fixed in your mind—such as for instance the thought of strength or health—the more of that thought element is attracted to you. Keep in mind the idea of force, go-ahead push, aggressiveness, stick-to-it-iveness, and you attract to you the elements which give you these qualities. Right thinking, serenity, self-confidence, determination, are the qualities we must aim to acquire in order to bring success. Whenever you think, you are affecting your fortunes for good or ill, all depending on the kind of thoughts you create and the impression they make on others. Every thought, whether silent or spoken, has real value.

Determination

If you fix in your mind a persistent determination to succeed in any kind of business you are engaged in, a process of thought construction, or unseen element to draw assisting forces to you, is begun. Let us further explain what is meant by "assisting forces"—first, ever-growing fertility of mind to breed new plans for pushing your business; and second, drawing you to the best people to aid you in working out your plans. To best gain this power we would say that silent, persistent resolve in your mind to do what you set out to do will do the work, and it will do it if you persevere in holding to this frame of mind. To think persistently that you can accomplish a thing, to push hard on your one aim and purpose, will create for you a power which is certain to produce results, if you keep but the one purpose in your mind at a time.

---

*Roscoe, Penn.

You will never find success in any profession until you seek for it within yourself. It is what you feel, what you think and what you do—not any one of these, but all of them—that help you to attain success. You may do all that the situation requires, but if you have no personal feeling in the matter your deeds will be almost barren of results. Have but one purpose at a time; there is no business in which you will succeed if you divide your interests. Too many "irons in the fire" speak failure, and it is usually attributed to "bad luck" by the victim. A great many of the failures are caused by the victim dabbling in too many things at one time, which takes a man's mind off his business and divides his energy. Many men belong to a class that are still more hopeless than the proverbial "fools," who will learn in no school but that of experience.

I do not wish it to be understood to say that you must have but one interest in life, but that you must have but one interest at a time in order to attain the goal of success. The laws of nature are changeless; the law of mind over matter, if closely followed, is bound to bring you that much-longed-for success. Think of one thing at a time; put all your mental, physical and spiritual strength into the accomplishment of the project you have at hand. Be direct and send your thought as straight as an arrow to the target of your desire. Don't swerve from your purpose to accomplish what you set out to do, and success is yours.

Success lies in you, and you only. When you come to an obstacle in your path to success, do not try to go around or climb over it or wait for it to move out of your way, but boldly put your shoulder to the wheel and push it away. Every person should strive with all his might to overcome the three principal obstacles to success, which are—discouragement, delay and hard knocks. One might just as well ask another man to walk for him as to ask someone to help him to success.

Depend upon yourself and go at anything you undertake determined to win and don't give up.

There is much inspiration in Herbert Kaufman's words:

Success is not for those who quail;
She gives her most to those who fail,
And then with courage twice as great
Take issue once again with fate.
'Tis better far to risk a fall
Than not to make attempt at all.

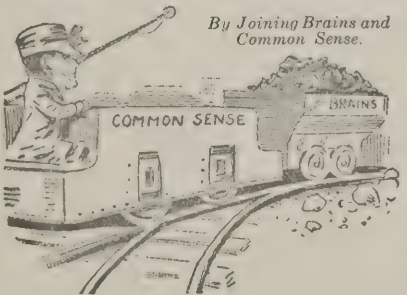
The Secret of Achievement

By Michael Bernard

Written Expressly for COAL AGE

When he was young he learned by heart
Those proverbs, maxims, saws and rules
That formed a necessary part
Of teaching in the older schools.
He followed all their sage advice,
Was punctual as day or night,
Persistent, patient and precise,
Unostentatious and polite.

But though he toiled with all his strength
And humbly did his honest share,
The firm conviction grew, at length,
He wasn't getting anywhere;
For still his job remained the same
As that on which he first began,
Until the resolution came
To modernize his working plan.



By Joining Brains and Common Sense.

The Firm Conviction Grew.

And so he purged his ancient creed
Of all that made it blind and dead,
And from restraint and error freed,
He plugged away, but used his head.
He found success was never gained
By plain, untiring diligence,
But that this object was attained
By joining brains and common sense.

The sneers of some were faintly hid,
While others branded him a fool,
Because, in everything he did,
He followed close the golden rule;
But when the miracle was wrought
And he had gained the laurel crown,
His joy was heightened by the thought
That he had dragged no brother down.

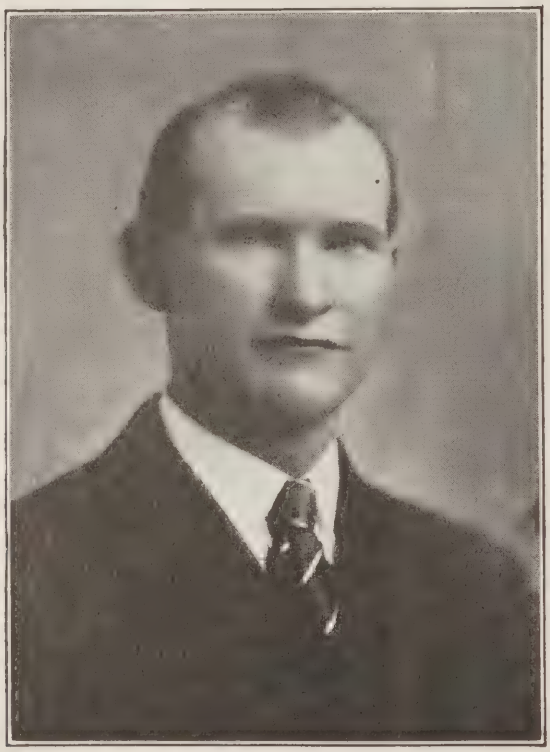
FOR PROGRESS *isn't plodding, nor tenacity, nor pains;*
Success rewards the man who tempers energy with brain.
And he who spurns his mind and on his brawn alone relies
May well expect to be a slave until the day he dies.

John F. Meagher

How would you like to be general superintendent of coal mines for the largest industrial concern in the South and still be only thirty years old? Wouldn't it make you feel that the mining game wasn't so bad after all? Below is the likeness of the man in this position—John F. Meagher, of Pratt City, Ala., who for three years has been general superintendent of coal mines for the Tennessee Coal, Iron & R.R. Co., in charge of six or eight divisions embracing 18 or 20 mines.

There is a story, you know, about a man who left his own home and went into a foreign country to seek diamonds. Unsuccessful there, he came back home and found a big one in his own front yard. This is true in some degree of Mr. Meagher. You will see later that he once took a little side trip, only in this case he not only found the diamond on his return, but the other fellow found one too.

The famous Georges Creek Coal Basin in Maryland furnished the coal-mining industry with the subject of this sketch. He was born at Lonaconing, in Allegany County, on Jan. 2, 1882. In 1887, when he was five years old, his parents moved to Pratt City, his father going to work in the mines, and later serving as mine foreman for a number of years.



Mr. Meagher of Alabama

In 1898, when he was sixteen years old, Mr. Meagher graduated at the Pratt City high school. Later he took the civil-engineering course of the International Correspondence School of Mines.

Early in life, Mr. Meagher gave evidence of the untiring energy and abundant capacity he possesses for work, and during school vacation in 1894 he got the permission of Samuel Allsop, then foreman at the old Drift Mines of the Tennessee Coal, Iron & R.R. Co., to go to work as a hand pumper. The first day he worked in water up to his waist and the next day he could hardly get out of bed, but he stuck to the job and in a few days found it too easy, so he helped his father mine and load coal.

In the fall of 1895, he started in the engineering department of the Pratt Mines Division of the Tennessee Coal, Iron & R.R. Co. as extra rodman and worked at this during his school vacations in 1896 and 1897. As soon as he graduated from high school in 1898, he accepted a regular place as rodman and worked up to transitman in 1902. In the meantime he was burning the midnight oil taking a course in civil engineering.

In March, 1903, he listened to the siren and took the little side trip mentioned above, accepting the position of division engineer of the southern district for the Weaver Coal & Coke Co., of Chicago, with headquarters at Duquoin, Ill. But the call of the Pratt mines and Village Creek water was too strong and in September of the same year he returned to become assistant division engineer of the Tennessee Coal, Iron & R.R. Co.'s Pratt Division. In the early part of 1905 he succeeded H. S. Geismer as division engineer. In these positions Mr. Meagher acquired an intimate knowledge of the mines and began to develop the qualities of management which have led to his present success.

In May, 1906, he was promoted to assistant superintendent of the Wylam Division and on July 1, 1907, was transferred to Whitwell, Tenn., as superintendent of that division, a position which he held with marked success until December, 1910, when he resigned to become superintendent of the Mulga mine of the Birmingham Coal & Iron Co. In November, 1911, he was promoted to general superintendent of coal mines for the latter company, which place he retained until May 1, 1912, when he came back home, so to speak, and accepted the position of general superintendent of coal mines for the Tennessee Coal, Iron & R.R. Co., with headquarters at Pratt City.

The frequency with which promotions have marked his course is of startling interest in reviewing Mr. Meagher's career. But when those who know him best from experience and association with him relate incidents concerning his ability to handle men and emergencies, the reasons for his success become evident. As for the men who have worked under him at various points, they are a unit as regards their loyalty and firm faith in "John," as he is known to them. It is a characteristic quality of Mr. Meagher that in meeting emergencies he first deals with the conditions, adjusts them, gets everything going right again and then ascertains the cause of the trouble. Questions are easy to answer when they are put at the right time and in the right way. He has a keen knowledge of what constitutes a day's work for a man in the mines, and it is doubtful if he has an equal in this line in Alabama. His practical knowledge of the engineering end of the mining game stands him in good stead, and this, coupled with natural talent for the mastery of every detail of his work, makes him an invaluable man.

Mr. Meagher takes keen interest in "Safety-First" work and has always been among the first to reach the scene and get in the thick of things when trouble occurred at any of the mines in the district. He is prominent in the "Safety-First" work of his own company.

Success can fairly be attributed to John F. Meagher, and there's not a man who knows him who is jealous of the fact, so unassumingly does he carry his laurels and exercise his authority.

Electrification of the Small Mine

By F. J. Foley*

SYNOPSIS—An actual instance where the installation of electrical equipment and the purchase of central power reduced the power cost from 7c. to 4c. per ton of coal produced.

When we look upon the application of electricity to coal mining as it is today, and remember how comparatively recent is its adoption, there are many things for which the coal operator can feel thankful.

As late as 1880 little or no machinery of any kind was used. The first use of electricity in the production of coal of any significance was in 1890, when the electric coal cutter was first put in service.

Coincident with the original application to cutting, an electrically driven haulage locomotive was put in service. At that time most of the work about the mine, such as pumping, hoisting, ventilating and tipple work, was done by steam. It is interesting to note the increase in production since the adoption of electrically driven machinery.

Mouth of Mine, Showing Trip of Loads

The Old Steam-Power Plant, Since Replaced

In 1890 the entire production of coal in the United States was 160 million tons. In 1914 it reached the highest mark, 570 million tons. This production would never have been possible without electrical machinery.

For a very long time coal producers, particularly the small operators, kept little or no record of their costs for power. The trend of thought seemed to be that the coal is here ready for use and it costs so much per ton to mine, therefore power costs and cost of coal used are the same. The machinery was inefficient, the cost of maintenance high and the cost of labor both for power-house attendants and miners had an upward tendency, while at the same time the market price for coal had a more or less downward trend.

Consolidations Have Been Beneficial

Conditions have changed very materially in the last few years. A number of smaller companies have consolidated, forming large combinations, the production and operations of which are so great as to make it possible for them to effect many economies not open to the small producer. For example, the use of a large central plant concentrates the total power in use by a dozen or more mines, and as a result produces power at about 60 per cent. of the total cost of that produced by individual plants.

This condition made it a difficult matter for the small operator to compete in the open market and live, and naturally he began to look for the answer. I have made many tests on small individual plants operating on the basis of 100-kw. to 200-kw. demand and, due to various causes, have found power costs varying from 5c. to 15c. per kw.-hr. There were many cases worse even than this, but the most unfortunate part of the whole situation was the fact that the operators were not keeping any records of cost on their power plants. There was no depreciation account, and worn-out plants 10 to 15 years old were placed on the books as assets valued at purchase price paid 15 years before.

The coal used in boilers by small companies was charged against power cost, not at the price for which it could be sold in the market, but at the *mining cost.* One of the first things to do was to prove the fallacy of this system of accounting. The work that the central station has done along this line is well known.

When the question of changing over to purchased power was brought up, the question of cost of attendance was always vital. It is a difficult matter to get high-class electrical help to stay at a mine unless well paid; on the other hand, the small mine cannot afford to pay for this class of help. As a consequence machinery was required which would operate continuously with a minimum amount of attention and repairs.

One of the most expensive commodities today is skilled labor. The machinery designed and built to operate without attendance saves just the amount of the attendant's wages, and usually is so built that little or no repairs are needed.

The Logansport Coal Co., located on the Buffalo & Allegheny division of the Pennsylvania R.R., at Logansport, Penn., has a capacity of 500 tons per day. Formerly it was operated entirely by compressed-air cutting machines and mule haulage. This system cost on an average 7c. per ton for power, not including upkeep.

In addition to this the air machines and steam engines being of the reciprocating type had many wearing parts, and it was necessary to be constantly repairing them and nursing the equipment along.

---

*Engineer with Westinghouse Electric & Manufacturing Co., East Pittsburgh, Penn.

About a year ago this company signed a contract for electric power with the West Penn Electric Co., and alternating current now is delivered to the plant at 2200 volts, 3-phase, 60-cycles. The mine has been completely equipped with electrical apparatus. The trolley and feeder construction and the rail bonding were given careful attention.

To digress briefly, this brings out a point in favor of central-station power for the smaller operator. When he makes an improvement in trolley construction or feeder system and bonding, the results are shown directly on the power bill.

Details of Operation

The cutting machines and locomotives operate at 250 volts direct current, and to get this voltage a converting station was placed about 200 ft. from the drift mouth. This station contains one 150-kw., self-starting synchronous motor-generator set—3-phase, 60-cycle, 2200-volt on the alternating-current end, and 250-volt no-load, 275-volt full-load on the direct-current end.

The fields of the synchronous motor are wound for 250 volts, and the exciting current is taken from the direct-current end of the set, thus eliminating the 3½- to 4-kw. exciter used on other types. The exciters on small sets have been responsible for a large percentage of the trouble which made attendance necessary.

There is a two-panel switchboard consisting of a synchronous motor panel, with a double-throw starting switch equipped with no-voltage and overload release. This acts as a circuit-breaker against both overload and failure of current supply. There is an overspeed device on the motor-generator set which will open this breaker should the set, for any reason, exceed a safe speed. In addition, the panel is equipped with a power-factor meter and an ammeter. The direct-current generator panel is equipped with a voltmeter, ammeter, circuit-breaker and switches.

This class of substation was designed especially for coal-mining work, is simple in construction and operation and needs very little care and attention. The locomotive motorman has started the particular set described every day for a year at 7 o'clock in the morning and left it to run without attention. A unique arrangement used at this mine is a lamp shunted across the trolley and ground where it can be plainly seen from the blacksmith shop, which is about 100 ft. from the substation. If the circuit-breaker goes out while the locomotive is inside the mine, the blacksmith or his helper resets it. This set has operated without shutdown for repairs for a year. At the time of my visit the commutator had not been cleaned since the installation, and commutation was perfect.

The locomotive shown in the accompanying illustration is a 10-ton Barsteel type, with two 50-hp. commutating-pole motors, steel-tired wheels and arc headlight. This machine has hauled coal from the day it was received until the visit mentioned without having lost one minute's time. The motors are equipped with bronze-sleeve bearings for oil and waste lubrication. They have never been inspected. This locomotive was guaranteed to haul 34-car trips; it has often hauled 50- and 52-car trips without the least effort.

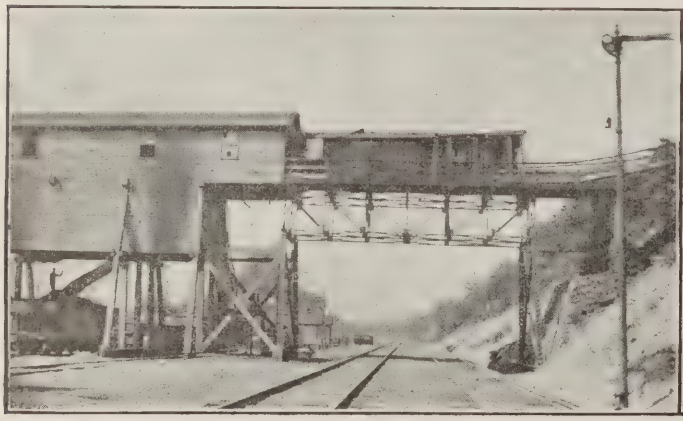
The fan is driven by a 50-hp., 3-phase, 60-cycle, 2200-volt squirrel-cage induction motor, equipped with hand starter.

Benefits of Central-Station Power

There are many other applications of smaller size that have shown up just as well as the larger equipment. This installation and many others like it spell success for the mine owner because they are absolutely trustworthy. They can be started and left to do their work. The worry and care of power supply are taken out of the coal operator's hands by using central-station power. The worry and care of plant operation are removed by using properly designed electrical machinery, and he is left free to attend to his own business, which is the mining of coal at a cost that spells profit.

The mine, the plant and the men at Logansport all bear the same mark, "on the job." Mr. Turner, superintendent of the mine, is justly proud of his model plant, and this pride is reflected by his men, who all work to get the most out of their machines and to keep them in good shape. The plant is well laid out and installed and will give good service for many years to come.

This plant—what it is and what it has done—is an excellent example of successful engineering, because the primary object of the engineer is to accomplish results in the most economical way. By making the installation above described, the power cost was reduced from 7c. to 3c. per ton; there are also low maintenance charges and almost a complete elimination of attendants. The company may well be proud of results such as these.



Logansport Coal Co.'s Tipple

10-Ton Westinghouse "Barsteel" Locomotive

Deep Undercutting with Mining Machines

By R. A. Lowry*

SYNOPSIS—The substitution of 10 ft. 4 in. cutter bars on coal undercutters in place of the 5½-ft. to 6½-ft. bars ordinarily employed results, under the conditions prevailing in southern West Virginia and western Virginia, in many advantages.

The use of mining machines as a substitute for the pick in undercutting coal or, in later days, as an alternative to "shooting off the solid," will be acknowledged by all readers as one of the most important improvements in coal-mining processes.

The compressed-air "puncher," the chain breast machine and now the continuous-cutting chain type of undercutter electrically or air driven have rendered mining more successful in safety, in rapidity of production and in economy. Another step in advance, made with the Ironclad cutter, is the employment of cutter bars longer than was formerly considered practical.

It used to be an accepted theory that coal of average height could not be shot successfully to the back of the cut when this exceeded one and one-third times the height of the face; or, in the case of thick seams, when cut to a depth greater than the height of the face. A standard maximum length for the chain-machine cutter bar has been, for several years past, 6½ ft.

About two years ago, Edward O'Toole, general superintendent of the United States Coal & Coke Co. at Gary, W. Va., came to the conclusion that with clean coal, free from sulphur and other impurities that hinder shooting, with strong roof and even bottom, coal could be undercut and shot successfully to considerably greater depths.

At his request, the Sullivan Machinery Co. made up Ironclad coal cutters with bars 8 ft. 6 in. long and then, as these proved successful, machines with 10-ft. 4-in. bars.

The performance of these machines at Gary was watched by the management with great interest. After a thorough test, the following results were evident. Comparing the 10-ft. 4-in. bar with the 6-ft. 6-in. bar, the longer bar cut 64 per cent. more coal in the same places, cost only about one-third more for labor and power, required fewer repairs per ton, produced a larger percentage of lump coal, and required less powder per ton in shooting.

Moreover, the progress of development is materially increased by the long-bar machines. An average advance of 160 ft. was made with 6-ft. 6-in. bars per month working single shift, while 250 ft. is an average for the 10-ft. bar during the same period.

The long cutter bar Ironclad machine is also used at the mines of the Clinchfield Coal & Land Corporation, at Dante, Va., mining the "Upper Banner" and "Lower Banner" seams, in Virginia correlation.

The "Upper Banner" is a woody, friable coal with comparatively well pronounced faces and butts, averaging 5 ft. in thickness. The top is sand rock and the bottom comparatively hard fireclay. The "Lower Banner" seam will average not over 3 ft. 6 in. high, and is more blocky, with a slate top and fireclay bottom.

Unloading Machine from Truck

Ready to Start Sumping Cut

These mines had been equipped with machines of several makes; but Mr. Lee Long, the general superintendent, became convinced that deep undercutting was adapted to his coal. He gave the Sullivan machine with 10-ft. 4-in. bar a thorough trial and was so pleased with the increase in over-all efficiency and economy shown that he later replaced many of his older machines with these long-bar Ironclads.

Deep undercutting at Dante has proved a decided success from several points of view. The machine runners were formerly paid per face-foot of undercut, but with the installation of the long-bar machines they were paid a stated price per place, a difference in the rate being made for wide and narrow work. This resulted in an increase in the earning capacity of the runners and a decrease in the cutting cost.

Actual performance in these mines shows that runners familiar with handling the long-bar machine get approximately the same face footage per shift as with the 6-ft. bar machine. Each machine has an assigned territory of 22 to 25 rooms. Since more coal is secured per cut than formerly, it is necessary to cut each place only every other night. In the 5-ft. or 5½-ft. coal, one cutting provides a loader with two full shifts' work, so that with an adequate car supply he may work continuously at his greatest efficiency. This efficiency is seldom attained in coal of any height with shorter cutter bars.

---

*841 Court St., Huntington, W. Va.

The Kerf Is Thoroughly Cleaned

When the undercut is finished, the loader takes care that his kerf, which is 5½ in. high, is thoroughly clean. A 7-ft. auger is then used to drill two holes (in rooms) 6 ft. deep and about 3 ft. from each rib. A center hole, 7 ft. deep, is also drilled, all three straight in from the face. Twenty-two inches of black powder is loaded at the back of the center hole, and 18 in. in each rib hole. The center is fired first as a pull or break-down shot, and breaks clear to the heel of the cut. The rib shots break 6 to 7 ft., so when the coal has been loaded out after the first shooting, about three feet of coal is left standing on each rib, with the center clean. One light shot at each rib then turns the standing coal over and squares up the place.

Coal Shot Down Ready to Load out

The "Lower Banner" seam has lent itself to deep undercutting with even better results, although it is only 3 ft. 6 in. thick on an average. There is a pronounced cleavage plane about 18 in. from the bottom in this coal, and when undercut to a depth of 10 ft., the lower part of the seam drops down over the kerf, thus enabling the loader to pull the remaining 2 ft. of coal with very light charges of powder. At present, all coal from these machines is loaded as "screened run-of-mine" and "slack," but the management estimates that the long bars give them an increase of 12 to 15 per cent. of lump that will go over a 4-in. screen. A modern three-track tipple with shaker screens is now under construction.

The Ironclad machines, equipped with these 8½-ft. and 10-ft. 4-in. cutter bars, differ from standard machines using 5½-ft. or 6½-ft. bars in no other particulars. The motors, gearing, friction feed mechanism, etc., are identical. These machines will cut either from right to left or left to right. They are furnished with a reversible cutter chain composed of drop-forged, high-carbon steel links with substantial blocks arranged to give the bit 9 positions in the chain and with setscrews in both sides of the links.

The conclusion reached from studying the results of several installations, particularly those of the United States Coal & Coke Co. and the Clinchfield Coal & Land Corporation, is that deep undercutting is a decided success, and where consistent with the mining conditions, nature of coal, etc., should be recommended since it reduces (1) first cost of machine installation, (2) powder consumption, (3) cutting cost per ton. Moreover, where a certain output is expected, deep undercutting should reduce the territory under development. This is an important feature when the maintenance of roads, ventilation, and supply of timber are taken into consideration. Furthermore, it should increase the percentage of lump and give the loader a more definite or dependable quantity of coal down, thus increasing his efficiency, and thereby raising that of the entire plant.

A Successful Roller-Bearing Mine-Car Wheel

Prior to 1908 there were no successful roller-bearing mine-car wheels on the market commercially. Many such wheels had been tried, but had proven unsuccessful. During that year the Sanford-Day Iron Works, of Knoxville, Tenn., placed on the market its roller-bearing mine truck, which was built with a floating axle and various other improvements differing radically from its predecessors.

During 1913 another step was made. After five years of experience, the above named company was able to produce an improved design of roller-bearing wheel, which was called the "Whitney Wonder." On this wheel the manufacturers are willing to place a five-year written guarantee, not only covering the wheel itself, but also the roller bearing. This wheel is fool proof and requires no attention other than greasing at intervals of from 6 to 18 months.

Upon actual test, this wheel has doubled the speed of motor haulage and saved 58 per cent. of the electric power consumed, in comparison with a solid-hub wheel working under similar conditions. This test was made by the engineer of the Virginia Iron, Coal & Coke Co., at Tom's Creek, Va.

The condition of test and results were as follows: Twenty-car trips, one equipped with "Whitney Wonder" wheels and one with solid-hub wheels, were moved by one motor three times over a distance of 3250 ft. and return. Each car held $3\frac{1}{10}$ tons of coal, and the best time possible was made for each trip. An average of 36 electrical readings was made during each trip, and the voltmeter and ammeter readings were checked with a wattmeter. With the solid-hub wheels, sand was necessary for the track, but was not required with the roller bearings.

AVERAGE FOR THREE TRIPS

	Solid Hub	"Whitney Wonder" Wheels
Time	14.9 min.	7.5 min.
Average amperes	178	154
Average volts	470	465
Average kilowatts	83.78	71.81
Average kilowatt-hours	21.0	8.8

The above test shows a consumption of 21 kw.-hr. per trip for the solid-hub wheel, and 8.8 kw.-hr. for the roller-bearing wheel. This is equivalent to a saving of 58 per cent. in haulage power. Combined with it is a saving of 50 per cent. in the time of haulage. What these savings may mean in the daily output of a mine will be at once appreciated by those who have had experience in mine operation.

Standard Coal Preparation

By Raymond G. Lawry*

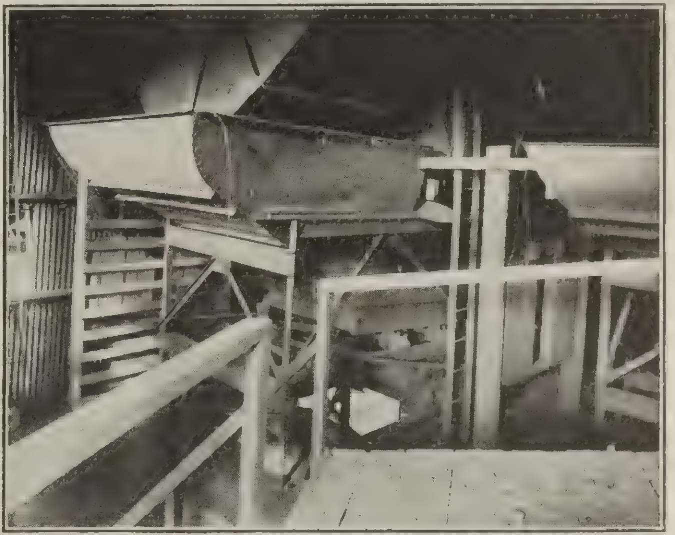
SYNOPSIS—In most localities in the Middle West the grading of coal into four sizes is sufficient for all commercial requirements. Simple and effective means may be employed to secure this preparation.

In opening a new mine, the kind and amount of preparation to be given the coal is undoubtedly the most important single item to be considered. The operator usually knows in advance the principal characteristics of the coal which he intends to work and sell. He knows whether it is hard or soft, the nature of its fracture, whether it contains impurities, their kind and amount, and he also has a fair idea of how these impurities occur in the measure, and the process involved in their elimination so as to obtain the most satisfactory product. An experienced coal man is also well aware of market conditions at the time of opening a new mine and knows how to meet them in selling the coal.

A Roberts & Schaefer Loading Boom at a Mine of the Milburn Coal Co., Keeferton, W. Va.

Planning for the future to meet new conditions and demands is more of a problem, to solve which with reasonable certainty and without unnecessary expenditure necessitates a close study of the necessary operations in screening and cleaning.

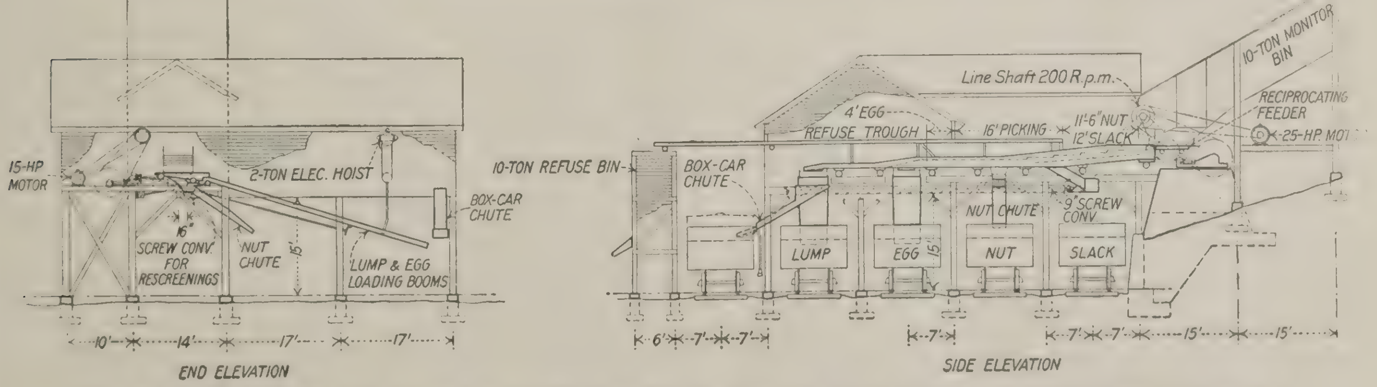
In considering coal preparation in the Central West, it should be observed that vastly different results are obtained at different mines and in different fields. One result secured is the careful sizing and handling of the coal in order to obtain a clean and uniform product. This is usually brought about by letting tonnage come secondary to quality. Most mines are so equipped that forcing the screening equipment results in the deterioration of the product.



Receiving Hopper and Reciprocating Feeder, Marianna Mine, Pittsburgh-Buffalo Co.

The opposite idea is represented by mines making few sizes, but depending on small margins and large sales for their profit. Here a large capacity and one that can easily be increased is essential. It would appear that to produce a high tonnage and give it care in both cleaning and picking would require an extensive and complicated installation. This is not always true as many mines are so equipped as to embody both features with a comparatively simple arrangement of machinery.

Coal separated into four sizes or a combination of these four will practically fulfill conditions of any use whatever; that is, coal suitable for almost any requirement can be selected from the lump, egg, nut or screenings, or a combination of two or more of these sizes. An outfit of



Side and End Views of Four-Track Tipple Using Marcus Picking Table Screen and Shaking Loading Booms mechanical equipment, then, that will screen coal, weigh it, provide for cleaning, careful loading and other matters can be outlined so that by changing one or two parts and making allowance for capacity, it will provide a standard equipment that can be employed at any mine. The style of such equipment is not changed by a variation in the size of the different grades, but if these sizes could be made standard, it would work to the advantage of both producer and consumer.

---

*Assistant engineer, Roberts & Schaefer Co., Chicago., Ill.

The various mechanical units in which coal is treated after hoisting and before leaving the tipple have gradually developed from the simple bar screen to the modern tipple with automatic weighing devices, feeders for regulating the flow of coal, reciprocating screens and picking tables, loading booms, recleaners and various devices for handling the fuel, pickings and rock from the mine as well as equipment for the easy manipulation of railroad and mine cars.

The development of this equipment is not due to any one man or set of men, but has come from every corner of the coal-mining industry. The type of equipment under consideration does not embrace any means for mechanical cleaning or storing, as these are regarded as special cases.

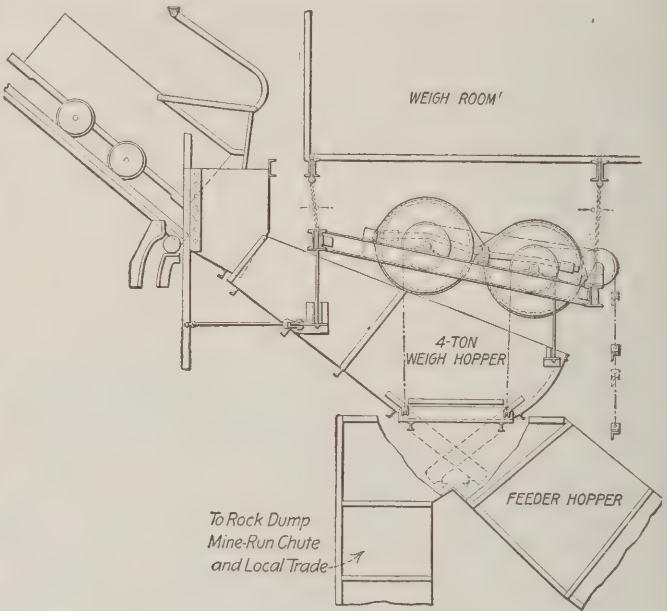
Looking up the Shaking Loading Boom

After the coal is dumped and weighed, the most important consideration is to feed it regularly to the screen or picking table. The feeder is therefore an indispensable device. The reciprocating feeder is a horizontal plate placed at the bottom of the hopper and pushes the coal forward in a solid mass with each forward impulse. It has a short stroke and slow movement and handles the material without breakage.

Another popular form of feeder is the apron conveyor type which is practically a steel belt. This will feed the coal at any rate depending upon its speed. It cleans itself after each charge and also if it be made of sufficient length forms a ready means of inspecting each car of coal.

From the feeder, the coal is discharged to the screen. Until recently these screens were usually set at an inclination of about 3 in. in 12 in. The Marcus patent picking table screen, as now made by the Roberts & Schaefer Co., of Chicago, is set horizontally, and may be used as a picking table as well as a screening surface. In common with the older shaking screen, it has a screening deck composed of perforated plates, and a lower deck to receive and carry forward the coal which passes through the upper. Valves in this lower deck deliver any size of coal to its particular track or other destination. Whenever such a valve is closed, the product is carried forward, making it possible to mix any size with the other sizes below it.

After screening, it is important to load the larger sizes into railroad cars without undue breakage. Loading booms may be used for this purpose. Steel aprons and rubber conveying belts have in the past been largely used for loading. A new type of this device known as the Roberts & Schaefer shaking loader, recently introduced, consists of two shaking chutes, the forward one being raised and lowered by an electric hoist similar to the conveyor type of boom. The advantages claimed for this device are easy delivery at the extremity and the possibility of rescreening by means of small perforations after the coal leaves the shaker screen.



Arrangement of Chutes below Weigh Hopper

Coal may be picked on the upper or horizontal part of the boom or upon the horizontal screen as noted above. In preparing lump, egg and nut coal for the domestic market, it is often desirable to rescreen them as they pass over the chute just before dropping into the car. This is especially true of the softer coal. Enough breakage and chipping occur when the fuel drops from the screen to the chute leading to the cars to justify the placing of a section with round or slotted holes which will remove this dust and breakage. A small conveyor spanning the tracks under these small screen sections delivers the screenings to the car on the slack track or beyond it to a bin for boiler fuel.

It is essential that any mine of large capacity be able to dump coal directly after weighing to railroad cars. One method of accomplishing this is to place a valve in the chute or hopper below the weighing unit, which when open diverts the coal through a chute to the car. Another method is the installation of a double-dump weigh hopper which may be dumped forward to the shaker screen or backward to the mine-run chute by the operation of different levers. As the weighing point is comparatively high above the railroad track, it is easy to insert a valve or bypass to send coal to a chute for local consumption, and perhaps another bypass for rock when it is desired to hoist it from the mine.

Modern market demands make it necessary to pick and screen many fuels which were formerly only imperfectly sized. The pickings are apt to contain bony coal or coal combined with small impurities as well as slate and rock. The former may often be used for boiler fuel while the latter is of course sent to a rock dump. To handle this refuse and semi-refuse, a double cross conveyor may be employed which delivers to two compartments in a small bin. The slate side of this bin delivers to a small dump car which runs to the rock dump. The other side contains the boiler coal which may be delivered to a car running to the bunkers in front of the boilers.

The foregoing illustrates how all of the special functions of the tipple may be obtained as well as the regular ones preparing all sizes of coal and any combination thereof, without interruption to hoisting or dumping.

As may be seen from the accompanying photographs all of the elements entering into the "standard" preparation plant above described are in successful everyday operation at many mines throughout the entire country.

* *

A Successful Man

By Pennsylvania Mine Manager

For some years I have wanted to see written in the "Who's Who" column of Coal Age something of the most successful mining man I know. No one who knows him well enough to furnish the facts for such an article will ever send them to a publisher during his lifetime, I think, because he is so strongly opposed to being "written up" that there is danger of losing his friendship, and this is something so well worth having that his friends are not apt to risk estrangement for the sake of the pleasure of seeing him in print. So far as I know he has never been photographed, and I am going to try to tell about him in such a way that he will not recognize himself.

I can not resist the temptation, however, to give the state the honor of his citizenship, so will mention Pennsylvania, which I think is large enough to hide from public view several successful coal men. I am at a loss for a fictitious name. He looms up so big that no one thinks of calling him "mister." He has reached that enviable stage when he goes by his first name.

Karl Smith, or "Big Karl," was a pick miner in the days when a pick miner found something to do whether cars came or not—back in the days when coal was handled twice, if the car was not close enough, and piled back along the ribs for rods, awaiting a chance to load. So when we start Big Karl as a pick miner, don't picture a fellow who drops in from nowhere, begs a pick and shovel from the company and goes in to make coal while his empty car is waiting.

When union labor came along and held out the usual emancipation from work, Big Karl was "some agitator," but as he was "some miner" he soon found that the fraternal spirit which requires both ant and sluggard to share and share alike was not conducive to success. Not that he renounced the principles of brotherhood; but he was too big to serve blindly a system making no allowance for individual merit. His first promotion came after a mine fire. No one knew just how it came about, but he was telling how to stop it and leading the work without any further authority than just being the only one who seemed to know what to do. Probably the officials who were in charge got the direct credit for the good work; but as he was soon afterward made "pit-boss" it may be supposed that there were some people looking on who were judges of men.

Although Karl could scarcely read or write—as was not infrequently the case among the old pick miners—he handled his mine with such good judgment that he was given an adjoining mine to look after also. As the company had numerous interests and many mines, he was soon used as an inspector to hunt down and eliminate various kinds of inside inefficiency. It being necessary to make reports and do some letter writing, Big Karl "met the situation." By the way, that is his pet phrase, the watchword of his success and the only thing about this sketch which might identify him.

As he gradually built up a position all his own by meeting the various mining situations confronting the company, he studied the language of the educated men with whom he associated, and studied the spelling and punctuation of the letters he received. He has read the best journals and kept up with the best mining practice. He has not been fooled by the froth and is by no means a wide reader, but seems to have a knack of picking out what he wants.

Because of his horror of "rushing into print" he has rarely been induced to contribute to the coal journals; but of late years the public has benefited by having from him some of the best papers ever delivered before mining men. In the meantime several of our most widely known experts have built up reputations, not consciously perhaps, by publishing mining methods and experimental practice taken first hand from Old Karl's fund of practical wisdom. He is a man you cannot associate with without taking on a lot of information so vivid that you are apt to consider that you have made an original discovery.

A man of such attainments must necessarily be aware of the "virtue gone out of him" when he recognizes it in print under the name of another; but Old Karl is "some philosopher," too, and "meets the situation" by a kind of jovial cynicism all his own, and remarks on the value of education, with the usual exaggerated idea of its value so common among those who have never been under a conventional schoolmaster.

I really wonder, after all, if he has lost much. He has met the situation, anyway. I once knew a boy with one leg. He played at all the games and excelled in many. I have looked at him stripped for a swim and examined that one good leg. I am sure no one could develop two like it, and he got it by meeting situations.

I have been prompted to write of Old Karl—and he is not an old man—because I think I owe most of what mining sense I may have to him. And I pick him out as an example of success because he seems to have made the best use of his opportunities—has met the situation.

Mine Timbering in Steel

By R. B. Woodworth*

SYNOPSIS—Some facts and figures dealing with the introduction and growth in the use of steel mine timbering in the United States.

My dear ————:

We had in stock at our ——— works several sets of standard steel mine timbers and collars. In building some overcasts, they took the liberty of using up some of the collars for these sets, and the same has caused quite a little flareup between this office and the works.

The superintendent states that he needs either 6-in. collars or 6-in. I-beams nearly every week, etc.

Yours very truly,

————————,

Purchasing Agent.

This letter is typical; it represents a condition which obtains at most mines where steel mine timbers are in use, and is beyond question the result of a careful adaptation of a steel section to an unquestioned need.

Steel-Timbered Pump House and Gangway

In the year 1907, the Carnegie Steel Co. detailed the writer to make certain investigations into mine timbering conditions in the anthracite region, as a result of which it began to roll sections particularly suitable for mine-timbering purposes and to devote special attention to the use of steel in ordinary operations underground.

Previous to that date, sporadic attempts had been made by several of the mining companies to use steel, largely on account of the enormous loads which had to be carried, and without much reference to the fundamental principles of economic use which at present underlie the commercial exploitation of the use of steel.

The Susquehanna Coal Co. installed its first lot at the Stearns Shaft, Nanticoke, Penn., in 1897. The Lehigh Valley Coal Co. had in like manner installed a steel-framed pump house in the same year at Hazleton Shaft Colliery, No. 40 Slope. These two installations were followed by a few others, so that in the year 1907 there was probabily a mile of steel-timbered gangway in the anthracite coal fields.

In the bituminous coal fields, little had been done owing to the lighter loads to be sustained, and the general availability of good wood for mine-timbering purposes. A fire, however, had caused the Spring Valley Coal Co. to timber the shaft bottom at Shaft No. 1, Spring Valley, Ill., with 15-in. beams in 1896, some 400 ft. being in place. In the United States, however, for obvious reasons, the use of steel within the mine was not nearly so far developed as it was in Europe, and when the writer began to look into the literature on the subject, he had to draw largely on transatlantic publications, and found little dealing with installations in this country.

At the present writing, there is increasing reference to the use of steel in the mining papers of the country and in the reports of the mine inspectors, and representative installations of steel mine timbers are to be found in all coal-mining districts. It is, of course, impracticable to trace the total quantity of steel so used since many manufacturers are actively competing in this as in other fields, but in the year 1914 the Carnegie Steel Co. alone furnished to the mines sufficient plain and fabricated beams for inside mine work to timber permanently 14 miles of main headings, in addition to 700 props.

The growth of the use of steel in the mine is borne out by the sales record of that company. It is sufficient here only to set down as an indication the number of three-piece sets:

1907	190	1911	2530
1908	252	1912	4183
1909	750	1913	3681
1910	1194	1914	3845

The success in the introduction of steel within the mines is due in the first place to the rolling of sections particularly fitted for inside mine work; in the second instance, to the furnishing of such sections in simple forms suitable for immediate erection, and in the third instance, to intelligent education of mine officials and operators along the line of an ultimate economy in expenditure, based not on first cost, but on service.

While the 5x4-in. beam was introduced for mine work in England in 1885 by the Darlington Iron & Steel Co., and while a similar section was rolled in the United States previous to 1907 for use as car stanchions and similar structural purposes, the rolling of the H-beam in 1907 gave an impetus to the use of steel in the mines of the United States, for the reason that these shapes were made in convenient sizes and were exact equivalents both for strength and for weight to the ordinary forms of wooden mine timbers.

H-beams were originally designed to be used as legs in the three-piece set. In addition to that purpose, they have been used for the legs of headframes, for chords of steel trusses, for buntons in concrete-lined shafts, for hoisting guides in hoisting compartments, and for use as light columns in inside mine construction. Their use in this direction has been so appreciated by the structural-steel trade generally that they have taken a field of their own outside that for which they were originally designed. The use of the H-beam has practically displaced the earlier forms of leg sections, such as double channels used in the first installations. The range of sizes rolled is commensurate to all the ordinary needs of the mine, and there are a simplicity and a strength in their use not possible with any other form of rolled steel.

---

*Engineer, Carnegie Steel Co., Pittsburgh, Penn.

Suitable as these sections were for use as single props in the working places, it was not until 1912 that records begin to show their appearance in quantities in the mines. Since that date numbers of them came into use in the anthracite coal fields and with simple cap and base have proved a coming factor in the support of large areas under severe loading conditions.

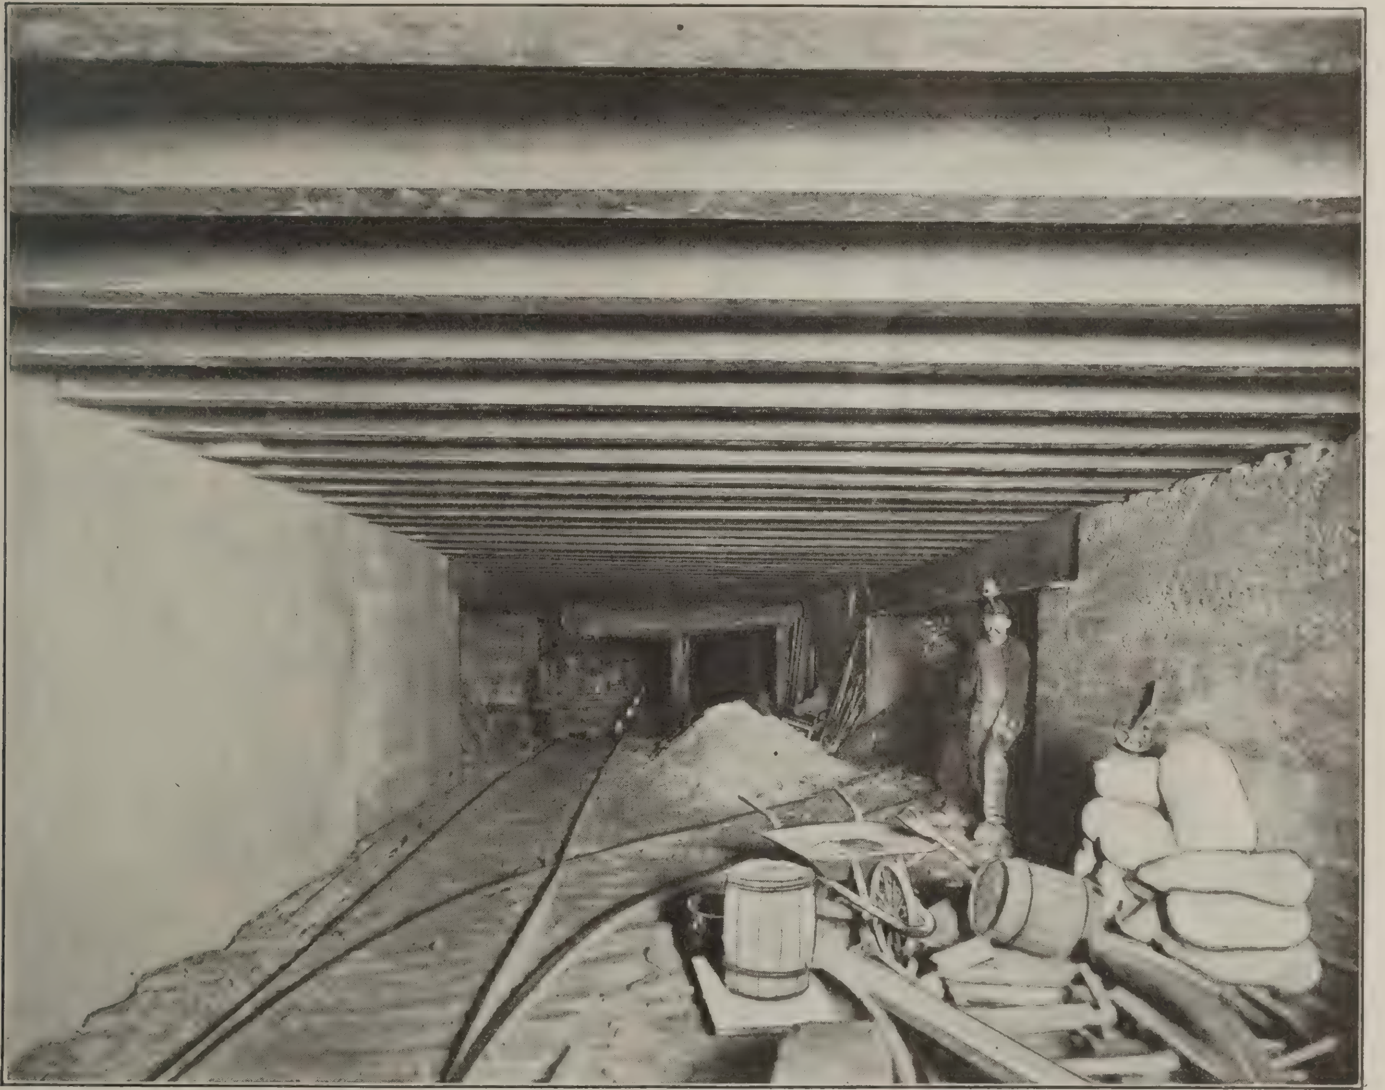
In the anthracite regions, the three-piece mine-timber set, consisting of two H-beam legs and an I-beam collar, is the standard form of modern construction, with the H-beam prop in sporadic use. Some beams are doubtless employed supported on brick or stone side-walls, or even directly on the coal.

In the bituminous regions of Pennsylvania, while there are many installations of three-piece sets, the ordinary practice is to use plain beams on brick, stone or concrete walls. In southeastern Ohio, Kentucky and Illinois, it is usual to support plain beams directly on the coal, or on short timber sprags, although there are representative installations in these mines also of the three-piece steel timber set.

The introduction of steel in place of wood in the United States has beyond question led to a decreased cost of production just as it has done in England and on the Continent of Europe. Average experience, therefore, runs parallel to statements made in the 35th Annual Report of the Chief Inspector of Mines for the State of Ohio, who, in discussing the retimbering of large areas in southeastern districts, comments on this work:

> Even with all this retimbering which has been done in the last two or three years, the management informs me that the cost of production is a great deal less than when they attempted to operate without properly timbering the haulways and taking the risk of anyone being there when the fall occurred. This demonstrates that in keeping the mine up to a high standard of safety, efficiency is increased and cost of production decreased.

Modern underground practice is summarily shown by the exhibit of the Carnegie Steel Co. at the Panama-Pacific International Exposition, San Francisco, Calif. The modern mine in its permanent headings at least is timbered with steel, lagged with poles, plank, concrete slabs or steel plates. Its haulage is electrical, power being transmitted on overhead copper wires, suspended from steel beams by simple hangers. The product is hauled in steel cars, supported on steel axles and solid rolled steel wheels. These wheels traverse steel rails, carried on steel cross ties. The exhibit represents many an actual installation, successful by reason of the intelligent coöperation of the manufacturer with the operator desiring the very lowest maintenance cost.

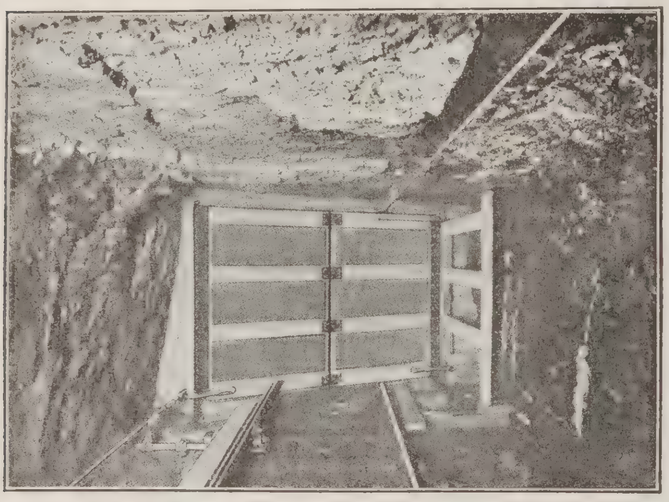


Steel Timbers at Maryland Coal Co.'s Mine, St. Michaels, Penn.

Mine Doors for Coal Mines

An automatic mine door is now in operation in the No. 2 mine of the Madison Coal Corporation at Glen Carbon, Ill. It was installed on Aug. 22, 1912, by C. L. Bowman, representing the American Mine Door Co., of Canton, Ohio. Upon the successful installation and operation of this and several similar machines the Madison Coal Corporation ordered 74 additional doors of the same pattern.

Briefly, the construction and method of operation of this device are as follows: The door extends diagonally across the track and consists of two sections swinging in unison in opposite directions by means of a connecting bar extending beneath the tracks. Steel channels extend either way about 32 ft. from the door, one leg of the channel being in alignment with the inner edge of the track rail. Each of these channels is in two sections hinged at a point 14 ft. from the farther end so as to permit of a vertical movement of the channel through a distance of about 5 in.



Mine Door in Mine No. 2, Madison Coal Corporation, Glen Carbon, Ill.

At three points on the underside of each channel toggle joints connect with levers which are secured to a rocker shaft. Other levers attached to the outer end of these rocker shafts are connected directly to each other and to each door by a system of links and rods. The arrangement is such that the channels are in an elevated position when the door is closed.

When a car or motor passes over the track it engages one of these channels, forcing it down, which movement communicated to the toggle joints turns the rocker shaft, which in turn actuates the rods and opens one wing of the door directly and the other indirectly through the connecting bar. To the middle rocker shaft on either side of the door is fixed a lever upon which an adjusting weight is placed. This is so arranged as to give sufficient power to close the door after the wheels have passed off the channel.

The construction of doors and door frames is such as to afford great rigidity with a minimum of weight. The panels themselves are covered with sheet metal and the joints at the top and sides are made airtight by specially treated cotton duck.

There are several reasons for placing the doors slantwise across the track. When so placed each half of the door moves through an arc of only 60°, whereas if placed squarely across the track it must of necessity swing through 90°. It is obvious that this position renders the operation of the door more rapid and positive. Since the two wings forming the door open in opposite directions, the air pressure is equalized, and this pressure tends to close one wing with as much force as it opens the other. The doors are thus capable of operating successfully under heavy pressure, while the air current may be reversed in direction without blowing the door open.

Such a door does not open until the trip gets to it, and closes as soon as the trip gets past. It is continually on the job—days, nights, Sundays and holidays, when trappers may be absent. It saves a considerable quantity of air, since it usually remains open for only a fraction of a minute. It reduces the liability to explosion because it remains closed when not in use. By its use the human element is eliminated, and with it the great danger to life and limb of trappers. On account of its economy it allows the placing of certain sections of large mines on a continuous air current, thus increasing the volume of air to each place and eliminating the necessity for expensive overcasts.

⁂

A Question

By A. M. Iner

I have been told the life story of a miner who is now well past the meridian of life; who would undoubtedly be regarded by expert mining men as being well versed in the principles and practice of his profession; sober, persevering and industrious, but who has never attained to any position of prominence in the industrial or social world.

He entered the coal mines before he was 12 years old. As time passed, he observed that those who occupied positions of trust and influence in the industry possessed or were supposed to possess educational advantages superior to the common coal miner. Naturally inferring that education was the keynote to advancement, his ambition was aroused to secure the possession of these powers. The time devoted to this was pilfered from his hours of recreation and recuperation. He learned the full truth and importance of the poet's expression as applicable to his own case:

The heights by others reached and kept
Were not attained by sudden flight;
But they, while their companions slept,
Were toiling upward in the night.

During the process of acquisition, he learned of the existence of a great moral truth; namely, that all men are spiritually equal, and by virtue of this equality they have rights that must be respected, and that he who infringes upon these rights, through the accident of position or power, is guilty of a crime against his Creator. Basing his rule of life upon this principle, he exerted his utmost endeavors to put it into practical application.

Three Characteristic Elements

In studying the biographies of great men he perceived that three characteristic elements were emphasized as forming the prime factors in the realization of an ideal; namely, honesty, industry and perseverance. Honesty he construed to mean the invariable practice of truth and justice as based upon the great moral law; industry, as being the honest employment of all the energies of body and mind in the performance of his duties; perseverance, as being the practice of honesty and industry in face of all discouraging opposition.

Actuated by these motives, he studied, practiced and observed, and succeeded, while yet young, in securing the necessary legal recognition of ability to fill any position in or about a coal mine. Not satisfied with this attainment, he continued his studies and practical work with the object of acquiring, as far as possible, a complete mastery of the subject, believing that he could thus become of more value to his employers and a source of greater good to his fellowmen. He secured an inferior position and discharged his duties faithfully and well, being able to bring to his assistance new and practical ideas of economy and efficiency. After several years, he was promoted to a slightly higher position, the duties of which he discharged in an equally commendable manner.

This, however, was the summit of his advancement. Since then he has been filling minor positions, almost invariably under men who are his inferiors so far as ability is concerned. In all this time he has faithfully adhered to his ideals of what is right. He treated the men over whom he had charge with invariable courtesy and kindness, enforcing obedience with firmness, and discipline without harshness. His men trusted him for his integrity and respected him for his justness. His intercourse with his superiors in position was marked with courtesy, respect and a degree of deference commensurate with dignity, but never with cringing or servility. He has availed himself of every opportunity and means for an honorable advancement.

The foregoing is no melodramatic character created from imaginary moral virtues. It is a human recital of an actual case. The story is not brought forward to point a moral, but rather to question the truth of an accepted fact. Is this man a success or failure? If success be the inevitable result of the practice of the principles stated, then he is most assuredly a success, but he is not so accepted. He possesses neither wealth, influence nor high position—three essentials dominantly characteristic of success as the term is generally accepted.

If there be some other element indispensable to a successful life, it has not been emphasized in the portrayal. Why? If it be honorable it should be known, or is it possible that what we so generally accept as success is simply the attainment of an end irrespective of the means or the demands of the great moral law?

The above cartoon illustrates a thought that bears more directly and more forcibly on the question of individual success than any other idea that might be advanced. Even unusual ability is impotent if it is not backed by the vigor and energy of healthy manhood. Mr. McCay, in his drawing, shows plainly how the great obstacles in the way of the man climbing toward success are pushed aside by health. When we are overworked or are distressed by sickness or debt, it follows that the degree of personal efficiency we attain in our work must be very low. Man might as well try to reach the moon as to hope for success while sickness and disease are sapping his vitality and strength. If we would be successful, we must first be healthy.

Coal Preparation at New Mine of Old Ben Mining Corporation

By L. S. Richards

SYNOPSIS—The Old Ben Mining Corporation, of West Frankfort, Ill., has installed a large spiral coal-cleaning plant at its new No. 9 mine, as its use of the spiral at the No. 8 mine proved the value of that device for removing bone and slate. A picking table and screens for the cleaned coal make the delivery of a high-grade product certain.

One of the most successful plants in operation today for preparing bituminous coal for market is at No. 9 mine of the old Ben Mining Corporation at West Frankfort, Ill. It is of especial interest, first, because the method of cleaning the coal is new to the bituminous field; second, because of the flexibility of the arrangement of the tipple and the thoroughness with which each step in the operation has been worked out and, third, because of the attention which has been given in design to selecting machinery of the greatest durability.

Development of Needs Shown in Earlier Plant

D. W. Buchanan, of the Old Ben company, has given the preparation of coal much study. This plant is the outcome of this careful consideration and was designed along the general lines of the equipment at their No. 8 mine after that plant had been in operation about three years and had proven that the method installed there would clean the coal in that vicinity both completely and economically. A great saving, both in loss of time and expense of upkeep, can be effected where both design and material are well selected. This is proved by both of these plants, for it is unusual to hear of either mine being idle because of a breakdown.

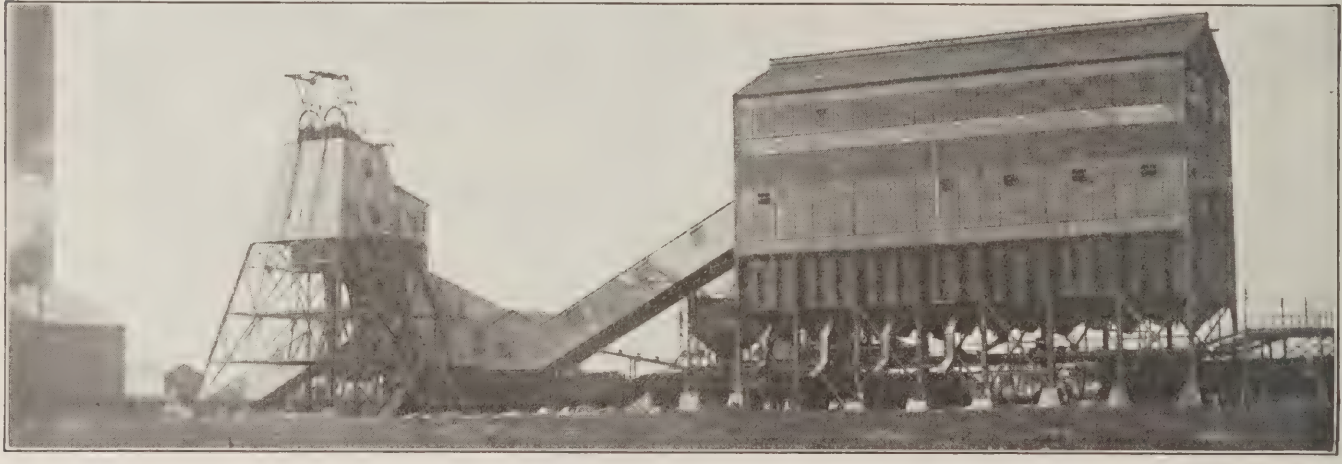
The tipple and rescreening plant are built entirely of steel and are of substantial design. The greatest care has been taken to provide ample clearances and ready access to all machinery. The floors are of concrete, and plenty of windows for light and air have been provided, thereby making the task of the workman easier to perform and his work consequently more efficient. By noting the windows in the lantern of the sizing plant, as seen in the illustration, an idea of the excellent lighting provided will be gained.

The coal is hoisted from the shaft in 4-ton mine cars and dumped directly into a weigh-box. The elimination of the usual dump chute lessens the drop of the coal into the weigh-box, thus saving in the breakage of coal. The weigh-box in turn discharges directly onto a pair of 10-ft. shaking screens. These are of ample width for the screening so that any necessity for a feed hopper at this point is removed. This also makes a big saving in the breakage of coal.

The shaking screens are supported by heavy 14-in. chilled-tread rollers, and the roller races on the screens are heavy castings provided with removable wearing strips of machine steel.

The Manager Can Deliver Coal to Satisfy Almost Any Size Specifications

On the screens the coal is separated into 3-in. slack, 3-in. to 6-in. egg and 6-in. lump, and by means of a flop-gate at the upper end of the upper screen the run-of-mine coal may be loaded directly into railroad cars on the slack track if desired. The 3-in. slack may be loaded directly into railroad cars or may be passed to a conveyor for delivery to the sizing plant. The egg coal may likewise be loaded directly into railroad cars or may be passed to the sizing-plant conveyor with the 3-in. slack, or it may be reduced in a 36x48-in. two-roll spring-relief coal crusher located under the screens to 3-in. slack and then passed to the sizing-plant conveyor.



General View of Tipple and Sizing Plant at No. 9 Colliery of the Old Ben Mining Corporation at West Frankfort, Ill.

The lump coal may be passed through a flop-gate in the lower shaking screen to the crusher and thence to the sizing-plant conveyor, it being reduced to 3 in. or 6 in., or it may be discharged over the end of the lower shaking screen to a flat-top apron-conveyor picking table and loading boom.

The loading boom is operated by a 4½-ton self-contained direct-current electric hoist, which permits of the boom being handled quickly and easily by the operative, thus lessening the chance of his neglecting to keep the end of the boom in position to give the minimum fall of coal into the car.

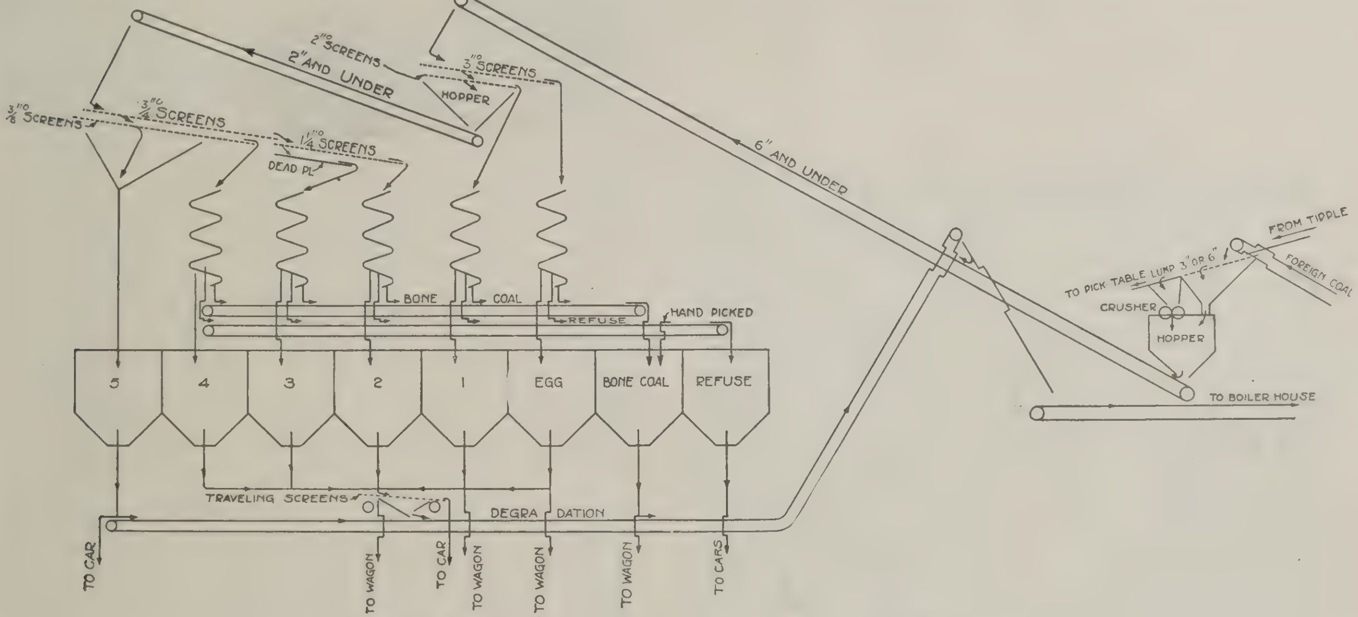
PICKING TABLE AND ROCK AND BONE-COAL HANDLING DEVICES

The horizontal length for picking is about 20 ft. and at the end of this level portion a hinged plow has been provided so that the coal may be discharged from the conveyor at this point into a telescoping box-car chute serving cars on a track outside of the lump track.

The rock from the picking table is passed by the pickers into a 24-in. apron conveyor located directly alongside the picking table. This conveyor elevates the rock to a rock bin over the lump track. This bin has a capacity of about one car. The bone coal picked from the lump is passed by the pickers to a 24-in. belt conveyor and delivered to the crusher and thence to the sizing-plant conveyor.

"FOREIGN" COAL WILL ALSO BE CLEANED

Provision has been made for bringing "foreign" coal to the plant and sending it to the sizing plant in the following manner: Under the egg track on the side of the tipple opposite the sizing plant is a track hopper for unloading railroad cars. From this hopper the coal is elevated by a 60-in. inclined apron conveyor and discharged onto the shaking screens, into the crusher or direct to the sizing-plant conveyor.



FLOW SHEET OF SIZING PLANT AT OLD BEN NO. 9

The conveyor to the sizing plant is a 60-in. inclined apron conveyor of the same type as that for the foreign coal. These conveyors are made of 60-in. steel overlapping pans with malleable ends mounted on a double strand of 18-in. pitch-bushed bar-link rolling chain with 8-in. inclosed oiling rollers. The sizing-plant conveyor elevates the coal to the top floor of the sizing plant, where it is delivered by means of a bifurcated chute to two sets of shaking screens, each set being made up of two screens, one 6 ft. wide with 3-in. perforations and the other 7 ft. with 2-in. perforations. These screens make a 3- to 6-in. egg, a 2- to 3-in. nut and a 2-in. slack.

The 2-in. slack is delivered to a 48-in. apron conveyor of the same type as the main conveyor and elevated and delivered by means of a four-way chute into four sets of two shaking screens each. One screen of each set is 4 ft. 6 in. wide with two decks, the perforations in the upper deck being 3/4 in. in diameter and in the lower 3/8 in. The other screen is 3 ft. 6 in. wide and has a single deck with 1 1/4-in. perforations. These screens separate the 2-in. slack into 1 1/4- to 2-in., 3/4- to 1 1/4-in., 3/8- to 3/4-in. and 3/8-in. slack.

SCREENS OF A NEW TYPE

The type of screen used is patented by Mr. Buchanan and is made with 3x6-in. pine side timbers and supported by 1-in. ash boards. These boards are rigidly attached to the screens and to the building structure, the movement of the screen being taken by the spring of the boards. The connecting-rods driving the screens are also of ash of 3x6-in. section. These are rigidly bolted to the screen side timbers and to the eccentric straps and are necked to a 3x3-in. section in the middle portion so as to allow them to spring sufficiently to take care of the vertical movement of the eccentrics. This type of screen has been used in a number of installations during the past few years and has proven satisfactory for the sizing of small coal.

THE SPIRAL SEPARATORS

Each size of coal except the slack is delivered by the screens to a set of spiral separators, there being six spirals for each size of coal on each side of the building, making twelve in all for each size. The spirals take out the bone coal and refuse, and each size of cleaned coal is delivered by means of conveyor spirals to two bins, one on each side of the building. The bone coal and refuse on each side pass to separate 18-in. belt conveyors, and by means of two 18-in. belt conveyors running across the building the bone coal is delivered to a bin on one side of the building and the refuse to a bin on the other side. The refuse is hand-picked on the cross-belt conveyor before it is discharged into the bin. The pickings are thrown over to the bone-coal belt.

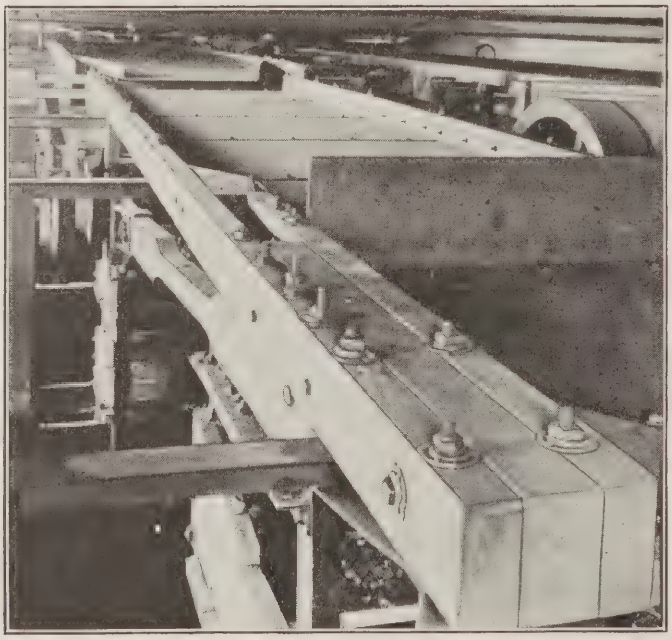
The spiral separators were furnished by the Anthracite Separator Co., of Hazleton, Penn., and they have proven very successful on this coal. The total storage for each size of coal in the rescreening plant is 250 tons and 125 tons each for the bone coal and refuse.

After Cleaning and Conveying the Fuel, Fine Coal Is again Screened Out

The cleaned coal is drawn from the bins by means of special rack-and-pinion gates and delivered to railroad cars, the five larger sizes passing over a traveling lip shaking screen, which insures the coal being loaded without undersize or dust. One of these screens is located over each track. These screens are also patented by Mr. Buchanan and are of the same type as those in the rescreening plant. Each screen is mounted on a structural-steel carriage with heavy double-flanged rollers running on a pair of rails carried from the bin columns on each side of the track. Two independent motors are mounted on the carriage, one for driving the screen and the other for the travel mechanism.

Boilers Are Fed by the Bone Coal, the Dust from the Cleaned Coal and Some Slack

The bins on one side for the three larger sizes of coal as well as the bone-coal bin are provided with chutes with undercut gates for supplying the wagon trade. The degradation from the traveling lip screens is collected by a 20-in. apron conveyor midway between the tracks and discharged onto a 20-in. belt conveyor, which carries it either to a conveyor for delivery to the boiler house or to the main sizing-plant conveyor and back to the sizing plant. Chutes are also arranged for delivering slack and bone coal to the degradation conveyor, and thence to the conveyor leading to the boiler house.



Buchanan's Patented Screens

The boiler-house conveying system consists of a 20-in. belt conveyor running alongside the slack track and inclined for about two-thirds of its length. This conveyor discharges onto a 12x5-in. horizontal double-strand flight conveyor, the whole system having a capacity of 40 tons per hour. The flight conveyor distributes the coal over a steel bunker in front of the boilers, from which it is drawn by spouts.

Spiral Separators

The various units throughout the plant are driven by individual motors, avoiding the necessity of long drives and a multiplicity of line shafting. The plant is designed for a capacity of 5000 tons a day and it is probable that this capacity will be reached in the near future.

The complete machinery equipment was designed, manufactured and erected by the Link-Belt Co., of Chicago, and the building structure was designed and built by the Wisconsin Bridge & Iron Co., of North Milwaukee, Wis.

Mr. Buchanan has every reason for feeling proud of this plant as it is without doubt one of the most uptodate in the bituminous coal fields today.

❊

A Failure

By Pennsylvania Engineer

Yesterday a man moved from our camp who is a failure. Since the first of July he has been out of work and has now secured a job at $2 a day.

Two years ago he was recognized as the best master mechanic in our region and drew a salary accordingly. Today he is down and out, and yet he is in the prime of life. The reason is that he became a "knocker." Success turned his head, and he wanted everything his own way. The general manager, superintendent, mine foreman, all were classed as "know-nothings" and fools if they did not agree with him. Not content with his disparaging remarks concerning them at our own plant, he carried his unjust comments to the surrounding plants, and his reputation as a master mechanic gradually became nil. Regardless of all our efforts to aid him and break him of this habit, he became worse and worse, and it was at last necessary to let him go.

Two years ago nearly every plant in the region would have been glad to secure his services; today no one wants him at any price. He is the most capable man I ever saw around machinery, and yet today he is down and out—a complete failure.

⁂

Success with Steel Mine Ties

By J. C. Evans*

Many steel mine ties have been patented. The majority of these have never been placed on the market, as the patentees were unable to interest practical men in their manufacture, since the ties were either too costly or were impractical from the mining man's standpoint. Others have reached the market at considerable expense, only to meet with failure. After considerable experimenting, J. J. Ross, a practical mining engineer and at the time general superintendent of the Hutchinson Coal Co. at Fairmont, W. Va., on Apr. 6, 1909, received a patent covering the channel tie which he had developed and tried out. This device is now known as the Fairmont tie.

Top-Cutting Machine Operating on Track Laid with Fairmont Ties

Mr. Ross then organized the Standard Tie & Manufacturing Co., of which he is the president. After making distribution of several thousand ties during the year 1909, this company, after considerable investigation, made arrangements with the Fairmont Mining Machinery Co. whereby the latter was given the exclusive right to manufacture and sell this tie.

During the year 1910 about 50,000 of these ties were placed in the mines, mostly in small trial lots ranging from 100 to 1000 ties, with the understanding that they could be returned at no expense to the mine owner if they were not a success. The same policy has been carried out each succeeding year, with the result that 99 per cent. of the trial consignments have been retained, and an increase in the size of individual orders as well as the total number of ties sold has been experienced.

The accompanying illustration shows a top-cutting mining machine in actual operation in Mine No. 303 of the Elkhorn Mining Corp., and operating upon tracks laid with Fairmont mine ties. This machine has a sweep of 21 ft. and weighs 7 tons, which will give some idea of the pressure placed upon these ties.

This steel mine tie has been successful at many other operations. There are over 200 mines that have in use this tie in quantities ranging from 500 to 50,000, while 300 other mines have these ties in lots of less than 500, in most of which cases they are being tried out. Four large coal companies have 180,000 Fairmont ties in use, or an average of 45,000 ties each, none falling below 41,000. Ten other firms have 115,000, or an average of 11,500 ties each.

Considering the short period since the Fairmont tie was placed on the market and the unsatisfactory conditions in the coal business during the last two or three years, this record spells success.

⁂

Hard Work, the Great Essential to Success

By E. H. Weitzel*

A great many qualities contribute to any man's success. Some have qualities which others lack. Some qualities which contribute to one man's success might not be helpful to another. The one great essential to success in any line of endeavor is hard work, and the measure of success of most people is in direct ratio to the application they are capable of giving to their business.

Natural ability, education, personality and opportunity are the chief contributing causes in the order named, but none of these, no matter how liberally they may be bestowed, will be productive of success without the added essential of consistent, conscientious effort.

In reviewing the history of the men who have achieved the greatest success in the present generation in our own country, we cannot fail to be impressed with the thought that the experience of almost extreme poverty in their early youth was a factor which contributed to their later success by teaching them early the lessons of economy and thrift and by requiring a habit of work which in most cases amounted to drudgery. Lack of early education does not seem to have hindered these men, and their success should lend encouragement to the youth of the land today, when there is so much being said on the subject of early education and lack of opportunity for those born in poverty and with so few of the advantages that are supposed to be necessary for their future well-being.

⁂

On Selling Coal

Count that day lost
Whose low descending sun
Sees coal sold at a loss
And business done for fun.

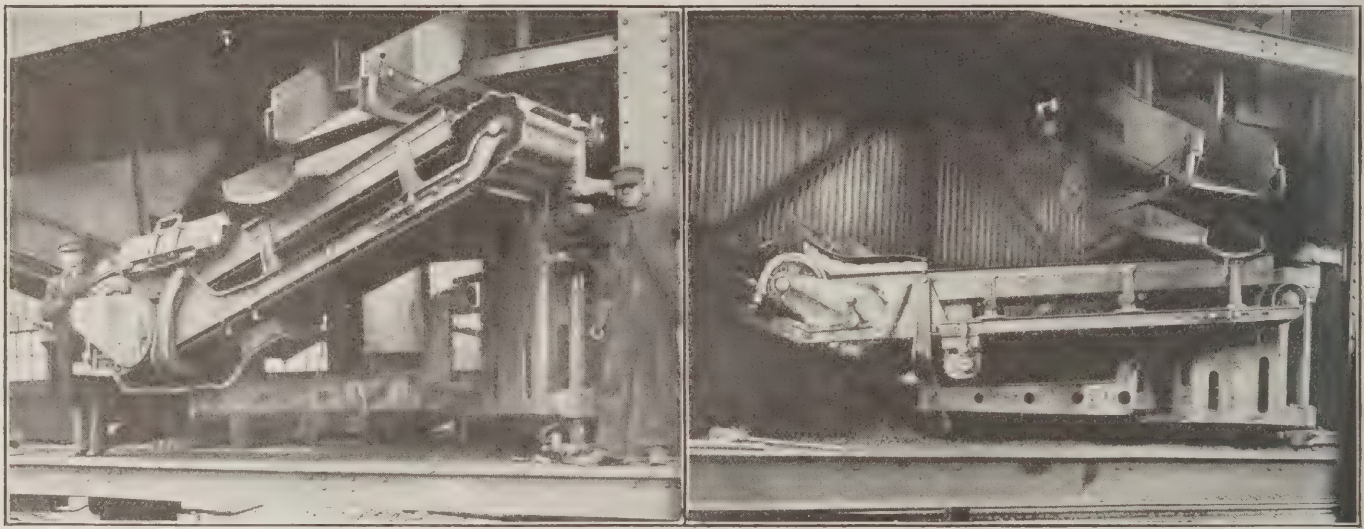
A Successful Box-Car Loader

Successful devices for loading coal into box-cars without breakage have been slow in development. Coal was first loaded into this type of car by hand with shovels, and the first machine devised for this purpose attempted to duplicate hand work. Improvements were introduced from time to time, the constant trend of which was in the line of a conveyor which would deposit the coal gently instead of throwing it into place.

The general type of loader of which this article treats is a conveyor. The idea was first applied in the loading of coke, the product being carried on a rubber belt. This conveyor was supported on hinged arms, which allowed it to be pushed well into the box-car. Operated electrically, it took 66 per cent. of the coke or coal from the chute, carried it on a belt to its resting place and allowed it only a short drop. The remainder of the material was tossed a short distance so as to roll off the pile into the end of the car. This was the basic idea of the original Manierre box-car loader, and has been retained in succeeding machines.



Steel-Apron and Belt Manierre Box-Car Loaders on Dock of the Berwind Fuel Co., Superior, Wis.

In July, 1914, the Berwind Fuel Co., at Superior, Wis., was having trouble loading coal into box-cars. It was believed that the most modern equipment obtainable was being employed. Three different makes of loaders of the throwing type for lump coal and a Manierre belt loader for sized fuel were being employed. Each was the latest product of its respective company. But the lump coal gave trouble, the big pieces falling apart when thrown against the ends of the box-car. Complaints had been numerous the previous winter and were already beginning to trickle in on the new season.

Then came George Manierre with his new loader, built to convey lump coal rather than throw it. This particular machine had a steel apron and was designed especially for large-sized fuel. The Berwind people were skeptical. They considered that a new type of loader was merely another means of breaking coal. But the Manierre machine which they then had in use worked fairly satisfactorily on coke and sized fuel, but for lump coal was not altogether desirable.

Mr. Manierre had, however, installed several steel-apron loaders and knew what they would do. The dock manager was interested, but felt that the new type of conveyor was still in the experimental stage, and he did not care, as he stated, to engage in costly experiments. It was suggested that steel-apron loaders already in use be inspected; and since the belt loader was admirably performing the work for which it was designed, the steel-apron machine seemed to deserve the courtesy of this inspection.

Mr. Manierre then proposed to write a guarantee on the performance of his machine, as he had confidence in it and the work which it would perform. The inspection of steel loaders in operation followed immediately, and as a result a steel-apron box-car loader designed to handle lump coal was installed. At the present time this loader is satisfactorily performing the work which up to its installation had been accomplished only imperfectly. Lump coal is now delivered to the cars as lump, not slack.

⁂

It is better to be a success as a coal miner than a failure as a schoolmaster. In the one case you are adding to the world's goods; in the other you are likely to be misguiding the rising generation.

⁂

The Man Who Wins

By Harry N. Taylor*

The old-time mine manager or pitboss, with his hit-and-miss methods, is a thing of the past. With the swing of the pendulum, the mining engineer depending entirely on theory and technical practice has had his inning and has passed into the discard. The man who has attained his knowledge by long training has taken the places once filled by the promoted coal-digger and the ultra-technical office engineer.

The really successful mine manager of today is a combination of the two. He must be a hard-working, practical underground man, with enough education along technical lines so that he can apply both theory and practical knowledge to his daily work. Such a man gets results. When a man can be found who can add to these two most necessary qualifications horse sense and an ability to deal with his men fairly but firmly, he is sure to make his mark and attain full and lasting success.

---

*Vice-president, Central Coal & Coke Co., Kansas City, Mo.

Such men are sought far and wide in the coal-mining industry and will always be first choice when the management of any large operation is in want of a mine manager. Being successful, their positions are always secure. Success attained by methods approved by all men is success worth while and will bring a far greater reward than success (so called) when the method of attainment is questionable. Hard work, good education, common sense, loyalty and firmness all point the way to the goal.

*

Economical Pipe Covering

The success here recorded is not by any means new. That, perhaps, is in its favor rather than the reverse, for in the 13 years intervening there has been time to show whether the success was temporary or permanent. In that length of time the ownership of the colliery has changed, but the pipe and its covering still continue their work. The covering was placed by the Parrish Coal Co., of Plymouth, Penn., but the mine is now owned by the Lehigh & Wilkes-Barre Coal Co.

The steam line to be covered was 14 in. in diameter and 1600 ft. long. The immediate coat placed over the pipe was J.-M. Asbestos-Sponge felted sectional pipe covering wrapped with wire, then a layer of rosin sized paper wrapped with twine, and another layer of hair felt 1-in. thick and also wrapped with twine. Over this was a layer of rosin sized paper held in place by twine and over all a jacket of asbestos roofing wrapped with galvanized wire.

Showing Covered Pipes at a Colliery of the Lehigh & Wilkes-Barre Coal Co., Plymouth, Penn.

According to tests made in the anthracite coal fields, it has been determined that an uncovered 14-in. steam line carrying live steam at 100-lb. pressure would waste 0.54 lb. of boiler fuel for every linear foot per hour. This waste of fuel would in a year amount to 3784 tons, and in the 13 yr. would total to no less than 49,192 tons. It is estimated that 91 per cent. of the loss is avoided by the use of this covering. Thus 344 tons of coal were saved every year, or 44,765 tons in the whole life of the coating to the present date.

Nearly a Cent and a Half per Ton Mined Saved by Pipe Covering

Thus calculated, the losses of inefficiently or uncovered steam lines are made quite clear, but yet there are coal-mine managers who apparently cannot see them. The plant of the Elkins Coal & Coke Co., at Bretz, W. Va., near Morgantown, used in December and January 4.4c. worth of fuel per ton of coal mined. On Feb. 1 the pipes were covered with Asbestos-Sponge felted pipe covering, and the manager, J. B. Hanford, states that the cost in the two months following was 3.1c. per ton of coal produced. The gain in that length of time was $307.20. As the total cost of the covering was about $800, it is clear that it will pay for itself in the first six months.

At the plant of the Phoenix Electric Co., in Butte, Mont., this same covering has been in use on 3500 ft. of pipe for five years in the steam tunnels. According to James E. Davidson, the superintendent, the condensation meters on these mains show approximately 11 per cent. less condensation per square foot of radiation surface than where the coating is 85 per cent. magnesia. The coverings mentioned are manufactured by the H. W. Johns-Manville Co., of New York City.

Saving in Kerf and in Blacksmithing Labor

In sections of the country where timber stumpage was cheap the circular saw had its great advantage in lumbering, but the band-saw is fast driving it out of use because the kerf of such a saw is far thinner and the saving of timber in cutting a stick into planks by such an economical machine is considerable. Sawdust is an unsalable product, and in fact in many cases it actually takes power and costs money to burn it. As soon as the surrounding country becomes populated it is no longer permissible to wash the sawdust into the streams. As a result the wide kerf-making circular saw has been largely driven from the mill.

Similarly the wide-awake colliery manager is striving to reduce the kerf in coal mining, not perhaps so much to save valuable coal as to avoid paying for mining, hauling and handling a fuel for which the market is not willing to pay a fair price. The ideal of the mine manager is to get all lump coal, just as the ideal of the saw-mill owner is to convert his standing timber into planks, boards or veneers without any unnecessary loss.

It was to gain this end that the Wasson Coal Co., at Wasson, Salem County, Ill., installed chains which made a kerf of 3½ in. instead of 4½ in., thus reducing by 22 per cent. the "bug-dust" made by the machine cutting and lowering the current used per machine from 60 to 39 amperes, or about 40 per cent. Concurrently the strain on the machine was reduced, more coal was cut and less bits used.

The cutterhead used in connection with this chain is one having all wearing parts renewable, and grease lubrication for idle sprockets is supplied by a compression cup built into the stud.

The problem solved at Kincaid, Ill., by the Peabody Coal Co. was the rapid sharpening of bits for 20 electric chain mining machines. To keep such a large number of machines in sharp bits required two power hammers and four men, and even then they had difficulty in keeping up with the work. So the Peabody Coal Co. installed a Morris automatic bit machine for test. The other mines of the company have now been equipped with these machines. The result has been uniformity in the bits, greater capacity, reduced necessity for repair of mining machines, less consumption of power, fewer bits to sharpen and reduction in the cost of sharpening.

The reduction in slack, increased speed of cutting and decreased use of power foreshadow changes in our present methods of working if slack coal continues to be a drug on the market. The chains and bit machine described were supplied by the Lott Mine Equipment Co., of 538 South Clark St., Chicago, Ill.

Successfully Draining a Flooded Mine

By J. J. O'Connell*

SYNOPSIS—Through the bursting of a canal the lower levels of a mine were flooded. New steam pumps were procured and after three months of continuous operation the submerged workings were recovered.

In many coal regions the pumping problem is an ever present one, the successful solution of which requires much skill and the selection of capable equipment.

A pump to successfully cope with the severe conditions encountered in coal mining must be simple, compact, rugged, and sufficiently heavy to stand considerable rough handling and also meet emergencies demanding excess capacity. Water enters the mine from all sides. So long as its flow is uniform or nearly so, the pump can usually eject it and keep the mine in good working condition, but there is always the danger of drowning out the workings by a sudden flood from some unforeseen source.

Just such an accident as this occurred in the coal mine of the G. B. Markle Co. at Jeddo, Penn. This firm operates several mines covering a considerable area in the neighborhood of Hazleton. A number of widely separated shafts are connected on the surface by steam railroads.

About 3 o'clock one December morning several years ago, the night pump man at Mine No. 5 noticed an unusually large volume of water rushing into the tunnel a short distance from where he stood. By hurrying out of the mine he narrowly escaped with his life.

An investigation showed that this sudden influx of water was caused by a break in a canal on the side of a hill above the mine. The escaping water had forced its way through a manway down to the lowest level of the mine about 500 ft. below the surface. As quickly as possible the steam pumps on the upper level were put to work and efforts made to check the flood. It had gained considerable headway, however, and in a comparatively short time the entire lower level with all the machinery and equipment was completely submerged, and it was promptly decided that in view of the seriousness of the situation more pumps of larger capacity should be installed at once.

John Markle hurried to New York, and had a conference with the engineering staff of the A. S. Cameron Steam Pump Works, he knowing from past experience that the Cameron pump in emergencies was capable of working far in excess of its rated capacity for a considerable length of time, even when submerged with water. He accordingly ordered two of the largest steam pumps in stock, a 20x12x20-in. piston pump, with a normal capacity of 42,000 gal. per hour, and a 22x14x20 piston pump, with a capacity of 48,000 gal. per hour. In the course of a few hours these pumps were on their way to Jeddo by express. They were installed immediately.

In the meantime the steam pumps on the upper level were kept operating 24 hr. per day. So great was the influx of water, however, that even when the larger pumps had been installed, it required six weeks of pumping with the entire equipment to force the water low enough to permit of the installation of the large Cameron steam pumps nearer to the lower level. Then it required another six weeks to recover the pumps and equipment installed in the flooded level. These pumps, after they had been cleaned and oiled, started up promptly and worked as well as ever, even though they had long been submerged owing to the break in the canal.

The foregoing can give but a slight conception of the tremendous work involved in recovering this mine. Some idea of the enormous quantity of water that had to be pumped may be gained from the fact that the two large Cameron pumps mentioned above had a combined normal capacity of 2,160,000 gal. per day. It required the constant operation of these two pumps and a number of others for three months to reduce the level of the water to a point where operations could be resumed.

This was an unusually difficult pumping problem, and in no small measure its successful solution may be ascribed to the remarkable performance of the pumps employed. In spite of the severe service conditions then encountered, these pumps have been operated more or less continuously for the last 14 years in the various mines of the Markle company. They are now installed in mine No. 6 and are giving good service.

⁂

The U. S. Geological Survey

By George Otis Smith*

Success finds its best expression in the wonderful growth of the coal industry in this country. Yet those annual increments, measured by tens of millions of tons, have been only the aggregate of small increases in output countrywide in distribution. In a similar fashion, any success the U. S. Geological Survey may claim in service rendered the coal-mining industry must be simply the sum of several items extended over three decades.

---

*A. S. Cameron Steam Pump Works.

*Director, U. S. Geol. Survey, Washington, D. C.

First of all, our knowledge of the nation's fuel resources is naturally largely the work of federal geologists. When in May, 1908, President Roosevelt assembled the first National Conference on the Conservation of National Resources, a national coal inventory was submitted by the U. S. Geological Survey. Between the issuance of the call late in December, 1907, and the time of the meeting, these estimates of the coal resources of the United States were prepared by M. R. Campbell, and a map of the coal fields of the United States engraved ready for distribution. For the Twelfth International Geological Congress, which met at Toronto in 1913, the estimates were revised and the map redrawn. In the later report, published in the "Coal Resources of the World," the estimates are increased by 1,289,300 millions of tons for the coals below the bituminous rank, and by 342,000 millions of tons for the bituminous and semibituminous ranks, the aggregate being an increase of 1,631,300 millions of tons. These increases largely represent the added knowledge due to five years' intensive field surveys in the West.

The field methods developed by this Survey in the course of its examinations of undeveloped coal regions are now adopted by mining geologists for such surveys in different parts of the world. The Geological Survey was, I believe, the first to use the contour method for showing the underground topography of coal beds and to publish convergence sheets for use in determining the depth of beds diverging at a low angle to the exposed strata.

Since 1902 this field service has surveyed all the accessible coal fields in Alaska, has examined the high-grade Matanuska and Bering River fields, has outlined the coal-bearing areas and the attitude of the beds and has determined the physical and chemical characters of the coals so far as the exposures permitted.

The greatest body of standardized analytical data accompanied by efficiency determinations, and the results of coking, briquetting tests, etc. ever built up by any governmental or other organization to show the qualities of the coals of a country was begun by this survey, whose Technologic Branch was later reorganized by Congress as the Bureau of Mines.

The statistical work of the Division of Mineral Resources, which was inaugurated in 1882, has been conspicuously successful. In presenting the annual statistics of the production of coal and coke, the Survey has not only accurately recorded the progress of these industries, but has kept the public informed of trade conditions and the influences which have affected prosperity or depression. The value of the Survey's statistical reports to the trade has been recognized, not only by the various industries at home, but also by foreign students of economy, who have testified to the superiority of the statistical work of the U. S. Geological Survey.

Watching the Bank Account Grow Fat.

SAID THE MINER, "I've worked as a
fellow should,
And honestly labored for livelihood;
I've toiled deep down like a human mole
And mined my share of the good black coal;
In working hours I have kept awake
And taken no chances I shouldn't take;
I've seen my duty and done it—pat—
And I guess I've made a success of that.

"I married a girl who was square and true
(And that was a sensible thing to do),
For she's made our cottage a cozy nest
And borne me five of the finest, best
And sturdiest youngsters you'll ever see,
And so, as the head of a family,
I feel some natural pride thereat—
And I guess I've made a success of that.

"I never was strong for the doubtful joys
Of batting around with the other boys
And coming home drunk with my cash all spent
That should have been kept for the grub and rent.
No, I've tried instead to put away
A pretty good share of my hard-earned pay,
And—watching the bank account grow fat—
I guess I've made a success of that.

"I'm doing my labor the best I know,
And I may be a boss in a year or so,
And I'm happy at home with the kids and wife
And playing my part in the game of life,
For I've got my health and a bit put by
And I look at the world with a fearless eye.
So, thinking it over the best I can—
I guess I'm a pretty successful man!"

Waste Coal Disposal by Means of an Aerial Tramway

At the mine of the Montana Coal & Iron Co., Washoe, Mont., it is necessary to dispose of many tons of waste daily. This waste is really fine coal, for which there is no market in that locality. As within a short time this slack catches fire from spontaneous combustion, it is necessary to dump it somewhere where it will cause no damage to property. Until a few years ago, it was loaded into railroad cars and dumped at a convenient siding. This was quite expensive, and the company began to look around for a more economical method of disposing this material.

After considerable investigation, an aërial tramway was installed. This is of the two-bucket or "jig-back" type, and was built by the Broderick & Bascom Rope Co., of St. Louis, Mo. The tramway is 1200 ft. long, spanning a gulch to a high point on an adjacent hill. The maximum dumping space is thus secured. The capacity is 25 tons per hour.

The buckets have a capacity of 40 cu.ft. and are self-dumping and self-locking. They are propelled by means of a 5/8-in. endless rope, making two half laps around rubber-lined driving sheaves. A 15-hp. motor furnishes the power required. Only one attendant located at the loading station and controlling the gates for filling the buckets as well as the power to and speed of the line is required. Dumping is accomplished by means of aërial trips fastened to the track cables. These may be moved from time to time as may be desirable. This tramway has been in successful operation for several years, and has proved an economical solution of the waste-disposal problem.

Money and Position Are Not Always Success

By George N. Lantz*

There was a man who had the faculty for making money. Midas-like, whatever he touched turned to gold. His wealth increased with every effort, every investment. He was very rich and possessed all the money he desired, but the man knew he was a failure.

After a time he decided that he would spend his money for things that could be seen and known. He bought property; he bought fine houses, and in them he placed beautiful furniture, pictures, tapestries, sculpture. He endowed schools and colleges, and he became known as a liberal man. But all the time he knew he was a failure.

Partly because he was wealthy, partly because he was young and handsome, and partly because he was educated and refined, the man became an idol of society. The doors of the most exclusive homes were opened to him; he joined clubs, was found at parties and at dinners. He was very popular, but he knew he was a failure.

One day he sat down and took a careful inventory of himself. He said: "I have money, property, position, yet I do not measure up to my own idea of success. Some men possess all these, and yet are successful. Other men are successful, and possess none of them. Why am I a failure?"

"Because," he answered himself, "I have forgotten that self-preservation is class-preservation; that self-success is class-success. I have forgotten that when my gain means another's loss we both lose, and that when my gain means another's gain we both gain. Every man can be successful if he helps others to succeed; no man can be successful at another's expense."

"Then," said he, "I will follow this rule: I will acquire nothing tangible at the expense of my fellowman."

The man is now a success.

---

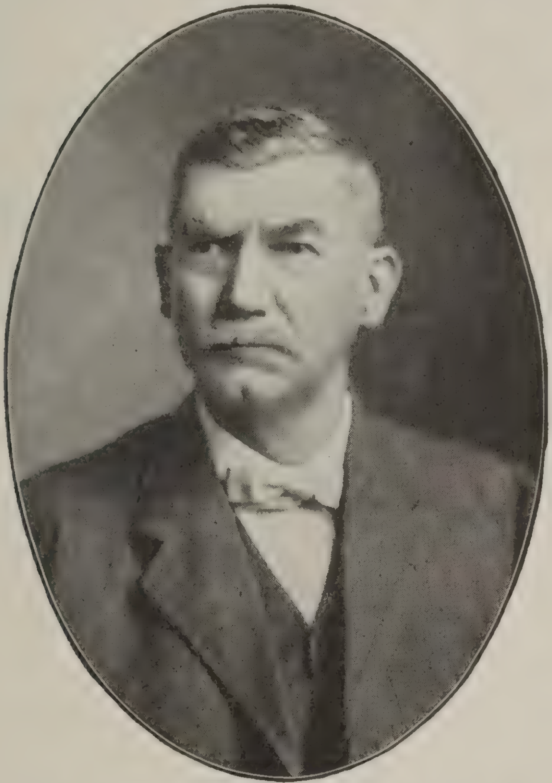
*New Straightsville, Ohio.

P. J. Rogers

It is an axiom of business that the man who is able to manage his own affairs well will be successful in directing and handling the affairs of others. Such men are always in demand and generally at the helm.

Down in Alabama the coal-mining business has produced a good many men of this type. Recognized among the foremost of these for his ability and sterling worth is P. J. Rogers, of Ensley, at present associate superintendent of the Wylam Division of Coal Mines for the Tennessee Coal, Iron & R.R. Co.

Mr. Rogers is one of the few men whose service with the Tennessee company is as old as the company itself, so far as its operations in Alabama are concerned. Born in Elmore County, Alabama, Nov. 22, 1856, his entry into the mining industry began in 1878, when he entered the employ of the Eureka Mining Co. at its coal-mining plant near Helena, Ala. This concern, by the way, at one time owned and operated the old Oxmoor Furnaces, near Birmingham, famous in the industrial history of Alabama. Fortunately for the mining industry Mr. Rogers stuck to this end of the business, and in 1882 transferred his allegiance to the Pratt Coal & Iron Co., then developing the famous Pratt seam near Pratt City, Ala. About that time the Pratt company began the leasing of convicts from the state for the operation of one or two of its new mines, and Mr. Rogers was made warden and given the management of these people.



P. J. Rogers of the T. C., I. & R.R. Co.

In 1886, the Tennessee Coal, Iron & R.R. Co. entering Alabama and acquiring the ownership of several companies in the district, among them the Pratt Coal & Iron Co., assumed charge of Pratt mines. The plan of leasing convicts being continued, Mr. Rogers was made manager of prisons. From that time until 1912, when the company voluntarily relinquished the employment of convicts, he remained in charge of this department, handling it so successfully as to earn the distinction of being the best posted man in Alabama on convict affairs. To him is due the credit for inaugurating the task system adopted by the State Convict Board early in his régime, by which the men were classified according to physical ability, and the amount of work or number of tons the various classes were required to mine was fixed.

The wisdom of his judgment in fixing the task on a correct basis has been fully demonstrated by the fact that this has never been changed or deemed excessive and remains the standard to this day. Mr. Rogers' opinion on convict matters was always sought by the state officials. It is a high testimonial to his successful administration of this department that the working and welfare of convicts on the part of the Tennessee company were always considered a model for other concerns in the same business. In other words, his management of this difficult task stood every test for a period of over 25 years.

In November, 1895, Mr. Rogers was appointed superintendent of the Pratt Mines Division, embracing 8 or 10 mines and several coke-oven plants and coal washeries. In this position he succeeded Erskine Ramsay, who became at that time chief engineer and assistant general manager for the Tennessee company. With the exception of a few minor changes in the division arrangement and name, Mr. Rogers has remained in charge of that department until the present time.

During the period covered by his service with the company, Mr. Rogers passed through several changes in management as the result of various interests assuming control of the old Tennessee Coal, Iron & R.R. Co., which, prior to its purchase by the Steel Corporation in 1908, was known as the "Football of Wall Street." Without doubt it could be said in absolute truth that in all these changes no executive head ever thought of trying to do without "P. J.," as he became known to his more intimate associates, for he was so quietly and unobtrusively successful in performing his work, and his solid reputation for character and integrity made him virtually indispensable to the enterprises with which he was connected.

Two dominant factors have contributed to his success—character and hard work. As for work, it was often said of him that he could nearly always be found on the job before starting and after quitting time. His character is of the cast-iron kind, solid and enduring. In his long service he has formed the acquaintance of thousands of individual mine workers, many of whom in the past have been out on strikes, but all of these men are now nevertheless his loyal friends and supporters.

He has always taken an active interest in public affairs, having served at one time as alderman of the Greater City of Birmingham. He is the kind of a man whose word is absolutely as good as his bond, and his bond would be worth a good deal, for as we said in the beginning, he has managed his own affairs as well as he has those of his employers. Such men are always in demand and will always be a definition of Success.

*

Hate never made a success of anything but war—and that is a kind of success of which the world is growing very weary.

Some Successes in Rock Drilling

By Charles C. Phelps

SYNOPSIS—The Jackhamer drill is of recent introduction in the coal-mining industry; but as it had been serving a long apprenticeship in metal mines, it proved its adaptability to coal-mine work without any further change, and its adoption as an adjunct to colliery work is rapidly spreading.

Three years ago the Jackhamer was unknown to the American coal miner. Today thousands of these little tools are in use in all branches of the coal industry—development work, shaft-sinking, stripping, driving gangways and cutting out seams of coal. They are also performing a multitude of other operations requiring the drilling of rock or coal. In this brief interval the Jackhamer has established for itself an enviable reputation in both the anthracite and bituminous fields as a mining tool of exceptional utility and efficiency.

Houston Collieries Co.'s Shaft at Carswell, W. Va.

It is probable that the miner first came to appreciate the value of the Jackhamer in connection with shaft-sinking. Some of its best records have been made in work of this character, and it is now looked upon as almost a necessity for this purpose. It works close up to the walls, keeping the shaft true to the required dimensions. It starts to operate without delay, whereas, in a crowded shaft, the mounted type of drill probably requires as much time to set up and adjust as is needed for the actual cutting. The steady rotation of the steel, the rapid blows on the drill and the constant blowing of the exhaust through the hollow steel, which keeps the drill hole free of cuttings, all tend to produce rapid penetration and to avoid troublesome delays.

Sunk 61 Feet of Shaft in 17 Days

The records of performance best illustrate the successful achievements of the Jackhamer. A few typical cases follow. At the Bellevue Mines of the Delaware, Lackawanna & Western R.R. Co. coal department, Mike Hoban, a contractor, sunk 61 ft. of shaft of dimensions 12x14 ft. in hard sandstone rock in 17 days, working three 8-hr. shifts daily and using only one Jackhamer. This machine was in almost continuous operation, averaging 280 ft. of hole drilled per shift.

Dolan Bros. recently sunk a shaft 15x16 ft. at the mine of the Lytle Coal Co., near Minersville, employing two Jackhamers for that purpose. In four months' time, working through ground varying from very hard material to slate, they sunk 359 ft. of completed shaft, including timbering. There were three 8-hr. shifts per day and six days' work per week. These contractors say: "We have sunk many shafts of this approximate size with mounted piston drills, but never made the progress we have made in this one." The progress in the case cited figures to about 90 ft. per month. Their best previous record, using other types of drills, was about 61 ft. per month. They evidently entertain hopes of exceeding even this figure, for they state further: "If we had installed a sharpener at this job when we started it, instead of sharpening by hand, we believe we would have exceeded this footage."

Shaft Completed in Three Months and One Week

Another interesting report is from Walter F. Patterson, Jr., of Pittsburgh, Penn. He sunk a shaft at the Houston Collieries Co.'s operation at Carswell, W. Va. The size of the shaft for the first 18 ft. was 30 ft. 4 in. by 22 ft. 4 in. Below that level it narrowed to 24 ft. 4 in. by 16 ft. 4 in., and continued with those dimensions till it reached the bottom at 253 ft. The monthly progress was as follows:

March, 1914	96 ft. excavation, 58 ft. timbering
April, 1914	86 ft. excavation, 53 ft. timbering, 1 water ring
May, 1914	54 ft. excavation, 109 ft. timbering, 1 water ring, 270 cu.yd. concrete
June (8 days), 1914	17 ft. excavation, 33 ft. timbering, 4 strings, guides, brattice and stairs

Three Jackhamers were employed per shift on an average. The weekly average was 18 ft. of completed shaft.

In Stripping Work Steam Can Be Used as Furnished by Shovel

In all of the work previously referred to, the Jackhamers were operated by compressed air. They work almost equally as well on steam. This feature is particularly desirable in coal stripping, as the Jackhamers can be run by steam furnished by the steam shovel used in stripping. During some observations on the use of steam-operated Jackhamers for coal stripping in Kansas the operator drilled 14 one-foot holes in the sandstone cap rock in 20 min. In the coal bed, which is 4 ft. thick, several 4-ft.

blast holes were drilled, the average time for completion being 3 min. each, whereas it required an average of 20 to 30 min. to accomplish the same result by hand. The exhaust steam kept the hole as clean of cuttings as if compressed air had been employed.

USING THE HAMMER DRILL IN AN ELECTRICALLY OPERATED MINE

The development of the electrically driven mine-car compressor has greatly broadened the field of usefulness of pneumatic coal-mining machines for underground operations and this applies especially to the Jackhamer. The mine-car compressor was described somewhat at length in the Dec. 12, 1914, issue of COAL AGE.

DRIVING GANGWAY WITH JACKHAMER DRILL, HOLLENBACH COLLIERY, L. & W.-B. C. CO.

Several other electrically equipped mines are adopting the same method for drilling blast holes in both rock and coal. It is a simple matter to move such units from place to place in a mine wherever they may be needed. They are run over the regular mine tracks, derailed wherever desired and placed to one side. It is a simple matter to connect them up electrically, and they require little attention to operate, being self-regulating, self-lubricating and having a hopper type of water-jacket that requires refilling only at intervals of several hours. The compressed air leaves the compressor in a somewhat heated state, which is a source of economy and avoids all necessity for a reheater.

SERVES WELL FOR DRILLING COAL

There is scarcely a substance known that the Jackhamer will not penetrate with ease—from the hardest granite to the softest coal. The same steel may be used for penetrating different materials, although larger-diameter steels are usually employed in drilling coal. "The Jackhamer is capable of drilling in either coal or rock, which makes it a much handier tool around a mine than the ordinary coal auger," writes W. B. Earnest, of Cordova, Ala., who has been using the Jackhamer in the Indian Head Mines.

He continues: "It is so far ahead of the coal auger as to make the odds ten to one. In using this Jackhamer drill you do not know when you strike a sulphur ball, whereas with the coal augers you readily know it, as you will have to replace your auger because the points break when the sulphur ball is encountered." In boring coal for blasting Mr. Earnest uses a 6-ft. steel with a bit of large diameter and runs it straight in without changing steels and without any support for the Jackhamer other than the hands of the operator.

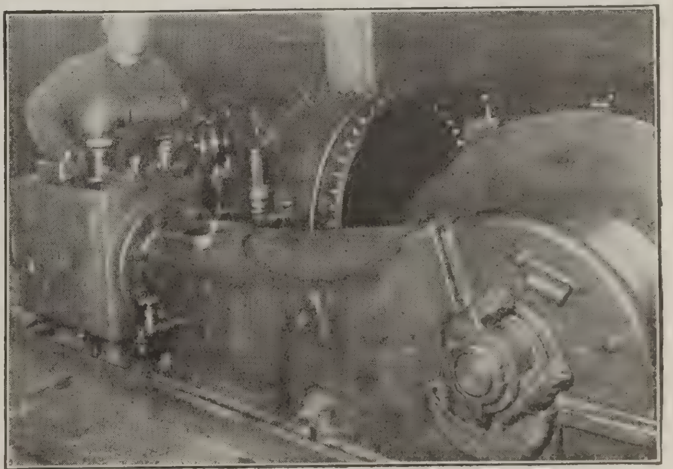
TWO FEET OF HOLE PER MINUTE IN HARD COAL

In the St. Clair Division of the Philadelphia & Reading Coal & Iron Co. the Jackhamer was observed to drill very hard coal at the rate of 2 ft. of 2-in. hole per minute, using twisted steel and a $1\frac{3}{4}$-in. sheep-nose bit. This type of bit worked without raising any dust, which was particularly appreciated by the drill runners.

In telling of its experiences with the Jackhamer the Rex Coal Co., of Kitts, Ky., states: "We have a hard sandstone top and with this drill we can put up a 6-ft. hole in from 15 to 18 min. Before we got this drill we were paying $4 per yard for entry work; now we pay $1.75 and drill the rock, which makes a total cost of less than $2 per yard. The Jackhamer is the finest thing we have ever seen in the way of a drill. One man operates it and doesn't use any support for it at all."

DRILLS WITHOUT MOUNTING

The few cases cited in the foregoing paragraphs will enable one to appreciate the reasons for the success which the Jackhamer has achieved in coal mining. The ordinary mounted drill would be quite out of the question for drilling blast holes in coal, for more time would be wasted in setting it up than in drilling. The Jackhamer, on the contrary, can be kept cutting nearly one hundred per cent. of the time if desired. For the same reason it has supplanted the mounted type of drill for cutting rock and is used for this purpose in many coal mines.



AN INGERSOLL-ROGLER ELECTRICALLY DRIVEN COMPRESSOR

It strikes many hundred blows per minute, which is the principal reason for its great cutting speed. It is a popular tool with the miners not only because it enables them to increase their production but also because it is an easy matter to manipulate it. Weighing only 40 lb., it is as easy to use in drilling a "flat" as in sinking a "down" hole; and in fact it is occasionally used for drilling "up" holes. The Jackhamer requires little physical effort on the part of the runner, as it is merely necessary to apply it to the desired spot and guide it as it cuts. The Jackhamer drill is manufactured by the Ingersoll-Rand Co., of New York City.

The Stonega Coal & Coke Co.'s Operations in Virginia

By Martin Prehn

SYNOPSIS—The story of a 20-year-old success. This is only another instance of the value of considerate treatment on the part of the company for its men.

The operations of the Stonega Coal & Coke Co. are mainly in Wise and Lee Counties, southwestern Virginia, and in Harlan County, eastern Kentucky, and include the communities of Stonega, Roda, Arno, Osaka, Imboden and Keeokee, in Virginia, and of Clover Fork, in Kentucky. Eighteen coal mines, with an average annual production of 5,000,000 tons, and four coking plants—at Stonega, Imboden, Osaka and Keeokee—the production of which is controlled to fit the market, are operated at these seven points and are in direct rail communication with the big coal centers via the Louisville & Nashville R.R., the Virginia & Southwestern Ry., the Norfolk & Western Ry. and the Carolina, Clinchfield & Ohio Ry.

This is one of the coal-mining companies that has given material form to the realization that the physical and social welfare of its employees may have a direct effect on its organization for good or evil. Embraced in this was the erection of attractive four-room dwellings for workmen. One of the photographs reveals the reasons for their popularity. They are neatly fenced in, with their complements of cow-barns, coalhouses and outhouses. The general welfare of each community is safeguarded by careful considerations of sanitation and water supply and through the establishment of schools and churches. The water service is handled directly by the coal company, and since every drop is pumped from deep wells there is little question as to its purity.

A modern, well-equipped hospital has also been erected, but on account of the general good health of the inhabitants its usefulness is confined almost entirely to unavoidable accident cases.

Welfare Work Pays

Can there be much doubt that the spirit of workmen and their families—their attitude toward their employers and company property—is elevated to a high level of loyalty when so much of the purely business side of the question of employment is transferred to the account of physical and mental wellbeing?

The value—the actual money value—of intelligent welfare work along such lines is demonstrated by the entire absence of strikes or other disaffection in the history of the Stonega Coal & Coke Co.

It requires a progressive spirit, an up-to-the-times organization, to foresee the great return that indirect investments of this nature are sure to create. And where this tendency is evident it generally extends to mechanical equipment also. Therefore, despite the 20 years of healthy existence that the Stonega company has enjoyed, the entire mechanical plant bears the stamp of modernity.

A Model Town of the Stonega Coal & Coke Co.

Coal is taken from two beds—the Taggart seam, which averages 6 ft. 6 in. in height, and the Imboden seam, which runs about 7 ft. Virtually all coal is undercut by electric mining machines before being "shot down," and is then moved to the mouth by electric gathering and main-line locomotives. It may be seen from the photograph of a room that the thick beds release a clean, lumpy product. This simplifies production immeasurably, and the larger part of the process resolves itself into a question of transportation. It follows then that the largest item of electrical expense is in haulage cost.

The progressive spirit of the Stonega company was attested recently by the announcement in the trade journals of the closing of a contract with the Electric Transmission Co., of Pocket, Va., for the supply of all electric current for every one of the 18 plants of the company. So drastic a change, fostered by a company whose farsightedness and engineering ability are widely known,

A Row of Miners' Houses

Loading Coal at Room Face

will arouse much general interest among mining men; and therefore one phase of economic management, which involves the consumption of much electrical energy, will probably prove especially interesting.

Experience, covering a period of many years, long ago led to an appreciation of the advantages of roller-bearing wheels for mine cars. Severe competitive tests revealed conclusively the economies obtainable with the best of such equipment. It was found that a given locomotive could haul a train equipped with roller-bearing wheels over a given piece of track in one-half the time and with half the power consumed in hauling an identical train equipped with plain bearing wheels. In addition thereto the enormous savings in lubricant effected by enforced economical lubrication and the fact that additions of fresh lubricant were found necessary only once or twice a year pointed toward operating economies of great magnitude from such wheels.

This naturally led to a series of competitive tests of a great variety of roller-bearing wheels, from among which the Enterprise wheel, of the Enterprise Foundry & Machine Co., of Bristol, Va.-Tenn., was finally chosen. That was three years ago. Since then all new cars, and old ones as fast as they went through the shops for repairs, were fitted with these wheels.

Other "home" activities that impress one with the progressiveness and initiative of this company are to be seen at every hand. A unique device designed and built in the company's shops enables one man at the tipples to run 2000 tons of coal through a rotary dump in 10 hours. A "barney-block" has been perfected for use on inclined planes which utilizes the same track as the mine cars—this is another evidence of intensively progressive and profitable use of equipment.

The coal produced by the Stonega Coal & Coke Co. is extensively known for its uniform heat value and freedom from excessive ash, and the coke made in its ovens—Wise County coke—is used in great quantities by foundries and furnaces in convenient rail communication with the company's mines.

This is the brief story of a 20-year-old coal-mining success; and the greatness of this success is attributed to progressiveness and fellow-feeling.

⁂

Water Hyacinth Briquettes

The director of the prison at Pnompenh, who has made a careful and thorough study of the subject, is authority for the statement that since April, 1911, the water hyacinth, which grows in such profusion in many streams as to seriously impede navigation, has been dried, compressed into briquettes, and used as fuel at Khartum and other points on the Upper Nile. These briquettes can be put on the market there at $6 (gold) per ton, and it is said that tests made on a steamer on the White Nile have demonstrated that their efficiency as a fuel is exactly equivalent to that of an equal amount of the best coal.

A View of Ovens and Coke Yard

⁂

There are plenty of recipes for success, but the only ones that are any good contain work as the principal ingredient.

⁂

In plastering a brattice or overcast use nine parts yellow clay and one part mule manure. Examination of the brattice months afterward will show that it is still moist and will not crack open.

A Real Success in the Pocahontas Field

By Flat Top Engineer

SYNOPSIS—The story of how modern ideas converted a positive mine failure into a successful operation. This case shows the beneficial effect of decent surroundings on the efficiency of company employees.

The line of demarcation between success and failure is often indiscernible. Sometimes it happens that the policy which, to everyone but the man who is behind it, looks as if it would precipitate the concern into a quagmire of bankruptcy and financial disgrace will, if carried to its logical conclusion, result in a colossal success.

I have observed many instances of this, but the one which has left upon my mind the most vivid impression occurred at a mine in the Pocahontas field.

For many years after the mines adjacent to this one had been shipping coal it stood untouched. Expert engineers had reported unfavorably concerning its development. The coal was low and dirty and the royalty high.

Finally an adventurous spirit, the success of whose sales agency had inspired him with the desire of conquering in the producing realms of mining, undertook its development. He visited all the nearby mines, took in the details of their general construction and layout and installed a plant true to the best traditions and practice, as he had gathered them from his tour of observation and from his advisory engineers.

In due time a satisfactory output was obtained, but here the mine vindicated the opinion of the examining engineers and refused to pay. The cost of production was high because of the thinness of the seam, and the price obtainable was low because of its dirty quality.

A Long Struggle

But the owner was game. For five years he devoted the profits of his sales agency to taking care of the deficit of the mine, which was accomplished with the assistance of an occasional mortgage on the property itself. But during the dull times of 1908 the sales agency, which had been hard hit by the panic of the preceding year, found itself unable longer to bear the financial burden of keeping the mine in operation, so it was sold to its creditors. They did not want it; but as it was the only tangible thing their money represented, they had to take it.

The man whom they appointed as manager was in many respects unusually well qualified for the position. He had a well-grounded knowledge of the technical details of both mining and plant construction, and—what was of vastly more importance—he had a thorough understanding of human nature and was a positive genius when it came to grasping the underlying elementary principles of a problem. If a man, a machine or a method did not function, he possessed to an unusually high degree the knack of divining just what was fundamentally wrong.

The purchasers of the mine had little or no confidence in the object of their purchase, but they had perfect confidence in the manager; so after he had studied the situation and asked for a large appropriation to be expended in improvements it was ungrudgingly granted. The first problem that he had to solve was to improve the quality of his product. This he did by the installation of a tipple and washer constructed along modern scientific lines, the first of its kind to be installed in the Pocahontas field. The product obtained set a new standard of excellence in Pocahontas coal and was such as to satisfy the demands of the most fastidious.

The first problem was solved; the second, and clearly the more difficult one, awaited his attention. This was the reduction of the cost figure.

Reducing the Mining Cost

As all mining men who have ever attempted it know, any change to more progressive methods is vigorously combated by adherents to the old order. This was especially true in the instance under discussion, but eventually in the face of bitter opposition from the miners the most uptodate electrical and mechanical equipment was installed throughout the mine. The pick was discarded for the mining machine, the mule was replaced with the electric gathering locomotive, and the trapper-boy abdicated in favor of the automatic door. Wherever it was possible for machinery to take the place of manual labor this was effected.

But this alone did not solve the problem. To have an efficient machine one must have an efficient man to operate it. How, then, must he attract to his plant, or develop and keep there as part of his permanent organization, men of good habits and sufficient intelligence to take care of and to operate on an efficient scale this large amount of machinery?

The personnel of his organization was at that time of as high an order as that of any of the neighboring operations, but this did not suffice. He realized, as did Henry Ford, that if one would excel in the production of an article he must have super-average producers, and here his knowledge of the fundamentals of human nature asserted itself. He knew that if given the same men the other fellow had, he could, with the aid of better living conditions, more generous treatment and more attractive surroundings, develop them into more efficient workmen.

With this in mind he set out to build a mining town so radically different from any of its neighbors and so entirely out of keeping with the building traditions of the Pocahontas field as to be a continual source of surprise and astonishment to the occasional visitor from other camps.

All of the buildings that had been previously erected were either torn down or remodeled; the building ground was laid out in broad streets and generously sized lots. Conveniently planned, neat-appearing and well-constructed houses were erected, well back from the street lines so as to afford a good sized front yard, which was grassed and set with ornamental trees and shrubs. In the rear of each house was a vegetable garden, usually 100x50 ft., the whole inclosed with a neat, substantial fence. Pure spring water was furnished to each dwelling, and poultry houses and cow stables were provided for the use of the tenants. Rent was reduced out of all proportion to the prices charged by neighboring operations, and prices in the company store were reduced to a competitive basis with independent merchants, and uniformly courteous treatment was accorded all customers.

The reader who may detect nothing unusual in these things must remember that this was some years ago; that it was in fact, though never advertised as such, pioneer welfare work in the Pocahontas coal fields. Other operations have been and are following rapidly in its lead. The reason they are doing so is because this instance has proved beyond a doubt that it pays good dividends in dollars and cents.

Yet there were those—and they were not in the minority—who held that the management was simply throwing good money after bad and that the result would be another forced sale. But time has demonstnated that each step was absolutely essential to the concern's financial success and that had the policy of improvement stopped short of its final perfection these pessimistic prophecies would have been fulfilled.

All this leads me back to my opening remark—that the difference between a successful and a ruinous policy is not always apparent to the onlooker, but that in this instance a judicious investment in human welfare spelled success.

Success in Rail Bonding

By G. H. Burge*

SYNOPSIS—Constant inconvenience and expense due to poorly bonded mine track led to the invention of a rail bond that required no drilling in the rail web, no pressing-in of terminals and no driving of pins.

Some four years ago, through the aid of a large electrical manufacturing company of Chicago, I secured a position as electrician with the Northern Central Coal Co., of Huntsville, Mo. At that time this firm was operating two mines, known as No. 2 and No. 12. These were about three-quarters of a mile apart and were supplied with power from the No. 2 Mine. Direct current was employed, this being furnished by one 250-kw. Ridgway generator and one Goodman 100-kw. generator.

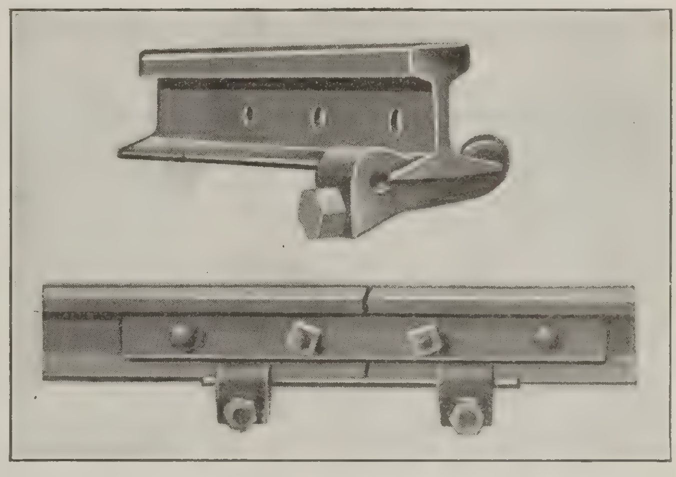
The grades in these mines were excessive, ranging from 1½ to 6 per cent., and not long after I went with this company it purchased a new combination rackrail locomotive in addition to the three 7-ton Goodman machines then employed.

The track in these mines was a fair specimen of mining practice, and the resistance of the track due to bad bonds caused an enormous current to pass through the motors, this being of course accompanied by a considerable drop in voltage.

On numerous occasions I have been called into the mine to a motor that had been stalled, and after going over the track and repairing the bonding or putting in new bonds succeeded in getting the motor to take its load to the shaft bottom. Almost every day motor troubles of one sort or another were experienced. These mostly took the form of burnouts of armatures, resistance coils or leads. I thought over the question of rail-bonding until I came to the conclusion that surely there should be some means of eliminating a part, and probably a large part, of the troubles to which we were subjected.

After considerable study I evolved what is now called the Economy rail bond shown in the accompanying illustration and had a few of these made up. Some of these bonds were put on the rails in wet localities and others where the road was dry. One was purposely attached to the track near the shaft bottom and so arranged that the whole amount of the current used in the mine had to pass through it on the return. These trial bonds proved so successful that I showed one of them to the general superintendent and told him of the results that they had attained. He examined it carefuly and assured me that it looked good, among its strongest points being the fact that no holes had to be drilled in the rail web and that scrap wire might be employed.

When motors were placed in No. 12 Mine the track was bonded with these bonds, a considerable number having been made up. The initial installation proved so successful that whenever the motor road was extended the bonding was done with Economy bonds, and they are today in use on over a mile of haulage road, giving excellent results and little trouble. They are inspected periodically about every four to five weeks.



The New Economy Rail Bond

Two years ago the track at No. 2 Mine was taken up and regraded, some of the low places being raised. It was relaid in part with new rail, all joints being bonded with Economy bonds. After this was done one motor was laid off, and the 100-kw. generator furnished abundant power where before it required the 250-kw. machine, which was then frequently overloaded.

As may be seen from the illustration, the Economy rail bond is extremely simple; since it requires no drilling of the rail and no pressing-in of terminals, it may be readily applied to either old or new track. The bonding element—which, as explained above, may be old or scrap copper wire—is down close to the base of the rail where it is out of the way of the wheel flanges and cannot be cut or otherwise injured even in case of derailment.

⁂

To carry hot babbitt metal in a mine, heat some small pieces of iron red-hot and drop them in the metal, which will keep it in a condition to pour for some time.

---

*Economy Rail Bond Co., Huntsville, Mo.

A Mine with a Haulage Schedule

By A. R. Anderson*

SYNOPSIS—In the mine of the Sterling Coal Co. the work of haulage is divided into gathering proper, trip making and main hauling, the first being performed by 2½-ton storage-battery locomotives and the other elements by trolley locomotives. To avoid delays the work has been carefully synchronized.

The fluctuating output from any one section of a mine makes it almost impossible to systematize the haulage of coal and the operation of locomotives so that a fixed time schedule may be even approached. Any variation from the old catch-as-catch-can basis of hauling coal is a departure from methods of long standing and a success of great interest.

The separation of coal mining into the several operations of undercutting, shooting and loading, uncertain elements such as water, faults, bad top, etc., the uncertainty of labor and a number of other like causes all militate against a definite labor schedule. Some of the more obvious causes have their source, however, in the fluctuating demand for coal. If the miners work steadily so that places can all be filled with men, if the miners know just when cars will be supplied some elements of fluctuation can certainly be eliminated.

Haulage System Usually Divided into Gathering and Main-Haulage Elements

The system of haulage generally adopted at the present time where the workings are at all extensive can be divided into two parts—the gathering and the main-haulage elements. For gathering, live stock or locomotives of the cable-reel, storage-battery or "crab" type may be employed and the main haulage may be afforded by rope or locomotives. To subdivide the haulage elements further than this has not often been attempted, because mining is not intensive enough as to territory or regular enough as to output to keep more elements than this working up to capacity. In other words added elements would generally mean additional apparatus and more idle time for both the apparatus and its attendants, because of the difficulty in establishing a schedule to which all the elements could conform as before stated.

However, it is obvious that, no matter how many elements are employed, if a system of haulage maintained according to a fixed schedule could be established, the efficiency and reliability of the operation of the mine would be raised to a much higher standard. In some cases it has been found possible to establish such a schedule and adhere closely to it.

In one notable case, which it is the purpose of this paper to describe, it was found advisable to employ, for reasons of economy and reliability, three elements in the haulage system, one element consisting of storage-battery locomotives which handle the cars in the rooms and hauls on the entry in front of the rooms only, the second element consisting of a trolley locomotive which handles the cars from their position in the entry in front of the rooms to a parting on the main entry and a third element consisting of a trolley locomotive which handles the cars between the parting and the tipple. This system is used in the mine of the Sterling Coal Co., Ltd., at Salineville, Ohio.

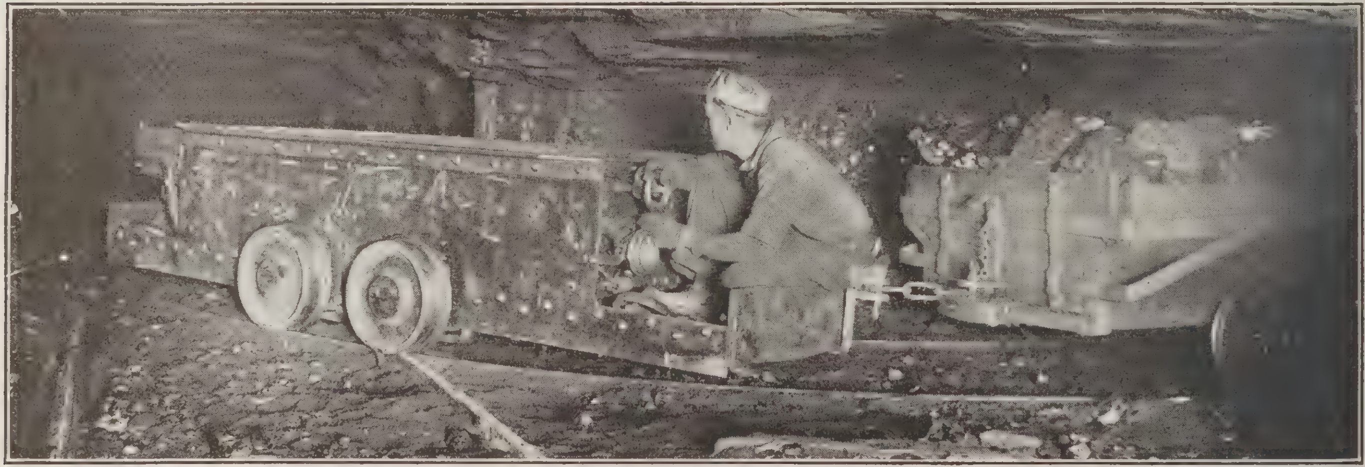


Fig. 1. Storage-Battery Locomotive Bringing Loaded Car Out of Room Neck

The establishment of a systematic haulage schedule at this mine is largely due to the efforts of E. B. McNichols, chief electrician, and the success with which this system has been operated gives it an eminence which cannot be overlooked. The plan of the mine consists of a main entry, off which are driven 11 butt headings and there are from 12 to 15 rooms worked on each butt heading.

Five Trolley Locomotives and Eleven Battery Locomotives

The haulage equipment in use consists of one 8-ton Jeffrey trolley locomotive for the main haul, two 3½-ton, one 4-ton, and one 4½-ton Jeffrey trolley locomotives for the butt-entry hauls, and eleven 2½-ton storage-battery gathering locomotives used for handling the cars in the rooms. One of these was built by the Atlas Car & Manufacturing Co., and ten by the Jeffrey Manufacturing Co. The main haulage locomotive handles 36 cars per trip, taking all the loads from, and placing all the empties at, a sidetrack along the main haul.

---

*Engineer with the Jeffrey Mfg. Co., Columbus, Ohio.

The butt-entry locomotives take the empties from the sidetrack in trains of 12 cars and deliver them to one of the 2½-ton storage-battery locomotives. Each butt-entry locomotive takes care of three butt entries.

Making Up a Butt-Entry Trip

When the butt-entry locomotive brings in a trip of 12 empties, this trip together with the 2½-ton storage-battery locomotive is pushed into a room. In the meantime the butt-entry locomotive makes into a train the 12 loaded cars which have been placed on the entry by the storage-battery locomotive. After the loaded trip is coupled up it is pulled down to the room where the empty trip and storage-battery locomotive are waiting and coupled onto them. The empty trip is then pulled with its battery locomotive out on the entry, after which the empty trip is uncoupled, the loaded trip taken to the parting by the butt-entry locomotive, and the storage-battery locomotive then proceeds to distribute the empty cars and push them to the face of the rooms.

The reason for pushing the empty trip into a room and pulling it out again with the trolley locomotive is to save the storage battery from handling the trip of empties while the trolley locomotive is on the entry. The twelve loads together with two other similar trips taken from two other butt entries are taken to the siding to make up a trip of 36 loads for the main-haulage locomotive.

The Schedule Adopted

With this system of haulage, a schedule is maintained approximately as follows: One entry produces 12 cars per hour. This means that the 2½-ton storage-battery locomotive in each hour places 12 empties at the face and takes 12 loads away to the entry leaving them just outside the room neck. When these loads have been placed on the entry, the butt-entry trolley locomotive comes along, leaves 12 empties and picks up the trip of 12 loads, taking it to the sidetrack.

This trolley locomotive comes into each butt entry once every hour, and inasmuch as it has three entries to take care of, there are 20 min. available for taking care of each entry. The main-haulage locomotive, handling 36 cars per trip, must make four round trips per hour, or a round trip every 15 minutes.

The average weight of coal loaded into each car is 2700 lb. and at a rate of production of 12 cars per hour per butt entry for 11 butt entries, the capacity of this haulage system is approximately 178 tons per hour. On this basis, the haulage capacity per day of eight hours, is 1424 tons.

Working Methods

This mine operates in what is known as the No. 7-A, or strip, bed, which has an average thickness of approximately 36 in. at this mine. The average grade in these workings does not exceed one per cent. and the maximum is less than four. The rooms are mined to a depth of 150 ft., spaced on 35-ft. centers and staggered on opposite sides of the butt entry. The distance between the first and last rooms worked does not generally exceed 250 ft.

These data give an idea of the conditions under which the 2½-ton storage-battery locomotives work, handling only one car at a time except when placing the empties. Then it is necessary to move the whole train of empties on the entry in front of the rooms until they are all placed.

The dimensions of the ten storage-battery locomotives built by the Jeffrey Manufacturing Co. are as follows: Track gage, 42 in.; overall width, 47½ in.; length over bumpers, 11 ft. 7 in.; overall height, 30 in.; wheel base, 24 in.; diameter of wheels, 16 in.

Description of Locomotives

The locomotives, one of which is illustrated in Fig. 1, have structural-steel frames and are designed for double-end control. The wheels are outside the frame, which is supported on spring journal boxes. Each locomotive has one motor designed to have a high efficiency for battery work, driving on one axle through a four-lead steel worm and a 34-tooth bronze worm wheel, housed to run in oil. A chain connects the axles. The locomotives are provided with swinging drawbars and band brakes on the armature shaft. The battery consists of 36 Type M. V. 9 Iron Clad Exide cells. A Sangamo ampere-hour meter, operating in conjunction with a shunt trip circuit breaker serves to open the circuit automatically upon completion of the charge.

At night one man takes care of the charging of all these locomotives. A simple charging panel with resistance coils mounted on the back is provided for each locomotive. On this, as seen in Fig. 2 which shows one of the storage-battery locomotives being charged, are mounted fuses, an underload circuit breaker and two switches which are used to vary the charging rate. Fig. 1 shows one of the storage-battery locomotives bringing a loaded car out of a room neck.

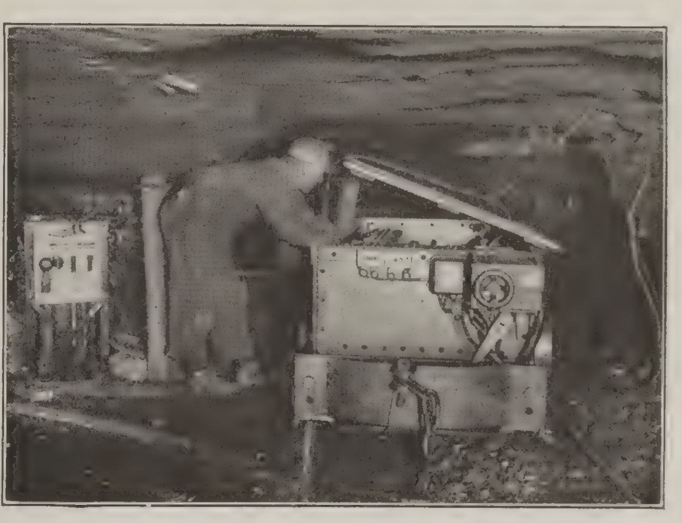

Fig. 2. Storage-Battery Locomotive Being Charged

Formerly Gathered Cars by Man Power

Prior to the installation of these locomotives the cars were handled in rooms by pushers, three being required on each butt entry. Now the motorman on the locomotive is the only man required to handle these cars. It is estimated that the saving thus effected will amount to approximately $15,000 per year.

Locomotives of this kind with an over-all height not to exceed 30 in. and a wheel base and over-all length not too great to interfere with its operation on small-radius curves, are necessarily limited to 42-in. gage and over. Any smaller gage would necessitate increasing the overall height of the locomotive in order to secure proper battery capacity.

Comparison in Favor of "Middleman" Haulage

In conclusion, a comparison between this three-element and a two-element haulage system which might be used in its place, may be of interest. The capacity of each storage-battery locomotive in an 8-hr. day under the present system is 96 cars. If these locomotives were eliminated and the butt-entry locomotives provided with cable reels, to enable them to go up into the rooms to place the empties and pull the loads, a cable-reel locomotive would be required on each entry. The cost of a storage-battery locomotive, such as is used here, and that of a cable-reel locomotive, such as would be required, are practically the same.

With the two-element system, then, only 11 locomotives would be required as compared with 15 under the present system, saving the installation of four locomotives representing an investment of approximately $7200. Assuming depreciation and interest at 25 per cent., this investment costs approximately $1800 per year. On the other hand, with cable-reel locomotives, two men would be required on each locomotive, or a total of 22 men for 11 locomotives.

With the present system, only one man is required on each storage-battery locomotive and two men on each butt-entry locomotive, making a total of 19 men. At $60 per month per man, the present system thus effects a saving of $2160 per year, which more than offsets the interest and depreciation on the added investment. To this should be added the freedom from cable trouble and expense, freedom from the expense of more carefully laid and bonded track in rooms and the possibility of operating on a smaller generator equipment. Thus the economic advantages of this three-element system become evident. No doubt there are many operations where this plan, which has proven its advantages and economy at this mine, can be applied with equal success.

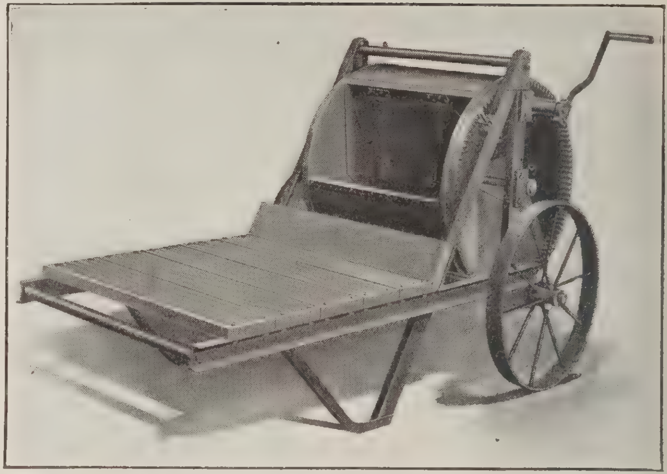
⁂

Concreting Underground

The Bunker Hill & Sullivan Mining & Concentrating Co., Stanley A. Easton manager, had about 3100 yd. of concrete to place 2100 ft. below ground and reached by the Kellogg Adit, which is 10,000 ft. long. This work consisted of a concrete lining for the ropeway over a station at the Kellogg shaft.

A job of this kind seemed to justify the purchase of a mixer. In fact, it seemed best to buy one driven by power as there was plenty of compressed air and electricity underground and there would be little difficulty in arranging for connections. But in buying machinery, it is always a mistake to look too closely at the job on hand, even though it may be the biggest to be attempted for a long time. In this case the power mixer would, however, be suitable for work in many places, for electricity and compressed air were available throughout the mine.

Portability of Power Mixers and Mixing Boards



Smith Portable Concrete Mixer

But a power mixer cannot be so easily moved about as a portable hand mixer, which, owing to its lightness, is available in steep as well as in flat places and where there are no roads as well as where the roads are good. The problem of how to get the power mixer into place would usually be a bigger matter for the mining force to solve than the concreting itself whenever a small job had to be performed.

Nor was it reasonable in the Kellogg Adit to plan to do without a mixer, because the work to be done was too large to be handled in that primitive manner. Besides it is hard to perform any kind of a concreting job in the mine by hand. The mixing board has to be made much too small for effective mixing. If used discontinuously it is likely to be always leaking, and even when constantly in service the continued strains of transportation have an equally bad effect on it. Moreover, a mixing board is not a readily portable piece of apparatus. In fact, hardly anything is more ungainly in a narrow and low place, and a mixer of a light pattern like that sold by the T. L. Smith Co., of Milwaukee, Wis., to the B. H. & S. M. & C. Co. is really

Concrete Work in an Idaho Mine

more portable than the outfit that would have to be hauled around the mine if the mixing was to be done by hand.

It is not necessary to emphasize the fact that machine mixing is more thorough than hand work whenever the work is not inspected, as must always be the case in the smaller jobs around the mine. There is no likelihood when a mixer is used that the work will be neglected because of its laboriousness.

Hand Mixer Available in Narrow Places

It was by reason of these advantages that the Smith mixer was purchased, and it mixed the concrete thoroughly and—what was more important in the cramped quarters available—it took up but little space and so made rapid work possible. For portability is not the only virtue needed in a machine when workmen have to perform their labors in narrow passageways. It is equally important to arrange matters so that it is possible to pass around the machine with the utmost facility.

The concrete work done by this Smith machine has stood for two years and has shown no sign of cracking or scaling, and the mixer is doing scattered jobs around the mines and is making money for the company. Had it been a power mixer it would probably have been idle from the time the big job was completed.

⁂

Electric Safety Lamps in Rescue Work

The success in the rescue work at the Mulga mines near Birmingham, Ala., on Oct. 5 of last year, was largely due to the opportune presence of electric safety lamps, which had been only temporarily installed in the mine by the Hirsch Electric Mine Lamp Co. for demonstration purposes. When the explosion occurred it extinguished the open lights and left the men to drift around helplessly in the dark. One old colored man in a heading just inby from the explosion was wearing an electric lamp, one of the eight installed for a demonstration of their value. He was able because he had an electric light to lead out the men in his entry, and also was successful in reaching the seat of the explosion and in bringing out four more men that could not have lived much longer in such air as they were breathing.

Superintendent, Foreman and Rescue Squad at Mulga Mine

The treatment of the lamps during the course of the rescue work, which lasted 60 hr., was not all that could be desired. They were used so as to get the best possible service for the time being rather than with any regard for their future use. Some were used continuously for 16 hr. without recharging, yet only one gave any trouble, and this apparently was tampered with.

Ira C. Dalrymple says that to the use of these lamps he attributes the speedy recovery from the mine of the dead and living persons. The rescuers, he says, were enabled by the lamps' aid to penetrate all portions of the disturbed area of the mine. There were about 300 men working at the time, and all but 17 escaped.

It is impossible to tell how many men lose their lives in an explosion from an inability to find their way out quickly owing to the extinguishment of their lamps. It must add much to the condition of panic and prevent the use of due judgment at a time when such judgment is most imperative. Provided the air contains sufficient oxygen, the lights can usually be reignited. Sometimes, however, the air is so foul that this is impossible; and in some cases this relighting is not safe, for the explosion may have disturbed several brattices, and the gas which collects may be the cause of another explosion. The electric safety lamp stays lit regardless of the pulsation of the air, and it cannot ignite gas even when the air is charged to the most effectual explosive percentage.

⁂

A Case of Inventive Ability

By William Crooks*

In the mining industry, as in all other branches of industrial activity, the man who possesses inventive power and energy is the one who succeeds.

I have in mind several successful mining men who have outdistanced their fellow-workmen and whose success came as a result of exercising originality in their daily work. One of these men, with whom I am personally acquainted and who is a mine superintendent, is forever trying out new schemes. Here are a few of his ideas that are now in practical use: The mine he has charge of has a shaft for hoisting purposes. The men enter the mine by means of a slope, sunk at an angle of 30 deg., through which most of the air enters the mine. The surface arrangements were so constructed that a large steam line passes near the mouth of the slope. This steam line is incased in a concrete culvert, the top of which is level with the surface.

This superintendent conceived the idea of connecting the steam culvert with the intake of the slope. He rightly assumed that he could utilize the radiation of heat in the culvert and increase the temperature of the air entering the mine. This he accomplished, and I am informed that a relative humidity of 94 is now obtained.

Another Practical Suggestion

Here is another of his ideas which increases the efficiency of haulage: Near the shaft bottom, there were several switches operated by trapper boys. He reasoned that the more men or boys there were on haulages the greater was the liability for accidents. To overcome this, he had an old scrapped hand-pump connected to the switch. The pump was operated by water pressure from the main discharge. With this pressure, he successfully operated the switch. Of course, this was crude, but since then he has had special cylinders made which operate from a point 25 ft. distant from the points of the switch, this being done by the motormen as they pass with their trips. Not only did this novel contrivance reduce the cost of coal, but from a viewpoint of "safety first" it was a desirable improvement, since it removed the boys from the haulageways. With these and similar ideas he has embodied in his work it is needless to say that he is a very successful mine superintendent.

---

*Ensley, Ala.

One of the secrets—the main secret—of my friend's success is that he keeps in touch with his surroundings. He believes that the mine itself is the best teacher of mining science, and he spends more than half his time in this great school. However, we should not neglect our reading in favor of ten hours per day in the mine, for our view on mining subjects may become very limited should we fail to keep in touch with what is going on in the mining world. There is no royal road to learning, and he who would win success must read, study and observe, to see where improvement can be made, and never let up until something has materialized.

Do not think that because you happen to have a first-class certificate in mining you know it all. The man who can evolve and invent is welcome anywhere, but the fellow who cannot originate and who cannot do anything for the interest of human progress requires a certificate before anyone will listen to his chatter.

⁂

Bit Sharpening

In early practice the power hammer might have been defined as a contrivance by which a heavier blow could be struck than a man could deliver with a sledge. No one seemed to realize that a handy little power hammer would cut out the need for the striker, would deliver more blows per minute and place them with more precision, and that the greater weight of the hammer was only one of its advantages. As has usually been the case with new inventions, ingenuity was devoted to the task of getting out larger and larger hammers with heavier bedplates and with cranes for handling large work, and the need and availability of machine hammers for the lightest work in the smallest shop were too often overlooked.

Speedy Work Eliminates Reheating of Steel

But there is no reason why a hammer run by machinery should not be made at a reasonable figure and be as much an adjunct of a small repair shop as is the drill press. There is a great advantage in speedy work, for the quicker the work is completed the less need is there for frequent reheating of the piece being forged. The speedy hammering not only accelerates the work but eliminates much of it and saves the steel from deterioration.

It was with this in mind that the Mayer Bros. Co. started the manufacture of power hammers in the town of Mankato, Blue Earth County, Minnesota. This village would still be unknown to the mining people of the United States, despite its 11,000 inhabitants, had it not been for its manufacture of hammers which have had a large and general sale wherever mining machines are used.

Description of Mechanism

The hammer is driven by a friction pulley having an adjustable boxing. This is placed on the same shaft as a heavy crank disk to which a pitman is attached, the rapid vertical movements of which provide the reciprocating motion of the hammer.

But if the hammer blows were taken up directly by the crank and shafting the result would be disastrous. In the Bradley hammer this strain was absorbed by a heavy spring of the carriage-spring type but almost semicircular in form. The Dienelt & Eisenhardt hammer, made in Philadelphia, had a similar attachment. In the Mayer Little Giant Power Hammer the blow is cushioned by a spiral spring, thus securing a like result.

The downward movement of the pitman causes the lower ends of two arms to approach each other, for these lower ends are attached to rods connecting to a wristpin which is raised when the hammer strikes the block. This approach is opposed by the spiral spring mentioned. Thus, without much motion the force of the blow is cushioned.

Every portion of the mechanism subject to wear is adjustable, and all the parts are of the best material. The foot treadle that causes the clutch on the friction pulley to operate passes entirely round the base of the anvil block and can be put in operation by the toe of the blacksmith while his heel rests on the floor. As soon as he releases the pressure of his foot on the ring, a spiral spring lifts the treadle and so releases the clutch on the friction pulley, thus shutting off the power.

Speed of Operation

The hammer is made in three sizes, 25, 50 and 100 lb., requiring motors of 1½, 2 and 3 hp. respectively. The rapidity with which the machine will rain blows on a piece of steel stock may be easily comprehended from a recital of the number of revolutions per minute, each complete revolution involving a blow on the anvil. The small-sized hammer makes 400 r.p.m. and the others 325 and 250 respectively. Consequently, it is not surprising that the company asserts that 2000 chisel-point bits can be turned out in a day or that 2500 old bits can be repointed in the same time. This is claimed in connection with the special bit die for the manufacturing of pick points for mining machines, which has been designed for use with the 50-lb. hammer.

The Monon Coal Co. of Cass, Ind., has no less than four of these power hammers and the Shawmut interests in Pennsylvania have an equal number at their coal mines.

⁂

Another Definition of Success

By Carl Scholz*

The definition of success is about as uncertain as our conception of electricity. Mathematically expressed, success is the result of ambition multiplied by degrees, which vary with the different individuals. What may appear as complete success to one may be regarded as utter failure by the other. By the poor, the rich are usually considered successful, and to the worker of the rank and file the higher officials and managers may appear symbols of success; and yet these parties may have aims and ambitions of a very different character and are totally dissatisfied with their accomplishments. In the strict sense of the word, success has been attained by those who have the feeling that they are doing their work to the best of their ability, striving always to do better, and are fair to the interests of their employees and employers, as the case may be.

---

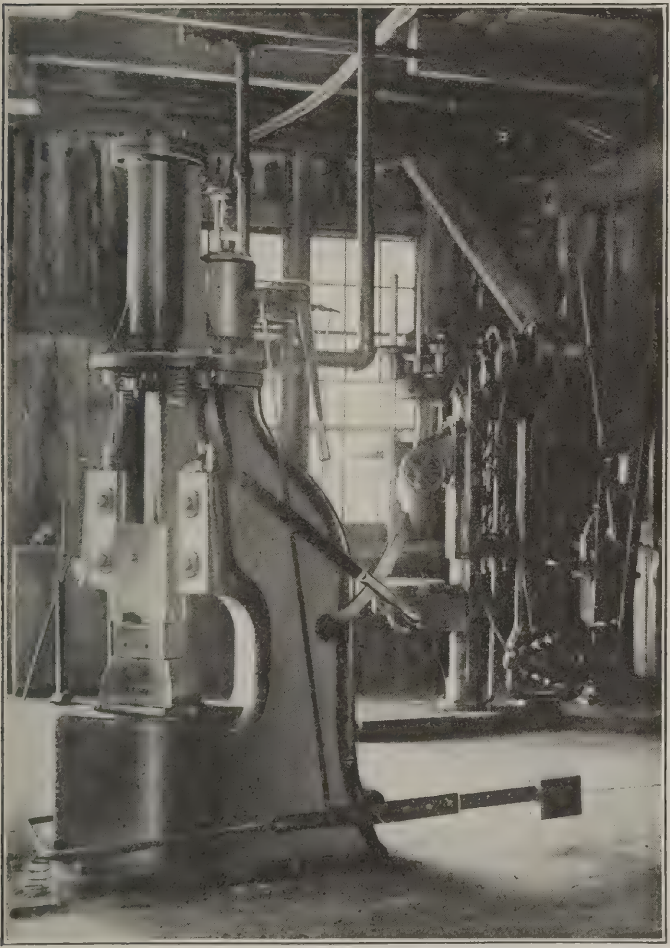
*President, Coal Valley Mining Co. and the Rock Island Coal Mining Co., also vice-president, Consolidated Indiana Coal Co., Chicago, Ill.

Ambition to advance and progress is the foundation of civilization, and to it is due the progress of this age. It is fortunate, however, that not all of us aim for success in the same direction, and many consider themselves successful without having attained riches or powerful positions.

In a practical way ambition usually receives its reward without this reward being the main aim in life. Men who apply themselves to their work in the proper spirit are usually advanced over those who are diffident. The two principal characteristics that always serve to procure advancement, and at the same time secure happiness and peace of mind, are loyalty and integrity; and employers value these two qualities more than anything else in their subordinates.

A Quick Repair

For those whose mines are not located handily to an adequate machine shop some form of steam hammer is an essential. The uncertainties—or should it not rather be the certainties—of inadequate service demand work on the spot. For if the repair job cannot be completed "between trains" there is a possibility that it may have to wait over for another day, and in some cases during the winter months the delay may be even more considerable, for exit and ingress are alike blocked for days.



A Bell Hammer at Hammond Colliery of P. & R. Coal & Iron Co.

A repair successfully accomplished was made, however, where the advantages are not so evident because the breakage occurred at a mine in the anthracite region where there are machine shops a-plenty. A piston-rod of a three-stage Norwalk high-pressure air compressor broke at the key connection to the crosshead. Onto this rod, turned to a diameter of $2\frac{1}{16}$ in., the blacksmith at the colliery with the aid of a Bell steam hammer welded a new end. There was a modern 16-in. lathe at the same mine, and so the rod was turned and finished in a couple of hours. It was placed in the compressor and is running satisfactorily.

Those who know what a delay is caused by an accident of this kind will realize how great an assistance is such a speedy means of repair. The breakage occurred at the Hammond mine of the Philadelphia & Reading Coal & Iron Co., which has ten 300-lb. steel-frame Bell combined steam hammers at its various collieries. These are used for welding pieces of circular section up to 2½ and 3 in. in diameter and those of rectangular section up to ⅞x3½ in. They also straighten axles 2½ in. to 3 in. in diameter.

The Bell hammer was originally designed for making the wrought-iron forgings to be used in the first coal-burning steamboat on the Great Lakes. It has been in active use and under continuous development for 50 years and so has proved its merits. The Oliver Iron Mining Co., for instance, has nine of these hammers of various sizes at its many operations. The Bell hammer is made by the Buffalo Foundry & Machine Co., of Buffalo, N. Y.

⁂

Nobody could make a success out of filling bottles with booze if nobody would empty those bottles.

The Labor Situation

SYNOPSIS—The Elk Coal Co., of Columbus, Ohio, has brought suit against its miners for violation of contract, and the miners have sued the company. The year-long strike in eastern Ohio continues. The Rockefeller Foundation has agreed to give relief to destitute miners in Colorado to the extent of $100,000. The act relating to minors in Alabama and the Workmen's Compensation Bill in Pennsylvania are discussed.

The Elk Coal Co., of Columbus, Ohio, which operates a mine in the Crooksville district near Roseville, Muskingum County, Ohio, has brought suit against its 154 miners individually to collect damages to the sum of $25,000 for the alleged failure of their employees to carry out the wage agreement made Apr. 1, 1914.

On Mar. 17 three men were discharged by the mine boss for insubordination. Thereupon all the miners stopped work and demanded the reinstatement of the discharged employees. The company refused to allow them to work, and the officials of the United Mine Workers of America in Ohio were notified. These state officials ordered the strikers to return to work, and the Roseville local charter was revoked. By a vote of 67 to 28 the Roseville local asked for the renewal of their charter, but the state officials require that their demands be granted before the charter is returned.

In its suit the Elk Coal Co. called attention to a clause in the wage agreement providing that all disputes are to be referred to the district mine officials for arbitration. This part of the agreement was violated; hence the filing of the suit.

Miners Endeavor to Offset Action of Elk Coal Co.

John Moore, president of the Elk Coal Co., is authority for the statement that about a dozen of the miners, practically all of whom are Americans, have transferred their properties to their families.

As no settlement had been made by the evening of Mar. 27 between the striking miners and the company, 50 of the employees filed suit against the Elk Coal Co. for their unpaid wages. It is expected that 90 others will file their claims. The coal company was holding back about $4000 due in wages to pay the expected judgment of $25,000.

Apparently there is some hope of a settlement in the Coshocton field. The operators and the union arrived at a settlement some months ago, but the miners were obdurate when the matter was submitted to a referendum. As the operators are willing to pay more than 47c., there is no reason for the delay in settlement. The district is small, having only about 1000 miners.

The eastern Ohio strike situation is unchanged. Only small operations are working in the eastern Ohio and Coshocton districts. There is no chance of a settlement in the former district, though the strike has now lasted a year. President Wilson seems to be waiting for the passage or rejection of the Gallagher amendment to the Green Antiscreen Bill before taking action.

Nick Mausreck, a striking miner of East Liverpool, was shot recently while he and two other strikers were trying to persuade nonunion men to quit work at the small mine of the Island Run Coal Co.

Rockefeller Foundation in Colorado

The Rockefeller Foundation, through its president, John D. Rockefeller, Jr., has consented to assist the State Committee on Unemployment and Relief in Colorado to the amount of $100,000 if necessary, during the next three months. It is hoped that by that time work may be found for the unemployed on farms and in mines or elsewhere. W. L. Mackenzie King is the director of the Industrial Relations Department of the foundation.

Seeing that many of these men who are thus cast on the generosity of the Rockefeller Foundation are men who since they drifted into Colorado have done nothing but make trouble for Mr. Rockefeller and the corporation in which he is interested, and seeing further that Mr. Rockefeller has not made anything but the most meager returns on his Colorado investment, we cannot but admire the liberality with which he overlooks the past and sees only the need of the men, disregarding their crimes and their folly.

We have heard much of the packed juries in Colorado, but however unfairly they may be selected, they seem to be little disposed to convict the men brought before them. Perhaps the men are not guilty, but someone is, and it is much to be regretted that no one is to suffer for the terrible crimes by which Colorado has been disgraced. The citizens of that state should make every endeavor to see that none escape.

Child Labor in Alabama

A law was approved on Feb. 24 in Alabama requiring that "no child under the age of 16 years shall be employed, permitted or suffered to work in any capacity in, about or in connection with any mine, coal breaker, coke oven or quarry." The act provides that after Sept. 1 of this year no child under 13 years old, and after the same date next year no child under 14 years, shall be employed in any gainful occupation, except agriculture or domestic service. Children under 16 years must not be employed at any hazardous occupation, and employment certificates are required before they can engage in such work, except in connection with agriculture or domestic service.

Compensation in Pennsylvania

The joint House Judiciary General Committee and the Senate Corporations Committee of the State of Pennsylvania have been giving hearings on the Brumbaugh Workmen's Compensation Law. The principal objections were to the exemption of farm labor and domestic servants, the granting of compensation to aliens in larger sums than they would get in their own countries, the judgment liens, the removal of the common-law defense for corporations and the state insurance features, which mutual- and stock-insurance heads claim remove competition.

The exclusion of farm laborers and domestic servants is merely a means of conciliating a large vote. The employees of a farmer or of a householder need compensation just as much as a man who works for a corporation. The miners want the compensation raised to 66⅔ per cent. of the wage. Van Bittner, of Pittsburgh, and Frances Feehan, of Hazleton, spoke in favor of this percentage.

Edgar W. Tate, of the Pittsburgh, Shawmut & Northern R.R. and the Shawmut coal interests, said that a death after 300 weeks should not be compensable, as the cause of death would be hard to determine and might not be due to the accident causing disability. He desired the time reduced to 100 weeks.

The Secret of Success*

By Thomas Dreier

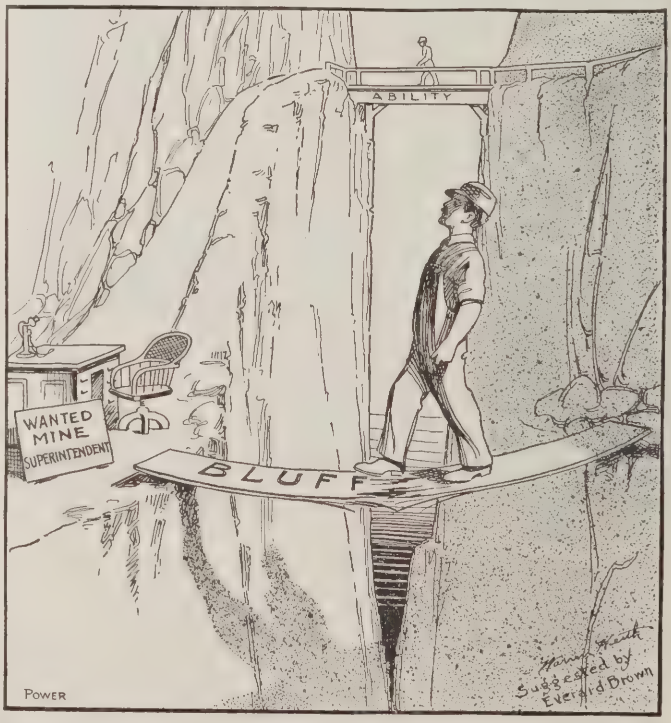
The secret of success is not a secret. Nor is it something new. Nor is it something hard to secure. To become more successful, become more efficient. Do the little things better. So work that you will require less supervision. The least supervision is needed by the person who makes the fewest mistakes. Do what you can do and what you should do for the institution for which you are working and do it in the right way, and the size of your income will take care of itself.

Let your aim ever be to better the work you are doing. But remember always that you cannot better the work you are doing *without bettering yourself*. The thoughts that you think, the words that you speak and the deeds you perform are making you either better or worse.

You can be what you will to be. Forget yourself in rendering service to others. If an employee, strive to make yourself of greater value to your employer. Look upon yourself as a manufacturer. Think of yourself as being in business for yourself. Regard yourself as a maker and seller of service, and ever bend your thought and your energies toward *the improvement of your product*.

The wise manufacturer never injures his machinery willfully. Your body, your mind, your soul serve as your plant. Eat and drink only that which will nourish your body; entertain only thoughts that will enrich your mind.

The world is hungry for quality service. It wants to pay for it. It is paying for all it can get. The market is not crowded. There is a chance for you right now. There is a chance for you right where you are. The time to start is now.



The Longest Way Around Is Often the Shortest Way Home

Editorials

The Mining Engineer and Publicity

The mining engineer has certainly failed completely to place himself before the public in the right light. We hear about the "wonderful" advances in bridgework and railroading. Even in our schoolbooks we read about the ingenuity of the inventors of the cotton gin, the harvester and the sewing machine. The pictures of these men and machines are associated with our earliest recollections. In fact there was a time when we were divided between a desire to duplicate these inventions and a longing to be a cowboy and kill Indians, so fervent was our hero worship for these pilots of industry.

But the public has no such thoughts about the mining engineer. Only his mistakes have refused to stay buried. His triumphs have failed to impress themselves on the public. The only epithet the average man deems fitting in connection with the mines is "awful." He has used that word so much that usually it has no meaning, but when he says those "awe-full mines" he breaks the word up with a hyphen and seems to be dwelling on its significant derivatives.

He does not admire the system with which mines are worked. He does not pay tribute to the marvelous successes of the mining-machine makers who have discovered a means of cutting coal like cheese. He overlooks the fact that the coal operator gets out the coal for a fifth or tenth part of the money which is actually paid for its delivery to the cellar. He does not marvel at the system of ventilation which delivers a steady breeze through miles of airways. There is no interest for him in the fact that the water pumped from our mines is in places ten times as heavy as the coal extracted.

The wonders of the mines have been overlooked, partly because the mines are far from the big cities, and partly because the mining engineer has not sought the requisite publicity, and partly also because we are no longer an appreciative people.

When institutes meet, the local spellbinders rise and tell the guests at the banquet table how important is the mining industry. All they know about the mines is the total tonnage produced and the number of men employed. Their rhapsodies fall entirely flat because no one has really acquainted these orators or the public with what constitutes the real wonder of mining—its ingenuity and its problems.

Recently a doctor was overheard to say that engineering was an easy subject to master, because once learned no more study was needed. The professional stock-in-trade required no replenishment. It was not like medicine, where new discoveries were being made every day.

It is needless to point out that mining is progressing as fast if not faster than medicine. And the retort discourteous, which we also overheard, was also true. It was that medicine was largely expending its energy in chasing its own tail and frequently heralded its revivals of old principles as if they were new inventions.

The trouble with the mining profession is that it lacks advertising. It should have its right place in the public prints. The articles read at the institutes should be carefully briefed for the public consumption and should be given a proper place in the press. Space for politics is conceded by the yard; space for mining and engineering—even in such mining and manufacturing centers as Pittsburgh—is granted grudgingly by the inch.

That is not the condition of things in England. The British Association for the Advancement of Science, when in session, receives in the better class of papers page after page of copy. Scientific lectures are reproduced in the newspapers, briefed it is true, but at what would here be regarded as being at great length.

Once accustom the public to consume such matter, and without question it will soon be in demand. It is the duty of the mining engineer to his profession and to his industry to give the public to understand what marvelous advances are being made by both.

⁂

Canada Desires a Higher Coal Tariff

The competition of foreign coal and fuel oil with local coal has led to efforts being made to induce the Dominion of Canada to protect the coal-mining industry of the western provinces. This desire for protection has probably been accentuated by the depression in business and the impoverishment in Vancouver Island following a long strike. It is also, perhaps, fed by the "Made in Canada" movement which has been fostered so naturally as a response to our own "Made in America" campaign.

This subject was brought before the convention of District 18, United Mine Workers of America, when delegates from the coal-mining districts of Alberta and southeastern British Columbia met at Lethbridge, Alta., about the middle of February. A press dispatch from Lethbridge, dated Feb. 19, stated: "To relieve the abnormal distress prevailing in mining camps the miners will take steps to forcibly impress on the federal and provincial governments the need for adequate relief. At the miners' convention a resolution was submitted urging that a tax be placed on all coal coming in from the United States. It was said that much of the distress was due to the fact that 50 per cent. of the coal used in Alberta and Saskatchewan was admitted to Canada free of duty, that the production of a similar quantity in the district would give employment to 3000 men and at the same time afford the government a revenue from the royalty paid on the increased quantity of coal which would be mined in the district."

About the same time a deputation from the coal-mining districts of Vancouver Island and of Nicola Valley on the mainland of British Columbia waited on the provincial government at Victoria and urged that it endeavor to induce the federal government to impose a customs duty of one cent a gallon on coal oil now admitted into Canada duty free. It was represented that last year there was brought into British Columbia a quantity of fuel oil equivalent to 700,000 tons of coal. Five years ago, it was stated, only 5,000,000 gal. of fuel oil was brought into British Columbia annually from California, but the trade has since grown enormously so that in 1914 the quantity thus imported was not less than 110,000,000 gal. The oil trade was said to be booming while the coal trade is languishing, with several thousands of coal miners working only half-time or less.

On the other hand, an influential deputation, representing some of the larger users of oil, made strong objections before the provincial government, opposing any such action as the coal-mining interests desired. Representatives of railway and steamship companies using much fuel oil and of a local oil-refining company urged that large investments had been made in railway and steamship equipment and plant for the storage and burning of oil and that the cost of substituting coal-burning for oil-burning equipment could not be borne. This deputation, as also that representing the coal-mining industry, was asked to put its case in writing and the provincial government would forward both to the federal authorities at Ottawa.

Western members of the Dominion House of Commons, now in session at Ottawa, have been asked by many of their constituents, through local boards of trade, to do everything possible to secure the imposition of a duty on fuel oil, for the reason, as urged from Nanaimo, that "conditions are not improving and the community's prosperity depends upon the protection of coal against duty-free oil." The representative of Nanaimo in the House of Commons has written in reply:

> We are taking up this matter with the Prime Minister, but I would warn you not to be too optimistic as to the result, for the following reasons: There is a war tax of 7½ per cent. ad valorem placed on crude petroleum, also on the finished product, that is, on the finer oils. There is also an import duty of similar amount placed on bituminous coal. Both these taxes are in favor of the coal-mining industry, especially of the Vancouver Island field. Of course they are essentially war taxes, and will be removed when they have served the purpose for which they were intended. This would leave the coal-mining industry without any protection whatever. We intend suggesting to the Prime Minister the advisability of appointing a small but efficient commission to advise the government as to the best means of encouraging and protecting the coal-mining industry.

⁂

The Consumption of Coal by Miners

In 1913 the mines of the United States sold to the local trade and their employees—principally the latter—15,871,535 tons, or an amount equal to 2.9 per cent. of the coal shipped and converted into coke. Had the miners of the United States produced only the same amount of coal per man per year as those in Great Britain, the tonnage consumed in local trade and for the use of employees would have been 44,282,000 tons. Thus 28,410,000 tons would have been wasted. The tonnage of coal used for local purposes would have been equal to 8.3 per cent. of the aggregate tonnage shipped and coked instead of 2.9 per cent., which, as has been said, was the proportion actually used.

The saving thus made of nearly 30,000,000 tons every year is a considerable conservation, arising partly from methods which are not conservational but which seek mainly a large production per man engaged. It must not be forgotten therefore that, in order to save coal, much coal, as well as much labor, is often wasted. The question for the conservationists is, How can we save coal without a loss greater than the value of the mineral conserved?

Were the miners of the United States everywhere to produce as much as they do in the Pennsylvania bituminous mines the showing in favor of this country's methods would be even better. In Pennsylvania an amount equivalent to 2.5 per cent. of the tonnage shipped and converted into coke was consumed by local trade and for the use of employees. Yet had the employees of Pennsylvania produced only as much as those in Great Britain the equivalent of 9.2 per cent. would have been expended in heating the homes of the employees and in local trade.

In fact, the small percentage of tonnage used locally in Pennsylvania bituminous regions probably arises chiefly from the large output of each man employed, for a miner who mines 3.78 tons per day in Pennsylvania will probably use no more and no less coal directly or indirectly than the man who mines 1.98 tons per day in Michigan.

Just to what extent the local trade in coal consists of trade not directly maintained for the benefit of the mines would be hard to assert. But it is certain that, on the other hand, much coal which is shipped is employed to manufacture what the miner needs. So that, all things considered, the figures labeled "for local trade and miner's use" really represent a sum not very different from that part of the tonnage which is actually used for purposes incidental to mining, excluding that used at the mines for steam and heat.

Some day, it is to be hoped, we shall adopt methods of conservation in which labor, surface conditions and material will all be conserved. It appears that it will soon be possible, by a form of mining slightly different from any now in operation, to make such a perfect consummation of economy. Our present room-and-pillar methods are as badly out of date as the methods of home industry customary in the Middle Ages. Some day we will see a mine run as intensively as a factory, the actual digging operations in which will be spread over an area scarcely larger than that occupied by a big machine shop.

Meantime we can congratulate ourselves that we have a lower loss of life per million tons produced than Germany, France or Japan and a larger output per man employed than any country in the world, while the future gives bright promise that we may yet capture other records. Meanwhile let the conservationists continue their good work, for it is not likely that we shall succeed in saving coal unless we are continually urged to handle it as a patrimony owned equally by our children.

⁂

Our readers will be pleased to be apprised of the following incident which occurred after the Layland explosion. Frederick T. Haskin, a writer for the Pittsburgh *Gazette-Times,* relating the story of the rescue work, says among other matters scarcely less apocryphal: "Staggering toward them were five men, pale as death through their grime, and barely able to walk. One of them had his head wrapped in an improvised helmet made of brattice cloth, so that his nose was covered, while he fanned air into his mouth with the aid of a tin bucket."

Apparently he thought that afterdamp has a peculiarly severe effect on the nose but could be breathed through the mouth with impunity. Or is this one of the many instances in which a newspaper writer has supplemented fact by drawing on a generous imagination?

Discussion By Readers

Success in Educating the Foreigner

The recent discussion on "The Foreigner in Mining" interested me greatly, and I want to relate some of my experience in educating this class of mine-workers. Before doing so, however, I will say that the foreigners, or the great majority of them at least, are not capable of making much headway by themselves. As a class, they require much pushing.

The majority of the foreigners employed in these mines enjoy sitting around the coke ovens, in the evening, after the day's work is done, and recounting the happenings of the day or recalling incidents past and present. Such was the general condition of this class when I first came to the coking plant. I approached several of these men and found a ready response to my inquiries. They said that they would gladly attend a night school if they had a teacher. I offered my services and promised that if more was required than what the superintendent of the plant and I could give them, we would arrange to have a teacher come over from the adjoining township.

The following evening a meeting was held in the little schoolhouse, and five men were present. Everything was arranged that evening for the opening of the night school at once. This was done, the first session of the school being held the next evening. The work began with the study of reading, writing and arithmetic. At the end of a month there were 14 scholars in attendance. Some of these could not read or write, and a few did not know A from B, but they all persevered in their work. The first term lasted six months and at its close each man could read and write and some were so far advanced as to be able to figure in decimals.

It may readily be imagined that it took lots of grit and perseverance to keep this class together and to make it interesting to all. Occasionally the men would stay away by turns, but whenever this happened I would hunt them up and ask them the reason for their absence. Often the reply was, "I can't learn," or "I hate to trouble you so much," or "I am so tired in the evening that I do not feel like studying." Still we persevered. The class was held twice a week, the session opening at 7 o'clock in the evening. Often we would not leave the school until 10 or 10:30 o'clock.

The class has been in session for three months, this term; and we have a few more advantages than we enjoyed last year, owing to the superintendent's taking up the matter with the company. Being a progressive man himself, he succeeded in interesting the company in the men's welfare. As a result the officials gave us the use of one of the company's houses and had it fixed up for a school, including also a "First-Aid room." The men were free to meet in this place every evening, if they desired, and those who wished enjoyed the privilege of smoking.

At the present time many of the men are well advanced in the common rudiments and have commenced the study of mining, including mining laws. Monday night is "First-Aid night." There are 20 men in the First-Aid class, and the mine foreman is the instructor. Indirectly, the sessions of the school are a great benefit in keeping the men occupied and drawing them away from the saloons. I often mention in my talks the evils of gambling and drinking, and this has a good effect.

The work of the school keeps me busy in my spare time, looking over the work of the previous night or preparing questions for the following evening. However, no one but those engaged in the work knows the satisfaction that comes from seeing the improvement of men who were once illiterate, but are now able to read and write. This satisfaction certainly pays well for all the energy expended in keeping the men interested and at work. I can say that the experience gained has been a personal benefit to myself. I am convinced that if more mine officials would interest themselves in the same way for the welfare of their men there would be less booze consumed and less crime committed. The work will produce better men and more skillful workmen in the next generation, if not in this. Its tendency is to make law-abiding citizens.

JOHN T. BRADLEY,
Mine Foreman, Elm Grove Works.

Dunbar, Penn.

⁂

Recognition of Bravery

Letter No. 8—I have been much impressed with the letters that have already been written on this subject and was particularly pleased to note the attitude taken by COAL AGE in response to the same, as appears at the bottom of p. 383, COAL AGE, Feb. 27.

As stated in "Bykem's" Letter No. 1, "Deeds of heroism in and about a mine are, as a rule, given little consideration and quickly forgotten, because it is generally assumed that such acts are a part of a miner's calling, and he is expected to face all dangers without a thought for his own personal safety."

I heartily concur in this judgment of public opinion. Wherever or whenever there is an explosion, or other disaster in a mine, the miner is ever on hand and ready to face any danger, none being too great for him, in an effort to rescue fellow workmen. What is his reward for such heroic sacrifice? The record of the disaster published in the county paper or possibly the daily local may contain a mention of his brave act; but rarely does his name appear in the official report of the disaster, and the fact is soon forgotten that others than members of the regular rescue corps rushed to the scene have taken part. Too often it happens that the names and deeds of the trained official rescuers are emblazoned on the record as being *the ones* to whom all credit is due. The humble miner, whose courage, bravery and prompt action made possible the later work of the regular rescuers, is practically lost to view in the glamor of the occasion. And yet he it was, in many cases, who ably assisted in the actual performance of the work done on the arrival of the official rescuers.

Bykem asks, "Would it be better to bring all worthy acts under one general classification?" and "Should the award be entirely honorary in all cases?" It seems to me better that any award for bravery should be wholly honorary and without partiality. In my opinion there should be an honor roll on which should be placed the names of all mine workers whose brave acts are worthy of mention. It is not that such recognition is necessary to arouse the miner to action; nor that the miner desires that his act should be especially mentioned; but this very fact that he asks nothing is all the more reason why his acts should be recognized in a suitable manner.

No true miner holds back from the work of rescue, in time of peril, fearing that he will not receive due credit for his act or be suitably rewarded for the sacrifice he makes. His first thought is the peril of his fellow workman, and he is actuated by his desire and hope that he can rescue the one in danger. He looks for no reward—he asks for none. For this reason he should be given a generous recognition in a way that will show clearly that his act is appreciated. I hope that this question will appeal to many and that we shall have the benefit of their views. By this means, the broadest and most helpful measures will be developed.

JOHN NEAL.

Dayton, Tenn.

[As an illustration of the fact mentioned in the above letter that the description of many mine disasters and the record of brave acts performed by local men and published in the local papers rarely find a wider publicity, we have abstracted the following from a report of the Belle Valley mine explosion on May 20, 1913, as taken from the *Jeffersonian,* a local paper of Cambridge, Ohio The record speaks for itself. It is, in substance, as follows:

> That there were not more lives lost in the Imperial mine disaster of Saturday night last is due to the cool head of J. B. Morris, superintendent of the Caldwell mine, at Caldwell, who with his able assistants, Harry Rowland, John Smalley and M. S. Moore, was the first to enter the mine and do any effective work following the explosion.
>
> Superintendent Morris is one of the most experienced coal-mining men in this part of the state. He is a quiet, unassuming man, having little to say of his own acts. Mr. Morris was at his home in Caldwell on the fateful Saturday evening when notified of the disaster in the Imperial mine at Belle Valley and asked if he would take charge of a rescue party. He replied that he would if he could get an automobile. Almost before he could equip himself for the journey, two automobiles were at his door and a flying trip was made to the mine.
>
> Arriving on the scene, Mr. Morris learned that a few brave rescuers, under the lead of Henry Fairhurst, were already in the mine attempting a rescue. Having carefully selected a few experienced men from among the many who offered their services, Mr. Morris hurried below with his party. Finding a doctor at the bottom of the shaft, waiting for those in the mine to bring out a man with a broken leg, Mr. Morris sent the physician to the top of the shaft, telling him to wait there for the man, who would be sent up as soon as brought out.
>
> Proceeding then as rapidly as possible along the entry, while making necessary repairs by closing open crosscuts with canvas, the party first picked up J. R. Yeager and sent him to the shaft bottom, badly hurt. Mr. Fairhurst was then found overcome with the afterdamp, and all the remaining members of the first party were more or less affected by the gas and had to be removed, they having advanced too rapidly ahead of the air. Having sent all these men out of the mine, the party in charge of Mr. Morris continued the investigation of the mine for three hours before returning to the top of the shaft. All this was done before the arrival of the special train bringing Superintendent Mathews and Deputy Mine Inspector Elwood, together with some Cambridge surgeons.

The above account taken from a local paper, we believe, found no publicity in any official record and illustrates the point to which correspondent refers and which is certainly worthy of attention.—EDITOR.]

Directors' Visits

In the "Extracts from a Superintendent's Diary" on p. 507 of COAL AGE for Mar. 20, 1915, is incidentally revealed what I believe is one of the greatest idiocies of the ordinary board of directors:

> For two years now we have been looking forward to a visit from our directors, but only today was the great event consummated.
>
> On several occasions during that two-year period word came down the line that we might expect the inspection party in a few weeks, but always before we completed our house cleaning the rumor would be discredited and our improvised whitewash squad would be dismissed. But about two weeks ago positive instructions were issued from our general manager's office to prepare for today's inspection, and the wording of the order made it clear that this time there would be no change of plans.
>
> As a consequence the past two weeks has been a busy time for the floating gangs. All scrap iron has been gathered up and classified, mud holes in our roadways have been filled in, grease and oil spots on engine house floors have been sanded and scrubbed, and two crews with whitewash mixtures have transformed trees, fences and outbuildings into veritable snowdrifts.

I know just the procedure, for the last big plant I worked in had a Boston board of directors that always sent word a week ahead that it was coming to see us, and then there would be the most frantic cleaning up imaginable. If the board had ever gum-shoed down to see us the members would have seen something that would have opened their eyes.

Inasmuch as industrial dirt usually means industrial inefficiency, if a plant were kept reasonably clean all the time, in fear of an unannounced directors' visit, the operating results would probably be better.

Here's hoping that some day there will be more pussy-footed directors whose desire to know the business will outweigh their sense of their own overwhelming importance.

DONALD M. LIDDELL.

Elizabeth, N. J.

Safety Hints

Letter No. 1—I wish to offer a few comments on two of the statements contained in the letter of Mine Inspector Rose, COAL AGE, Feb. 27, p. 385. First, Mr. Rose states as follows:

> I am not opposed either to safety committees in mining or to the posting of danger signals in and about coal mines as a precautionary means of impressing the idea of safety on all mine workers. However, I greatly fear that the multiplicity of these signs, giving warning of unsafe places or conditions, may engender in the minds of many mine workers the idea that all unsafe places are properly marked and guarded, and that less care and precaution are needed on their part in protecting themselves in their own working places or where such danger signals do not appear.

I agree with Mr. Rose's suggestions that danger signs may be overworked and, as a result, lose part of their significance and usefulness. Where there is a great multiplicity of such signs it is true that miners may grow careless and indifferent to their meaning; and, in the absence of danger signs in certain places, they may naturally assume that if the place was dangerous it would be so marked.

However, from Mr. Rose's reference to the miners' own working places it would seem that he suggests placing such signs at the working face. I do not believe that the erection of danger signs is justified in working places; nor in the inside entries leading to a few rooms only. In such places covering but a small area, the miners working there may be assumed to know the weak places and to be more familiar with the local conditions existing therein than anyone else. In fact, Mr. Rose later remarks, in respect to the mine foreman not being as well acquainted with the conditions in a working place as the miner who works there continually, shows that he is of the same opinion.

Tracklayers and timbermen whose duties call them to work in many such places have learned to look for danger and they do not expect to see danger signs in such places. In general, it is a safe rule that where but a few men are working they may be expected to be thoroughly acquainted with the conditions of the place and the verbal instructions of the foreman warning them occasionally of the need of caution should be sufficient. Moreover, a verbal warning carries with it the human element, and is often more forcible than a printed sign, which is merely mechanical.

On all main entries, haulways, manways and other frequented places I favor the posting of danger signs in every place where danger lurks. However, it is important to remember that the erection of such danger signs does not fulfill *all* the duties of the mine foreman or the men frequenting such places.

I believe the sign "Safety First" has a good general effect as impressing continually on the minds of all persons the need of necessary precaution in their work; but let the management follow this precept by making the mine reasonably safe. It is incumbent on them to see that all entries are well lighted; the floor free from obstructions; the roof well timbered; refuge holes provided at regular intervals where needed and kept whitewashed and well lighted. Indeed everything should be done to promote safety in the mine. In addition to this, all places that cannot be made absolutely safe should be plainly marked with suitable danger signs to warn any who are not acquainted with their condition.

Again, referring to Mr. Rose's statement, "Train and discipline every mine worker to detect dangerous conditions and to know how to avoid or escape them," I want to say that in spite of the best effort in this direction, on the part of both officials and miners, it is unavoidable that many who are employed and permitted to work in the mine do not possess the necessary knowledge and training that will enable them to detect and avoid danger. Their training is inadequate. In many cases, it is the result of the miner's previous association and experience in mines where he has been employed.

For example, it frequently happens that a young miner when first engaging in the work of mining coal at the face finds that his "buddy" takes all the necessary precautions for safety. As a result, he comes to depend too much on the older man rather than on himself. Again, the more frequent visits of the mine foreman to a new man's place has a tendency to relieve the worker of that sense of personal responsibility which is thus shifted to the foreman's shoulders.

The negligence of the average practical miner as a factor in the inadequate training of the beginner was forcibly impressed on me by the words of an old miner, who remarked, "When I took my boys to the mine with me I always went over the roof, sounding it carefully, while the boys went at once to work. In doing this, I made a mistake. I should have made them do the sounding of the roof. As it was, they learned to depend wholly on me instead of on themselves, in this respect. Now I find when I visit the rooms where they are working for another that they follow too much their old habits of going at once to the coal face and beginning to work as soon as they enter their rooms, without knowing whether the place is safe or not."

GEO. N. LANTZ.

New Straitsville, Ohio.

⁂

Mining Laws, Legislation and Mine Regulations

Letter No. 41—I have read with great interest all the letters relating to mining laws and legislation. I consider this discussion a most important one, in which many valuable suggestions have been made. There are, however, two points that I think have been neglected by writers thus far.

Much has been said in regard to the granting of certificates; but I do not remember that the question of requiring a mine superintendent to hold a certificate has been mentioned. I want to ask, Why is a mine foreman required to hold a certificate showing that he is capable of performing the duties of his position, while the mine superintendent, who is his superior, is exempt from such requirement? By what law of reasoning can it be shown that the responsibility for the safe operation of the mine should rest on the mine foreman, who *must* act in accordance with the orders he receives from his superintendent; while the latter is not required by law to pass an examination or to otherwise give evidence that he possesses the same knowledge and is as capable as the foreman who carries out his orders?

The mining laws of Europe are often held up as being examples to follow. If this is true, why should not some of the best features of these laws be incorporated in our own statutes? In England, a mine manager (superintendent) must have a first-grade certificate, while the mine foreman is only required to have a second-grade certificate, in order to hold that position, in any mine.

In England, all mines are considered gaseous; there is no such classification as "gaseous" and "nongaseous." The mine manager (superintendent) there must pass an examination that is about as severe as that required of our mine inspectors. If this is necessary in England where the conditions of labor are much better than in this country I would ask, Why is this matter entirely ignored in the mining laws of Pennsylvania and other states? The condition existing here seems all the more strange when we reflect that the mine foreman can perform the duties of superintendent without any additional examination or certification; but a superintendent cannot perform the duties of a mine foreman until he has passed the examination and taken out a certificate qualifying him for that position.

Another incongruity in our mining laws is in respect to the relative danger due to the presence of gas and lack of sufficient timber. Mine inspectors' reports show that the loss of life due to falls of coal and slate very largely exceed that caused by gas—the former being 62 per cent. as against only 2 per cent. due to the latter cause. Notwithstanding this fact, mines are classified as dangerous or otherwise, according as they do or do not generate *gas*. It is clear that a mine might be perfectly safe as far as gas is concerned and yet, owing to peculiar conditions in the roof, the same mine might be one of the most dangerous class to work.

The mining law generally requires the mine foreman or his assistant, in *gaseous* mines, to visit every working place before the men are permitted to enter the mine for work. Contrast this condition with the fact that, no matter how dangerous the roof conditions in a mine may be, there is nothing in the mining law that compels the same frequent inspection of the working faces. A miner may enter such a mine and proceed to work in a place not visited by any official, until later in the day if at all. I know mines where gas is not reported more than once in six months; but because they are classed as "gaseous" mines, the mine foreman or his assistant must visit each working place three times a day to comply with the law.

In offering these remarks, it is not my purpose to suggest a less frequent inspection of mine workings generating gas. I desire, instead, to emphasize the need of giving the same close attention to the inspection of mines where the conditions are such as to require a better support of the roof and constant watch and care.

Every practical mining man knows that this feature of the mining law imposes a heavy burden and one that is unwarranted on certain mines that are unfortunate enough to be troubled with an occasional pocket of gas; and must therefore be classified as gaseous mines; whereas it is possible that such a mine may be far less dangerous and require less frequent inspection to provide the same degree of safety than another mine close by that has been able to evade such a classification with all its attending evils, such as, for example, the employment of three or four additional firebosses to make the daily inspection demanded by the law.

I would suggest, in this connection, that there would be less incentive for some mine foremen to omit reporting "gas" when such is found occasionally at the face of a room or heading, if the mining law read somewhat as follows: All places where men shall work or pass shall be examined daily by a duly appointed competent person. Such a provision of the law would make the inspection of mines more general and not discriminate in favor of nongaseous mines that are often equally dangerous with those classed as gaseous.

THOMAS HOGARTH.

Burgettstown, Penn.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

CARBON DIOXIDE

This gas, often called "carbonic acid gas" or "chokedamp" is a colorless and odorless gas, having a distinctly acid taste. It is not combustible and will not support combustion in any ordinary form.

How Produced—Carbon dioxide is the product of the complete combustion of carbon or carbonaceous matter in a plentiful supply of air or oxygen. It is produced, in mines, by the breathing of men and animals; burning of lamps; explosion of powder; slow combustion of fine coal and slack in the gob; and other forms of combustion taking place.

Effect on Flame—Carbon dioxide has a similar effect on flame to that caused by an excess of nitrogen; or, what is the same thing, a depletion of oxygen in the air. The presence of carbon dioxide in the air tends to reduce the activity of combustion. It dims the flame of a lamp and extinguishes it when present in sufficient quantity.

The percentage of carbon dioxide that will extinguish flame depends on both the **nature of the flame** and the **amount of oxygen** in the air feeding the flame. A **gas-fed flame,** as the hydrogen flame of the Clowes lamp, or the acetylene flame of a carbide lamp, is less susceptible to extinction from this cause than is an **oil-fed flame.**

The flame of a lamp burning sperm or cottonseed oil is extinguished in an **artificial atmosphere** (which is the usual condition in a mine) containing 14 per cent. of carbon dioxide. But, in a **residual atmosphere** formed by allowing the lamp to burn till extinguished in a closed place, only 3 per cent. of carbon dioxide is required for extinction of the flame.

Effect on Life—Carbon dioxide is not classed as one of the poisonous mine gases, although it exerts a **toxic effect** on the human system. It is irrespirable when unmixed with air and if breathed produces death by suffocation. In smaller quantities, it causes headache, nausea and pains in the back and limbs.

According to Dr. Haldane, no appreciable effect is produced by breathing air containing carbon dioxide, until there is about 3 per cent. of this gas present. Breathing then becomes slightly more difficult; 5 or 6 per cent. of the gas causes decided **panting;** and 18 per cent. **suffocation and death.** The effect of the gas is much increased if the oxygen content of the air is below the normal.

For example, with 18 per cent. carbon dioxide present, there is $0.209\ (100 - 18) = 17.14$ per cent. oxygen and $0.791\ (100 - 18) = 64.86$ per cent. nitrogen, under normal conditions. This is a **fatal atmosphere.**

But, if the oxygen of the air has been depleted so that the ratio oxygen : nitrogen is less than 20.9 : 79.1; then a less percentage of carbon dioxide than that named above (18%) would be **fatal to life.**

Treatment When Overcome—Remove promptly to fresh air; apply alternately cold and lukewarm bandages to the chest; rub the limbs and body briskly to start circulation; and, if necessary, use artificial respiration. When consciousness is restored put the patient to bed and keep him quiet for several days.

The Coal Age Pocket Book

BLACKDAMP

It is a common mistake in mining practice to regard carbon dioxide as another term for "blackdamp," which is found in such quantities in many poorly ventilated mines. The two gases, however, are quite different.

The term **blackdamp** describes a variable mixture of air deficient in oxygen, and carbon dioxide. It consists therefore of carbon dioxide, nitrogen and oxygen, in varying quantities. The percentage of **oxygen** in the mixture will determine its respirable quality. The **nitrogen** is wholly inert and acts only to dilute the mixture and thus reduce the percentage of oxygen present. The **carbon dioxide** not only dilutes the mixture but produces also a toxic effect on the human system, although this effect is not of such a nature as to class carbon dioxide as a poisonous gas.

The **production of blackdamp** in coal mines is due to two chief causes: 1. The absorption of the oxygen of the air by the coal. 2. The generation of carbon dioxide by the various forms of combustion or oxidation continually taking place in the workings of the mine.

The **absorption of oxygen** from the mine air by the freshly exposed surfaces of coal is more rapid than what is generally supposed. Experiment has shown that a certain freshly mined bituminous coal absorbed from one-eighth to one-seventh of its volume of oxygen from the surrounding air, in 24 hr.; while only about one-tenth of this oxygen was converted into carbon dioxide. It is suggested that the remaining nine-tenths of the oxygen absorbed unites chemically with certain unsaturated hydrocarbons in the coal.

The **effect** of this rapid absorption of oxygen, in the still air of badly ventilated places, in coal mines, as can be readily imagined, is to **deplete the oxygen** content of the air. This is especially the case where tons of coal are shot down at night and left to be loaded out the following day and the ventilation during the night is much diminished in the mine.

On the other hand, where the ventilation is adequate and there is still blackdamp produced in quantity, it is the result of the generation of carbon dioxide from some cause—generally a mine fire or the slow combustion of fine coal.

AFTERDAMP

The term "afterdamp," as the word implies, is used to describe the variable mixture of noxious gases that remains after any explosion of gas, dust or powder in a mine.

Composition—It is impossible to give the composition of afterdamp, except in the most general way; because the gases formed depend on so many **varying conditions,** in respect to the character of the gas or dust burned; the relative volume of available oxygen; the size of the workings where the explosion takes place, as determining the temperature and pressure developed; and the condition of the mine with respect to gas, dust and moisture.

Afterdamp may contain variable quantities of nitrogen, carbon dioxide, carbon monoxide, water vapor and, at times, lesser amounts of nitrous oxide gas and possibly some unburned methane. The mixture is extremely dangerous, being fatal to life and often highly explosive.

Inquiries of General Interest

Firing a Boiler with Gas from a Blower

Kindly state if it is advisable to utilize a strong gas blower for heating steam boilers, instead of using coal as fuel. There is a strong gas well within 500 ft. of our boiler plant, at the mine. We think that it is producing sufficient gas to fire two boilers of the return-tubular type and 150-hp. units. If this is feasible, kindly explain the best method of fitting a burner under the boilers in order to burn the gas economically and get the best results.

I should be pleased to have you or some of the readers of Coal Age explain and show by sketch how to equip these boilers for burning the gas, and how to regulate the supply of free air required for the combustion of the gas under the boilers.

Fireman.

———, Penn.

There is always a great saving in fuel accomplished when it is possible to utilize a gas blower for the firing of boilers. Any type of boiler may be fired in this manner, but success depends largely on the proper installation of the burner so as to give the highest efficiency. Different types of boilers need different treatment in this regard.

In the use of gas as fuel, it is necessary to protect the boiler plates above low-water line with firebrick or clay that will stand a high temperature. The furnace must be so arranged as to exclude all air except what is admitted for the proper combustion of the gas. The furnace must be well built and constructed of material that will withstand the high temperature developed in the burning of the gas.

The accompanying diagram shows the general arrangement of the system. The gas is piped to the furnace through the main header *H*. This pipe must be of sufficient capacity to supply the required quantity of gas. Its area should not be less than the combined areas of all the burner connections. As shown in the diagram, the header is carried along the front of the boiler and small pipe connections *C* convey the gas to the burners *B*, under the boiler. There is a large valve *V* in the main header, to control the supply of gas to the furnace, and smaller valves V_1 control the supply to each burner. This is important in order to obtain a uniform distribution of the flame in all parts of the combustion zone referred to later.

The number of burners used under a boiler can only be determined by the size and type of boiler in use. There should be, however, a sufficient number of burners to give a good distribution of flame in the furnace. A baffle-plate *P*, built in checkerboard fashion with openings between the bricks, is placed from 3 to 5 ft. in front of the burners, inside the furnace. The purpose of this is to give a greater diffusion of the gas and render its combustion more complete, besides forming what is termed a "combustion zone" *Z*, between the baffle-plate and the burners where the gas is burned.

The radiation of the heat into this combustion zone facilitates the combustion of the gas. It is important that thorough combustion take place in this zone before the gases come in contact with the cooler surfaces beyond, in order to avoid the deposition of unburned carbon in the tubes and on the furnace walls. As shown in the figure, a layer of firebrick *F* is also made to cover the grate surface in the combustion zone, which adds greatly to the radiation of the heat.

Where it is desired to install the burners in such a manner as not to interfere with the burning of coal in the furnace, at times when desired, the gas burners should be placed above the furnace doors. Otherwise, these doors can be removed and the burners set in their place. As indicated in the diagram, gas enters the burner through the small pipe connections *C*. Air is admitted chiefly through the opening *O* in the ends of the burner closed by an adjustable shutter. By this means, the supply of air is regulated according to need. An annular opening close to where the burner enters the brickwork also permits air to enter at that point continuously, which has the effect to keep the tip of the burner cool and protect it from the intense heat of the furnace. The entry of air at this point is indicated by the small arrows, in the figure. An important feature in the Winner gas burner is the fact that the bore of the burner is rifled in such a manner as to give a rotary motion to the gas and air flowing through it. This greatly facilitates the mixing of the gas with the air and gives a more perfect combustion. The installation shown above was made by removing the furnace doors and building up the opening with brick.

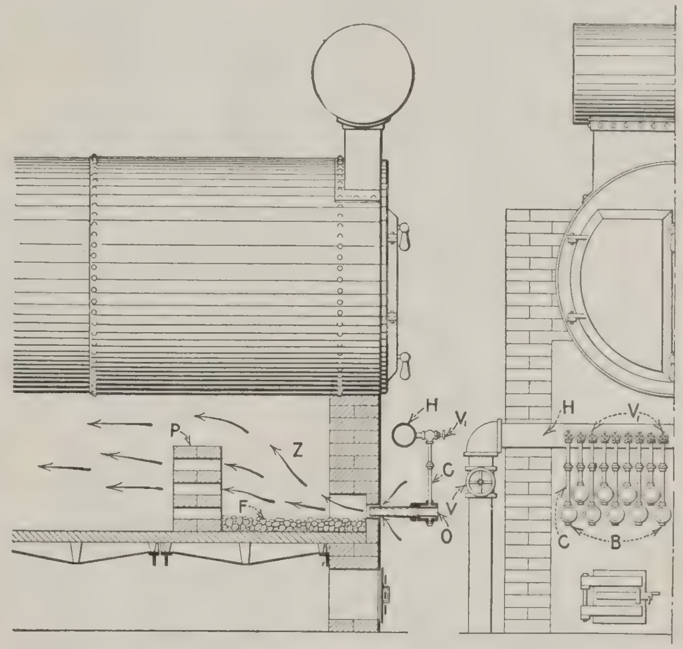

Diagram Showing General Arrangement of Gas Burners under a Return-Tubular Boiler

Examination Questions

Alabama First-Class Mine Foremen's Examination, Held Jan. 25-28, 1915

(Selected Questions)

Ques.—If the ventilation of a mine is insufficient, how may it be increased without increasing the power?

Ans.—Without increasing the power on the air, the circulation in a mine may be increased by cleaning up the air courses; removing all obstructions in crosscuts and breakthroughs; shortening the distance the air must travel; and splitting or dividing the air current wherever this is practicable. It is necessary that the sectional area of all crosscuts in entries and breakthroughs in rooms should be equal to that of the entries and airways.

Ques.—What instruction would you give in reference to the care and preparation of safety lamps before giving them to the workmen; and how would you instruct workmen as to their use?

Ans.—Every lamp should be carefully examined, cleaned and filled immediately after being brought out of the mine. This work should be done in the lamphouse by a competent lampman who is responsible for their safe keeping. Before being given to the workmen, each lamp should be trimmed, lighted and tested so as to reveal any defects in the lamp or any omission in the assembling of its parts.

No workman should be allowed to use a safety lamp in the mine until he has been shown how to handle the same and understands that the lamp is *not safe* when improperly used. He must be taught how to carry his lamp, to keep it in an upright position and shield it from a strong air current and exposure to dust and dirt. He must know how to adjust the flame and understand the importance of not permitting the lamp to smoke. He must be instructed to watch the flame of his lamp and shown how to detect gas by the appearance of the flame cap. He must be taught how to extinguish his lamp in case of necessity and instructed how to proceed in case the lamp fills with flame.

Ques.—In the examination of a mine, if a large territory was found to be filled with explosive gas what steps would you take to remove the same, a continuous air current being used?

Ans.—Place a danger signal at and guard every entrance to the mine, permitting no one to enter except those authorized to perform the work of removing the gas. Assuming that no one is in the mine, in company with competent firebosses equipped with safety lamps proceed to the intake end of the affected section of the mine.

If necessary and practicable, the air current passing into this section should now be increased by sealing the air entering other sections. The work of removing the gas should be conducted wholly from the intake end and should proceed slowly, sweeping the gas from each working place in order and giving time for its complete removal before proceeding to another place.

Much will depend on the character of the workings and the inclination of the seam. It may be necessary to erect special brattices, in order to dislodge the gas accumulated at the face of a pitch or chamber driven ahead of the air. As the work proceeds, careful tests must be made with the safety lamp to note the progress that is being made. In this manner, the work must be carried on until the entire section is free from gas. While performing the work, all safety lamps should be carefully protected against a rush of air that may occur at any moment, caused by a possible fall of roof in the workings.

Ques.—In mines having extremely tender roof, state what precaution you would adopt when introducing the various types of mining machines, in order to insure the safety of employees and economy of operation.

Ans.—It is most important, in mining coal with machines under tender roof, to adopt a systematic method of timbering. Posts should be set in rows not more than 3 or 4 ft. apart and parallel to the face. These posts should be staggered, that is to say, the posts in each row should be set so as to divide the distance between the posts in the preceding row. The distance between the coal face and the first row of timbers should not be greater than what is required for the machine to work freely.

In very bad roof, it may be necessary to set temporary posts close to the face or dividing the distance in which the machine works and to remove these and reset them as the machine is advanced. The coal should be well spragged as the cut is made. In adopting such a method at the face, the rooms should be driven double so that the machine can be taken in on one track and, after cutting across the face, taken out on another track. The width of opening and thickness of pillars will depend on the depth of the seam below the surface.

Ques.—State how the several mine gases may be detected. In what proportion in the air are they fatal to life? In what proportion do they extinguish light?

Ans.—Methane or marsh gas (CH_4) is detected in mine air, by the action and appearance of the flame of a safety lamp. This gas when present in the air causes a faint, pale blue cap to form at the tip and above the flame. The height of the cap increases with the percentage of gas present, until at about 5 per cent. the unbonneted Davy lamp fills with flame.

Carbon monoxide (CO) is best detected in mine air by observing its effect on small birds and mice, which are prostrated in a much shorter time than a person exposed to the same atmosphere. Carbon dioxide (CO_2) is detected by the dim burning or extinction of lamps in its presence. Hydrogen sulphide (H_2S) is detected by its smell.

The percentages of the nonpoisonous gases, methane and nitrogen, fatal to life are such as deplete the oxygen of the air to 7 per cent.; namely, CH_4, 66.5, and nitrogen, 93 per cent. But 18 per cent. of carbon dioxide or 0.5 per cent. of carbon monoxide are fatal, because of their poisonous qualities. An oil flame is extinguished in 14 per cent. of carbon dioxide.

Coal and Coke News

Washington, D. C.

While no official announcements on the subject have been given to the public, it seems to be generally understood that the new Trade Commission is likely to be severely restricted in its operations during the first few months of its existence. Congress was obliged to deal with such a mass of legislation during the last few days of the recent session that it left a good many things in an incomplete and unsatisfactory condition, and the Trade Commission was one of them.

The salaries of the Commissioners were provided for in the legislative, executive and judicial appropriation bill, but for the remainder of its functions, only some $300,000 was furnished while the Commission was obliged to take over the Bureau of Corporations. As the latter concern had been costing from $200,000 to $275,000, all of it for work that is expected to go on, the new appropriation clearly gives only a narrow margin for new undertakings. In particular, it seems out of the question to expect that there will be much available for conducting hearings and investigations.

One subject that the Commission had been expected to take up early in its career was that of existing conditions in the oil industry, it having been desired by various members of Congress that there should be an authoritative official finding as to the extent to which the dissolution of the Standard Oil Co. had resulted in genuine competition.

If this should be dealt with even in a preliminary way, there would be nothing for other work so that this would constitute the practical limit of what would be done. Perception of this situation has disappointed those who had looked for early work on industrial conditions, and has correspondingly pleased those who felt that early activity on the part of the Commission would be dangerous and consequently to be depreciated.

There have been some of both groups of thinkers on this topic in the coal industry, as there had been confident predictions that conditions in that line would be among the first to receive attention. While there has been no official statement on the subject by the Commission and no definite plans so far as learned have as yet been forecast, this proposal (for coal investigation or study) is generally regarded as having been necessarily deferred for a good while, so far as anything save a mere preliminary survey is concerned.

The Report of the Commission on Industrial Relations

Meantime, the Commission on Industrial Relations is expected to report. As is well known, this commission has devoted considerable time and attention to the coal industry and the expectation is that conclusions regarding the business will, therefore, figure largely in what may be stated to Congress as a result of the work done by it.

Apparently, the Commission has of late leaned heavily to the side of extreme radicalism, and as most of its work has been done through "hearings," there is a general expectation that it will not develop much in its report except the familiar facts regarding the Colorado, and other coal situations that have already been made known by witnesses who testified at public sessions.

The Commission will doubtless, like all other bodies of the same sort, leave behind it, for use by others, the papers, data and other information remaining over from its work. The Trade Commission is believed by many to be likely to fall heir to these, so that whatever has been done with regard to the coal industry by the Industrial Relations Commission may in that case afford the basis for such further development as the Trade Commission may choose to give it.

Meanwhile, as already noted in this correspondence, most of the legislative mining and "conservation" program was left suspended when adjournment arrived on Mar. 4, and will have to be reintroduced at the opening of the next session. When that time arrives, the proposed measures will probably be referred to the Commission, just as railroad bills have for a good while been customarily sent to the Interstate Commerce Commission for its report or expression of opinion before action was taken on the floor. In this way, therefore, the Trade Commission may be able, from the very first, to exercise an important, even if indirect, influence upon the direction of Federal policy regarding the mining business.

Probable Revival of Rate Cases

Careful observers of the trend of events in Interstate Commerce Commission affairs are of the opinion that the next few months will be likely to see a revival of the attempt to secure further rate concessions in the interest of the railroads. The express companies have, within the past few days, filed with the Commission a petition for the revision and improvement of the rates granted them and there is more and more reason to fear that the 5 per cent. rate advance already granted the roads will not suffice to put their revenues into satisfactory condition.

It is believed that, should this effort to get better rates be undertaken, a feature of it would be the discussion of an increase on heavy commodities such as coal, which were largely exempted in the 5 per cent. decision. As yet, the matter is purely speculative, there having been no definite announcements as to what may be expected in the matter. The situation is admitted to depend largely on the developments as to railroad revenues in the near future. These will be largely affected by the export situation growing out of the European war.

Alaska Railroad Route Is Undetermined

There has thus far been no announcement of any decision regarding the choice of a route for the new government coal road in Alaska, although one is expected shortly to be forthcoming. Whether, in the present depleted state of the Treasury, anything immediate could now be done on a large scale by way of construction, even if all were ready to proceed, is believed by many to be questionable.

Revenues have not recovered since the beginning of the war, and the war taxes of last autumn are yielding less than had been expected. It cannot yet be stated what the yield of the income tax will be, but unless that is larger than generally expected, there may be a disposition to avoid heavy new expense commitments so far as practicable, in order not to increase the large outlays made inevitable on other accounts by the appropriations of Congress.

PENNSYLVANIA

Anthracite

Pittston—The Lehigh Valley Coal Co. is testing the thickness of the coal under its tract in Moosic Borough and may sink a shaft there. The tract comprises 400 acres and is known as the Bramwell property. Only the Red Ash vein, lowest in the Pittston region, underlies the land. Mining will depend on the thickness of the coal. If a shaft is sunk, the coal would be removed overland to the Heidleberg breaker.

Wilkes-Barre—What was probably the first arrest of its kind in this vicinity occurred Mar. 24, when Stanley Mookimas was arrested upon a warrant, charging him with having worn a button of local No. 1407, United Mine Workers of America, without being entitled to wear it. Mookimas appeared at No. 5 colliery of the Lehigh & Wilkes-Barre Coal Co., it is alleged, wearing the union button in violation of the union's constitution and by-laws and the state law.

The annual mining institute dinner, which is always the largest dinner in the city during the year, will be held in Irem Temple Wednesday May 5. The program committee is now making arrangements. Judge John M. Garman, will be toastmaster.

Bituminous

Uniontown—In the annual examinations for mine foremen and fire bosses certificates in the bituminous region this year, special emphasis will be laid on character. This will count as much as mental ability. No man who is not temperate in his habits can hope to get his papers, is the verdict of the mine inspectors.

Connellsville—Persons living on the North end of 10th St., have received notices from the H. C. Frick Coke Co. that the coal is being removed from under their residences and the ribs are to be pulled. The coal in this branch of the Davidson mine is just about exhausted, at least in the portion under Greenwood. If the surface should sink the gas connections are in danger of being broken.

Traffic in coke continues to show slight gains, the present production being in the vicinity of 280,000 tons per week. While the business being handled is not heavy, the improvement has been steady for some time. Mills are now taking more fuel than was expected in view of the restricted railroad buying of their products.

Marianna—The relief work in behalf of the destitute miners and their families was recently placed on a sound footing when a check for $1000 was received by the committee from the Union Trust Co., of Pittsburgh. This, together with other contributions recently received, amounts to $3000, which it is said will be enough to carry the relief work through until Apr. 1, when it is expected the mines will re-open in part, at least.

Johnstown—Rumors are current that the United Coal Co. mines in Jerome, Boswell and Elklick, in Somerset County, are to be taken back by the Merchant Coal Co., of Baltimore, which sold them to the Kuhn interests of Pittsburgh five years ago. It is believed that this indicates an early resumption of work at the mines and a heavy shipment of coal from Somerset County to Baltimore for export.

WEST VIRGINIA

Williamson—Extensive developments in the Guyan River, Piney and Cow Creek districts are planned by operators from the Pocahontas and Thacker fields, Logan and Wyoming counties being involved. The Pocahontas Co., it is understood, has closed a dozen leases, covering 20,000 acres of virgin coal land on Guyan River, which will be developed during the year, while Col. Wm. Leckie, of Welch, W. Va., has acquired control of about 5000 acres from John W. McCreary. Other operators are also interested. To handle the traffic the Chesapeake & Ohio Ry. Co. will extend its line to the new developments, and will also build a branch on Piney Creek.

Charleston—There continues to be considerable inquiry from persons believed to represent Eastern capital, also some from the Middle West, for West Virginia coal tracts, a large number of which are on the market at prices which are considered bargains because the financial depression in the state has put the original buyers of these tracts in need of cash. Many of these tracts were originally taken up and blocked out.

Miners of the Cabin Creek district have asked their officials to call a meeting to consider whether they will make a demand on the operators for an increase in wages. The miners, it is understood, claim an increase is due them by an agreement entered into at the end of the 1913 strike. The operators, on the other hand, claim they will not consider a change from the present scale.

Wheeling—The summer meeting of the West Virginia Mining Institute will be held here on June 15 and 16. The affair promises to be the largest meeting of coal interests ever held here.

Mullins—A large number of new operations are in process of development around Mullins. Many of the best known coal men in southern West Virginia have become interested in the town, and it is expected that it will shortly spring into prominence as one of the leading coal-field towns of the state.

Crown Hill—A part of the mine equipment and commissary stock of the National Bituminous Coal and Coke Co. will be sold at public auction at the front door of the courthouse on the morning of Apr. 10. The sale is to be made by Constable G. D. Acree in accordance with a warrant issued at the instance of Julian M. Johnson and others.

ALABAMA

Ensley—The work of repairing the Tennessee Coal & Iron Co.'s hospital which was badly injured by fire last month, has been completed and the patients moved back from Muscoga mines near Bessemer, where they have been since the accident.

Birmingham—The Alabama Safety Association, composed of mine officials and coal miners, will hold a Field Day at Richwood Park in Birmingham May 29. The program will comprise first aid drills and other demonstrations made above ground. The next meet of the American Mine Safety Association, this year, will probably be in Birmingham as the Secretary-Treasurer H. M. Wilson favors this place of meeting.

Republic—First Aid Corps from Palos, Warner and Sayreton mines of the Republic Iron & Steel Co. held a general Field Day recently at Republic.

Gadsden—Tom Peters Henley, through his attorneys, has filed suit in the Circuit Court of Walker County to recover 7160 acres of coal and mineral land in Walker County, now held by Gen. E. W. Rucker, a prominent Birmingham capitalist and coal operator. The land is estimated to be worth $200,000. The complaint in the action filed contains only nine lines and does not set forth any of the details under which the claim is made.

KENTUCKY

Harlan—The Wilhoit Coal Co. at Yokum's Creek made an increase of 500 tons of coal per day recently, so that the daily output is now 1000 tons instead of 500. The report is circulating that the coal business is increasing nicely throughout the Cumberland River, or Harlan coal field.

Nolansburg—The Golden Ash Coal Co. announces an increase in mining operations to 7000 tons daily. It also plans other increases from time to time during the year.

Whitesburg—The plants of the Consolidation Coal Co. and the Elk Horn Mining Corporation in the Jenkins-Burdine-Fleming-McRoberts fields are increasing their output. Beginning Apr. 1 it is said that every mine will operate at full capacity. The coal shipments over both the Baltimore & Ohio and the Lexington & Eastern railroads are getting heavy—both lines being practically taxed to the limit.

OHIO

Lisbon—The Lisbon Coal Co., which has recently been reorganized will soon open a new mine near the Erie tracks. The company has been operating a small mine for several years. A switch will be built to the mine.

Crooksville—The announcement has been made that operations at the W. P. Rend mine have been suspended indefinitely throwing 100 miners out of employment.

St. Clairsville—James A. Paisely, of St. Clairsville has sold a tract of coal land in Belmont county to the Valley Camp Coal Co. for $75,000. It is said that the new owners will try to develope the property if labor troubles are straightened out.

INDIANA

Evansville—H. P. Allen, manager of the Deep Water Coal Co. of this city states that his company, within 90 days, will close options on 210,000 acres of coal lands in western and central Kentucky. It is said the price paid exceeds $5,000,000. Eastern capital is interested in the venture. A large coal tipple and dock will be built on the Ohio River, a few miles below this city and barges will be loaded there for Southern markets.

Clinton—Work has been begun at the Hugh Shirkie mine No. 1, near Shirkieville, to uncover the fan, fan engine and the building in which they stood, which were all buried by a cave-in. It was at first proposed to dig a new air shaft but it was finally decided to remove the dirt through the entries at the bottom. The damage is estimated a $15,000.

Oakland City—The Ayrshire mine, No. 1 closed down Apr. 1, it having been found that mines Nos. 5 and 7 could take care of the present volume of trade.

ILLINOIS

Ottawa—The LaSalle shaft was recently closed down on account of slackness in the coal business. This mine employs about 300 men, but the majority will be distributed among other mines, of the LaSalle County Carbon Coal Co. in this vicinity.

Nashville—Local capital is organizing a coal company to sink a mine one quarter of a mile west of here, on a piece of property between the Louisville & Nashville and Illinois Southern railroads. Several hundred acres of coal rights have been acquired, and the movement is well under way.

WYOMING

Cumberland—The Union Pacific Coal Co. has ordered the output of its coal mines here increased 500 tons daily. Fifty additional miners will be employed at once. About 500 men are at present employed.

TEXAS

Sierra Blanca—It has been announced that a large bed of high-grade coal has been discovered near here. Plans are now on foot to develop the property and to construct a railroad from Sierra Blanca to the mines, a distance of about 28 miles. This coal deposit is about 75 miles west of the field which was exploited several years ago by a syndicate of Pittsburgh men.

PERSONALS

George Watkin Evans, consulting mining engineer of Seattle, during the latter part of March, visited southeastern Alaska on professional business.

Charles Dorrance, general manager of the Harwood Coal Co., has resigned to become assistant general manager of the Delaware & Hudson Coal Company.

Edwin Staley, formerly with the U. S. Bureau of Mines, has resigned in order to take charge of the office details of the Mine Safety Appliance Co., Pittsburgh, Penn.

B. R. Lindsay, formerly connected with the mining department of the Cambria Steel Co., as assistant superintendent of the Rolling Mill mine, has accepted a position at the Bowood mine of the Republic Iron & Steel Co.

Captain W. A. May, president of the Pennsylvania and Hillside Coal Co., informed the City Planning Commissioners of Pittston, who conferred with him at Scranton, that the mines of the companies would undoubtedly work steadily until July at least.

Chas. A. Sine, of Royalton, Ill., formerly general manager for John L. Mitchell's mining properties in Illinois, and J. B. Brown, manager of the Royalton mine, have resigned their positions to engage in the coal operating business at Sebree, Ky. They have acquired a mine at that place and are refitting it and expect to start operations shortly.

Alfred Kauffmann is now vice-president of the Link-Belt Co. in charge of operations at Indianapolis. Mr. Kauffmann served in the engineering department at Philadelphia for a number of years, from which he was promoted to take charge of the erection work of the company. He then proceeded to the sales department, looking after the coal mining business in the East, and particularly in the West Virginia field. His many friends in this industry will be glad to learn that in recognition of his competent and able work he has been elected vice-president of the Link-Belt Co.

OBITUARY

Simon Jones, identified for years with the mining interests of Kentucky, died at the age of 74 at his home in Render, Ky., after a long illness. A native of South Wales he came to this country in 1869 and was employed at St. Marys, Ind., Tamara, Ill., and Newburg, Ind. He then went to Earlington, Ky., where he opened the first mine for the St. Bernard Mining Co. in 1871. He became associated with the old Render Coal Co., in 1872 and remained with the Central Coal & Iron Co. when that concern absorbed the Render company.

RECENT COAL AND COKE PATENTS

Stoker. E. P. Stevens, Chicago, Ill. 1,127,940 Feb. 9, 1915. Filed Sept. 25, 1913. Serial No. 791,690.

Furnace Grate. A. Cotton, Newark, N. J. 1,117,795, Nov. 17, 1914. Filed Feb. 18, 1914. Serial No. 819,653.

Boiler Furnace. F. J. Widman, Chicago, Ill. 1,129,825 Feb. 23, 1915. Filed Jan. 7, 1914. Serial No. 810,832.

Coal Shifter. W. L. Marberry, St. Louis, Mo. 1,117,875, Nov. 17, 1914. Filed Apr. 3, 1914. Serial No. 829,391.

Coal Drill. J. G. Huntley, West Pittston, Penn. 1,128,878 Feb. 16, 1915. Filed Aug. 3, 1914. Serial No. 854,759.

Mechanical Stoker. A. G. Elvin, Somerville, N. J. 1,128,428 Feb. 16, 1915. Filed Oct. 21, 1913. Serial No. 796,377.

Smoke Consumer. A. E. Wilson, Indianapolis, Ind. 1,129,151 Feb. 23, 1915. Filed Aug. 14, 1914. Serial No. 856,740.

Rotating Mechanical Stoker. S. H. Dunning, Paterson, N. J. 1,118,748, Nov. 24, 1914. Filed July 16, 1914. Serial No. 851,243.

Coal Loading Device. W. W. Jamison, Greensburg, Penn. 1,128,880. Feb. 16,1915. Filed July 2, 1913. Serial No. 776,930.

Grate Construction for Furnaces. C. L. Davidson, New York, N. Y. 1,129,172. Feb. 23, 1915. Filed Aug. 15, 1911. Serial No. 644,097.

Leveler for Charges in Coke Ovens. D. F. Lepley, Connellsville, Penn. 1,129,352 Feb. 23, 1915. Filed Aug. 31, 1910. Serial No. 579,856.

Locomotive Fire Box. J. T. Anthony, assignor to American Arch Co., New York, N. Y. 1,118,615, Nov. 24, 1914. Filed Oct. 1, 1913. Serial No. 792,807.

Water Tube Boiler. J. E. Bell, assignor to Babcock & Wilcox Co., New York, N. Y. 1,129,538 Feb. 23, 1915. Filed July 8, 1907. Serial No. 382,588.

Mechanical Stoker for Promoting Smokeless Combustion. K. Yano, Oaza, Japan. 1,116,664, Nov. 10, 1914. Filed June 26, 1912. Serial No. 705,905.

Chain Grate Stoker. W. A. Jones, assignor to Babcock & Wilcox Co., Bayonne, N. J. 1,117,395, Nov. 17, 1914. Filed Feb. 3, 1913. Serial No. 745,776.

Steam Boiler Furnace. J. Wolff, assignor to Babcock & Wilcox Co., New York, N. Y. 1,129,534 Feb. 23, 1915. Filed Jan. 2, 1913. Serial No. 739,684.

Mining Machinery. C. O. Bemies, McClellandtown, Penn., and J. F. Bemies, New York, N. Y. 1,127,395 Feb. 9, 1915. Filed Nov. 7, 1910. Serial No. 591,031.

Means for Saving Fuel and Promoting Combustion in Furnaces. W. B. Evans, Philadelphia, Penn. 1,129,656 Feb. 23, 1915. Filed Nov. 28, 1913. Serial No. 803,496.

CONSTRUCTION NEWS

Linton, Ind.—A mine will be sunk on the 500 acres recently purchased three miles southwest of this city, by the Fourth Vein Coal Co. It will employ 400 people.

Mullens, W. Va.—W. H. Thomas, of Bramwell, W. Va., is making arrangements to start work at once on the Iroquois mine, on Winding Gulf Creek. The property will be placed in operation as soon as possible.

Scranton, Penn.—Work was recently begun in re-timbering the shaft of the Conklin mine, formerly the Clearview, by Markwick & Co. Later on the shaft will be sunk 250 ft. deeper so that coal in the Clark vein may be mined.

Baxter, W. Va.—The store building of the New Central Coal Co., at Baxter, which burned down some weeks ago, is now being rebuilt. The structure which will be about the size of the former building and two stories high, will be of concrete. It is being built on the same location as the building which was destroyed.

Barbourville, Ky.—Contracts are being placed for cross ties and other materials to be used in the Barbourville-Manchester extension of the Louisville & Nashville R.R., with every prospect that actual construction work will begin inside the next two months. Clay County supporters of the project have secured rights-of-way in that county and have raised a bonus of $50,000 and rights-of-way are now being signed in Knox County, while engineers are to go over the proposed route immediately.

Huntington, W. Va.—It is reported that 20 new coal companies will begin operations in Raleigh and Wyoming Counties within a short time. Of 30,000 acres of undeveloped coal land in the Winding Gulf section, approximately 23,000 acres will be developed within the next few months. Both the Virginian and Chesapeake & Ohio railroads are planning extensions, the former starting from Stone Coal Junction and extending up Stone Coal Creek, and the latter building from Woodpeck up Piney Creek.

Bearcreek, Mont.—Developments and improvements of considerable significance have been planned by the International Coal Co. The plans contemplate the tapping of the No. 4 vein at the International Plant. This will be the first time that this measure has been touched on the Bearcreek side. It is expected that by fall the new slope will be completed, a new electric system for handling the coal underground installed, and perhaps a new tipple built. This will increase the out put of the International by some 400 tons per day, and increase the working force from 160 to 200 men.

NEW INCORPORATIONS

Tacoma, Wash.—The Ozark Coal Mining Co. has been incorporated with a capital stock of $400,000. The incorporators are E. Hutchinson, D. W. Watkins and C. C. Leigh.

Pekin, Ill.—The Ubben Coal Co. has been organized with a capital stock of $25,000 to engage in coal mining. The incorporators are A. U. Ubben, Theodore H. Ubben and John Bonk.

Terre Haute, Ind.—The Vigo Mining Co., of Terre Haute, was recently incorporated with a capital of $50,000. The directors are J. G. Van Winkle, Samuel D. Royse and M. E. Godley.

Cincinnati, Ohio—The Matthew Addy Co. has been incorporated with a capital of $100,000 to mine and deal in coal, iron and coke by James A. Green, Louise Coy Green, Benj. N. Ford, A. Burt Champion and Leland G. Banning.

Charleston, W. Va.—A charter to do business in West Virginia was recently granted to the Loraine Coal & Dock Co. with head-quarters at Columbus, Ohio. It is the intention of this firm to develop coal mines in Logan County.

INDUSTRIAL NEWS

Bridgeport, Conn.—The Bridgeport Brass Co. is erecting an addition to its plant, necessitated by its increasing business.

Pittsburgh, Penn.—The Chas. T. Topping Machinery Co., dealers in contractors, mine and quarry equipment, announces the removal of its offices to Suite 928, Oliver Building.

Birmingham, Ala.—The Montgomery Coal Washer Co. announces that it has closed a contract with the National Coal Co., with general offices at Seattle, for a 300-ton washer, at a cost of about $9000.

Buffalo, N. Y.—The Buffalo & Susquehanna R.R., between Buffalo and Wellsville, will be continued until July 1 by court order. The line was some time ago ordered abandoned, but stays have been granted in the hope of selling it.

Grafton, W. Va.—A supplementary contract or agreement has been made by the Sterling Coal Co., of West Virginia and Ohio, making its property security for a bond issue of $2,500,000, which was issued in 1910 by the Guardian Savings & Trust Co., of Cleveland.

Juneau, Alaska—The United States Land Office has announced the cancellation of 47 coal claims in the Christopher group in the Behring River coal field. These claims cover 7000 acres which were held to have been fraudulently located.

Morgantown, W. Va.—According to reports received at the headquarters of the United Mine Workers, preparation for the opening of the spring trade is being made by local coal operators and the opening of navigation on the Lakes will find all the mines in the district working to the limit of their capacity.

Port Jervis, N. Y.—It is stated that coal in paying quantities has been discovered in the hills near this city by the North American Exploration Co., and that work will be started shortly on a drift to reach the coal measure. If this verifies reports on diamond drill borings submitted to mining engineers, coal mining will be started.

Offutt, Ky.—The large commissary owned by the Royal Colliery Coal Co. at Offutt, Ky., was recently entered by burglars and several hundred dollars' worth of merchandise was stolen. An attempt to blow the safe proved fruitless. Dynamite was found in the crevices near the hinges. The goods stolen consisted of clothing, shoes and pistols.

Buffalo, N. Y.—The Delaware, Lackawanna & Western R.R Co., which was ordered to remove its coal trestle on north pier by Apr. 1, has asked the government to be allowed to remove the structure 60 ft. back, thus allowing a wider harbor entrance and not interfering with navigation. It seems likely that a compromise will be reached on this basis.

Martins Ferry, Ohio—A deal was recently consummated whereby a company known as the Burlington Coal Co. became the owners of the Miles Megrail Coal Co. The amount changing hands as a result of the deal was not made public, but it is thought to have been considerable. The new owners will take possession shortly and a new tipple, office and barn will be erected and a number of other improvements will be made by the new firm.

Columbus, Ohio—Charles Seidenfeld, president of the Seidenfeld-Hammond Coal Co., of Columbus, announces that after Apr. 1 the executive offices of the company will be moved to the location of the operating offices, at Murray City, Ohio. Mr. Seidenfeld some time ago acquired the interests of E. H. Hammond in the company and has also taken over the entire ownership of the Skidmore Coal Co., of Rutland, Ohio. These companies will be operated separately.

Washington, D. C.—West Virginia coal operators from all parts of the state recently met in Washington to take preliminary steps looking to united action to protect the coal industry. Another meeting will follow shortly at which an organization will be formed to resist encroachments on the rights of coal men. It seems to be the consensus of opinion that something must be done to prevent attacks on the coal industry, state legislation evidently being held principally in view.

Bluefield, W. Va.—At the recent meeting of the Pocahontas Fuel Co., it was decided to establish a line of ships to ply between Hampton Roads and the New England coast, and engage in making coal deliveries for the company. It is understood that the new firm, or rather the subsidiary company, will be known as the Pocahontas Navigation Co., and it is expected that by the expiration of the present contract for transportation, the Pocahontas Navigation Co. will be ready for business.

Philadelphia, Penn.—The Circuit Court of Appeals on Mar. 26 dismissed a petition for rehearing in the case of Charles A. Otis, et al, plaintiff in error, versus the Pittsburgh Westmoreland Coal Co. in the Western District Court. In the petition filed by Otis, it was indicated that the Appellate Court had affirmed a judgment upon two equally inconsistent grounds, first as to acceptance, because the bonds in suit were taken under the written contract, and second, as to termination because they were so taken.

Charleston, W. Va.—The statement of the shipments of coal and coke over the lines of the N. & W. Ry. for the month of February and the two months of the current year, has just been made public. The statement shows 1,689,606 tons shipped during the month, as against 1,762,344 tons during the same month last year, a decrease of 72,738 tons. For the two months of the year 3,646,759 tons were shipped over the lines, as compared with 3,846,903 tons during the same period in 1914, a decrease of 200,144 tons.

Pittston, Penn.—Mayor M. N. Donnelly will appoint a committee of business men to solicit subscriptions to purchase the coal under the Reap property, which the government proposes to buy for a Federal building site, and to present the title to the mineral rights to the government. Purchase of the coal by the government would make the price exceed the appropriation for the purpose. The company asks $10,000 for the underlying mineral but the mayor believes the government will be satisfied with less than the entire amount of coal or sufficient to give surface support.

Huntington, W. Va.—According to plans presented at a recent meeting of stockholders at Ashland, Ky., various coal companies operating in the Big Sandy and Kentucky River valleys, whose aggregate capital amounts to about $3,500,000, will be incorporated as the Kentucky Coal Corporation. The companies concerned in this merger include the Letcher Coal & Coke Co., the Slemp Coal Co., the Henry Coal & Coke Co., the Haley Coal Co. and the Kentucky River Consolidated Coal Co. It is understood that the new company expects to start extensive new developments in the Big Sandy and Kentucky valleys as soon as the organization is perfected.

Coal Trade Reviews

General Review

Anthracite buying lacks the customary vigor that should characterize the opening prices. Bituminous continues dull and contracting is slow. Current sales substantially below normal and some agencies are attempting to force the market.

While the opening of the new coal year finds a large volume of anthracite coal moving it is clear that the season is not starting up with the customary snap. There is a large amount of coal in all directions, and buyers will have no difficulty in getting full shipments of any description they require. Now that the large companies are quoting the minimum price of the year, the dealer demand has shifted from the individuals, but buyers are failing to respond to low quotations with the usual vigor and the situation is replete with uncertainties. Interest is centering principally on the steam grades; the stocks of the large companies are all cleaned out of these sizes, and there is some anxiety as to the supply during the summer.

The Eastern bituminous trade is devoid of interest. Some buyers are apparently trying to force the market with low prices, but with indifferent success, while others have about made up their minds to await further developments. Very cheap coal is being offered at nearly all of the distributing centers, and current receipts are absorbed with considerable difficulty. A turn for the better in ocean freights, together with the exceedingly high prices ruling on Cardiff coals, has caused a better outlook in the foreign trade, and there are already an increasing number of vessels moving to South American points; a number of coastwise boats are also going into this trade as fast as they can be released.

Though consumption has increased somewhat in the Pittsburgh district, it is clear that the production has been advanced faster than conditions warranted and there is a decidedly depressed situation with a large surplus of free coal. Contracting is proceeding very slowly, and operators are showing a disposition to make attractive offers to induce business, but consumers are strongly inclined to withhold contracts and confine their purchases to the prompt market.

Production in Ohio continues at an exceptionally low ebb and the situation is still generally weak on all grades with little hopes for any improvement in the immediate future. Dealers' requisitions are at a minimum, while expiring steam contracts are being renewed with the greatest difficulty. Steam coals are scarce in the Southern market due to the limited work at the mines. The outlook for the summer stocking is regarded as unfavorable because of the unusually low prices ruling throughout the past year.

Sales throughout the Middle West are substantially below normal, and the beginning of this month finds a number of mines in certain districts closing down indefinitely pending an improvement in the market. A large number of contracts have been let at moderate recessions on last year's figures while prices generally are varying over a large range; collections are also slow. The market is being maintained only by the most rigid curtailment in production.

ATLANTIC SEABOARD

BOSTON

April opens with a mid-summer market. Pocahontas and New River cargoes arrive "on the market." Little doing on contracts. Georges Creek and the Pennsylvania grades also dull. Sailing vessels chartering for South America. Anthracite companies accept April business without reservation.

Bituminous—April finds the Pocahontas and New River market as lifeless as in July. There are few favorable sides to the situation; both f.o.b. and alongside there is no demand worth mentioning. Even coal for contract application is very dull and cargoes continue to arrive without orders. No new business of any size has been closed recently, although one of the largest power-house contracts is pending. Some of the shippers are striving to make prices that will induce buying but so far they have had little success. March was a mild month and stocks are still large in most directions. Buyers generally are holding off and several of the agencies have about decided to sit still and wait developments. The bids on the City of Boston harbor institutions later in the month are bound to be followed with much interest.

The export trade so far is not proving much help to the Hampton Roads shippers. Cargoes for South America are increasing in number but the vessels are mostly small. The high prices on Cardiff coals are expected to throw an extra demand on the Chesapeake Bay terminals but such demand seems to develop very slowly.

In Georges Creek, coal is accumulating at all the distributing points and a general curtailment is beginning to be enforced. Receipts here are absorbed only after delay, and inquiry is light.

The Pennsylvania grades also share the general dullness. The transportation that ordinarily brings the bulk of these coals here is just now engaged in the anthracite trade and that reduces the volume that will be received this month. Prices remain about the same, although most operations are under heavy curtailment. Coal comes down only on orders; few operators are now willing to stand the risk of demurrage at the loading ports. All-rail movement is only spasmodic.

Water Freights are still dull at 85@90c., Hampton Roads to Boston, on bottoms 2000 tons upwards. Sailing vessels are chartering on South American business as fast as they are free of coastwise engagements. Since these voyages are of three to four months' duration it takes them out of the New England market for most of the season. There is little enough inquiry, however, for the barges and steamers that are left and a further recession in rates is still looked for.

Anthracite shipments have come forward with a rush, so much so that many dealers are expecting to get their entire storage filled at minimum prices. There is apparently very little restriction this spring on the proportion of stove size in shipments and buyers are assured they can have about what they require. Individual shippers are holding out special inducements but the tonnage so far developed has been small. May has every appearance now of being a dull month in anthracite.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*..........	$0.90@1.40	$1.15@1.60	$1.67@1.77

Providence†......	....	....	....	3.55@3.73

* F.o.b. †On cars.

NEW YORK

General apathy in bituminous with contracting proceeding slowly. April anthracite business opening up slowly. Uncertainty in the steam grades. Holidays interfere with production.

Bituminous—The soft-coal market is more remarkable for its extreme apathy than anything else. Dullness prevails in all directions, with requisitions and contracts apparently down to an irreducible minimum, and no demand at all in the prompt market. The bunkering trade is fair, holding up somewhat better than anticipated, and coastwise water rates are practically back to a normal basis. Operating schedules at the mines continue at about half capacity.

In contracting circles, the principal feature of the week was the closing of the Lehigh Valley R.R. Co.'s contract involving about half a million tons. In general, contracting is proceeding slowly with concessions of various kinds still the rule. The prompt market continues quotable on the same basis as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—With the company circulars now down to the April schedule, dealers are shifting their orders from the individuals, with the result that the latter are feeling the effect of the restricted demand quite severely. The business during March was generally unsatisfactory, though this is usually the case during that month. The outlook for April is not very well defined as yet, but it will probably be lacking in the customary activity that usually characterizes the period during which the lowest prices of the coal year are in effect. Buyers will be able to get all the shipments they desire and probably in any proportion that they want.

There is considerable speculation over the outlook for the steam grades during the summer. It is generally felt that with the mines on heavily curtailed working schedules, as now seems to be the outlook, there is liable to be an acute shortage of the steam sizes. Nearly all the companies have picked up their reserve stocks of buckwheat and with the storage piles cleaned up they will, in any event, have to depend on their current production in the future.

Mine operations during the past week were heavily restricted by the holidays. Eight-hour day on Thursday, and Good Friday resulted in a suspension on both of these days in most cases at all of the collieries while at a great many the holiday was carried on through Saturday and Sunday with a result that most of the companies got only three days during the week.

The New York hard-coal market is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.60	$4.60	$4.55	$4.55
Egg	4.85	4.85	4.80	4.80
Stove	4.85	4.85	4.80	4.80
Chestnut	5.10	5.10	5.05	5.05
Pea	3.55	3.35@3.55	3.50	3.15@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.35@2.75
Rice	2.30	2.30@2.40	2.00@2.25	2.10@2.35
Barley	1.80	1.60@1.80	1.75	1.40@1.75

PHILADELPHIA

The anthracite market starts the season fairly active but there is an absence of the customary rush. Bituminous shows slight improvement here and there, as industrial conditions pick up.

Anthracite—There will be no surplus during the month of April, as practically every dealer is in the market for his requirements at the opening circular, but the fact still remains, that there is far from an optimistic feeling in either the wholesale or retail trade. Large dealers are predicting a slow market for the first three months of the coal year which is in sharp contrast with the conditions usually prevailing. Quite a large quantity of coal was carried over from the winter stocks, and there does not seem to be the usual disposition among householders to fill up their cellars at the spring prices.

The dealers are placing comparatively small orders for April shipment, as they do not expect a heavy demand, owing to the mild winter and the condition of the money market. This latter is receiving the particular attention of the retail men. Many of the dealers express the opinion that there will be no difficulty in securing all the coal they require at the April prices or even better, later in the season.

Bituminous—Here and there are indications of slight improvement in bituminous. The call for spot coal seems better, but this seems due to the fact that many purchasing agents are still combing the market for bargains, though it is also a fact that industrial conditions are slowly mending, and this would naturally have a tendency to improve the situation.

BALTIMORE

Bituminous business remains exceptionally quiet. Cool weather keeps up a small buying of anthracite. Foreign shipment prospects are good.

Bituminous is more or less of a drug on the market, as to spot business. Very cheap coal is offering at all of the mining centers. Fair grades of soft coal are offering in West Virginia and western Maryland as low as 85c., while the market for the less desirable kinds of coal is practically wiped out. Best coals are offering around $1.15 to $1.25. Pennsylvania low grade fuels are bringing from 85 to 95c., with best grades at about $1.20 and $1.25.

There is persistent demand for small quantities of hard coal for immediate household consumption. Most of the householders have reached the end of their winter supplies, and yet the weather has been very cool, the monthly average for March being about seven degrees below normal, with several days below freezing. Nut and pea coal have been the principal late sellers.

That April will be a good export month is indicated by the number of foreign charters. During the past week the following were noted: British steamer "Strathberg," to Sicily; bark "Bruce Hawkins," to Maranham, Brazil, at $5.70; British steamer "Holtye," to Geona; Italian steamer "Angelo Parido," to west coast of Italy, at $10.80; British steamer "American Transport," to River Plate, $9.60; schooner "Van Allens-Boughton," to River Plate, $8; British steamer "Westlands," to Alexandria, Egypt; British steamer "Llangollen," to Montevideo, $9.60.

TORONTO, CAN.

Dealers busy getting stocks cleaned up. Little coal coming in.

Trade is fair with a lessening demand for anthracite as the season advances. Stocks on hand are being reduced by dealers in view of stock-taking next month and anticipated fall in prices, and only a little coal is now coming forward. Quotations are as follows with some shading on wholesale bituminous: Retail anthracite egg, stove and nut, $8; grate, $7.75; pea, $6.75; bituminous steam, $5.25; screenings, $4.25@4.50; domestic lump, $6; cannel, $7.50; wholesale f.o.b. cars three-quarter lump, $3.80; screenings, $2.96.

OCEAN FREIGHTS

Steamers offering more freely and slight recessions are noted in rates.

A number of steamers have been chartered for export coal, some for South America and for the Mediterranean, at slight concessions under recently quoted figures. Steamers are offering more freely, but are being absorbed by various trades at rates slightly under those previously in effect.

Note—Steamers are indicated by **bold face type**, all others being schooners.

HAMPTON ROADS

Movement continues fair. Excess accumulation in railroad yards. Dumpings for March close to a million tons.

The dumpings over the tidewater piers during the week have shown up well. There have been large cargoes coastwise and while the export movement has not been as heavy as anticipated, at the same time some fair sized cargoes have moved to Cristobal, Rio de Janeiro, Havana, Iquique, Pernambuco, Santo Domingo and Genoa. The demand for Pocahontas and New River run-of-mine seems to be increasing somewhat although there is practically nothing doing with the high volatile or nut and slack. Export shipments are still being made by sailing vessels although during the last week the number sailing was not so great as the previous week.

Prices for the standard grades of New River and Pocahontas remain at circular with an excess accumulation in the railroad yards. One of the large coastwise colliers which has been in the foreign general cargo trade for several months, is again in the coastwise service having loaded about 7500 tons at Hampton Roads during the week. These large vessels are much more satisfactory to handle than barges or schooners and are dispatched much quicker in a majority of cases.

All of the coastwise movement of the week has been to the

New England market, the largest quantity going to Boston, Providence, Portland, Everett, Beverly, New Bedford, Portsmouth, and Lynn. Practically all of the coal moving has been New River and Pocahontas mine-run although there have been some small quantities of nut and slack and the high volatiles shipped on contracts.

From figures now obtainable the indications are that the dumpings for the month of March should amount to close around the million-ton mark.

Vessels clearing from Hampton Roads ports from March 19 to 26 inclusive, were:

Norfolk			Newport News		
Vessel	Tons	Destination	Vessel	Tons	Destination
Ocland	4800	Cristobal	**Tibagy**	3300	Pernambuco
Procida	5400	Genoa	**Olaf**	2500	Havana
Wm. Critchett	802	Santo Domingo		and 159	coke.
Napoli	5800	Genoa			
Rebecca Palmer	3505	Rio de Janeiro			
Celia	1241	Iquique			

Note—Steamers are indicated by **bold face type**, all others being schooners.

LAKE MARKETS

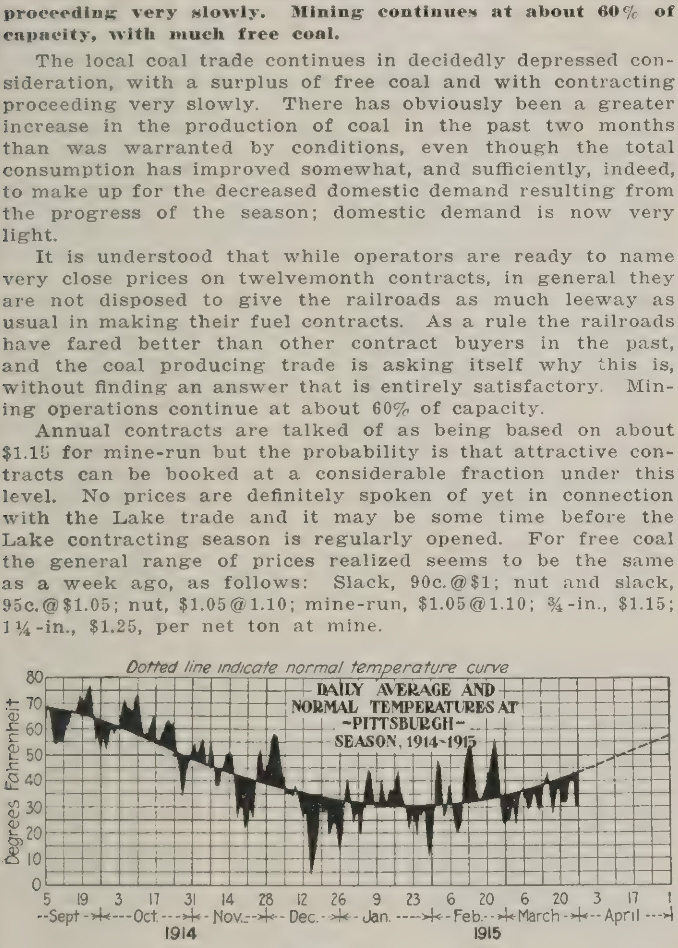
PITTSBURGH

Market still depressed with prices low and contracting proceeding very slowly. Mining continues at about 60% of capacity, with much free coal.

The local coal trade continues in decidedly depressed consideration, with a surplus of free coal and with contracting proceeding very slowly. There has obviously been a greater increase in the production of coal in the past two months than was warranted by conditions, even though the total consumption has improved somewhat, and sufficiently, indeed, to make up for the decreased domestic demand resulting from the progress of the season; domestic demand is now very light.

It is understood that while operators are ready to name very close prices on twelvemonth contracts, in general they are not disposed to give the railroads as much leeway as usual in making their fuel contracts. As a rule the railroads have fared better than other contract buyers in the past, and the coal producing trade is asking itself why this is, without finding an answer that is entirely satisfactory. Mining operations continue at about 60% of capacity.

Annual contracts are talked of as being based on about $1.15 for mine-run but the probability is that attractive contracts can be booked at a considerable fraction under this level. No prices are definitely spoken of yet in connection with the Lake trade and it may be some time before the Lake contracting season is regularly opened. For free coal the general range of prices realized seems to be the same as a week ago, as follows: Slack, 90c.@$1; nut and slack, 95c.@$1.05; nut, $1.05@1.10; mine-run, $1.05@1.10; ¾-in., $1.15; 1¼-in., $1.25, per net ton at mine.



BUFFALO

Contracts for bituminous scarce and prices low. Very little spot business developing. Large sales of pig-iron by local producers regarded as a hopeful sign. Anthracite more active.

Bituminous—Demand has not been gaining any momentum and all the agencies are reporting trade slow. A feeling of entire indifference on the subject of contracts prevails among consumers; there is a belief that business is to be poor throughout the year and consequently coal will be bought in the open market. Some large users are of course contracting as usual, but they are insisting on low prices; it is reported that they are meeting with success, though there is a feeling among many shippers that business will improve shortly and prices go higher. The Lake trade is not counted on for much this summer, but industrial conditions appear to be slowly mending. Coal on track is reported from leading Canadian centers, much to the injury of the market. Business in Canada remains poor and most factories are doing little.

The outlook for pig iron has been improved by the heavy sales which the local furnace interests have been making in New England; if pig iron revival is an indication of better business the situation is certainly encouraging. The business was taken at rather low figures, but furnaces have now advanced their quotations from $12 up to $12.50 for early delivery and $13 for delivery in the third-quarter of the year. Local furnaces will have plenty of business for some months to come.

Pittsburgh prices are uncertain at present and contracts are said to have been made at 5 to 10c. below the nominal figures which have been ruling for some time as follows: $2.80 for Pittsburgh select lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny Valley sizes about 25c. lower tnan Pittsburgh

Anthracite—The April demand starts off fairly well, though orders are scarcely up to a year ago. The retail dealer had a poor month during March, so that buying was limited to immediate requirements. Now a good many find their bins about empty and are taking advantage of the low prices. A large amount of coal is above ground and orders will be filled more promptly than in most previous years.

Loading of anthracite into vessels has been going on rather slowly of late, though more companies are now beginning to take some storage coal. An inactive season at the start is the prediction and there will be no such rush as occurred last year. About 30 cargoes have been loaded thus far.

TOLEDO

Slack the feature of local market. Lake business will be slow in opening. Large amount of coal at the upper ports.

There is very little life in the trade but in a short time the usual spring and summer contracts will be open for bids which will create some activity. The first large contract will be that of the board of education; this is always a large contract and is usually let about April or May.

The general trade, both steam and domestic, is light. Slack is growing scarce and firmer as to price but this seems to be about the only feature of interest at the present time. The Lake trade will open late; the amount of coal carried over at the upper ports is so large that there is little prospect of Lake business opening much before July.

Coal shipped from the Pocahontas field to Cleveland in the future will be advanced 10c. per ton so that the Cleveland tariff will be on a level with the Toledo rate of $1.45 per ton. The new tariffs will be effective Apr. 12 and will be issued by the Pennsylvania and Big Four roads.

COLUMBUS

The trade continues featureless. Both domestic and steam demand are quiet. Lake trade will be slow in opening.

Weakness still characterizes the domestic trade and steam business is also at a low ebb. There appears to be little hope for improvement until the stocking season opens. The indications are that the Lake trade will be slow in opening because of the large surplus being carried over on the docks of the Northwest.

Dealers are only buying when it is absolutely necessary to take care of scattered orders; they are not desirous of entering the summer season with any large stocks and have been devoting their attention to cleaning up. The weather has been mild and consequently retail orders have been few. Prices have held up firmly even in the face of the slack demand but the April discount is now in effect.

The steam business is slow, although quite a few steam contracts are expiring at this time and are being renewed with considerable difficulty. Prices generally are not lower than those prevailing last year but a large part of the steam tonnage is now being purchased in the open market at rather low figures.

Lake trade is still a matter of considerable speculation. Reports from the Northwest indicate that it will be late in opening, as about 4,000,000 tons will be carried over. Boats will be plentiful and very few have been chartered for the coal trade to date. Lake prices have not been fixed.

Production in Ohio fields has been small in every locality. It is believed that with the closing of many mines, the output in the Hocking Valley is only about 20% of normal and the same is true of Jackson, Crooksville, Cambridge and Massillon. In the Pomeroy Bend field the output is also small.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.45	$1.50	.....
Inch and a quarter	1.30	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	0.65	0.70	0.60
Coarse slack	0.55	0.60	0.50

CINCINNATI

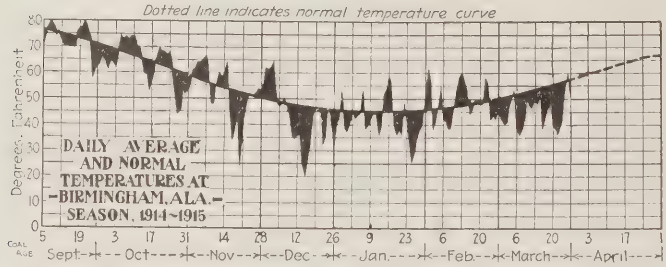
Improving industrial conditions and larger advance orders have caused a distinctly better tone. Continued over-production now the worst feature. The steam market is some stronger.

Cessation of domestic consumption and the delay in the opening up of the Lake trade have resulted in over-production, even with the mines on a restricted basis, but the steam market has been greatly improved. The large war orders, principally for machine-tools and ammunition, are having their effect and steam consumption is approaching a normal volume. In the absence of sufficient nut and slack, mine-run is being supplemented very generally. Many concerns using mechanical stokers have made arrangements to crush mine-run.

LOUISVILLE

Steam coals in active demand. Outlook on the summer stocking movement doubtful.

Steam coals continue scarce and strong, due to gradual improvement in the industrial situation, with nut and slack in the best demand at unchanged prices. It is hoped that a normal stocking business will be done in spite of the fact that during the past two winters it would have been possible for the retailers to have bought, at practically any time, at the prices they paid the operators during the early part of the season. Around $1.50 to $1.60 for the fancy coals and 65, 70 and .5c. for nut and slack of the better grades, are the prevailing prices.



COKE

CONNELLSVILLE

April furnace coke sold at good price. One large inquiry in market. Prompt coke dull. Production and shipments continue at fair rate.

The Producers Coke Co. has sold 10,000 tons of Thompson-Connellsville coke to the Eastern Steel Co. for April shipment at the reported price of $1.65 at the ovens. The contract made by the sales interest with Pickands, Mather & Co., for 10,000 to 12,000 tons a month to go to the Perry furnace at Erie, reported a week ago, likewise involved Thompson-Connellsville coke. The Pittsburgh Steel Co. is inquiring tentatively for about 20,000 tons of furnace coke for the twelvemonth beginning July 1 but negotiations are proceeding slowly as some operators are indisposed to quote for such extended delivery and none, apparently, will quote anything like the prices now ruling for prompt and second half. The prospective buyer has a contract with the Rainey interest running through June.

Prompt furnace coke continues in poor demand. Some choice brands are understood to have sold lately in a limited way at $1.65, but there is coke of fair grade available for spot shipment at about $1.50. We quote as the general market, depending on grade; Prompt furnace, $1.50@1.60; second quarter furnace, $1.60@1.65; second half furnace, $1.75; prompt foundry, $2@2.35; contract foundry, $2.20@2.30, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Mar. 20 at 279,442 tons, a decrease of 285 tons and shipments at 281,384 tons, an increase of 2032 tons.

Buffalo—Nothing has developed to increase the demand for coke, while it is stated that foundry coke is in increased supply, which will no doubt have some weakening effect upon prices in the near future. All grades are showing little activity. Prices remain the same at $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

Chicago—The demand for furnace and foundry cokes is light, with prices remaining unchanged. Domestic sizes show a little more activity. Quotations are as follows: Byproduct, $4.45@4.75; Connellsville, $4.65@4.80; Wise County 72-hr. (select), $4.50@4.75; gas coke, $4@4.10; furnace, $4.40@4.65.

THE STEEL INDUSTRY

War orders assuming large proportions. Domestic buying less than shipments.

Orders placed in the past two weeks with steel works in this country by European governments have exceeded those in any fortnight since the war began. An important French steel interest has just placed 100,000 tons of bars with a Lake steel works through a Central Western dealer and specifications for 45,000 metric tons of 2-in. and 3-in. rounds applying on this order are already in hand. Negotiations are pending for 30,000 tons additional. Deliveries are to be made at the rate of 25,000 tons a month.

That this country must furnish large amounts of steel first and last to France and England is daily more evident and the urgency of the need will relieve shipments on these contracts from the uncertainties of ordinary ocean transport, the governments themselves providing vessels in some cases.

In domestic business new buying in most lines has been less than shipments, production of finished material in March being the largest in months, and an excess of shipments over orders is indicated for the immediate future.—"The Iron Age."

MIDDLE WESTERN

CHICAGO

Market in a comatose condition. Steam coals still bullish but domestic sizes without snap. Production below normal.

The Western coal trade continues in the same dull condition. Complaints are general that sales are much below normal proportions, and buyers show an almost complete indifference. Contracts for screenings are being renewed, in some instances, at higher figures than last year, but a number of buyers are seemingly delaying action with the hope that after Apr. 1 they will be able to obtain concessions.

The fact that a number of Chicago municipal contracts were recently let at less than last year's prices is having a bad effect, and one or two other large contracts have been executed at slightly reduced figures. The tonnages called for by most contracts so far executed have been of about the same proportions as last season. Little progress has been made thus far in the closing of contracts for domestic sizes.

Screenings have been averaging well around the 90c. mark, reaching as high as $1.05 per ton in spots, which is the average price of mine-run.

The demand for all grades of Indiana coal is very quiet except in screenings, where the undertone is very strong due to decreased production.

Southern Illinois operators report bullish prices for screenings; the demand for domestic coal is nil, and prices for the coarse sizes at a low level.

The demand for railroad coal from the Springfield district has slightly increased the last week, and activity on screenings is pronounced. The price of fine coal has increased 10c. per ton.

There is a comparatively fair market existing for Hocking coals, and little consignment coal is being offered.

There is a surplus of eastern Kentucky coals and prices have been badly cut.

The demand for anthracite is exceedingly slow, and some anthracite from the docks has been offered in lots of 500 tons or more on a 35c. commission basis under list, but it has not had the effect of stimulating orders.

Prevailing prices are as follows:

	Williamson and Franklin Cos.	Springfield	Sullivan	Clinton	Carterville

ST. LOUIS

A slight change in certain directions but the general situation continues as discouraging as ever. A number of mines closed down indefinitely on Apr. 1.

As compared with conditions during the past two or three weeks, the present week was not as disappointing as anticipated. Orders from the country were a trifle more plentiful, even though the price was low, and this helped to some extent to off-set the lack of demand from the steam trade. Local retailers were kept fairly busy with continuous small orders, so that there was a light demand for domestic coal throughout the entire week.

The same applies to the 5th and 9th district, or Standard field. Even the washed market is not strong, with the exception of Nos. 3 and 4, which seem to be in demand. Mines in the southern Illinois field that have crushers are crushing their lump and egg to take care of their contracts on Nos. 2, 3 and 4.

Effective the first of April, several mines in both the high grade and the Standard district will shut down for an indefinite period, until market conditions are better.

During the past week a little anthracite has moved in at the April circular, and a fairly good tonnage has been placed for April, but not in the same volume as in past years. There is very little doing in smokeless.

PORTLAND, ORE.

Warmer weather causes falling off in demand for domestic coal and business is quiet.

Warmer weather set in here this week and the dullness of spring is evident in the coal business. Until lower prices are put into effect to induce buying for storage for the next winter, this will undoubtedly continue. The summer prices will probably go into effect this month.

PRODUCTION AND TRANSPORTATION STATISTICS

BITUMINOUS COAL MOVEMENT

The following is a summary of the movement of coal and coke over 13 principal railroads during November and the first twelve months of the last two years, in short tons:

	December		12 Months	
Anthracite	1913	1914	1913	1914
Baltimore & Ohio[1]	118,264	126,240	1,516,916	1,371,563
Chesapeake & Ohio[1]	681	1,082	16,545	16,728

[1] Includes coal received from connecting lines.

[2] Includes company's coal.

[3] Does not include company's coal hauled free.

Note:—The Southern Railway hauled 282,881 short tons of bituminous coal during November, 1914, and 3,607,584 short tons during the eleven months ending Nov. 30, 1914.

BALTIMORE & OHIO

The following is a statement of coal and coke tonnage moved over this system and affiliated lines during February and the previous two months:

	December		January		February	
	1914	1913	1915	1914	1915	1914
Coal	2,227,899	3,005,914	2,293,406	2,917,834	1,906,210	2,385,243
Coke	232,594	269,998	221,395	274,955	232,111	265,380
Total	2,460,493	3,275,912	2,514,801	3,192,789	2,138,321	2,650,623

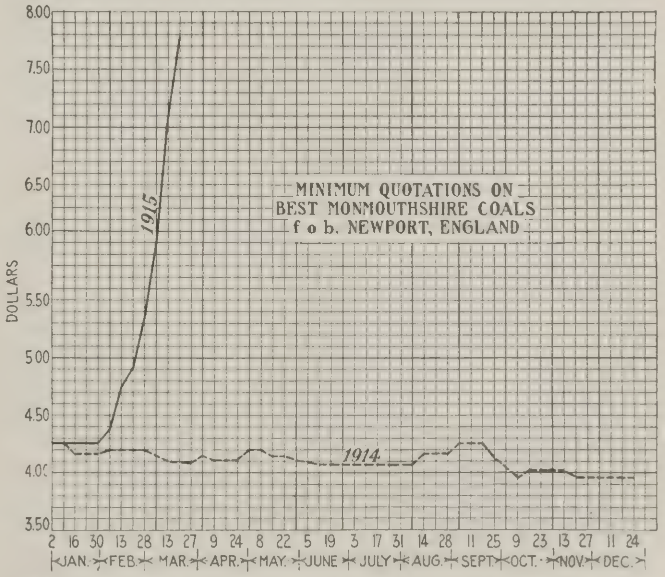
FOREIGN MARKETS

GREAT BRITAIN

Unsettlement in labor circles still the predominating feature of the coal market. House coals a trifle easier.

London, Mar. 19—Labor difficulties still loom large in the coal mining industry, and are engaging a great deal of attention which might be devoted to meeting the needs of the country in the present crisis. It is to be regretted that the Welsh miners have rejected the offer made by the coal owners, and at the special conference of the Miners' Federation of Great Britain held in London on Wednesday it was resolved to demand a general increase in wages to the extent of no less than 20 per cent. in view of the increased cost of living. The provisional agreement arrived at by the Conciliation Board for England and North Wales has been accepted by the men, and that difficulty is out of the way perhaps, but at present interest is naturally centered upon the demand for an immediate advance in wages all round, which may be considered apparently by a joint conference of employers and employed which the Mining Association of Great Britain has been requested to convene.

Despite the possibility of a higher wages bill, the market has been a little easier during the week so far as house coal is concerned, but most other kinds are firmly maintained at their former level, while in some cases further advances are reported.—"The Iron & Coal Trade Review."



Mar. 19—There is not much alteration in the general conditions. Tightness is fully maintained for all qualities, the production being still limited, while the demand is as heavy as ever. Quotations are approximately as follows:

Best Welsh steam	Nominal	Best Monmouthshires	$7.68@7.92
Best seconds	$7.92@8.16	Seconds	7.44@7.68
Seconds	7.68@7.92	Best Cardiff smalls	4.92@5.16
Best dry coals	7.20@7.68	Cargo smalls	4.32@4.56

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport both net, exclusive of wharfage.

Freights—Business is still very quiet. In most directions rates have sharply declined due to shortage of coal and the dearth of stems. Rates are approximately as follows:

Gibraltar	$5.04	Naples	$6.48	Las Palmas	$5.04
Malta		Venice, Ancona	9.60	St. Vincent	5.28
Marseilles	5.60	Alexandria	7.20	Rio Janeiro	7.44
Algiers	5.40	Port Said	6.72	Monte Video	6.72
Genoa	6.24			River Plate	6.96

Note—These quotations are based on an exchange rate of 24c. to one shilling.

Coal Contracts Pending

Contracts listed in this department are authoritative in every respect except where the source of information is questionable, in which event it is noted. All contracts are listed promptly on receipt and only repeated when additional information becomes available or in the last issue previous to the day on which bids will be closed. Liberal remuneration will be paid for all legitimate notices of this kind sent in.

+Indicates contracts regarding which official information has been received.

+No. 96—Farmington, Mo.—The Municipal Electric Light & Water Plant will be in the market during the current month for about 200 tons of 1½- to 2-in. screenings (p. 356). The usual contract price is $1.90 f.o.b. railroad station, Farmington. Address Supt. C. M. Thomsen, Municipal Electric Light & Water Plant, Farmington.

No. 97—Baltimore, Md.—According to recent press reports, this contract (p. 356), which provides for furnishing about 210,000 tons of soft coal to the Merchants' and Miners' Transportation Co., has been awarded. The Baker-Whiteley Coal Co., Shaw Bros., and Coale & Co., received a large portion of the Baltimore supply, and part of the Philadelphia supply, and W. H. Bradford, Philadelphia, received a large part of the Philadelphia business. It is understood that the supply for Newport News went to several out-of-town concerns. Address Pur. Agt. and Gen. Mgr. W. P. Coria, Merchants' and Miners' Transportation Co., Baltimore, Md.

No. 107—New York, N. Y.—The New York & Baltimore Transportation Co. purchases about 60,000 tons of soft coal per year (p. 357). This contract will be let during the current month. Address Pur. Agt. B. R. Roome, Pier 10, East River, New York, N. Y.

No. 110—Baltimore, Md.—The Maryland Biscuit Co., Baltimore, purchases 1200 tons of bituminous coal per year (p. 357). This company lets its contract during the current month. Address Pur. Agt. W. C. Scott, Maryland Biscuit Co., Baltimore, Md.

No. 112—Baltimore, Md.—The Coca-Cola Co. will award a contract during the current month for a supply of good grade steam coal (p. 357). Address Pur. Agt. William Martien, 3 Calvert St., Baltimore Md.

No. 114—Baltimore, Md.—Wise Bros. will soon be in the market for a supply of standard grade mine-run coal, the present contract expiring this month (p. 357). Address Pur. Agt. and Supt. L. A. Hazzard, Wise Bros., Baltimore, Md.

No. 116—Baltimore, Md.—Stewart & Co., of this city, consumes about 200 tons of Georges Creek coal per month (p. 357). The present contract expires this month, and is awarded on a competitive basis. Bids are received by J. Middleton. Address Pur. Agt. Geo. R. Russell, Baltimore, Md.

No. 117—Boston, Mass.—The Stone & Webster Co. will be in the market this month for 50,000 tons of New River and Pocahontas mine-run coal, deliveries to be made in proportionate amounts each month at Tidewater, Boston (p. 357). Address R. E. Hamilton, 147 Milk St., Boston, Mass.

No. 123—Baltimore, Md.—The G. B. S. Brewing Co. consumes about 10,000 tons of standard mine-run coal per year. The present contract expires this month (p. 357). Address M. L. G. Fesenmeier, care of the G. B. S. Brewing Co., Baltimore, Md.

+No. 143—Buffalo, N. Y.—The lowest bids submitted on this contract (p. 398), which provides for furnishing the annual supply of anthracite and bituminous coal for the schools and other buildings were as follows: C. A. & M. Kaiser, bituminous: Mine-run, $2.65; screened nut, $2.60; slack, $2.45; screenings, $2.15; smokeless, $2.70. Connell Anthracite Mining Co. quoted on anthracite as follows: Grate, $5.10; egg, $5.30; pea, $4.25. Address Comr, of Public Works, Col. Francis G. Ward, Buffalo, N. Y.

No. 165—Stamford, Conn.—Beck & Co. will contract for 2500 tons of bituminous coal about Apr. 7 (p. 399). Address Pur. Agt. George F. Leeming, 206 West 29th St., New York, N. Y.

+No. 205—Norristown, Penn.—The local Board of Education will be in the market this month for 165 tons of anthracite, egg and stove coal each, 225 tons of pea, and 150 tons of bituminous coal (p. 400). Address Sec. Harry W. Akins, 717 DeKalb St., Norristown, Penn.

+No. 206—Woonsocket, R. I.—The local school board will be in the market some time this month for about 1000 tons of the best Lehigh and Scranton coal (p. 400). Address Chn. of Comn. on Supplies, T. Guerin, care of Alsace Worsted Co., Woonsocket, R. I.

+No. 225—Madison, Wis.—The Board of Education of this place will be in the market this month or next for about 500 tons of anthracite pea and Pocahontas coal (p. 446). Address Chief Clk., Board of Education, Madison, Wis.

+No. 268—Buffalo, N. Y.—On this contract (p. 448), which provides for furnishing anthracite and bituminous coal as required by the Police Department during the year beginning Apr. 10, the Buffalo Fuel Co. submitted the lowest bid. Address Board of Police Commissioners, Headquarters Bldg., Franklin and Seneca St., Buffalo, N. Y.

+No. 282—Meriden, Conn.—The School Board here will place a contract for about 800 tons of anthracite coal this month (p. 448). Address Chairman of Committee on Buildings, School Department, Meriden, Conn.

+No. 298—Clarendon, Ark.—The Clarendon Electric Light & Ice Co. will be in the market this month for about 2400 tons of pea and slack coal (p. 488). Address Cont. Agt. J. T. Bateman, Clarendon Electric Light & Ice Co., Clarendon, Ark.

+No. 305—Atlantic, Iowa—The Municipal Electric Light Works will contract this month for about 4300 tons of Iowa steam coal (p. 488). Address Mgr. T. E. Nichols, Municipal Electric Light Works, Atlantic, Iowa.

+No. 306—Algoma, Wis.—The City Water & Light plant will be in the market this month for a supply of mine-run Youghiogheny coal (p. 488). Address Supt. J. O. Posson, City Water & Light Plant, Algoma, Wis.

+No. 311—Chaska, Minn.—The Municipal Electric Light & Power Plant of this place will be in the market this month for approximately 800 tons of coal (p. 488). Address Mgr. & Supt. E. F. Strong, Municipal Electric Light & Power Plant, Chaska, Minn.

+No. 316—Wyandotte, Mich.—The Municipal Light & Water Plant will be in the market this month for 5000 tons of West Virginia mine-run coal (p. 488). Address Supt. A. S. McClenehan Municipal Light & Water Plant, Wyandotte, Mich.

+No. 320—Clarion, Iowa—The Clarion Light Plant will be in the market this month for 1000 tons of ¾-in. Christopher Illinois screenings (p. 527). Address G. Mack, Clarion Light Plant, Clarion, Iowa.

No. 349—Baltimore, Md.—The National Enameling & Stamping Co. advises that it is not in the market for coal as stated in our previous issue (p. 566). Address Pur. Agt. R. D. Samuels, 305 Fifth Ave., New York, N. Y.

No. 371—Alexandria, Ind.—This contract (p. 567) provides for a supply of mine-run coal for the Alexandria Paper Co., and not the Alexander Paper Co., as stated in our last issue. Address the Alexandria Paper Co., Alexandria, Ind.

NEW BUSINESS

+No. 432—Minneapolis, Minn.—The Board of Education at this place will be in the market during April or June for about 15,000 tons of bituminous and semibituminous coal. This includes the annual supply, and the contract is awarded on the B.t.u. basis. Address Business Agt. F. E. Reidhead, Board of Education, 407 City Hall, Minneapolis, Minn.

+No. 433—Reading, Penn.—The Board of Education at this place will be in the market during April or May for approximately 2500 tons of pea, egg and stove coal. This contract is usually let to local dealers. Address Secy. F. Roland, Jr., Board of School Directors, Reading, Penn.

No. 434—Adams, Mass.—The Renfrew Mfg. Co. will be in the market for 4000 to 6000 tons of anthracite and bituminous coal about May 1, delivery via B. & A. R.R. Address Treasurer, Renfrew Co., Adams, Mass.

+No. 435—Gloversville, N. Y.—The Board of Education at this place will purchase about 800 tons of egg coal during May or April. The present contract was closed at $6.60 per ton, and was awarded to a local company. Address Supply Committee, Board of Education, Gloversville, N. Y.

+No. 436—West Point, N. Y.—Sealed proposals in triplicate will be received until 2 p.m., Apr. 26, for furnishing anthracite coal required at the U. S. Military Academy during the fiscal year ending June 30, 1916. Address Quartermaster, U. S. Military Academy, West Point, N. Y.

+No. 437—Boston, Mass.—Sealed proposals will be received until 2 p.m., Apr. 14, for furnishing 2000 tons of anthracite coal and 1300 tons of bituminous coal to the Post Office and Sub-Treasury building during the fiscal year ending June 30, 1916. Address Custodian William F. Murray, U. S. Post office and Sub-Treasury, Boston, Mass.

+No. 438—Fort Reno, Okla.—Sealed proposals will be received until noon, Apr. 22, for furnishing domestic and steam coal as required during the fiscal year, commencing July 1, 1915. Address Depot Quartermaster, Fort Reno, Okla.

+No. 439—Fort Sam Houston, Tex.—Sealed proposals will be received until 11 a.m., Apr. 15, for furnishing charcoal and smithing coal, as required at the Southern Department posts during the fiscal year commencing July 1, 1915. Address Depot Quartermaster G. S. Bingham, Fort Sam Houston, Tex.

No. 440—Chicago, Ill.—The American Compound Door Co. will be in the market about Apr. 20 for a month's supply of Franklin County, Illinois, No. 2 nut coal. This company consumes from 350 to 400 tons per month. Address the Purchasing Agent, American Compound Door Co., Chicago, Ill.

+No. 441—Garfield, N. J.—The Standard Oil Co. at this place is in the market for 2000 tons No. 1 buckwheat, deliveries to be made over the next year. Address Coal Pur. Agt. J. L. Hutchinson, 26 Broadway, New York City.

+No. 442—Minot, N. D.—Sealed bids will be received until 2 p.m., Apr. 5, for furnishing coal to Ward County for the ensuing year. Address County Audr. L. J. Thompson, Minot, N. D.

+No. 443—Troy, N. Y.—Sealed proposals were received until 11 a.m., Apr. 2, for furnishing and delivering anthracite coal to the various city buildings and charities, for the season of 1915-16. Address Secy. John J. McLaughlin, Board of Contract and Supply, Room 21, City Hall, Troy, N. Y.

+No. 444—Kalamazoo, Mich.—The Board of Education is in the market for about 3500 tons of Pocahontas mine-run coal and bituminous No. 2 gas coal. Address the Secretary, Board of Education, 207 Majestic Bldg., Kalamazoo, Mich.

+No. 445—National Soldiers' Home, Tenn.—Sealed proposals will be received until 2 p.m., Apr. 19, for furnishing and delivering 10,500 tons of bituminous coal to the National Soldiers' Home, Mountain Branch, N. H. D. V. S. Delivery is to be made according to instructions. Address Treas. Oliver K. Marshall, Mountain Branch, N. H. D. V. S. National Soldiers' Home, Tenn.

No. 446—Buffalo, N. Y.—The Larkin Co. at this place is in the market for a supply of slack coal, contract to go into effect Apr. 1, and the amount required being from 100 to 150 tons per day. Address Purchasing Agent, Larkin Co., Buffalo, N. Y.

No. 447—Alexandria, Ind.—The General Ins. & Mfg. Co. is erecting a plant at this place, and it is understood that they will be in the market for coal about Apr. 1. Address General Ins. & Mfg. Co., Alexandria, Ind.

+No. 448—Springfield, Mass.—Sealed proposals will be received until 10 a.m., Apr. 15, for furnishing coal to the armory for the fiscal year commencing July 1, 1915, and ending June 30, 1916. During the fiscal year ending June 30, 1915, 65,000 lb. of egg and 110,000 lb. of nut coal were used. Address Depot Quartermaster, Springfield Armory, Springfield, Mass.

+No. 449—Fort Wayne, Ind.—Sealed proposals will be received until 5 p.m., Apr. 9, for furnishing and delivering to the different engine houses, 165 tons of nut coal, 64 tons of egg coal, and 17 tons No. 4 stove coal. Address Clk. D. C. McCarthy, Board of Public Safety, Fort Wayne, Ind.

+No. 450—Braddock, Penn.—Sealed bids will be received until 7:30 p.m., Apr. 4, for supplying the Braddock Water Works with the best steam mine-run coal for one year, beginning Apr. 1, 1915. The amount required is about 125 tons per week, to be delivered as specified by the Water Commissioner, at water works siding of the P., McK. & Y. R.R. Bidders are to state from which mine coal is to be supplied, and bond of $1000 is required. Address Secy. L. L. Todd, Braddock, Penn.

No. 451—Chicago, Ill.—The American Sand & Gravel Co. will purchase throughout the coming year about 100 cars of Illinois or Indiana lump coal. The first purchase will be made about Apr. 15. Address Gen. Mgr. Fisher, American Sand & Gravel Co., Chicago, Ill.

+No. 452—San Francisco, Calif.—Sealed proposals will be received until 10 a.m., Apr. 15, for furnishing bituminous mine-run coal for steaming purposes for the army transports, also screened bituminous coal for the National Cemetery and Recruiting Office. Address Depot Quartermaster Lieut. Col. W. H. Hart, 1086 North Point St., San Francisco, Calif.

+No. 453—Fort Keogh, Mont.—Sealed proposals will be received until 11 a.m., Apr. 26, for furnishing 600 tons of lump coal and 150 tons of pile-run coal, at the Fort Keogh Remount Depot, Mont. The storage capacity is 400 tons lump and 150 tons pile-run. The siding of the N. P. Ry., also the siding of the C. M. & St. P. Ry. Co., permit direct unloading into storage shed. Address Depot Quartermaster Capt. Sam. Van Leer, Fort Keogh Remount Depot, Mont.

No. 454—Cleveland, Ohio—The Municipal Electric Light Dept. will be in the market about Apr. 1 for from 35,000 to 40,000 tons of Youghiogheny coal. The present contract was closed at $1.70 per ton. Address Supt. of Service and Distribution C. G. Beckwith, Municipal Electric Light Dept., Cleveland, Ohio.

+No. 455—Clinton, Mass.—Sealed bids were received up to noon, Mar. 30, for supplying the School Department with coal. Address Frederick E. Clerk, Clinton School Committee, Clinton, Mass.

+No. 456—Dell Rapids, S. D.—Sealed bids will be received until noon, Apr. 6, for furnishing 500 tons of Youghiogheny coal to the city, for the year commencing Apr. 1. Delivery is to be made as required. Address City Audr. James Ridlington, Dell Rapids, S. D.

+No. 457—Belle Fourche, S. D.—Bids will be received until noon, Apr. 6, for furnishing egg, lump, and mine-run coal to the County Court House and Jail. Address County Audr. N. P. Lang, Belle Fourche, S. D.

No. 458—Baltimore, Md.—Press reports state that bids will soon be received for furnishing about 25,000 tons of bituminous coal for the Maryland penitentiary, House of Correction at Jessups, the State Sanitarium at Sabillasville, and the Maryland Agricultural College at College Park. Samples are to be analyzed by the United States Bureau of Mines. Bids are to be submitted separately on each contract or one bid is to be made on all contracts.

No. 459—Chicago, Ill.—The American Cocoa Butter Co. will be in the market about July 1 for a supply of Indiana mine-run coal, the contract to cover a period of one year. This company uses about 200 tons per month. Address the Purchasing Agent, American Cocoa Butter Co., Chicago, Ill.

+No. 460—Belvidere, Ill.—The Board of Education at this place will be in the market during July for about 300 tons of Winifred Splint and Pocahontas coal. Address Secy. R. B. Andrews, Board of Education, Belvidere, Ill.

+No. 461—Boston, Mass.—Sealed bids will be received until noon, Apr. 7, for furnishing and delivering about 41,300 gross tons of coal, as follows:

PLAN NO. 1—For big vein Georges Creek Cumberland coal, mined in Maryland, or best quality Pocahontas or New River.

PLAN NO. 2—Or for any good steaming coal, to be paid for on a valuation basis, to be delivered as follows: About 800 tons in bins of Children's Institutions Dept., Suffolk School, Rainsford Island; about 6000 tons in bins of Infirmary Dept., Almshouse and Hospital, Long Island; about 11,000 tons in bins for Ferry Service; about 8000 tons in bins of the Calf Pasture Pumping Stations, Sewer Division: about 6500 tons alongside Penal Institutions Dept., Deer Island; about 9000 tons in bins to the City Hospital, deliveries as required by the Superintendent. Address Supt. of Supplies D. Frank Doherty, Room 808, City Hall Annex, Boston, Mass.

No. 462—Rochester, Ind.—The Rochester Electric Light, Heat & Power Co., at this place, will soon be in the market for approximately 7000 tons of Indiana mine-run, or coal of equal quality. Address Mgr. Charles Davis, Rochester Electric Light, Heat & Power Co., Rochester, Ind.

No. 463—LaFayette, Ind.—The Wabash Valley Coal Co. is in the market for a supply of Indiana 1¼-in. and 4-in. lump coal and also a supply of egg coal. Address Secy. P. F. Freel, Wabash Valley Coal Co., LaFayette, Ind.

No. 464—Boston, Mass.—Bids will be received about May 1 for furnishing about 3500 tons of anthracite coal, furnace size, to the State House. Delivery is to be made as required. Address Sargeant-at-Arms Thomas F. Pedrick, State House, Boston, Mass.

+No. 465—St. Louis, Mo.—The Board of Education here will be in the market during May for about 30,000 tons of bituminous coal and 700 tons of anthracite. Pennsylvania anthracite best quality coal, in stove and chestnut sizes, and standard Illinois bituminous screened coal is required. The present contract was closed as follows: Stove, $7.60; chestnut, $7.85; bituminous, $1.77¼. Address Supply Comr. E. M. Brown, 3431 School St., St. Louis, Mo.

+No. 466—Reading, Penn.—Sealed proposals will be received until 10 a.m., Apr. 14, for furnishing 400 tons of pea coal and 50 tons of stove coal to the Berks County Prison. Coal is to be freshly mined and is to be either Schuylkill Valley or Lorberry red ash. Address County Controller D. K. Hoch, County Controller's Office, Reading, Penn.

+No. 467—Somerset, Penn.—Sealed proposals will be received until 1 p.m., Apr. 6, for furnishing coal at the Water Works, Pumping Station, and Municipal Building. Address Secy. C. E. Pile, Town Council, Somerset, Penn.

+No. 468—Constable Hook (Bayonne), N. J.—The Standard Oil Co. will receive bids for anthracite coal for delivery at this point. The tonnages involved are 13,000 tons of pea coal and 6000 tons of No. 1 buckwheat. The contract will be closed this month. Address, Coal Pur. Agt. J. L. Hutchinson, Standard Oil Co., 26 Broadway, New York City.

No. 469—Chicago, Ill.—The American Hide & Leather Co. will be in the market about June 15 for a supply of Illinois or Indiana screenings and Illinois or Indiana mine-run coal. This company uses from 400 to 500 tons of screenings per month and two cars of mine-run coal. This contract is to cover a period of one year. Address Assist. Pur. Agt. Mr. Bruno, American Hide & Leather Co., Chicago, Ill.

+470—Batavia, Ohio—Sealed bids were received until noon, Mar. 26, for furnishing genuine Thacker mine-run coal or Pocahontas mine-run coal, for operating and running the waterworks and electric light plant at Batavia. Address Secy. Thomas Glancy, Board of Public Affairs, Batavia, Ohio.

No. 471—Chicago, Ill.—Spielman Bros. Co. contract about Apr. 1 for approximately 4000 tons of egg or mine-run coal, the present supply coming from southern Illinois. Address Pur. Agt. Geo. W. Raithel, Spielman Bros. Co., Kingsbury and North Ave., Chicago, Ill.

No. 472—Traverse City, Mich.—Bids were received on Mar. 30 for furnishing the City Water Works, a supply of mine-run, lump or slack coal. The works consume from six to seven carloads per annum, and delivery is made via the G. R. & I. R.R., or the Pere Marquette R.R. Address City Clk. W. H. Nash, Traverse City, Mich.

+No. 473—Portland, Ore.—Sealed proposals will be received until Apr. 20, for furnishing the steam and lump coal required at Portland and Astoria, Ore., and Seattle, Wash., for vessels and stations of the 16th and 17th lighthouse during the fiscal year ending June 30, 1916. Address Lighthouse Inspector, Portland, Ore.

+No. 474—Niagara Falls, N. Y.—Sealed bids were received until 8 p.m., Mar. 29, for furnishing 1500 tons of anthracite coal in grate, egg, stove, chestnut and pea sizes, to be delivered to the various school buildings in the city. About 1260 tons is for immediate delivery and the balance as directed. Address Clk. J. B. Kelley, Supply Committee, Board of Education, Niagara Falls, N. Y.

+No. 475—Rock Island, Ill.—Sealed proposals will be received until 11 a.m., Apr. 15, for furnishing fuel to the Arsenal for the fiscal year commencing July 1. Address Lieut.-Col. Kenneth Morton, Rock Island Arsenal, Ill.

+No. 476—Jeffersonville, Ind.—Sealed proposals in triplicate will be received until 10 a.m., Apr. 21, for furnishing about 1,000,000 lb. of bituminous coal to the Jeffersonville depot during the period commencing July 1, 1915, and ending June 30, 1916. Address Maj. Joseph T. Davidson, Jeffersonville, Ind.

No. 477—Chicago, Ill.—The American Asphalt Paving Co. at this place will be in the market about May 1 for approximately 4000 tons of No. 3 washed or raw Illinois or Indiana nut coal. Address Purchasing Agent, American Asphalt Paving Co., 133 West Washington St., Chicago, Ill.

+No. 478—Newfoundland, N. J.—The Standard Oil Co. at this place is in the market for 3000 tons of No. 1 buckwheat, delivery to be made via New York, Susquehanna & Western. Address Coal Pur. Agt. J. L. Hutchinson, Standard Oil Co., 26 Broadway, New York City.

No. 479—Jersey City, N. J.—The Public Service Gas Co. is in the market for 25,000 tons of coal, to be delivered during the period beginning Apr. 1, 1915, and ending Mar. 31, 1916. Deliveries are required alongside the Gas Company's dock on the Hackensack River, West End Works, Jersey City. Address Pur. Agt. J. A. Pearson, Public Service Gas Co., Broad and Arch Sts., Philadelphia, Penn.

+No. 480—Toronto, Ont., Can.—The University of Toronto is in the market for about 8000 tons of bituminous slack coal and 2000 tons of anthracite grate, stove and nut sizes, deliveries to be made some time after July. At present, tests are being made of various kinds of coal for the central heating plant of the University. Address Superintendent, the University of Toronto, Toronto, Ontario, Can.

+No. 481—Toronto, Ont., Can.—The City Property Department will soon be in the market for 3500 tons of anthracite, 500 tons of bituminous coal and 2000 tons of slack coal. Address Property Comr. Daniel Chisholm, Toronto, Ont., Can.

No. 482—Louisville, Ky.—The Kentucky Wagon Mfg. Co. is testing various grades of coal in order to find the variety that is best adapted to its needs. This company consumes about 8000 tons per year, and usually contracts during January for its supply. Although the present contract has been let, it is understood that the supply does not come up to the requirements of the company and there is a probability of a change being made. Address Pres. R. V. Board, Kentucky Wagon Mfg. Co., Louisville, Ky.

No. 483—Chicago, Ill.—The Hartman-Sanders Co. will soon be in the market for about 25,000 tons of 2-in. southern Illinois screenings, or some coal of equal quality. Address Pres. A. P. Weidner, Hartman-Sanders Co., 2155 Elston Ave., Chicago, Ill.

No. 484—Holland, Mich.—The present contract of the Holland-American Sugar Co. for 20,000 tons of slack and 3500 tons of lump coal expires on Apr. 30. This coal comes from West Virginia mines. Address Pur. Agt. C. M. McLean, Holland-American Sugar Co., Holland, Mich.

No. 485—Chicago, Ill.—The Art Bedstead Co. at this place will be in the market about May 1 for several cars of No. 2 southern Illinois washed nut coal. This company purchases about 1200 tons of this grade during the year. Address Gen. Mgr. F. W. Adams, Art Bedstead Co., Chicago, Ill.

CONTRACTS AWARDED

Note—Successful bidders are noted in **bold face** type.

No. 285—Lynchburg, Va.—This contract (p. 187), which provides for furnishing approximately 800 tons of coal, has been awarded to **Diuguid Bros.**, at $3.25 for mine-run coal and $6.90 for Pennsylvania anthracite. Address City Clk. J. M. Otey, Board of Education, Lynchburg, Va.

+No. 296—Leavenworth, Kan.—This contract (pp. 488 and 566) has been awarded to the **Carr Coal Mining & Mfg. Co.** for furnishing screen lump coal at $2.10 per half-ton lots and $3.90 per ton lots. Address County Clk. J. E. Voorhees, County Clerk's Office, Leavenworth, Kan.

+No. 334—Jersey City, N. J.—This contract (p. 566), which provides for furnishing anthracite coal to the various public school buildings, has been awarded to the **E. L. Young Co.**, 507 Grand St., Jersey City. Address Secretary, Board of Education, Jersey City, N. J.

+No. 344—Attleboro, Mass.—This contract (p. 528), which provides for furnishing and delivering 450 tons of bituminous coal, has been awarded to the **Eastern Coal Co.**, Providence, R. I., at $4.90 per ton. Address Supt. of Pub. Wks. H. J. Goodale, Room 9, Sturdy Block, Attleboro, Mass.

CONTRACT NOTES

The high cost of coal to the Boston & Maine was responsible for the deficit which this company shows. Five representative Eastern carriers are perhaps the New York Central, the Pennsylvania lines, East and West, Baltimore & Ohio, and Erie, and these roads, together pay on an average of $1.48 per ton for their fuel at the points of distribution on their lines, as compared with $2.86 thus paid by the Boston & Maine. Although many of the transportation rates now in operation on the Boston & Maine (for example, its passenger fare basis of practically 2½c. per mile) are no higher than rates on other enumerated lines. The Boston & Maine, if it could last year have gotten the fuel consumed by its locomotives at the average cost of $1.48 per ton, it could have showed earnings $2,245,225 higher than they were, the equivalent of 5.7% on common and preferred stock.—"The Boston News Bureau."

Portland's consumption of coal during the year 1914, that is, coal sold by dealers, was about 100,000 tons, which is a little under the normal consumption on account of mild weather. In this district wood and oil fuel figure prominently; it has been estimated that if all the fuel used here were coal it would amount to 1,000,000 tons. It is believed, therefore, that increased shipping facilities and reduced prices will mean a large increase in the consumption of coal here in the future.

One of the commercial attaches of the Department of Commerce in a neutral European country reports that buyers of American coal there desire specific terms and information relative to deliveries, quality, etc. Quotations should be made c.i.f. port of delivery.

An American consular officer in South America has been requested to assist in securing connections with a firm in the United States which is prepared to sell and deliver gas coal. It is stated that the inquirer uses about 7000 tons per year.

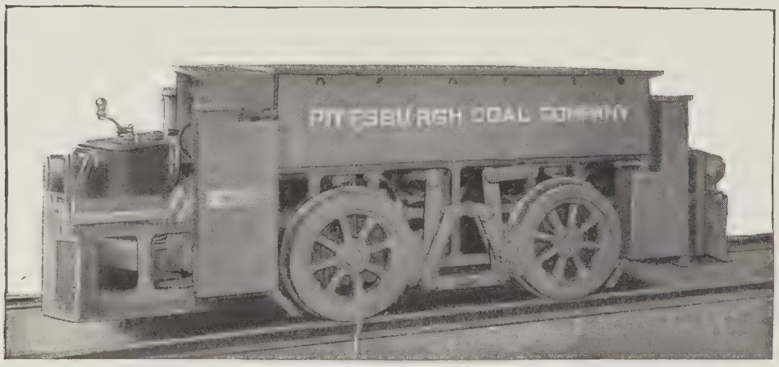
Why It Costs Less

to gather coal with

The Barsteel Storage Battery Mine Locomotive



It handles more cars on one charge—

Pulls less current from the battery—because it has

1. Five-point series-parallel control—Only two resistance points.
2. Low voltage battery motors—with highest efficiency.
3. Maximum drawbar pull—with minimum current.
4. No dead weight in frames.

Low Maintenance Cost—Secured by

1. Outside-hung motors—*accessible without removing battery.*
2. Open side frames—*Inside parts accessible without removing battery.*
3. Most rugged batteries made—*long life—minimum repairs.*
4. Spring-suspension of entire frame—*prevents jarring of battery.*
5. Best brake rigging—3 point suspension—Double brake shoe hangers—M. C. B. detachable Brake Shoes—Turnbuckle adjustment to keep full pressure on Brakes.
6. Barsteel frames—*Unbreakable.*

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

HERE'S a little talk that will interest every one of you. It is by Herbert N. Casson, Vice President, H. K. McCann Co., New York.

"What is the matter with the United States?" As I have been residing in London since the beginning of the War, I have been hearing this question asked on all sides. I have never heard any satisfactory answer. No one seems to know.

Why are the American factories not running night and day? Why are the railroads not opening up new territories and getting ready for the millions of immigrants who have already made up their minds to leave Europe as soon as the war is over?

Why are there not fifty American drummers in London right now, trying to sell $200,000,000 worth of American goods in place of the goods that were bought last year from Germany and Austria?

Why have advertisers become quitters, just at the time when their advertisements were most needed and most effective, in cheering on the business forces of the United States?

From the European point of view the United States is a haven of peace and security and prosperity. It has no troubles that it dare mention to Belgium or Austria or France or Germany or Servia or Great Britain or Russia.

Every tenth Briton has enlisted. Every tenth Frenchman is at the front. Every tenth Belgian is dead. What does the United States know of trouble?

If I could afford it, I would charter the Mauretania and Lusitania, and convey a party of 5,000 *American advertisers* to Europe for a trip of education. I would give them a week in London, a week in Paris and a week in Antwerp.

I would let them look at the United States from the scene of war. I would give them a look at *Real Trouble.* I would let them see trains, ten at a time, five minutes apart, packed with the maimed and the dying.

I would let them hear, from fragmentary survivors, the incredible story of battlefields 150 miles wide, and armies that are greater than the entire population of Texas.

I would let them see graves 100 yards long and full—and Belgium, the country that was, nothing now but 12,000 square miles of wreckage.

Then, when they began to understand, to some slight extent, the magnitude and awfulness of this War, I would say to them:

"Now go back and appreciate the United States. Realize your opportunities. Don't start digging trenches when nobody is firing at you. Don't fall down when you have not been hit. Don't be blind to the most glorious chance you have ever had in your life.

"Go back and advertise. Get ready for the most tremendous boom that any nation ever had. Build your factories bigger. Train more salesmen. Borrow more money. Go ahead, and thank God that you are alive and that your family is alive, and that you are living in a land that is at peace, at a time when nearly the whole world is at war."

COAL AGE

Vol. 7 NEW YORK, APRIL 10, 1915 No. 15

How Are You Educating Your Children?

> "Of all work that produces results, nine-tenths must be drudgery."
>
> *—Saying of an English Bishop.*

THE FATHERS of growing boys around our coal-mining camps would do well to ponder these words of the bishop. Too many of them—frugal coal miners and company men as well, who have laid by a small competency—so train their sons that they are fitted only for a life of idleness. These fathers realize the truth expressed by the bishop's maxim so far as their own work is concerned, but do not get it through their heads that it applies with equal force to the learned professions.

Such men, because they have toiled long and hard, often with meager rewards, decide that they will choose differently for their sons, and in consequence do not allow them to labor around the mines nor soil their hands and clothes, but urge them to acquire an education and fine manners so that they may secure a sufficient income to live in ease.

Because such fathers have passed through life without an education, they do not realize that nine-tenths of education is also drudgery and that it takes the same amount of determination to pull through the periods of drudgery along the educated route to bankable knowledge that it does to win a competency through manual labor.

If fathers could relieve their sons of the tribulations apportioned unto them by Fate by assuming themselves all such tribulations, the sons of this world would have a tolerably easy time of it. It generally happens, however, that when a father attempts to shield his son from a predestined rap the father gets the rap and the son gets two whacks immediately thereafter.

At any rate, many fathers who stint themselves for years that their sons may be advanced a round or two on the social ladder often live to see their boys disgraced and dropped back to a station in life below that occupied by the parents themselves. When such a father looks back at the wreck of his boy, he sees too late that the young man followed instructions implicitly.

Much of the prejudice against education in laboring communities can be traced to the unsuccessful careers of many educated sons of uneducated men, born and reared in the community in which they disgraced themselves.

Because of the growing tendency to force education upon all children by legislation, no matter what the sentiment of the particular community may be, it is important that uneducated parents be made to realize the reasons for such failures so that their own children may be prepared to receive an education that will fit them for a useful career instead of a life of idleness.

Laying Out Development Work in the Anthracite Region

By J. McCrystle*

SYNOPSIS—The work of prospecting, locating the mine opening, laying out the mine and yard tracks, staking out tipples, breakers, etc., is here described, and some useful hints for tunnel driving are given.

In the anthracite region when an unexplored territory is to be developed, surveys are first made locating the dip and strike of the exposed measure; and a map is drawn showing the black dirt laid bare by uprooted trees, the terraces which often indicate the outcrop of coal beds, the streams, roads, timbered areas, the inhabited sections and other objects and natural features that are likely to have a bearing on future operations.

Where more than one coal bed underlies the area, if the identity of one of the measures can be determined, the others may be sought with greater certainty. In the vicinity of Lansford, Penn., egg conglomerate underlies the Buck Mountain vein, while pea conglomerate is found in proximity to the Lykens Valley and Mammoth coal beds.

FIGS. 1, 2 AND 3. SHOWING SUCCESSIVE STAGES IN THE STAKING OF A MINE SHAFT

The color of the ash, the thickness of the coal measure and the relative distance from other coal beds, as well as the texture of the coal itself, the partings in the vein, etc., may be used in a general way to identify the seams found. Shafts and drill holes may also be sunk to further ascertain the geologic formation.

Cross-sections not over 1000 ft. apart are now drawn and the adjacent provings projected upon them. The general work of prospecting is continued until sufficient data are secured or the funds allotted for this purpose have been exhausted. During the progress of the above work, the boundaries of the tract are relocated, topographic surveys made and levels carried from the nearest tidewater elevation. Spur tracks from the main-line railroad are also located.

Small-scale maps showing the entire lease, contour improvement maps to the scale of 50 ft. per in. and temporary working maps at a scale of 100 ft. per in. are next drawn. Contours are also drawn of the coal measure which show the probable location of these beds at intervals of from 5 to 25 ft.

The limits of the proposed collieries are now laid out on the small-scale map, and working maps at the 100 ft. scale are made for each colliery and coördinated. All surveys on these latter are traversed and balanced.

LOCATING THE MINE OPENING

The location of the mine opening is determined in a general way by the position of the railroad, the height available for dumping into the breaker, the disposal of refuse, the geologic and surface condition (including the location of the mine buildings, tracks, wagon roads, timber yards, reservoir, etc.) and the position of present and future town sites.

A water-level drift and tunnel which entail no hoisting or drainage form the most economical mode of development. Their use, however, is restricted to ravines and hillsides.

Although various types of slopes may be employed, in many instances to advantage, the shaft is today everywhere supplanting other forms of hoisting. The shaft may be carried to great depth, its maintenance is less than that of a slope, it is not easily affected by local conditions of either strata or surface, and if properly constructed its output is great.

As soon as the nature and location of the mine opening have been determined a preliminary plan of mine tracks is drawn on the improvement map. Turnouts are usually designed to hold 50 empty or loaded cars. The loads feed to the hoist or dump on a 1.6-per cent. grade to within 50 ft. of the shaft, while the balance of the way 2-per cent. is employed. The empties run on a 3-per cent. to the kickback and then on a 1.8-per cent. grade. Standard frogs and switches are employed, the lead being taken at twice the gage times the number of the frog and the radius as twice the gage times the square of the frog number. A No. 5 is the largest frog carried in stock, while a No. 2¾ is the smallest. A 50-ft. radius is the least that experience will allow.

When the paper location has been approved, it is staked out on the ground. Two methods of staking the tracks are in common use: First, to scale all curves and tangents from the map and replace them on the ground—this is the method generally followed. Second, when the opening is some distance from the dump, grade stakes are placed every 50 ft., tangents are selected from them and the intersections established. The distance from the point of intersection to the line of grade is used as the external secant in determining the radius of the curve. In this latter method, the idea rather than the letter of the plan is carried out.

---

*Division engineer, Lehigh Coal & Navigation Co., Lansford, Penn.

If a shaft is the type of opening approved, the landing at the top is frequently elevated, the rock from the development being employed in grading the tracks and yards. The piers for the permanent headframe, etc., are, however, first built a few feet above the proposed surface.

In the staking out of piers, engine houses, buildings, etc., the corners are roughly staked out for the excavation and grade stakes are placed a few feet distant for the building lines. When anchor bolts for engines, steel work, etc., are to be hung, an additional center line and cross line are given for setting the template.

The accompanying illustration, Fig. 1, shows the method of staking out rectangular shafts. The point 1 in the center being located, the center lines *CC* and *C′C′* are placed where they may be extended at any time and will not be disturbed. The setup points 1, 2, 3, 4 and 5 in Fig. 1 are to be used merely for the original staking and are on the line of the inside edge of the concrete. The planking behind the square timber is used as the inside edge of the concrete form.

In Fig. 2 if the original staking has not been disturbed, the stringers, which are usually of 8-in. to 12-in. round timbers, are measured from this staking so as to bring the inner face of the stringer 6 in. inside of the inside face of the square timber. It is frequently necessary to notch the stringer or spike a "scab" onto it in order to bring it to the proper alignment.

When hard rock is encountered the sinking is stopped and the shaft is timbered to the surface. The set of spads on the stringers is used until the timber is only a few feet below them. The operation for Fig. 2 is then repeated, and permanent hangers are placed in the corners instead of spads (see Fig. 3). Plumb bobs are hung from these hangers, and others are placed below them, this continuing until the shaft is complete.

ALIGNMENT OF SLOPES

In aligning slopes a notch is cut in one of the mudsills on the line. A nail is driven in it and allowed to protrude about 1/8 in. Two spads are then placed in collars a few sets below the notch in the mudsill and lines given as often as requested. In using these lines one end of a cord is looped over the protruding nail and the other end fastened a short distance below the set to be erected, so that the cord will just touch the bobs suspended from the spads.

In staking out breakers the center lines of the sidings and breaker are first located and heavy plugs driven flush with the ground on the center line of the various rows of piers. The sum of the distances between the piers is then checked against the total measurement. A transit is then set up upon the center line of each row and heavy plugs put in at right angles at intervals where they can be easily referred to and where they will probably not be disturbed. The cross base-line is then located, and heavy plugs are put opposite each longitudinal row of piers. The transit is then set on these plugs, and heavy plugs are placed at intervals as was the case with the cross-line. As the center lines of the pier boxes are usually saw-marked they are easily brought in line with the longitudinal and cross-lines.

Levels are then run over all the center-line plugs and level boards placed for the height of the pier as desired. The elevation on top of the form is checked before the concrete is poured, and again after it has set. All subsequent work is based on the original center line. For convenience the staking is marked off for easy reference on a print of the ground plan.

SHAFT LANDINGS ARE 17 FT. HIGH AND TAPERED

In turning landings off a shaft the distance is given to the top. This is 17 ft. above the wall plate at the landing. This distance gives ample room for taking long timber and rails off the cage and permits the testing of the cages readily. A set of bearers is placed sufficiently above the opening to be secure, and the timber between the bearer to the top of the opening is hung.

The next set of bearers is placed two sets below the landing. This set consists of one bearer under each end piece and a longitudinal bearer under each wall plate. The shaft is sunk sufficiently below the landing to prevent the blasting from affecting it. No timber is erected opposite the proposed opening until the landings have been turned 30 ft. Punch props the full height of the opening are then erected under the end pieces, as well as buntons for fastening the guides.

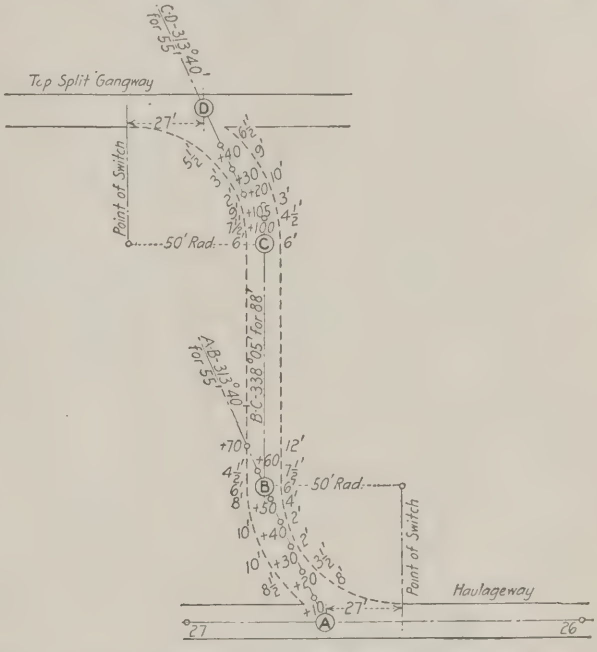

FIG. 4. PROPOSED LAYOUT OF A CURVE IN A TUNNEL

The top of the opening to the shaft is tapered 30 deg., so as to have the regular 8-ft. tunnel height at 15 ft. from the shaft. In most cases the alignment for 300 ft. of tunnel on each side of the shaft is given by right-angling from the shaft timber. This allows a sufficient length of tunnel to place plugs.

At the landings on the shaft, as distinguished from the one at the bottom, the loaded cars do not feed directly into the shaft, but to a transfer beyond the end of the shaft, on which they are then taken to the desired compartment. The chances of a trip running down the shaft are thus eliminated.

The difference in elevation necessitated by the grades to and from the shaft or slope is overcome either by a car hoist on the empty track or, if possible, by the motor. The pitch of the car hoist is usually made 4 to 5 in. per foot.

DRAWBAR PULLS ARE MADE EQUAL

From the ends of the turnouts the main haulageways are driven on a grade of 0.35 per cent. in favor of the loaded cars. This grade is sufficient to drain the workings and give the same drawbar pull for empty as for loaded trips.

A tracing with the probable contour of each coal bed at the elevation adopted for the level is made, and all proposed panel tunnels, etc., are laid out upon it. The gangways are all driven on a grade to connect the panel tunnels with the haulageway. One of the lower beds the maintenance of which is small and which will not be disturbed by the robbing of the overlying veins is usually selected for the permanent airway and haulageway.

For driving tunnels, three points are given in the roof, and plumb bobs are hung from them and the face aligned by sighting over the strings. The distance between the bobs should be between 2 and 4 ft. where possible. This method requires two men to do the aligning—one at the plumb bob and one at the face. This line is extended whenever requested, but in any case it should be extended when the face has passed the inside bob 100 ft.

Planes through rock are usually aligned in a manner similar to tunnels. A piece of ¾-in. or 1-in. pipe about 5 ft. long is sometimes suspended from the plumb bobs. This is adjusted so as to give the same pitch on the pipe as is required for the plane. One man at the face and one at the pipe do the aligning, which gives the grade and line at one sighting. In Fig. 4 is shown a suggested method of aligning tunnels. The lines *AB* and *CD* are each given as the work progresses, the foreman cutting the ribs to agree with the offsets as indicated. When the tunnel has reached the point *B* it is necessary to give instructions for drilling a short distance further without a line before a set-up at *B* can be made. This is necessary at each turn of the tunnel. It frequently happens when the engineers are sent for that a sufficient distance has not been driven to permit giving the next angle point.

In Fig. 4, instead of stopping at the point *B*, the ordinates to the ribs have been given for 15 ft. beyond this point. This gives the foreman time to advance the tunnel three cuts on the proper offset and keeps the transit out of the way of drilling, giving the engineers a short time to arrange for the next alignment.

In remote portions of the mine, where locomotives do not ordinarily operate, curves of smaller radius than mentioned above may be employed, the rails being bent to the curve of a board template. Where coal beds lie close together, the panel tunnels are driven at 1000 ft. intervals, and the various measures, with the exception of the haulageway, may be then robbed.

A Stoker Installation That Has Proved Economical

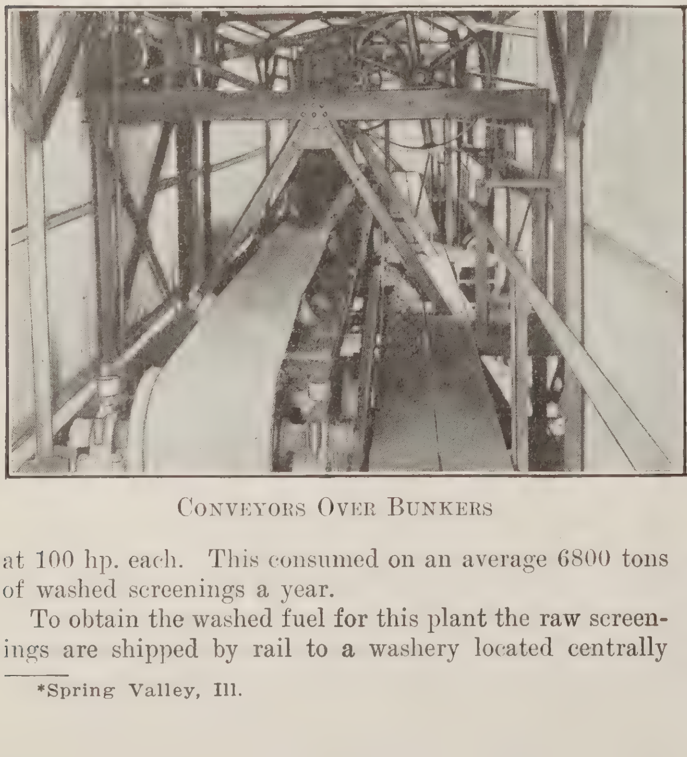
By W. N. Cole*

SYNOPSIS—At an Illinois mine where washed slack had been employed as fuel the installation of stokers which successfully burned raw screenings resulted in a saving of more than $5000 per year.

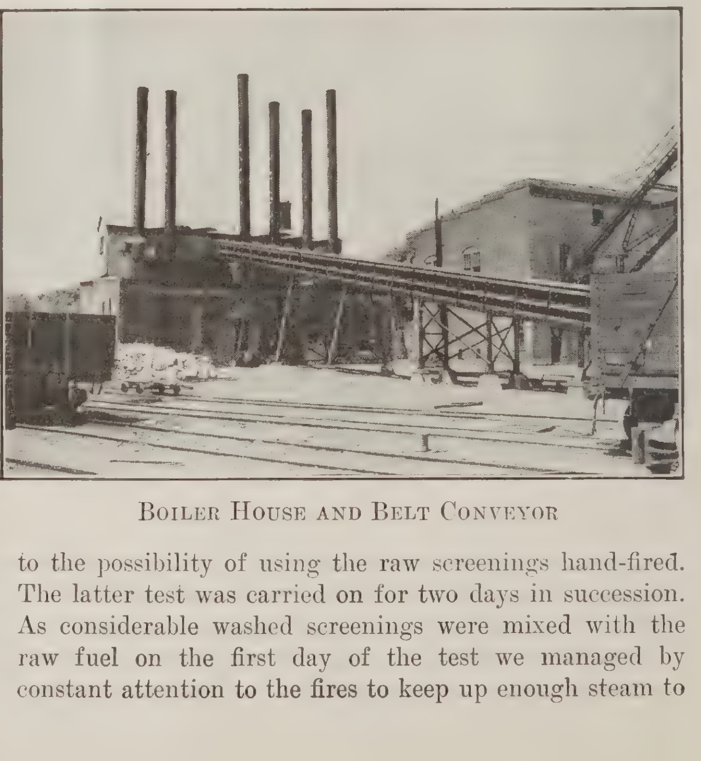
The boiler plant of a certain mine in northern Illinois consists of six 66-in. by 16-ft. return-tubular boilers rated at 100 hp. each. This consumed on an average 6800 tons of washed screenings a year.

To obtain the washed fuel for this plant the raw screenings are shipped by rail to a washery located centrally with respect to four mines. This movement carried a switching charge both ways and with the cost of washing added 83c. a ton to the cost of the raw screenings at the mine before shipment. The question arose as to whether the raw screenings could not be used for fuel in place of the more expensive washed coal.

I made several tests to ascertain the efficiency of the boilers with the fuel we were using and also a test as to the possibility of using the raw screenings hand-fired. The latter test was carried on for two days in succession. As considerable washed screenings were mixed with the raw fuel on the first day of the test we managed by constant attention to the fires to keep up enough steam to



Conveyors Over Bunkers



Boiler House and Belt Conveyor

---

*Spring Valley, Ill.

enable us to run; but on the second day the washed screenings had been entirely worked out, and we found it impossible to raise the steam to a working pressure, so I had to place three of the boilers on the better fuel in order to keep the plant running.

I then submitted the results of my tests and a sample of each of the coals to the Underfeed Stoker Co. of America for figures and estimates.

The results of my tests for efficiency showed an evaporation of 6.02 lb. of water per pound of coal from and at 212 deg. F. with washed screenings. The stoker company guaranteed an evaporation of 7.28 lb. of water per pound of coal with the same coal or an evaporation of 5.48 lb. of water per pound of coal using the raw screenings. In other words, it would take 1.1 times as much raw screenings stoker-fired as washed screenings hand-fired, or on a yearly basis of 6800 tons of washed screenings it would mean a consumption of 7480 tons of raw screenings; but as there was a difference of 83c. a ton in favor of the raw screenings the use of the latter would mean a saving of $5028 a year in our coal bill.

The proposition looked so good that the company decided to make the installation, and orders were given to that effect.

In connection with the stokers, we installed in the boiler room a 100-ton Ferro-Inclave coal bunker made by the Brown Hoisting Machinery Co. with spouts to each stoker; a 14-in. Robbins belt conveyor, 172 ft. c. to c., from the screenings chute to the center of the bunker, and a 14-in., 30-ft. cross-conveyor from the discharge point of the main conveyor running across the top of the bunker, thus enabling us to fill the bunker at any point necessary. A practically automatic feed of the fuel from the tipple to the bunker and from thence to the stokers and boilers was thus secured.

This installation has been in operation for about a year and a half and has proved entirely successful. Our records for the first 12 months succeeding the installation of the stokers show a consumption of 7031 tons of fuel, making a saving of $5431.48, and as the cost of the entire installation was less than $15,000 it will pay for itself in less than three years.

⁂

Some Views of the Layland Rescue Work

SYNOPSIS—The head of the State Department of Mines of West Virginia declares that no Federal apparatus-men should receive medals for the Layland rescue work. An editorial published by a local newspaper is quoted to show how sentiment in Fayette County is directed.

The following remarks by Earl A. Henry, the head of the Department of Mines of West Virginia, will be of interest to readers:

"I arrived at the Layland mine on the evening of Mar. 2, the day of the explosion, and was on the ground from that time until all the bodies, both dead and alive, were removed from the mine. The rescue work was in charge of H. M. Bertolet, the general superintendent, and the State Mine Department, ably assisted by Oscar Knerr and John Clapperton, superintendents under Mr. Bertolet, also several hundred volunteers from the different mines in the New River coal field.

"While Secretary Lane and George S. Rice, through the press, give great credit to the helmetmen connected with the Bureau of Mines, they would be unable to convince the mining people of any heroic work accomplished by them at the Layland disaster. The statement has been made in an interview that the helmetmen worked in advance of the state mine inspectors and others; that their work consisted of constructing brattices and arranging the ventilation in the dangerous sections of the mine, making it possible for the parties engaged in the rescue work to proceed without any danger whatever. If the helmetmen constructed any brattices or did anything to assist in arranging a system of ventilation, it is unknown to any person who was on the ground.*

"There were no extremely dangerous conditions encountered in the rescue work, as the mine did not liberate explosive gas and there was no evidence of great force in any section of the mine, there being only a few light slate falls to travel over. The greatest difficulty was the afterdamp resulting from the explosion.

"I have no desire to do or say anything that might detract from or take away any honors due to the helmetmen. I believe that credit should be given to those to whom credit is due, and I desire to go on record by saying that no more heroic men could be found on God's earth than those who volunteered their services and assisted in the rescue work at the Layland mine. These men were mine superintendents, mine foremen, firebosses, miners and mine laborers from the different mines in the New River field. They hurried to the scene and entered into this work of their own free will and did not expect to be rewarded with medals of honor for anything they might do in an effort to remove the dead, or to rescue the living, if any might be found entombed in the mine. Their only motive was one of humanity, and they were in no way seeking honors.

"As to the helmetmen rescuing a number of live persons—this is a misstatement of facts. At midnight on Friday, Mar. 5, all the rescue workers were called from the mine and the fan was stopped so that arrangements could be made on Saturday morning to reverse the air current. About 8 a.m. of the latter day five Italians walked out of the mine with open lights, making the statement that on the morning of the explosion they had inclosed themselves behind a brattice at the head of 9th left entry off No. 3 main haulage road, approximately a mile and a quarter from the entrance of the mine.

"These men had each day tried to make their way out, but could not do so by reason of the afterdamp; but after the fan had been stopped and the air current had ceased for about seven hours these men were able to travel to the outside, at which time they reported that 42 men were bratticed off in the 10th left heading off No. 3 main haulage road, a distance of 500 ft. farther in the mine than the 9th left heading. The 9th and 10th left headings were the regular working places of these men and were in no way affected by the explosion except by the cutting off of the ventilation.

---

*In our issue of Mar. 20, p. 508, George S. Rice, chief mining engineer of the Bureau of Mines, states in effect that the oxygen-apparatus men "explored in advance of the rescue men, who, being without apparatus, were engaged in bratticing and the recovery of bodies."—EDITOR.

"The question that is raised by the mining people in this state is, Why should the use of helmets be necessary to rescue the entombed men when they were able to use an open light all the time they were entrapped in the mine and when rescued were able to travel to the outside without the use of helmets?

"In conclusion I desire to say that the Department of Mines of West Virginia is willing to coöperate and assist the Bureau of Mines in all its efforts to determine the cause of these disastrous explosions and will cheerfully adopt any recommendations that will prevent any other disastrous catastrophe in this state, but I do not believe that mine explosions can be prevented by long-winded statements given out to the newspapers booming the work of any person along this line."

The report of the coroner's jury contains no matters of interest, the statement being that the five men whose deaths were investigated "came to their death by a dust explosion caused by a blownout shot in the third left of the main tunnel heading in No. 3 mine of the New River & Pocahontas Consolidated Coal Co., located at Layland, county of Lafayette, State of West Virginia, on Tuesday, Mar. 2, 1915."

The *Fayette Tribune and Free Press,* of Fayetteville, W. Va., on Thursday, Mar. 18, 1915, under the heading, "Pricking a Bubble," said:

"It is learned from newspaper reports emanating from Washington that the 'expert' rescuers sent by the Federal Government to Layland are to be decorated with gold medals in commemoration of their brave services in rescuing 47 men alive from the mines. And not only are they to have these mute testimonials of their rare courage, but the Secretary of the Interior, Mr. Lane, treats them to a tribute such as would make modesty shrink. Here is the item that is going the rounds:

"Tribute to the Bureau of Mines' rescuers for saving 47 men from death in the mine at Layland, W. Va., was paid by Secretary Lane, of the Interior Department, in a statement issued this week. 'Out of the gloom of such a catastrophe,' said Secretary Lane, 'involving, as it appeared from the earlier dispatches, more than one hundred lives, the saving of 47 men comes almost as a benediction. I am proud of the brave fellows from the Bureau of Mines who have been working heroically for several days to bring about this consummation. I am equally proud of their associates who have been trained in the modern rescue methods by our men. For years it has been demonstrated that the old methods of rescue work not only did not save lives, but even cost the lives of many brave volunteers.

"'The oxygen helmets worn by the trained rescuers, which permitted them to penetrate parts of the mine filled with poisonous gases where no other human being could go, are undoubtedly responsible for the saving of the miners. The bureau's men, always in advance of the volunteers, restored the ventilation in the mine, thus permitting the volunteers to advance. Presumably the entombed men had protected themselves from the deadly gases by the erection of temporary doors. Then the way out of the mine was comparatively easy, for it had been restored to normal conditions as the rescuers proceeded.

"'I have wired to the rescuers,' said Secretary Lane, 'my heartfelt appreciation of their heroic efforts in saving these lives. I am also told that the American Mine Safety Association has already started a movement to award to each rescuer one of its gold medals.'

"From unbiased, unprejudiced sources the *Tribune* learns that not only are the federal rescuers not entitled to so lavish a testimonial, but are entitled to none at all. Instead of being of service in this time of great distress, they were an almost intolerable nuisance, for they could not be induced at any time to penetrate the mines beyond where the local rescuers were working, despite the fact that they were equipped with oxygen helmets and other paraphernalia intended to increase their efficiency in this kind of work.

"Such credit as is due for heroism in the rescue work at Layland, and much *is* due, should go to the volunteers and not to the trained rescuers of whom Secretary Lane speaks. They were there with the real article of courage and almost foolhardy zeal in their efforts to clear up the mine and rescue survivors, if such there should be.

"The State Department, headed by Mr. Henry, assisted by Inspectors Holliday, Absalom, Murray, Blenkinsopp, Lambert and Cobb, working without safety appliances and unaccompanied by canary birds to give them warning of foul air, were the real heroes of the week of horror at Layland. There were dozens of others too that might be mentioned who went about the work with a seriousness born of courage.

"These were thinking of the distress and discomfort of the mourning ones about the mine mouth. The others were taking up their time telegraphing reports to headquarters and informing the newspapers of their heroic handiwork. Secretary Lane has been imposed upon."

The Largest Electric Mine Locomotive in the World

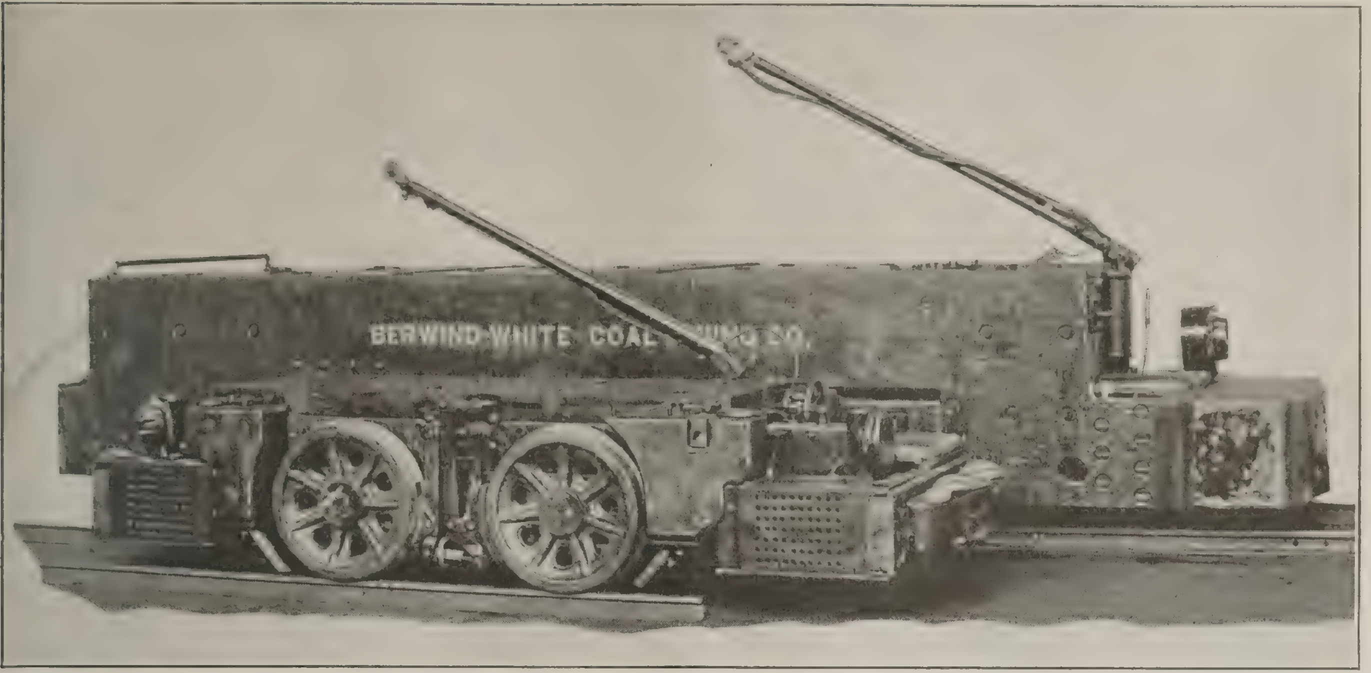
It is the endeavor of every mine operator to secure a maximum output with a minimum cost. In order to successfully execute this plan, the haulage apparatus must operate at a high percentage of efficiency. Where conditions will permit, electric locomotives are displacing all other methods of mine transportation and are giving uniformly satisfactory results.

To keep up with the demand of the times for increased production, the Berwind-White Coal Mining Co. recently placed in operation at Windber, Penn., the two largest and most powerful single-unit electric mine locomotives in the world. These machines weigh 30 tons each, and are of the three-motor, six-wheel type, with equalizing levers to evenly distribute the weight upon the drivers. The side and end frames are constructed of what is known as "armor plate," solid rolled steel slabs, the sides being 5-in. thick, 40 in. high and 17 ft. long.

These members by the aid of angles of heavy steel casting are securely bolted together, forming a rigid unit.

The motor equipment of each locomotive consists of three 115-hp., 500-volt ball-bearing motors, capable of developing a tractive effort of 15,500 lb. at a speed of 8 miles per hour. Incorporated in the design of these motors are the essential mechanical and electrical features which have, to a large extent, solved the troubles encountered in mining work. The application of ball bearings permits the use of gearing of 5½-in. face, and a commutator 5⅛ in. wide, within the space available on a 36-in. track gage, without a sacrifice in size of any other part.

The use of ball bearings eliminates to a large extent the motor troubles arising directly and indirectly from the wearing down of armature supports of the ordinary type.



Comparative Size of 6-Ton and 30-Ton Locomotives

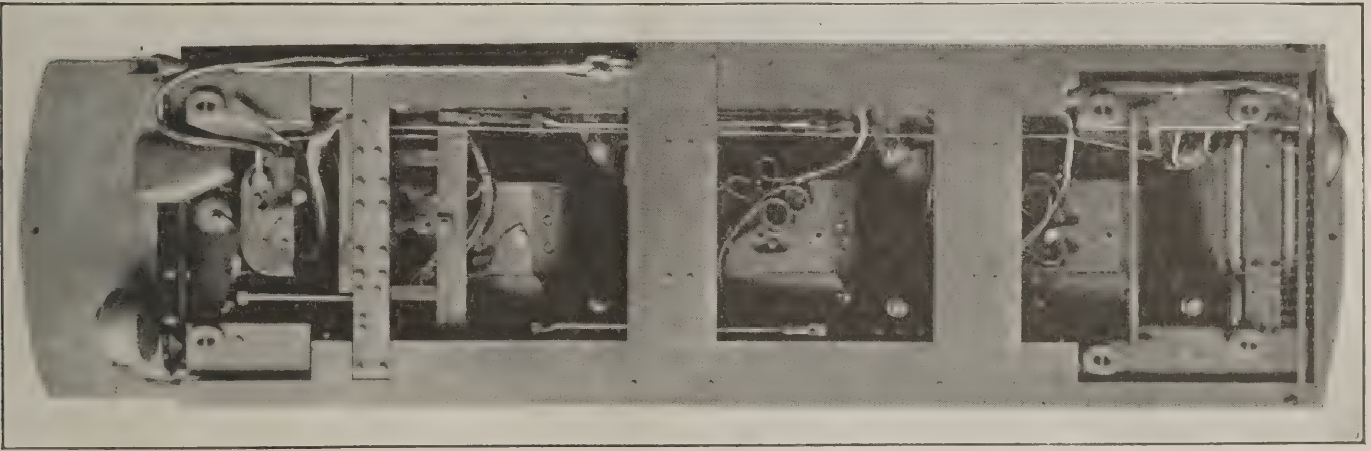
Large commutator doors give ample access to the brushes and commutator for inspection and cleaning.

The armature field frames are supported from the bottom half, so that the top may be removed, thus permitting the removal of the armature without disturbing any other part. Three-point suspension on a spring-hung cross-bar gives flexibility and absorbs shock.

The controller is of exceptionally large current-carrying capacity, with a double set of brushes on the operating cylinder, which are used to cut out the steps of the rheostat when bringing the locomotive up to speed. The two sets of brushes are each provided with a magnetic blowout coil.

On each end of the locomotive is mounted a powerful arc headlight, which is the most efficient method of lighting for work of this nature. The four cast-iron sand boxes have a total capacity of approximately 9 bu., this amount being necessary for the successful operation on the long hauls and heavy grades over which these locomotives run.

The journal boxes are of the latest type, with a hardened steel plate in the lid for taking up the thrust of the wheels transmitted to it through the hardened steel pin in the end of the axle. This eliminates the wear on the wheel hubs and the face of the journal box incident to the end thrust.



Top View of Locomotive, Showing Interior

Among the electrical features is an automatic contactor connected in series with and operated by the controller cylinder. The contactor is designed to break circuits carrying heavy current and its use eliminates the heavy arcing in the controller case sometimes encountered where the main break is incorporated within the operating cylinder. The rheostat is of the cast-grid type of the latest design and of sufficient capacity for operating without excessive heating.

The wheels are of rolled steel, 33 in. in diameter, pressed and keyed onto a 5½-in. axle. Wheels of this type have been adopted as standard by the manufacturer.

These machines were built by the Jeffrey Manufacturing Co., of Columbus, Ohio.

❋

Right to Terminate Coal Lease—If a contract for the privilege of mining coal on the royalty basis does not fix any duration of the lease, it is terminable at the will of either party. (Alabama Supreme Court, Christian vs. Stith Coal Co., 66 "Southern Reporter," 641.)

The Labor Situation

SYNOPSIS—A settlement is anticipated in the Coshocton district of Ohio. Cabin Creek miners, and those at Blakely mines, W. Va., present grievances. The coming contract in the anthracite region arouses interest. The monthly employees in that district receive a favorable decision.

There has been no change in eastern Ohio, though the miners have now been on strike over a year. A few tons are being produced in small mines, but there is no hope of a general settlement. Both sides are awaiting the passage or rejection of the Gallagher amendment to the Green Antiscreen bill, now pending before the House of Representatives.

In Belmont County it is stated that the strikers are leasing farms, but most of the miners do not understand the business. Charles J. Albasin, the president of the subdistrict in which the strike is in progress, No. 5, has issued to the press a long, poorly worded notice alleging that the Ohio operators have been keeping up the Ohio railroad rates so as to make more money out of their West Virginia mines. Probably a truer statement would be that the high Ohio railroad and wage rates drove them to purchase the properties in West Virginia.

It has been persistently reported, and never denied, that the strike leaders proposed that the rate be made 47c. instead of 44.61c., agreeing to make up the difference between the two rates by modifications of the dead-work and yardage scales. Thus the strikers would be able to claim a victory and to declare that they had kept their word to the other operators in Ohio. One leading eastern Ohio operator has said that if the mine owners of that district had the Hocking Valley conditions, they would regard 49c. a ton as a figure from which a profit could be obtained.

The miners on strike desire to farm the coal companies' properties and much resent the fact that these lands are to be used as pasturage for the idle mules. They are making extensive application for government seed.

At the joint conference of representatives from operators and miners in the Coshocton district in Ohio, which started Apr. 5, at 2 p.m., and continued the following day, prospects for the settlement of the wage controversy, which has continued for more than a year, appeared brighter than for some months. Reports from the conferences declared that both sides showed a more conciliatory attitude. The wage agreement in this district was practically settled at one time, but in a referendum vote the miners failed to approve its provisions.

West Virginia Troubles

The Cabin Creek coal miners of West Virginia are declaring that they should receive the check-off and outside daywage scale, as secured by the Kanawha River miners. They claim that they are entitled to these under the 1913 contract. A committee of seven has been appointed to wait on the operators. The latter, it is stated, declare the contract to have a different meaning.

Apparently the referendum in the New River and Winding Gulf sections of Fayette and Raleigh Counties of West Virginia has ratified the agreement recently prepared between miners and operators. At the Blakely mines of the Blue Creek Coal & Coke Co., in the same state, which had about 300 employees in 1913, the miners are said to have been required to throw the bug-dust from the electric machines into the gob. This they refused to do, as thereby they would have to handle it without compensation.

A convention will be held on Apr. 12 by the members of District 17 of the United Mine Workers of America to elect a vice-president in place of John Cunningham, whose election was set aside by the executive board last autumn. The entire set of officers may be voted upon again. This action grew out of a contest instituted by C. G. Griffith, the defeated candidate for vice-president, who claimed that there had been extensive frauds in the Winifrede district and elsewhere, resulting in his defeat and the election of Cunningham. Cunningham did not contest the matter, and the decision of the board was unanimous.

The 134 men arrested in connection with the riot and with the death of Constable W. R. Riggs during a strike of the men at the Jamison Coal & Coke Co.'s works near Farmington, W. Va., on Feb. 20, will be tried on Apr. 6 before Judge W. S. Haymond.

Quiet in Colorado

In Colorado conditions are quiet. The coal commission has reported to President Wilson that 71 of the mine operators, producing 61 per cent. of all the coal mined in the state, have expressed the opinion that no useful purpose would be served by the commission going to Colorado at this time. The same opinion, it is said, is shared in labor circles.

At the mines of the Harrison Coal Co., Streator, Ill., the men have struck for higher pay and the right to fire shots twice in each shift instead of once as at present. They claim that there is too much material to be handled. The mine employed about 105 men in 1913.

Conflicting Statements about Kentucky

W. S. Wells, the general manager of the Middle Creek Coal Co., writes us among other matters:

> In your article you state that this company employs only 40 men, when in fact we have between 125 and 150 working for us. You further stated that we have resumed irregular operation at the old scale, which is entirely false, as we have started at three days per week at the new scale—a reduction of 15 per cent. on everybody from the general manager down, excluding trappers. The cut is merely temporary, and the old rates will be put back into effect on May 1, if conditions permit.
>
> Your article seems to cast reflection upon our action, and we cannot see wherein it is of importance to you. Therefore, we shall demand that you immediately publish the facts in this case, giving reasons for your recent misinformation.

We had the story, at least, almost correct in the first instance, when a correspondent, who is a leading coal man in the State of Kentucky, wrote us that we had overstated the importance of the Middle Creek Coal Co. It is, we believe, just as we said, the largest concern in Floyd County. We avoided stating how many men were employed, because our record was back in 1913. It was only after we were told what we believed was the truth that we made the correction. We leave it to Mr. Wells to remove any misunderstanding, and merely quote his statement. We cannot, however, admit that we believe it is good policy to reduce wages.

Next Year's Scale in Anthracite Region

The celebration in the anthracite region of Pennsylvania of the establishment of the 8-hr. day in bituminous mines served John P. White and others with an opportunity to express the intentions of the miners relative to the coming scale to be signed in that region in 1916. Apparently the 8-hr. day is the leading issue, but an increased wage of 5 per cent. for inside employees and 10 per cent. for outside workmen is also sought, and it is desired that the check-off be made a part of the contract.

The miners take hope from the unity of the organization. They desire a full 100 per cent. membership when the strike commences. The unions in the anthracite region embrace so large a proportion of the men that there is no fear as to the outcome of a strike. J. P. White, the president, however, does not appear so sure of the outcome. To him membership is not so important as funds; and though membership, time and peace will assure the necessary capital to sustain a strike, the time is now too short to accumulate the funds, and there is no peace, for 15,300 men are on strike. Unless the times improve, it is likely that the 8-hr. day will alone survive the progress of time.

A Welcome Decision for Anthracite Mine Workers

Judge George Gray, of Wilkes-Barre, Penn., gave two decisions this week in favor of the men. It was decided that the Delaware, Lackawanna & Western R.R. coal department and the Price-Pancoast Coal Co. must pay their men a 10-per cent. increase over the schedule in force on May 30, 1912.

After the agreement operative on that date certain monthly men, such as watchmen, electricians, helpers and barnbosses, were denied the 10 per cent. increase, the companies contending that these men relinquished their rights by accepting a stipulated salary at increased pay after the agreement of Apr. 1, 1903. This decision is retroactive and applies to all the companies in the anthracite region. It will compel the disbursement of a large sum of money, the ruling retroacting for nearly three years. The Price-Pancoast Coal Co. did, however, give an increase in no case less than 5½ per cent. to its monthly men.

There is much dissatisfaction throughout the anthracite region with the status of the compensation bill. It is alleged that Senator W. M. Lynch, who is chairman of the Mines and Mining Committee of the state, is opposing the reporting of the Catlin Bill, without the passage of which, it is stated, the miners cannot obtain compensation.

The Discussion of Mining Laws and Needed Legislation Summarized

By J. T. Beard

SYNOPSIS—Following is an altogether too brief summary of the leading points and arguments presented in one of the most valuable discussions that have thus far been conducted in Coal Age. *These suggestions merit close study and careful consideration, as they are all the outgrowth of experience in the practice of coal mining.*

Probably no discussion that has been conducted in Coal Age has attracted wider attention or excited deeper interest among all classes of coal-mining men than the discussion of the manifold features of the present mining laws of the different states. Certainly none has proved more valuable in the results it may be expected to accomplish.

The criticisms offered and the suggestions made come from practical mining men whose experiences have revealed to them the weak points in existing laws and led them to suggest measures that would insure greater safety in mining. In the following review, I will attempt to group these references under common heads and to emphasize those points that have received the widest attention at the hands of contributors.

The Need of Clear and Specific Terms in Mining Law

Letters Nos. 7, 8, 19, 20, 31, 32 and 37 have drawn attention to the fact that the wording of the mining laws, in many cases, leaves much to be assumed. The wording is often *ambiguous* and capable of different interpretations by different persons. More often it is *contradictory* or, to say the least, *inconsistent* in itself, instances of which have been pointed out in the letters referred to above. The fact of the matter is that most of our mining laws are patchwork; they do not show the steady growth and development from a single root base. Too often the terms used need to be specially defined or the language requires to be interpreted in order to understand the intention of the law.

Responsibility for Accident

The lack of clear definition and logical development in mining law is one of the greatest obstacles in the fixing of the *responsibility for accident* or for a violation of the law where it belongs. Attention has been drawn to this fact in numerous letters, Nos. 8, 12, 13, 17, 25, 33, 35, 37, 40 and 44. The truth of this condition is shown in the following numerous references.

The Anomalous Position of the Mine Foreman

Reference has been made to this feature in Letters Nos. 25, 30, 32, 35 and 43, in which it has been shown that the mine foreman is, so to speak, a "bumping block" between the mine inspector and his company. In Letter No. 22, it was shown that the mine foreman is usually given *too much territory* to supervise, which makes it impossible for him to comply honestly with the requirements of the law. This condition led to the suggestion that a *sworn statement* should be required by the inspector of every foreman and assistant foreman as to the actual condition of the mine in the interval between the inspectors' visits.

The Mine Foreman a State Officer

It was even suggested in Letters Nos. 30, 35 and 40 that, owing to the conflicting duties of his position, the mine foreman might properly be *employed by the state* and act under the direction of the mine inspector of the district. This suggestion, however, was strongly opposed by the writer of Letter No. 35, who argued that this would practically place the mine foreman beyond the control of the company of whose mine he has the charge.

To obviate the loss of his position because of a faithful compliance with a requirement of the mining law objectionable to his company, it was suggested (Letter No. 30) that the removal of a mine foreman from office should only take place after a fair trial before an executive board. But this, it was stated (Letter No. 35), might be an injustice to the company, which would at times be compelled to operate at a loss, if at all.

Classification of Mines

The need of a proper *classification* of mines, in mining law, was referred to in Letters Nos. 7, 14 and 24; and it was suggested in the last-named letter that a similar classification should apply to *all* legislation relating to safety in mining. It was shown that, owing to the lack of such a classification on a practical basis, it frequently happens that neighboring mines are brought into *unequal competition* with each other because of different methods being employed for evading those requirements of the law that would bring the mine under the particular classification of a "gaseous mine." Instances were given of such dishonest evasions of the law whereby the mine inspector was hoodwinked and deceived.

Attention was drawn in Letter No. 41 to the fact that, owing to peculiar roof conditions that required special methods of timbering, mines generating no gas are often more dangerous than others generating gas. But notwithstanding this fact, the more dangerous mine is classified as nongaseous and therefore subject to fewer restrictions and less expense, while its operation is accompanied with greater possible fatality than the mine generating gas. Similar *unnecessary burdens* imposed by law in coal mining were referred to in Letters Nos. 8, 14, 19 and 42.

Letter No. 9 draws attention to the importance of specifying in mining law the particular method to be adopted in the *removal of accumulations of gas* in mine workings, in respect to the withdrawal of all men working on the return current of the affected section of the mine and permitting no persons to enter the mine except those actually engaged in the work of removing the gas until after the mine has been again examined and pronounced safe for work. It is further urged that the law should forbid the *dangerous practice* of "brushing" out the gas, making it compulsory to remove all gas by the ventilating current and using only safety lamps while so doing.

THE USE OF NAKED AND MIXED LIGHTS

Attention is drawn to this important matter in Letters Nos. 34, 37 and 38, and the two last named letters refer to the danger of the provision made in Sec. 2, Art. 28, of the Pennsylvania bituminous mine law (1911), which apparently annuls the requirements of previous sections of the same law in respect to the use of safety lamps. The section here referred to states that the provisions of the act relating to the use of safety lamps "shall not apply to any mine wherein explosive gas is being generated only in live entries."

It has seemingly been overlooked that the gas generated in the "live entries" would circulate through the rooms and other workings where it is permitted to use open lights. Perhaps no feature of coal mining is attended with so great a risk as the permitted *use of open lights* in any portion of a mine requiring the use of safety lamps in other portions. Letter No. 26 suggests that state mining laws should compel the introduction of *safety lamps* in every mine where it is known that quantities of firedamp are generated.

WORKING MINES IN OIL AND GAS FIELDS

Letters Nos. 23 and 35 draw attention to the great danger encountered when operating a coal mine in *oil and gas fields*. In this respect probably the new law of Ohio furnishes the fullest protection from accident due to this cause. The provisions of the Ohio law in this regard are fully given in Letter No. 35. This is certainly a very important matter and should receive careful consideration in all mine legislation.

APPROACHING ABANDONED WORKINGS

The need of using special precaution when driving toward abandoned workings that may contain either gas or water is mentioned in Letters Nos. 8 and 19. It is recommended that *advance boreholes* should be maintained in the face of all headings or other workings that are being driven toward abandoned places. In addition, it may be stated that flank holes should be bored at an angle, every 8 or 10 yd., in the ribs of all such headings, which should be driven single. Plugs should be kept ready for instant use to stop the holes in case water is tapped. Only safety lamps should be used, and a close watch must be kept for the first appearance of water or gas in the seam.

MINING METHODS AND EQUIPMENT

A good suggestion is made in Letter No. 32 in respect to making an *effort to standardize*, as far as practicable, certain general mining requirements relating to the conducting of the ventilating current, the construction of stoppings and air bridges, the shooting of coal, the timbering of working places, lighting of mines, safeguarding electrical installations, and the foolproofing of mining machines and all mechanical appliances.

The compulsory use of *safety catches* on all cages and trips used for hoisting or lowering men is recommended in Letter No. 9. Letter No. 10 refers to the Avondale, Penn., disaster, which first drew attention to the need of maintaining *two openings* in every mine; likewise, the terrible Cherry, Ill., disaster, which taught the lesson of greater *fire protection* for mines and the need of the fireproofing of mine shafts. It may be added that the Throop, Penn., disaster taught the lesson of a similar fire protection for all underground engine and pump-rooms.

Letter No. 10 also advises legislation prohibiting the use of *gasoline motors* in coal mines. Other recommendations in respect to mine equipment are: The maintenance of *refuge stations* that would be available in time of accident, Letter No. 34; the regulation by law of *mine timbering* and the adoption of some regular system of timbering the working face in every coal mine, Letter No. 26; the adoption of the *electric head lamp* in gaseous mines, Letter No. 9; the regulation and control of the *company-store curse* where such exists; the prohibition of the *sale of liquor* in all mining towns and districts; and the prohibition of the employment of persons who cannot *speak and understand the English language,* Letter No. 38.

BLASTING IN COAL MINES

Letters Nos. 9, 13, 15 and 17 draw special attention to the dangers of the all too common practice of *"shooting off the solid,"* the *excessive use of powder* in blasting and the *use of dynamite* for breaking down the coal. A closer *examination* of the workings and *inspection* and *firing of shots* by duly authorized *shotfirers* is recommended, also the exclusive use of *permissible explosives.* These recommendations are certainly worthy of the most careful consideration.

THE MORNING EXAMINATION OF A MINE

Letters Nos. 5, 9, 12, 13, 14, 20 and 26 refer to the important matter of regulating by law the time within which the morning examination of a mine should be made by the firebosses. Attention is drawn to the fact that in most cases the fireboss is given *too large a territory* to examine and is therefore unable to cover the ground within a proper time before that for the men to go to work. It is stated in Letter No. 5 that no fireboss can truthfully say that a place is "free from gas" 6 or 8 hr. after making his examination. It is urged in Letter No. 9 that this examination should be made not more than 3 hr. previous to the time set for the workmen to enter the mine.

Letter No. 12 argues for a *higher standard of inspection* of all working places and the most *improved methods of timbering* the roof and coal. It may be added that the work performed in the morning examination before the men are permitted to enter the mine should include the *inspection of the roof, timber and brattices* and other requirements of safety in all working places. Letters Nos. 5 and 20 urge the *limitation* by law of the amount of work required of the fireboss and the employment of *a sufficient number* of men to make this examination thoroughly within the time limit.

THE SELECTION OF STATE MINE INSPECTORS

The manner of selection of state mine inspectors, *by appointment* by the governor or *by election* by popular vote, is treated in Letters Nos. 9, 14, 17, 26, 27, 28 and 29. Almost without exception the writers of these letters argue for a competitive examination to determine the eligibility of candidates for this office. It is worthy of note that not a single writer advocates the elective system of choosing mine inspectors, but the arguments are strongly opposed to this method.

A strong argument is advanced in Letter No. 29 in reference to the *length of tenure of office* of the state mine inspector, and Letter No. 9 argues that the *removal from office* of an inspector should only be effected "for cause." This feature of mine inspection work has often been advocated in Coal Age.

The Discretion of Mine Inspectors

It is remarked in Letters Nos. 10, 14, 32, 37 and 38 that in many mining laws too much is left to the *discretion and judgment* of the mine inspector. While this is undoubtedly a necessity in respect to certain mining conditions that cannot be forecasted in the law, it is too often carried to an extent that makes the mine inspector the lawmaker. This feature possesses the disadvantage that the inspector is liable to an error of judgment and occasional favoritism and unjust discrimination. But, in addition to this, the law thus imposes an unnecessary burden on the inspector in requiring that he shall both make and execute the law.

Effect of Political Influence

The undue effect of political influence as affecting the *selection and appointment* of men to the position of state mine inspector and the *certification* of mine officials is forcibly treated in Letters Nos. 5, 10, 11, 14, 18, 26, 27, 28 and 29. The two letters last named argue strongly for *civil-service control* in these matters. Instances are cited illustrating the baneful effect of such political influence in securing the appointment of men to positions that they are unfitted, by knowledge or experience, to fill. Letter No. 29 refers to the influence of the United Mine Workers' organization in this respect as particularly harmful under the elective system, owing to the strength of the miners' vote in the inspector's district.

The Enforcement of Present Mining Laws

Much stress is laid on the enforcement of present existing mining laws as being of as great importance as the enactment of new laws, in Letters Nos. 5, 9, 11, 12, 13, 14, 17, 19, 20 and 22. The truth of this argument cannot be denied. The *rigid enforcement* of any law standing on the statute books is absolutely essential to safety in mining. The law should either be enforced or wiped from the record. *A dead law is a menace to safety,* as it invites a similar disregard of other laws.

In this connection it is rightly claimed in Letters Nos. 22 and 38 that the mine inspector frequently has charge of *too large a territory* for the thorough performance of his duties. In order to secure the enforcement of his orders in a mine and to enable him to place the responsibility for any violation on the right shoulders, it is argued in Letters Nos. 25 and 35 that the mine inspector should give *written orders* to the mine foreman and a duplicate to be handed to the mine superintendent, the mine foreman being required to read and sign said order at once, thereby indicating that he understands the same.

Interstate Mines

Attention is drawn in Letters Nos. 16 and 24 to an important condition that is quite generally overlooked in mining laws. This relates to the rightful jurisdiction of the mine inspector in those portions of a mine in his charge that extend beyond the border line of his state. The pertinent question has been raised, How can the mine inspector be responsible for the safe operation of such a mine when his jurisdiction is limited by the state line on the surface and underground? This is an important matter that should be treated in all state coal-mining laws, and we hope for its further discussion in Coal Age.

Coöperation and the "Play-Safe" Spirit

Commendable attention is drawn to the need of coöperation on the part of mine officials in assisting the mine inspector to carry out the mining laws as they pertain to the *safety of mine operations.* This feature is mentioned in Letters Nos. 3 and 10, while Letters Nos. 19, 20 and 37 draw forcible attention to the fact that the mines in which the greatest degree of safety is secured are those in which the management manifests a *desire to "play safe."*

Many large companies have shown a praiseworthy desire and purpose, not only to carry out all the requirements of the law, but to go further and enforce such other regulations as are found to be necessary for a safer operation of the mine and the health of the men employed therein. It goes without saying that a still greater manifestation of this spirit on the part of not only mine officials, but all mine workers, would greatly reduce the number of mine fatalities and accidents and increase the health of mine workers.

The Workmen's Compensation Act

Reference is made to the generally successful operation of coal mines in different states under the Workmen's Compensation Act, which provides for a suitable compensation for loss of time and injuries sustained by mine workers while in the performance of their duties in the mine. Such references appear in Letters Nos. 3, 10, 11, 18, 25 and 38 and argue strongly for the adoption of such a law in all coal-mining states as being an effective means of increasing the degree of safety in mining operations and lowering the cost of coal production by reducing the number of fatal accidents with all their attending expenses.

The Education and Technical Training of Mining Men

Letters Nos. 6, 11 and 27 urge the growing need of more technical knowledge combined with experience on the part of *all* mine workers and the recognition of this need in all state mining laws, to the end that suitable provision may be made for the necessary training and instruction of mine workers. While many laws require the examination and certification of certain mine officials, little attention is given to provide the means for such education and training among all classes of employees.

Certification of Mine Officials

Numerous features of the certificate law in many coal-mining states are discussed in Letters Nos. 14, 17, 22, 24, 31, 34, 36, 38, 39 and 41. Letters Nos. 14 and 22 refer to a proper *classification and grading* of these certificates that would insure greater safety. Letters Nos. 17 and 34 urge the need of more *rigid examinations* as a requisite to obtain a certificate of competency. Letter No. 24 draws attention to the different *standards of efficiency* and requirements for certification in the different states, and with Letter No. 38 argues for the *interchange of state certificates.*

Letters Nos. 31 and 36 refer to and illustrate the *inconsistency* of the Pennsylvania anthracite law, requiring that the applicant for a certificate of competency to act as mine foreman shall have had five years' practical experience as a miner. Letter No. 34 advises that all mine officials should be examined at least every five years up to the age of 50 years. Letters No. 38 and 41 urge the need of requiring the *certification of mine superintendents,* as being the mine foreman's superior in office and ordering his work; while Letter No. 39 draws attention to the fact that an *uncertified assistant* mine foreman is frequently compelled to perform the duties of the mine foreman and held responsible by law for any violation of its requirements, while the law does not require his certification. These are all important matters and worthy of careful attention in mine legislation.

Requirements of Examination for Certificates of Competency

The kind of examination that should be given to determine a candidate's fitness to hold the office and perform the duties of mine foreman, assistant mine foreman or fireboss is treated in Letters Nos. 14, 17, 24 and 29. These letters urge that the *questions propounded* in examinations should be suited to the class of work to be performed and the duties involved. Letters Nos. 17 and 29 urge that both *practical and theoretical* questions should be given to determine the candidate's knowledge of mining, while Letter No. 24 urges a *uniformity* in state examinations for these positions that would make possible a suitable *interchange* of certificates between states.

Rights of Examining Boards

In this connection, Letters Nos. 2, 4, 10, 11 and 21 discuss the *right of examining boards* to withhold the corrected papers and not return the same to the candidate to whom they belong. On the one hand, it is claimed that the return of these papers to the candidate, after they have been properly corrected by the examining board, would enable the candidate to understand better the points in which he failed. On the other hand, it is argued that examining boards are not necessarily instructors and that the return of the papers so marked might do the candidate more harm than good. It was suggested that the return of candidates' papers to them might necessitate much correspondence and explanation, which is avoided by the filing of the papers in the State Department, where they can be seen by the candidates interested.

Capability of Members of Examining Boards

The frequent incapability of the members of examining boards is discussed in Letters Nos. 2, 4, 10, 11, 28 and 29. Attention is drawn to the fact that probably a majority of the mine superintendents appointed on examining boards are *incapable* of passing intelligently on the technical questions asked in examinations; and, further, that the miners appointed on these boards are likewise *incapable,* with few exceptions, of knowing whether or not such questions are correctly answered in candidates' papers. The suggestion is made, Letter No. 2, that such *board members should themselves hold a certificate of competency* obtained in a previous examination. We heartily indorse this suggestion and advise that such a provision be made in all mining laws relating to the examination of mine officials.

Mining Capabilities of Lawmakers

Attention is drawn in Letters Nos. 3, 8, 11, 14, 19 and 24 to the fact altogether too well known that it cannot be expected that lawmakers shall be intelligently acquainted with mining operations and requirements. For this reason, it was suggested in Letter No. 3 that it is desirable that mining representatives shall be present on needed occasions to give to legislators the desired information that would enable them to act more intelligently on the passage of mining laws. Objection is taken to this suggestion by the writer of No. 11, who states that such *lobbying* does not tend to generate the best of feeling among the working classes, who are prone to regard such activities as animated by a selfish purpose on the part of controlling interests.

With this summary of views, the discussion of needed mining laws and legislation will close. As stated some time since (Coal Age, Vol. 6, p. 958), it is expected to print a résumé of the opinions expressed in this discussion and to place the same in the hands of lawmakers in all coal-producing states. Copies will also be sent to the different state mining departments, mine inspectors and leading mine officials. Copies can also be secured by request in writing when these are ready for issue; but such requests should be made at an early date.

⁂

The Price of Anthracite

The brief filed on behalf of the respondents in the Interstate Commerce Commission's investigation of rates, practices, rules and regulations governing the transportation of anthracite coal contains the following statement of the amounts respectively retained by the retailer, the transporter and the producer out of the consumer's payment for a long ton of tidewater coal:

DIVISION OF THE COST OF A TON OF ANTHRACITE

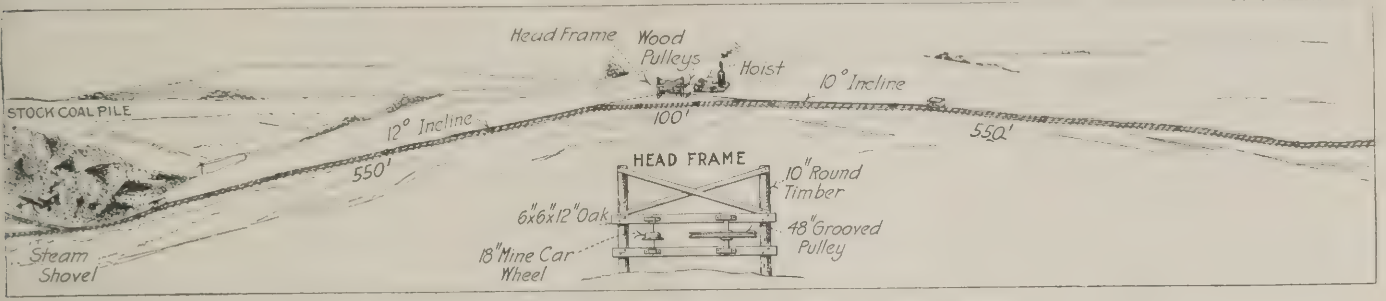
Size of Coal	Consumer Pays	Retailer	Transporter	Producer
Grate	$7.28	$2.68	$1.60	$3.00
Egg	7.28	2.43	1.60	3.25
Stove	7.28	2.43	1.60	3.25
Chestnut	7.56	2.46	1.60	3.50
Pea	5.88	2.33	1.45	2.10
Buckwheat No. 1	4.37	1.57	1.30	1.50
Buckwheat No. 2	3.53	1.23	1.15	1.15
Buckwheat No. 3	3.19	1.39	1.15	0.65

The amounts retained by the retailer, the transporter and the producer represent gross returns and not net profit. Out of them the retailer must pay for the cost of marketing coal and delivering it to his customers, the transporter must pay in large part for the maintenance and operation of his railroad and equipment and for hauling the empty cars back to the mines, and the producer must pay for mining his coal, preparing it for market and also find the wherewithal to meet his taxes and royalties.

Getting Coal from Stock-Pile to Breaker

By D. R. Llewellyn*

The accompanying sketch shows the general plan used to reclaim a stock-pile which was dumped on the opposite side of a hill from where the shaft and breaker were located. The colliery in question belonged to the Enterprise Coal Co., and the chief problem was to get the coal to the breaker for preparation. An engine was installed on the top of the hill in such a way that the coal could be hoisted up one side and let down the other, with one engine and one gang of men; otherwise it would have taken an engine to hoist it up and a double-track plane to let it down. The system here shown requires only a single track on both sides of the hill and a steam shovel to load the coal. A switch and double track are located close to the steam shovel. The size of the engine is 8x12 in., double geared 3 to 1, 34-in. drum; size of the mine car, 119 cu.ft.



A Practical Plan for Recovering a Stock Coal Pile

⁂

A Simple Plan for Cooling a Pump Bearing

By Timothy A. Ryan†

An interesting experiment was tried at the mine where I am foreman. Some time ago we had a centrifugal pump installed, driven by a 75-hp. motor, at a speed of 1200 r.p.m. Owing to the high speed, the pump is equipped with a water-cooled thrust bearing.

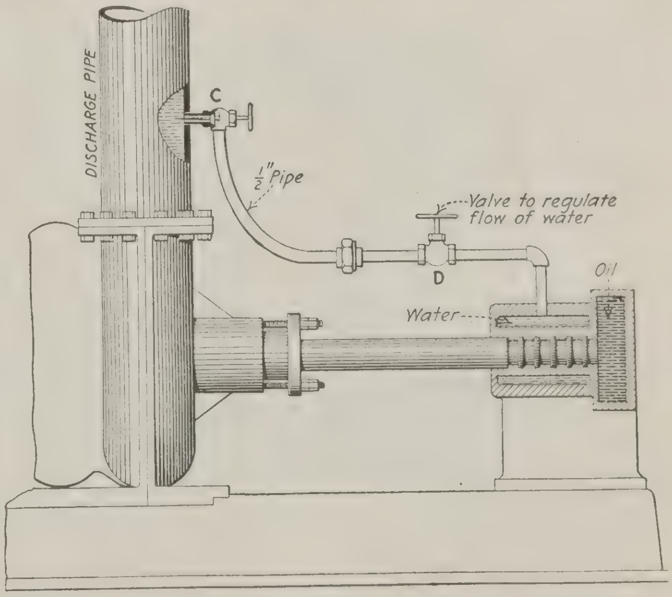
The first question that arose was the supply of water for the bearing. As there was no fresh water around the plant except what was purchased from the city water company—and which would be too expensive to use on the bearing—we decided to use the mine water. We tapped the column for a ½-in. pipe and connected it to the bearing, as shown by the sketch. We did not, however, have the angle valve shown at *C*; we had a ½-in. ell in its place.

We first had a screen put on the suction pipe, with a ¼-in. mesh, but we found it blocked very easily; so we replaced it with a ½-in. mesh, which eliminated that trouble.

We next had trouble with the feed pipe leading to the bearing. Every little particle of wood or foreign matter that found its way into the pump would lodge in the ½-in. nipple that was tapped into the column, thus stopping the flow of water to the bearing. If no one were present to stop the pump, inside of 20 min. the bearing would be destroyed and the pump disabled. One pump, therefore, required one man's attention, and even at that we had the pump only four months before the bearing commenced to run hot and disabled the pump for three days.

We then tried the arrangement shown at *C*. It is very simple, but works like a charm. It consists of an old ½-in. angle valve, with a piece of heavy brass wire attached to where the disk was, and the wire extends down through the nipple and about an inch into the column. When the water shows any sign of slowing up, open and shut this angle valve a few times, thus moving the wire up and down in the nipple. This keeps the nipple clear.

We have had this arrangement on for about eight months, and it has never failed or given any trouble. It does not require the service of a man watching the flow of water and the pump runs for weeks without any attention except cleaning and oiling once a week. The drawing here shown is intended to give an idea of the arrangement of the cooling-water pipe and not the details of the pump or bearing.



Arrangement of the Cooling-Water Pipe and Discharge Column

⁂

Since the weight per unit length of any electrical wire varies directly as the cross-sectional area, it follows that the resistance of a wire weighing, for example, 500 lb. per mile will equal one-fifth of the resistance of a wire weighing 100 lb. per mile. This is assuming uniform quality and treatment in manufacture.

†Hazleton, Penn.

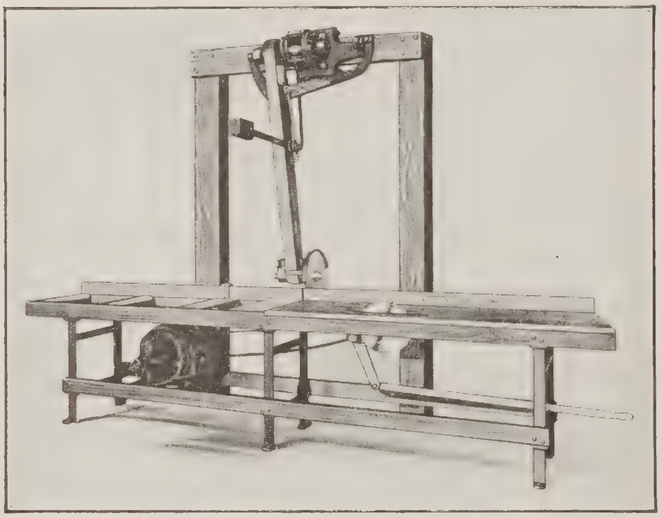
New Apparatus and Equipment

Believing that one of the greatest services that a journal such as Coal Age *can render its readers is to acquaint them with new and improved equipment which may be employed directly or indirectly to the benefit of the coal-producing industry, this department is inaugurated. For the present it will appear in the second and fourth issues of each month. We shall therefore be glad to receive from builders, manufacturers or dealers brief descriptions of new or improved pieces of apparatus in which they are interested, the use of which will tend toward better results in or the economic development of the fuel industry or any of its numerous ramifications.*

⁂

Reliance Motor-Driven Saws

The Reliance swing-saw for crosscut work is a self-contained unit, which may readily be installed by fastening with four bolts to any convenient wall or post. It is motor-driven, thus doing away with the loss of power incident to line shafting and belting. An automatic starting-box permits of quick starting and stopping by means of a knife switch placed convenient to the operator. Current is thus consumed only while the saw is in operation. Outfits of this variety are made in several sizes for both direct and alternating current and will cut lumber up to 12 in. thick.



The Crosscut and Rip-Saws Attached to the Same Frame

A recent addition to the Reliance line of electrically driven saws consists of the above-described swing-saw in combination with a rip-saw. A double-throw switch controls the operation of these saws and assures that only one may be in use at a time.

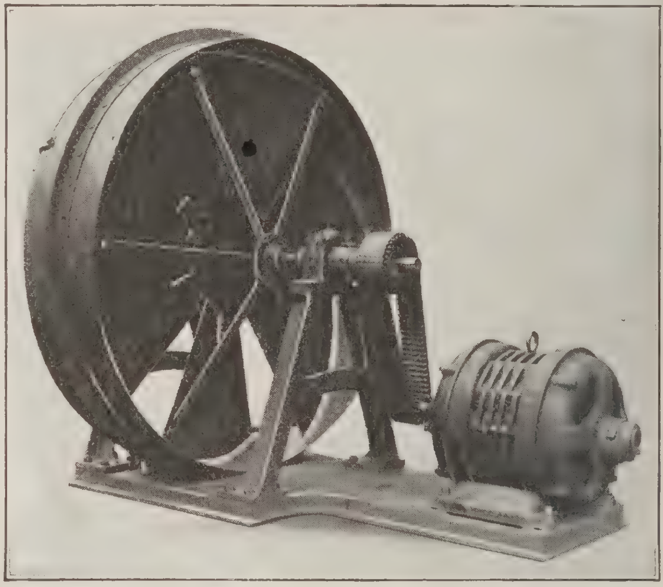
Another attractive feature of this combination is the fact that the two units may be employed independently of each other at different parts of the plant.

Both of these outfits are especially suitable at mines for cutting up and shaping lumber in the manufacture of cars and the linings of mine shafts. They are manufactured and sold by the Reno-Kaetker Electric Co., of Cincinnati, Ohio.

⁂

A New Two-Speed Fan Unit

In order to secure the benefits and savings inherent to two fan speeds in mine-ventilation work, the J. C. Stine Co., of Tyrone, Penn., has recently placed upon the market the unit shown in the accompanying illustration. The fans are built in sizes ranging from 4 to 8 ft. in diameter, the bedplate being extended to receive the two-speed alternating-current motor. These motors, instead of being connected to the fan by gearing or belt, as has formerly been done, are connected by a Morse silent chain, and the fan is supported on Hyatt roller bearings.



The Fan and Motor on One Bedplate Ready for Installation

This combination forms an exceedingly compact and reliable unit, as well as one which is comparatively inexpensive from every standpoint. Experience has shown that the roller bearing not only requires less power to overcome friction, but that considerably less attention is required in the way of attendance and supervision generally.

The silent chain drive possesses many advantages over gears or belts. It is compact, silent, powerful, reliable and is not affected by moisture or mine gases. It is consequently highly efficient so far as power transmission is concerned, and—what is more important from the mining standpoint—thoroughly reliable.

The savings which may be effected through running the fan at high speed during the daytime or working hours and at half speed during the balance of the day are greater than is usually appreciated. In a mine which requires under working conditions 70,000 cu.ft. of air per min. at a

1-in. water-gage, operating the fan at half speed during the night effects a saving of about $480 annually, when power costs 1c. per kw.-hr., or enough to pay for this fan equipment in about two years' time. The motors may be wound for either 220, 440 or 550 volts, as may be desired.

Combining the fan and motor upon the single cast-iron bedplate renders only one light foundation necessary, and at the same time maintains both motor and fan shaft in correct alignment with, and at the proper distance from, each other. The minimum amount of work is therefore necessary, both in installing this unit and in maintenance and attendance after it is in proper working condition.

"Pottsville Telltale" for Electric Lamp-Charging Rack

When charging electric mine-lamp batteries in large numbers on a mine-haulage circuit subject to voltage variations and interruption, an active attendant is required to watch all details to see that the batteries receive proper attention during the time they are on charge. The Philadelphia & Reading Coal & Iron Co. has devised an electric servant ready to work every minute of the day or night, one that never gets tired, needs neither rest nor sleep, never complains of too much work, and whose services cost nothing. In fact this is exactly what is embodied in what is termed the "Pottsville Telltale" for miner's electric lamp charging racks.

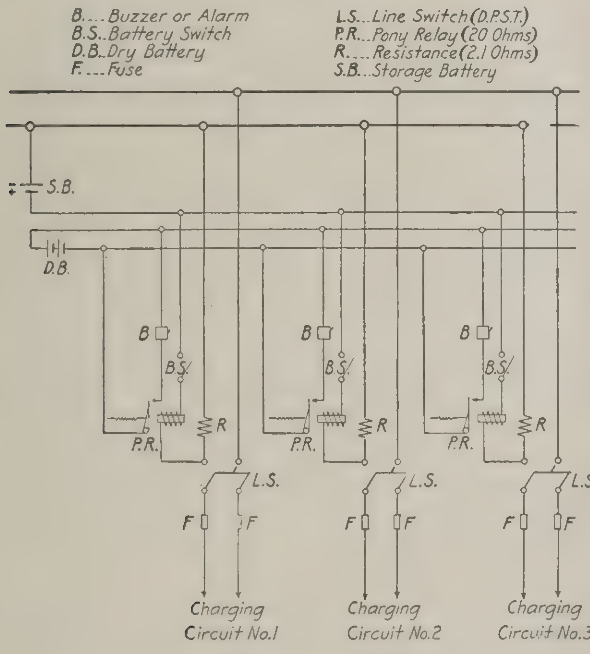


DIAGRAM OF TELLTALE CONNECTIONS

When the charging commences the attendant simply closes a switch and the little worker responds instantly, sticking to the job until finished. The accompanying illustration shows the connections for such a system, which can be applied to any number of charging racks. The equipment consists of a miner's lamp battery, two dry cells, relay, buzzer, resistance unit, switch and wiring. The function of this device is to sound an alarm when any of the following conditions exist:

First, when the charging current varies above or below the normal by a predetermined amount. Under this condition the operation is as follows: Assuming a charging current of 1 ampere is desired, a resistance unit of 2.1 ohms is inserted in the negative side of each charging circuit, thus giving a voltage drop of 2.1 volts across the resistance. A storage cell which gives a normal potential of 2.1 volts is connected across the resistance through the primary of a relay of about 20 ohms with its polarity opposing the voltage drop across the resistance, the small buzzer being connected in the battery circuit across the relay contacts. Should the charging current drop below 1 ampere the voltage drop across the resistance becomes less than the battery voltage, permitting the battery to discharge through the relay, which will act, closing the contacts, thus ringing the buzzer. Should the charging current increase above 1 ampere the voltage drop across the resistance becomes greater than the storage cell voltage, hence it will take a charging current through the relay, closing the relay contacts, thus ringing the buzzer. By the relay spring adjustment any desired variation of the charging current to a minimum of 10 per cent. can be maintained, the buzzer continuing to operate until the charging current is brought to normal.

Second, should the charging circuit become open by reason of a fuse blowing or poor contacts, no current will flow through the resistance, thus destroying its counter e.m.f., and the full voltage of the storage cell will actuate the relay, thus ringing the buzzer.

Third, should the supply of power fail, the batteries on charge will discharge back into the line. This reversal of current through the resistance will produce a voltage drop that will be added to the battery voltage, which will actuate the relay regardless of the value of the reverse current. It will be noted that the storage cell will automatically keep charged without attention.

The usefulness of this "Telltale" system may be summarized as follows:

It enables the station attendant to maintain the proper charging current without constantly watching the ammeter.

It saves the battery from an excessive discharge in case of a reverse current.

It prevents the battery from becoming injured by an excessive charging rate.

When putting the batteries on or removing them from a rack it immediately notifies the attendant of any poor contacts.

In testing the voltage of each battery on charge it is essential that the proper charging current be maintained when readings are taken; therefore considerable time and work are saved as it is unnecessary to read the ammeter each time.

This device has been in use for the past six months on the "Pottsville charging rack" described in Volume 7, page 427, of COAL AGE, and is giving the results above enumerated.

⁂

George Otis Smith says that to increase industrial prosperity in the United States we need to export finished rather than crude products and to import raw materials rather than manufactures. Betterment of industrial conditions can come best through expansion of manufacturing. The increase of the element of labor in the product exported will mean that we are not bartering away our heritage of natural resources, but rather that we are using these resources as a basis simply for the expenditure of labor, which renews itself.

Extracts from a Superintendent's Diary

Of late I have fallen into a habit of amusing myself by trying to divide all of my subordinates into two classes: Those who would be able to credit all of their impulses to subordinates, or fellows lower in rank, and those who are spurred into action by keeping their eyes constantly upon their superiors.

The idea was suggested to my mind by a sermon in which men were conjured to shun evil companions, and by companions, the minister explained, he meant that one's thoughts should be given first consideration. That text is as old as the hills, but never before had the importance of one's thoughts been brought out so convincingly and it set me to thinking.

It is evident that some people are easily led, but the thing that I had never realized before was that the people who are easily led measure themselves in terms of their inferiors—no wonder the inferiors often take the whip hand. The minister brought that point out clearly and it impressed me.

I began to dig into the motives of the men who call me boss and I found that a man's point of view is the key to most of his actions. Some men spend most of their time comparing their lot with the circumstances of those below them in rank, and they are naturally very much pleased with themselves and have no time to turn about occasionally in search of inspiration from the men above them in position. Others forget the old job as soon as they rise above it and begin to cast longing eyes on the men still higher up; they can never be boastful or fall victims to flattery because they think in terms of the men above them and realize their own insignificance.

At first I tried to discover a third division somewhere between the other two, but I have decided that it does not exist. Numbers of men seem to be satisfied to remain where they are, but they justify their acts entirely by their past record, and as they are continually in need of justification in order to keep their conscience under control, they keep close tab on the men who have succeeded them lower down the ladder.

I find this study of the motives underlying men's actions of the very greatest assistance in choosing men for promotion, and with a little more experience I feel that I shall always be able to pick men who will make good, and in time I shall have a nearly perfect organization.

There is one thing sure and that is with an organization where every man has his eyes on the job of the man just above him, every man, the superintendent included, will have to keep extremely busy to even hold his own, and it wouldn't be possible under such conditions to conceive of a man who considered himself so important to the organization that the organization could not get along without him. That would eliminate a whole lot of unpleasantness because it is pretty hard to handle a valuable man after he becomes possessed of the idea that he is indispensable.

I find myself applying the test not only to my own employees, but to my former associates who are now occupying various high and low positions. And in recalling their ruling passions my memory plays me strange tricks and wanders off into reveries and often before I get control of myself again, I have submitted my past to my own test, and then I realize why at times I stood still.

How a Coal Miner Can Save

Several years ago there came to the manager of one of the coal mines in the New River field of West Virginia a darky from South Carolina, by the name of Ike Mitchell, who asked to be put to work in the mine. He was given work, and for the first time entered a coal mine. From the start, his industry was noticed, as were also the facts that his home surroundings soon had a clean and healthy appearance, that his wife and children were well clothed, and that his family lived well, as judged by his purchases at the company store.

After working several months, Ike came to the manager one day and asked if he would keep for him some money he had saved from his earnings, and the manager was surprised when he was handed $300. From this time on, this industrious colored man left his savings with the manager, and at the end of two years, after paying all his living expenses, he had accumulated upward of $2000 in cash. This he drew, and returned with his family to the cotton fields of his native state. There he bought a piece of land, and the latest report from him was to the effect that he was raising cotton, as well as serving a milk route in a neighboring town, and was still making money from the capital he had accumulated from working in the mine.

Ike Mitchell might have picked cotton in his native state for a life-time before his savings would have amounted to as much as they did in the West Virginia mine in two years, and there is a similar opportunity in many coal fields for the laborer who wants to work hard and save his surplus earnings.

⁂

Guyan Valley Coal Operators Association

The operators of the Guyan Valley in West Virginia, forming what is known as the Guyan Valley Coal Operators Association, met in Huntington, March 24, for their fourth annual meeting.

The objects of the society are to standardize the sizes of coal, to promote more friendly relations between the employer and the employees, to do more effective betterment work in behalf of the latter, to extend trade to foreign nations, particularly South America, and to disseminate accurate knowledge concerning the industry. C. W. Jones, of Logan, is president; A. R. Beisel, of Holden, is vice-president and A. H. Land, of Barboursville, W. Va., is secretary.

⁂

"Mine, Quarry and Derrick"

Our Canadian friends have been publishing under this title since Feb. 3 of this year an excellent fortnightly magazine of about 36 pages, which appears to be well deserving of the support of the reading public.

It is edited by J. C. Murray, whose fitness for the work is unquestioned. W. C. McGinnis is associate editor, and R. W. Coulthard is a contributing editor. L. S. Kempher is manager. The offices of the paper are at Calgary, Alta. Attention is given all kinds of mining, and the field covered by its title seems to be well filled by this publication. The subscription price is $3 per year.

Editorials

The Layland Rescue Work

The rescue work at Layland after the recent regrettable explosion does not prove the uselessness of oxygen apparatus, but rather the fact that if men so equipped will not take an energetic initiative they will retard rather than aid the recovery of a mine. The Layland operation did not have many live workings, so it is a fit matter for surprise that it was still not wholly explored after four days.

Forty-seven men were after that length of time still huddled in the roadways leading to their working places. They were not hidden in their rooms, nor in old workings, nor buried in the gob, nor under falls of roof, nor in sags full of water, but located and easily findable in just those places where men should first seek them—just where a preliminary reconnoissance might be expected to be made. But they were not discovered; in fact, five men had to come out and reveal their presence, which they did at the drift mouth. Only then were the other 42 men really sought.

Had the work been pressed at Layland as it was at Royalton by the state rescue-men of Illinois, an earlier release for the entombed would have been assured. Happily, the unfortunates had a leader, or leaders, of good judgment and marvelous patience; otherwise the long delay would have been fatal to the two small bands of entombed men. As it happened, they suffered only from hunger and thirst, but that their experience was no worse was not due to the work of those directing the rescue.

Who these directors were seems to be open to much doubt. Probably no one was invited to take the lead, yet by tacit consent leadership was accredited to those generally known as the "experts of the Bureau of Mines." It is not well for a coal company already self-condemned by a disaster at its mines—for what company, however correct its management, wholly escapes condemnation—to oppose the representatives of the nation, which have the ear of the public press.

If the state department and the corporation have no oxygen apparatus, they must await the reëstablishment of ventilation before investigating any part of the mine. They cannot well bid the oxygen-apparatus men examine this or that place, when they themselves are not competent to do so. Certainly they do not like to instruct the "experts."

So without being arbitrary at all, and without any great obsequiousness on the part of the state department and corporation, the oxygen-apparatus men of the Bureau of Mines are permitted to take the lead. If they fail to do so, effectual apparatus work cannot be done.

We purposely overlook the men from Gary, W. Va. No one could expect an outsider like Vitus Klier to force his little band in ahead of the federal rescuers. So it is clear we cannot avoid the view that to the Bureau of Mines should have been accorded the glory, and to that organization must be accorded—whatever is rightfully due. Let us not express it too baldly.

It is stated that the oxygen-apparatus men examined for fire. They were there, we are told, not so much for salvatory as for precautionary measures, to prevent a second Hanna, Wyo., or Rush Run, W. Va., disaster. Yet air was allowed to play on parts of the mine not explored. The air was so good that men came through it alive, some even entering, working and returning in it, and not being even discommoded.

Had there been a fire, there would doubtless have been a Hanna which would have killed the 47 men and maybe others around the drift mouth. So the oxygen-apparatus men did not fill their part as guards, much less as rescuers.

Brave men there were at Layland. Sore-hearted men they are now, to think that with all their fearlessness they failed to cut the strand of red tape and relied on others when the right of initiative was theirs.

We have always claimed the life of the canary hung on a thread and that the endurance of that bird was not the proper measure for that of a red-blooded man when life was in the balance. Still less is it his measure when he has an oxygen apparatus, and half a hundred men are still unfound and several working places still unexplored.

We do not blame Secretary Lane for his words of congratulation to the bureau under his charge. He is one of the best men in the President's cabinet, and he did but voice the natural judgment of an ill-informed public. But there should be no medals for anyone; for though many were fearless, there seemed to be a lack of moral and mental bravery. The courage of leadership is different from the quality which risks life for humanity, and that courage was lacking.

But if there is to be a medal awarded by the American Mine Safety Association, as Mr. Lane has suggested, it would seem to belong rightly to that veteran who took charge of the 42 men and bade them wall themselves in and prohibited smoking, who put heart into his followers when they despaired. He is a credit to America and to the mining industry. He had courage, brains and heart. By all means, if room can be found to express on a medal all the honor due him let him have it and an engrossed diploma to boot. The whole coal industry salutes him.

◆

Amortization, a National Issue

Amortization is the continual replacement of dead by living capital, an action corresponding physiologically to the renewing of dead animal tissues. Without such tissue renewal the physical death of the individual would result, just as without replacement there must come an end of all capital.

We more often consider amortization as the repair of the decadence of a single business than think of it as a corrective of the property decay of a whole industry. Still more rarely do we regard it in terms of a nation as the redemption of a yearly national loss, or in world terms as the replenishment of an annual world-fund decrement. So it is to us a small thing if the result of the business of Tom and Dick and Harry is an unrepaired loss of capital. We do not see that the death of their property is a partial death of the national or world property from which we must all derive our sustenance.

The nation which loses and does not amortize its losses is not pursuing conservation. It is spending its all on its immediate needs and is drifting to a condition of pauperism. We wonder sometimes if the world realizes that periods of depression like the present are times in which there is a permanent loss to the world's fund. They are times during which there is a real lack of conservation. When the buildings of the nation stand idle and the labor of its people is unemployed, then there is no conservation, but rather capital decay. The construction wealth of past years, the slow accumulations of the centuries are wasted in the immediate expenditures of a generation or part of a generation.

Let it never be forgotten that amortization is not solely an interest of the individual capitalist, but of the nation, or rather of the world. A century without it would restore us to the condition of the Middle Ages, when war and pestilence and lack of machinery took toll on the people just as restrictive legislation takes today.

History records several actual declines in wealth, times when as it were the nations of the world lived on their past and became emaciated from the lack of reproductive energy. No one seems to know what happened, but wealth declined. We may face such a blight if the clothes, pleasures and idleness of the toilers be the sole outcome of activities of capital.

Clean-Up Day

The annual clean-up day has or should have arrived at all mining camps. The winter has snowed under all the pollutions of months, and winds have scattered the rubbish far and wide. Now the sun is removing the snow and revealing all the distressing unpleasantnesses which have been accumulating.

It behooves all mine managers to get busy and, when nature decks itself in new garments, prevent the unseemliness of beerkegs, waste-paper, ash-heaps and tin cans from spoiling the natural beauties of the town-sites. The cities have their clean-up days, and the villages should have theirs. Above all, the things which cause disease should be removed.

In West Virginia we learn that most of the mining villages will get a general refurbishment. It is to be hoped that in other states an equal energy will be shown.

The period now shortly to follow is one in which disease is often rampant. The ground swept off by rains and melting snows pollutes the streams, and the greatest care should be taken to protect the water-supply. The wash-water from the houses should be sewered to some nearby stream that is not used by men or animals as a source of water-supply, or better yet to a cesspool. Springs liable to contamination should be sealed up.

In some states the turning of sewage untreated into streams is forbidden. Whenever it can be mixed with strong sulphur water from the mines it would probably be rendered entirely harmless. In some states turning untreated mine water into the streams is also unlawful, but the law is probably a dead letter, as the handling of such a volume of water in the existing state of the science of treatment is almost an impossible proposition.

Pollution of water, with consequent milk contamination, seems the most important source of typhoid. The "typhoid" fly has received much of the blame, but the figures suggest, even if they do not prove, an alibi. We have compiled the case rate for typhoid in Pennsylvania, somewhat arbitrarily terming May, June, July, August, September and October the fly-beridden months and taking the others as being free from that pest, and we have arrived at the following result:

PERCENTAGE OF TYPHOID CASES IN PENNSYLVANIA

Year	In Months When Flies Are Common	In Months Which Are Too Cold for Flies
1906	45.8	54.2
1907	44.8	55.2
1908	52.5	47.5
1909	60.6	39.4
1910	62.2	37.8

The uncertainty of results seems to show that a nonseasonal cause is back of the plague of typhoid, and for that reason care should be taken to keep the water-supply under surveillance.

Why the World Needs Pockets

The cry of the worker of late has been that capital gets an undue share of the gross receipts of industry, the attempt to prove it usually being made successful by sedulously overlooking the cost of material in evaluating the manufacturers' profits. But in recent years it has been extremely doubtful whether capital has been, in any large number of instances, in the receipt of even adequate reward.

It is surely true that the capital of the coal industry, especially of the bituminous branch of it, has been invested without a fitting return. In this case the material purchased, both unmined coal and supplies, may be ignored, and still the showing will attest that the income is meager. Making allowance for the value of the material used and destroyed, the return for coal production is more often loss than profit.

The workman believes that the need for profit would be removed should the state replace the capitalist. This is a grievous error. Profits might be made even larger in order that there might be an opportunity to expand industry with increasing population and in accord with the demands for more complex machinery and equipment arising out of our growing needs and desires.

The worker should never get the full usufruct of his labor under any administration of mundane affairs. If he digs a ton of coal, he cannot expect to get the equivalent of that ton in pay. Some part must go to swell the world capital, and that deduction might be greater under an enlightened socialism than ever it has been under a restrictive capitalism.

Let no one think that when the Millennium comes man will have hands and a mouth, but will get along without pockets. For the pocket is one of the most wonderful contrivances of civilized man. Mankind saves because it thinks, and because it both thinks and saves it is superior to all other animal-kind.

The question of the capitalist has been always, Where do I "come out" when there are no profits? It may be said truthfully that the world is caring less and less as to the answer. But another question is just as natural; namely, How can the public and the workingmen be provided with a progressive, comfortable living or even with the degree of prosperity which they now enjoy if there is no increase in the instruments of production other than an increase of laborers?

Book Reviews

THE ANTHRACITE COAL COMBINATION IN THE UNITED STATES, with Some Account of the Early Development of the Anthracite Industry. By Eliot Jones, associate professor of economics, State University of Iowa, sometime instructor in Harvard University. pp. xiii + 250 + 9 index; 5⅞x8⅞ in. 7 charts. Harvard University Press, Cambridge, Mass., 1914. Price $1.50, cloth boards.

This book, which is a perfect mine of information regarding the financial aspect of the anthracite industry, was awarded the David A. Wells prize for the year 1913-14 and is published from the income of the David A. Wells fund. It is a careful, concise, scholarly review of the formation of the anthracite combination. Sometimes we wish it were a little less dispassionate, perhaps, for the interest occasionally flags—and we find ourselves in a mass of information so long and detailed as to be burdensome. But reviewers are apt not to be sufficiently patient, and the man who wants the facts for his weapons of defense or of offense wants a complete armory and not a few instruments of war, no matter how quaint and interesting they may be.

Arkansas and Virginia Anthracites

We do not feel able to question the facts in this volume, except, perhaps, the short references to geology. But with these exceptions the book is probably in every way reliable. It says: "Other deposits of anthracite besides those in the State of Pennsylvania are found in the United States, but they are so small as to be of slight consequence." "There are deposits" of anthracite "in Alaska, Washington, Arkansas and possibly in a few other states, but as yet litle is known of their extent or their value." And again: "The anthracite beds in the southwestern portion of the State of Virginia are now being developed."

The American technician will tell you that there is no anthracite in Arkansas or southwestern Virginia, but the trade will possibly agree with the professor, owing to a difference in definition. If the trade view of what constitutes anthracite is correct, then the Arkansas anthracite is somewhat important. The Geological Survey, by Marcus R. Campbell, its chief, lists in "The Coal Resources of the World" neither anthracite nor semianthracite in southwestern Virginia. However, in an extremely lax use of the word, anthracite is found in Arkansas, southwestern Virginia and even in central Pennsylvania, and the deposits are important. It is wrong to say in one breath that they exist and that they are not of much significance.

Maps and Charts

The maps in this volume are somewhat deficient, and we cannot but wish that the various railroads had been named and the canals had been charted and designated on maps of adequate size or number. The one map furnished—the same as that in the report made by H. H. Stoek on "The Pennsylvania Anthracite Coal Field" for the Geological Survey—does not contain the names of any railroads or canals. Yet the reader can get this information from a good map if he will take the trouble, so that it is not really so important an omission as is that of a map showing the confines of the various districts—Wyoming, Lehigh and Schuylkill; for these divisions are not exactly geologic, but are rather geographic and topographic, and as the geologic areas are alone shown on the map furnished, the student needs to be informed as to the exact delimitations of the commercial areas mentioned.

The book is not quite up to date, the charts and figures unfortunately being only extended up to 1910. The illustration we produce, slightly changed, we have ventured to extend to 1913 on the basis of the report of Edward W. Parker, statistician of the Geological Survey. However, much of the information in the text is not so recent, as it dates back to 1907, when an investigation was made from which many figures in the book are derived.

The following quotations from the book will give a good idea of the character of the information to be found within its covers:

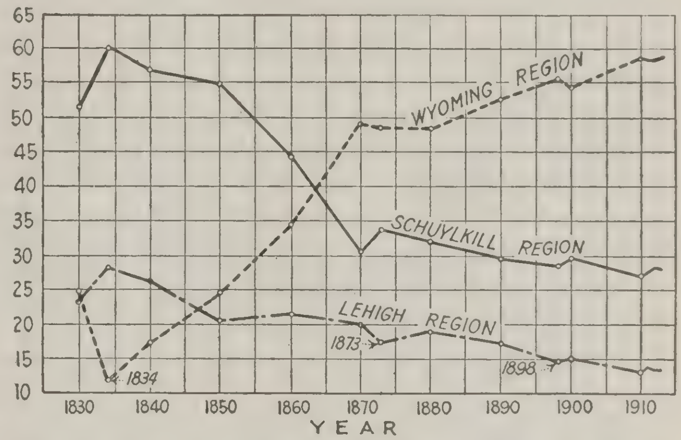
The Preponderance of the Railroad Coal Companies

"Most of the anthracite coal now produced is mined by the railroads, or by their subsidiary coal corporations, which will be referred to hereafter as the railroad coal companies. This classification head includes the coal departments of roads like the Delaware, Lackawanna & Western, which has always mined its coal directly.

"These companies in 1907 produced nearly 80 per cent. of the total output. By far the largest producing company, in spite of the fact that its coal lands are located mainly in the southern field, where the cost of mining is greater, is the Philadelphia & Reading Coal & Iron Co., which produced, in 1907, 12.3 million tons, or 16 per cent. of the total anthracite output of Pennsylvania. The second largest company was the Delaware, Lackawanna & Western R.R., which mined directly 12 per cent. of the total output. The Reading Coal & Iron Co. and the Delaware, Lackawanna & Western R.R. Co., therefore, together produced considerably more than all the independent operators in the whole anthracite basin.

The Railroad Companies Increase Their Percentage of Output

"The proportion of the total output mined by the railroad companies has steadily increased. In 1900 the combined production of these corporations was 62 per cent. of the total output, while the operators not controlled by the railroads produced 38 per cent. of the total. By 1901, through the purchase of the Pennsylvania Coal Co. by the Erie and that of a number of independent operators by the New York, Ontario & Western, the output of the railroad coal companies had increased to nearly 70 per cent. of the total.



Graph Showing Percentages of Anthracite Mined in the Three Pennsylvania Districts from 1830 to the Present Date

"The acquisition of individual properties continued in the years which followed. In 1905 the large firm of Coxe Brothers & Co. was purchased by the Lehigh Valley, and a number of smaller properties were absorbed by other railroad companies. By 1907 over three-fourths—78.04 per cent.—of the total output of anthracite coal was being mined by the railroad coal companies, while less than 22 per cent. was mined by the remaining operators. The largest individual operator at this time was the Kingston Coal Co., producing in 1907 slightly over 1.5 million tons, yet 425,855 tons of this were mined for the Delaware, Lackawanna & Western R.R., and practically all the balance was sold to various railroad coal companies. This was the only independent company with a production of over a million tons. There were eight other companies in 1907, producing over a half million tons, but all these, with one exception, sold practically all their coal at the mines to the railroad coal companies—hence they were not important competitive factors.

The Railroad Companies Control over 90 per Cent. of the Anthracite Production

"In 1907, as we have seen, the anthracite coal roads, either directly or through their affiliated coal companies, produced 59,960,287 tons, or 78.04 per cent. of the total production of anthracite coal. This does not indicate fully, however, the completeness of their control over the output of anthracite. The production of the individual (and independent) operators in 1907 was 16,875,795 tons. This includes the 425,855 tons mined by the Kingston Coal Co. but belonging to the Delaware, Lackawanna & Western R R. Deducting this amount, the independent output is reduced to 16,449,940 tons, or 21.41 per cent. of the total production.

"But, it will be remembered that a large number of the individual operators had entered into long-term, and in many cases perpetual, contracts with the railroad coal companies, whereby they agreed to deliver at the mines to the coal companies all the coal mined by them. The output thus bound by contract in 1907 according to the record in the Sherman Anti-Trust case was 7,427,634 tons. This figure includes two-thirds of the output of the Pine Hill Colliery, approximately one-third being free and really independent. This tonnage, for all practical purposes, was as thoroughly controlled by the railroad coal companies with whom the contracts had been made, as if it had been produced directly by them. It should therefore be added to their production in order to ascertain the extent of their control over the output.

RELATIVE AND ACTUAL PRODUCTION OF RAILROAD AND OTHER ANTHRACITE OPERATIONS

Operator	In Percentages 1900	1901	1902	1903	1904	1905	1906	1907	Millions of Tons, 1907

From Transcript of Record in Sherman Anti-Trust Case, iii, Exh. 169.

Some of the Independence Is only Relative

"After deducting from the independent output the tonnage sold to the railroad coal companies under the percentage contracts, the independent operators are in control of only 9,022,306 tons, or 11.74 per cent. of the total production. The railroad coal companies controlled, therefore, 88.26 per cent. of all the coal mined. One further deduction, however, still remains to be made. A number of the individual operators sold their total output, or a portion thereof, to the railroad coal companies under contracts based upon the 65 per cent. division, but extending only for a year or in some cases terminable at will by either party. The amount so sold to the railroad coal companies in 1907 was 2,335,918 tons. These purchases placed the railroad coal companies in control, in the year 1907, of 70,149,694 tons, or 91.3 per cent. of the total production. Therefore, though the individual (and independent) operators mined in 1907 nearly 22 per cent. of all the anthracite coal produced, yet so much of this was bound in various ways to the railroad coal companies that only 8.7 per cent. of the total production could be classed as really independent.

The Independent Operators Own Less than Nine per Cent. of the Anthracite Coal

"A consideration of the unmined area shows that the proportion of the total output mined by the independent operators will steadily decline. The individual (and independent) operators not controlled by a transportation company owned, in 1896, 9.07 per cent. of the unmined tonnage available for shipment to market. In making this estimate, all the coal not owned by the railroad coal companies has been classified as belonging to the independent operators. Some of this may have been undeveloped and separately owned. But the tonnage owned by the independent operators certainly did not exceed 9.07 per cent. of the total. Since 1896, as the result of the buying out of a large number of operators, the holdings of the railroad coal companies have been considerably increased. It is obvious, therefore, that the proportion of the unmined coal owned by the independent operators has declined.

"In spite of this decline, these operators as late as 1907 mined nearly 22 per cent. of the total output. Yet it is clearly impossible for them to maintain this proportion, inasmuch as they own less than 9 per cent. of the unmined tonnage. A steady decline in their relative output, therefore, is to be expected. Yet just how long their production will continue is difficult to predict with assurance.

DISTRIBUTION OF THE UNMINED TONNAGE ON JAN. 1, 1896, IN THOUSANDS OF TONS

Owner	Unmined Coal Owned	Per Cent.	Owned and Controlled byContract	Per Cent.	Duration in Years on Basis of Shipments in 1895
Philadelphia & Reading Coal & Iron Co.	2,087,490	41.14	2,143,706	42.25	216
Lehigh & Wilkes-Barre Coal Co.	863,760	17.02	877,569	17.30	163
Lehigh Coal & Navigation Co.					
Lehigh Valley Coal Co.	787,200	15.52	855,511	16.87	116
Delaware, Lackawanna & Western R.R.	300,853	5.93	332,332	6.55	54
Susquehanna and affiliated coal companies	248,142	4.89	316,502	6.24	63
Delaware & HudsonCo.	115,823	2.28	115,823	2.29	26

Scranton Coal Co.	......	....	13,971	0.28	9
Remainder	460,008	9.07	187,822	3.71	
Grand total	5,073,786	100.00	5,073,786	100.00	

A summary from William Griffith's estimate.

"We may certainly look, however, in the comparatively near future for the elimination of the independent element, unless, indeed, new conditions shall arise through the enactment of additional, and effective, legislation, state or national."

PRESENT WORTH OF SERIAL PAYMENTS. By W. E. Fohl, Mining Engineer, Farmers' Bank Building, Pittsburgh, Penn. pp. 20; 4⅛x6½ in. Price $1.00 postpaid, linen paper cover.

In this pamphlet are given the present worth or equivalent of single payments of $1000 to be made after various periods of time, these periods being in a series of half-year intervals running from 6 months to 50 years. The rate of interest is compounded semi-annually and is figured as 3, 4, 5 and 6 per cent. Thus if we desire to pay $1000 4½ years hence, we find in these tables that we can lay aside $874.59 and, by the end of the 4½ years, it will have increased in value so that it will meet the payment of $1000.

The tables also show what fund must be provided to meet, with the help of 3, 4, 5 or 6 per cent. interest, a drain of $1000 at the end of every six months for times varying by half years from six months to 50 years. For example, if the interest rate is 3 per cent., it will take $8360.51 to provide for the payment of $1000 at end of every six months for 4½ years.

Such tables have considerable value for persons who are planning to start up a coal plant. A saving of $2000 a year which will last 10 years will justify an immediate expenditure of $14,877.49 figuring on six per cent. as the rate of interest. With the same increment it is profitable to pay only $306.56 for a piece of land which it would cost $1000 to buy after 20 years. There are endless other applications of these tables. If, however, the reader has bought some coal land and can't sell it for any price, he should keep away from such a book for it will spoil the serenity of his slumbers.

PROCEEDINGS OF THE COAL MINING INSTITUTE OF America, 1913. R. Dawson Hall, Editor, Tenth Ave. and 36th St., New York City. pp. 240; 6x8⅝ in. 7 ill. Price $2, cloth boards.

The proceedings are as usual belated and this year are not as long as has been customary, but the work of R. Baur & Son, the printers, is of exceptional merit. If we may be pardoned for so doing we will mention the principal papers according to our view of their value.

"Basic Coke," by J. K. Campbell is by far the best paper. The discussion on it is also quite valuable especially the remarks of Fred C. Keighley. H. H. Clark's remarks on "Portable Electric Mine Lamps" should be read by everyone. Harrington Emerson's talk on "Efficiency Thought as to Coal Mining" was good, but everyone present thought his discussion was even better. Thomas L. Lewis spoke on a threadbare subject—the way to advance the interests of the coal industry. Somehow when he sat down, his hearers discovered that he had found something entirely new to say. Where everyone else had merely deplored conditions, without finding a remedy, Mr. Lewis offered a not impossible solution.

These are the best parts of the book. As the discussion is given almost without excision much of the best material in the volume is not to be found in any other publication.

Discussion By Readers

Recognition of Bravery

Letter No. 9—The work of rescue in coal mining has many sides to be considered. I believe that most men have a natural ambition to be recognized and honored as a hero; but the opportunity for action does not present itself during the life of every man. Again, when the opportunity arises it is not every man that can master his own fears and, as previously stated, bring his courage up to the pitch that will enable him to chance the saving of the life of a fellow worker at his own risk.

The desire to achieve honor may, as has already been suggested, lead some men to make a desperate and foolhardy attempt to rescue another and to assume an unwarranted risk in such endeavor. Examples are frequent where a greater loss of life has been incurred, owing to the excessive zeal of would-be rescuers who rush into danger without thorough preparation and with little chance of doing effective work. By such hasty action they not only endanger their own lives, but greatly hamper the later work of rescue dictated by cooler judgment and a better knowledge of the conditions existing inside the mine.

Everything considered, it is readily recognized that the possibility of rescue is often difficult to determine. In some cases men that have been given up for lost have been rescued later by some timely occurrence; and this fact often leads rescuers to hope against hope. It must be remembered, also, that rescue is not always effected from the outside. Many brave deeds are performed by the cooler-headed and more self-possessed among those entombed in the mine. Many a brave man has thus given his life for others, whose self-sacrificing act performed in the dark recesses of the earth has never come to the knowledge of the world.

Mention has been made of the man who has established a record for bravery and has a reputation to sustain. This, in connection with the allurement that any substantial compensation for bravery would offer, may often induce unwise and hasty action in rescue work. Such is more apt to be the case than that, as was suggested, "the substantial recognition of brave acts might increase the efficiency of the work of rescue."

There can be little doubt that mine foremen, assistant mine foremen and firebosses, who are held responsible under the mining law for the safety of the men in their charge and the security of valuable property, perform acts almost every day that would class them as heroes, although such acts are incumbent on them in the faithful discharge of their duties in the mines.

It is seldom that any great good is achieved without some attending evils, and the proposed recognition of heroic acts and self-sacrifice will no doubt prove the truth of this. It might even happen that some worthless fellow, in the hope of securing a pension for life, would contrive a scheme in which he would pose as a hero and secure recognition, but such a possibility is extremely remote.

Permit me to say, in closing, that I believe it would be right and proper to establish a fund, which might be called the Mine Industrial or the Civil Hero Fund, to be supported by the state or by persons of wealth, in the name of humanity. While honorable mention, certificates and medals are well enough, they do not compensate for a crippled body or afford any consolation to loved ones bereaved by the accident.

H. R. K.

Curtisville, Penn.

Letter No. 10—Referring to the interesting and valuable discussion of the "Recognition of Bravery" that has recently appeared in Coal Age, I beg to call the attention of readers to the work that has been done along this line by the American Mine Safety Association.

This is a national association, the object of which is to promote the science of safety in mining by the adoption of logical methods of procedure in mine inspection and in rescue work; to recommend the adoption of approved types of first-aid and mine-safety rescue appliances; to obtain and circulate information on these subjects; and to secure the coöperation of its members in establishing proper safeguards to prevent the loss of life and property by explosions or fires or from other causes.

The American Mine Safety Association confers medals in recognition of acts of heroism, according to the following rules:

1. Medals of heroism will be issued to the most deserving persons who have participated in rescue work in mines, under conditions where their lives were endangered and when human life was saved.
2. Medals will be awarded, not for reckless courage, but for the heroic running of known risks, by the use of careful and scientific methods in conjunction with organized and trained rescue parties.
3. Medals will be awarded only to persons directly instrumental in saving life and under conditions where their own lives were endangered thereby.
4. Recommendations for the award of such medals must be accompanied by all the facts, duly certified by the mine superintendent or other person in charge of the mine-rescue operations and by witnesses personally cognizant of the facts, such data to be referred to the executive committee for recommendation to the president of this association.
5. If the candidate for such medal is deceased, the same will go to his wife or oldest male child, if any.

One of the association's medals was awarded to John C. Davidson, at Terre Haute, Ind., Sept. 12, 1914, for rescue service at Starkville, Colo., following the Starkville mine explosion of Oct. 8, 1910. Mr. Davidson is the first miner to receive this medal.

The form of certificate to be used in applying for the American Mine Safety Association medal of heroism is as follows:

CERTIFICATE OF HEROISM, AMERICAN MINE SAFETY ASSOCIATION

In furnishing the information necessary to the award of a medal of heroism, please fill out the following questions in full, giving names and addresses of as many eyewitnesses as possible:

1. Name and address?
2. Date or dates on which services were rendered?
3. Name of mine and its location?

4. A statement of the training previously received by you and under whose supervision and where?
5. Purposes for which the men engaged in rescue or recovery work?
6. Were any lives saved by the act of the above using breathing apparatus? Give names and addresses.
7. Were bodies of victims of disaster recovered by above using breathing apparatus?
8. Did the men wearing breathing apparatus endanger their own lives in the effort to rescue life?
9. A general statement of circumstances or conditions not enumerated above.
10. Names and addresses of witnesses.

I draw attention to the work of our association along this line in order that readers shall be acquainted with the same and that there may be no conflict in our several aims and purposes in so noble a cause.

AUGUST F. KNOEFEL,
President, American Mine Safety Association.
Terre Haute, Ind.

⁂

Mining Laws, Legislation and Mine Regulations

Letter No. 42—I want to indorse the point so often overlooked but brought out clearly in Letter No. 41, COAL AGE, Apr. 3, p. 613, regarding the difference between gaseous and nongaseous mines and the requirements of the mining law in respect to the same. While I admit that the *gaseous* mine is far the more dangerous, I believe there is much room for legislation in respect to nongaseous mines.

For the past 27 years I have worked in mines of each of these classes, and I fail to see any reason why a nongaseous mine is exempt by law from a morning examination before the men are allowed to enter the mine for the day's work. In my opinion such an examination is as important in one case as in another.

All practical mining men know that great changes take place in roof conditions, especially in pillar workings, during the night. It is a common occurrence for a man who has left his place in safe condition the night before to find in the morning that it has been "working" during the night and that cracks and slips have developed in the roof, making the place dangerous for work. In a gaseous mine, when a fireboss finds such conditions in a place on making his morning examination the place is fenced off and reported as "dangerous," and the men are notified not to go to work until the danger can be removed.

It is true that Art. 25, Rule 1, of the bituminous mine law of Pennsylvania, compels each miner to "examine his working place before beginning work and take down all dangerous slate or otherwise make it safe by properly timbering it before commencing to mine or load coal." It must be remembered, however, that there is a wide difference in the way in which men regard danger. While some men habitually make a careful and thorough examination before commencing work, others neglect this precaution, and they are generally the ones to be caught.

I am sure that a glance at any conscientious fireboss' report book would show a far greater number of dangers from "bad roof" than from "gas." Mining statistics show that a much greater number of accidents occur from "falls of roof and coal" than from "gas." The morning examination of the mine would, moreover, prove a benefit in its daily operation, as it would reveal possible falls of roof on the haulage road, which could be promptly removed, and the necessary timbers set before it is time for the mine to start up. Such an examination is an absolute necessity in all mines to fully carry out the idea of "Safety First," which is the universal slogan today.

Art. 4, Sec. 14, of the same law requires the employment of shotfirers in mines "where explosive gas is being generated in quantities sufficient to be detected by an approved safety lamp, etc." The same article forbids the firing of shots in gaseous and dusty mines where locked safety lamps are used, "unless the entries and rooms which are dry and dusty are so thoroughly wetted as to prevent the existence of any dry dust for a distance of not less than 80 ft. from the hole to be fired."

Since the large number of experiments made by the Bureau of Mines at its Pittsburgh Testing Station and in other places in this country and in Europe have proved conclusively the explosibility of coal dust in the absence of explosive gas, it seems strange that this same law relating to shotfiring should not apply to nongaseous as well as to gaseous mines. I am glad to say, however, that I know of many mine officials who go farther than the requirements of the mining law and make these precautions obligatory in the operation of their mines.

CHAS. ADAMSON.
South Brownsville, Penn.

Letter No. 43—I have been much impressed and can heartily indorse all that has been said in regard to the peculiar position occupied by the mine foreman of a coal mine.

The law provides for his certification and makes him responsible for the ventilation and drainage of the mine and numerous other matters that relate to its safe operation. On the other hand, in order to hold his position with the company, he must *hustle for coal.* The law wants *safety,* while the company wants *coal.* To supply the demand for coal often necessitates putting men in dangerous places, and any objection from the mine foreman in this regard meets with little consideration from the mine superintendent. His terms are, "Get the coal or take your time and get out."

The point I want to urge is that the superintendent is not under any obligations to the state and is not responsible by law for the safe operation of the mine; while the mine foreman, who must take his orders from the superintendent, is made by law responsible for the safety of the operation. I want to say most emphatically that I am in favor of some law that will free the mine foreman from the curse of two masters.

The problem might be solved by the passage of a law providing for daily inspectors in mines, to be paid by the state a salary in proportion to the size of the mine and the number of men in their charge. On these men would devolve the duty of examining the ventilating apparatus and other safety appliances and to see that the mine is operated in compliance with the law. Their duties would not conflict with the operations of the company, provided these complied with the law.

It stands to reason that, by such a method, fewer risks would be taken and as a result there would be fewer accidents, and the mine foreman would not be in danger of losing his position or becoming liable to the law of the state. Beside the daily inspection of all ventilating apparatus and safety appliances, the safety inspector could check the men going in and coming out of the mine. If, however, he had charge of more than one mine, he could delegate an assistant to do this work for him alternately at one of the mines. Such daily inspectors should not be given charge of greater territory than they could cover regularly each alternate day. It seems to me that some such provision as this would solve the difficulty.

OSTEL BULLOCK,
Assistant Foreman.

Cleaton, Ky.

Letter No. 44—There is a point in the bituminous mine law of Pennsylvania to which attention should be called before this discussion is closed. It has reference to the legal standing and responsibility of the assistant mine foreman.

Art. 4, Sec. 1, of the bituminous law (Penn.) reads, in part, as follows:

> When the mine workings become so extensive that the mine foreman is unable, personally, to carry out the requirements of this act pertaining to his duties, he shall have the right to employ a sufficient number of competent persons to act as his assistants who shall act under his instructions in carrying out the provisions of this act.

By the provision of the last clause of the law quoted above, the personality of the assistant is eliminated. He is not permitted to act in his individual capacity, but the law compels him to act in accordance with the mine foreman's instructions. The law thus assumes that all orders issued by the assistant do not proceed from him as an individual, but emanate from the mine foreman, who is given by law all the authority of a personal command. The foreman thus simply uses his assistant as a mouthpiece. But the prosecution of this official, from time to time, would lead one to infer that the law does not intend to relieve the assistant foreman of his share of responsibility. If this is true, the law is a paradox and will undoubtedly require a legal mind to explain its meaning.

The question may well be asked, Can a person be held legally responsible for the results of an action that he has performed at the dictation of a legally authorized superior in office? In attempting to give a positive answer to this question it cannot be assumed that the assistant, in the performance of his duty, acts to a certain extent upon his own initiative. It cannot be assumed that he must do this because it is impossible for the mine foreman to be present to decide and give instructions in every particular case and for that reason the assistant becomes responsible for the result of his actions in carrying out the foreman's orders.

In answering this question regarding the legal responsibility of an assistant mine foreman, due consideration must be given to his relative position as determined by the law. The law seems to compel the assistant to act as the will and pleasure of the foreman dictate, and it seems reasonable to conclude, therefore, that the foreman and not his assistant is thus made the responsible party.

Any other interpretation of the law would provide a convenient way for the mine foreman of a large operation to shift the responsibilities of his position. It is unquestionably true that many mine foremen do take advantage of this means to blame an assistant for his own mistakes. The law has a tendency to make the foreman less efficient in the discharge of his duties, affording as it does a comparatively easy means of making an assistant foreman the scapegoat in case of accident or failure of the foreman's plans.

With an efficient corps of assistants, a mine foreman's work is greatly curtailed, and this doubtless is the object of the law with respect to assistant foremen; but the mine foreman should not be permitted to forget that *his* responsibilities cannot be curtailed or foisted on another.

If such a construction of the law as I have described is correct, the mine foreman can be held accountable for only a comparatively few of the accidents and violations that are features of coal mining. Many parts of the mine where accidents and violations are the more liable to occur are not under his personal daily supervision, and consequently the blame for such occurrences must be borne by the assistant.

The frequent action of mine inspectors in holding assistant foremen responsible and thereby relieving the mine foremen, I believe, has greatly assisted in fostering carelessness and negligence on the part of the latter official. These men are generally equally culpable with their assistants for a casualty that may be the result of their own lack of supervision and ability to safely direct the work. I believe that if a test case were to be made of this point no judge would uphold the validity of the law. A clear understanding of its meaning is an important factor in safe mining.

Assistant mine foremen have the right to be informed in regard to their legal status as provided by the law. If it is urged that this knowledge would result in greater negligence and carelessness of assistant foremen, it can be said with equal force that it will act as a greater stimulant to the *foremen* and make them more careful and watchful.

As I understand the law, in its present form, the assistant mine foreman is not and cannot be held responsible for any casualty that might occur in the discharge of his duty as assistant to the foreman; and, until his legal status is specifically defined, he remains immune from the law. If the law requires a victim for sacrifice, let it take the individual upon whom it distinctly imposes the responsibility for the safe operation of the mine.

I. C. PARFITT.

Jerome, Penn.

Electrical Requirements in Mine Law

In the issue of COAL AGE, Mar. 20, p. 516, appears a query of Fred Vinton regarding certain rules in Art. 11 of the bituminous mine law of Pennsylvania (1911). The first rule mentioned is with respect to the use of high-voltage current underground, and the second has regard to the use of certain incandescent lamps in gaseous mines.

The use of electricity at high voltage in any mine introduces a certain hazard if not properly applied, and for this reason each installation should be surrounded with every reasonable safeguard. Reference to the mining laws of the different coal-producing states will disclose the fact that in many cases the use of high-potential current underground is not recognized. It is certainly a very liberal provision that will allow its use, and in order to render it reasonably safe certain safeguards have been provided in the bituminous law of Pennsylvania.

The minimum capacity of 5 kw. placed in this law, on any transformer connected to a high-potential circuit, is such as will meet every ordinary mine requirement; and experience subsequent to the framing of these rules has shown that this could have been made several times this capacity without working a hardship on anyone. All high-potential apparatus located underground should be placed in a substation; and, inasmuch as these substations are located at a central distribution point, there are few, if any, cases that would warrant the high cost of a substation switchboard equipment and wiring to take care of smaller units than that named in the law. The only possible objection that could be raised to this is that small transformers are required in connection with switchboard instruments; but, inasmuch as these transformers are mounted on and made part of the switchboard equipment, it is obvious that this rule would not apply to such cases.

In the case of high-voltage motors, it is not practicable to use motors of less than 15 b.hp. underground, and this minimum could safely have been increased to 50 b.hp. without working a hardship on anyone. Inquiry of the different manufacturers will develop the fact that few small high-potential motors are manufactured for use above ground, and certainly their use underground would be less practicable.

The rule referring to the use of electric lamps in gaseous mines is in keeping with the recommendations of the Federal Bureau of Mines, and their recommendations are based on the results of exhaustive tests on the performance of incandescent lamps when exposed to explosive gas.

Referring to the comments that appear in connection with Mr. Vinton's query, it is fully apparent that the author did not make a thorough "inquiry" as to what this rule actually meant in respect to motor capacity. The rule in no way prohibits or restricts the use of motors of less capacity than 15 b.hp. in mines, if the same are supplied with current at medium or low potential as defined in the law.

While some rules in the article referred to could be criticized because of recent developments, the rules governing the use of high-potential equipment are extremely liberal and not open to this criticism. If, on the surface, it is not considered safe and practicable to use motors of less than 15 b.hp. when wound for high potential, it certainly would be wrong to attempt to use them underground where they would be subjected to much severer conditions. The intent of this rule is to restrict the use of high-potential motors to proper locations, and it is not the intention that small equipment be tapped off indiscriminately along a high-potential underground circuit. If the character of the work warrants the cost of high-potential apparatus, no rule of this mining law is in any way a hindrance thereto.

Study Course in Coal Mining

By J. T. BEARD

The Coal Age Pocket Book

INFLAMMABLE MINE GASES

The presence of combustible gases in the atmosphere of a mine is always an element of danger for three principal reasons. 1. The percentage of gas in the mine air may be sufficient to form an explosive mixture known as **firedamp.** 2. The temperature of ignition of most of these gases is lower than that of methane, which is usually the chief constituent of firedamp, and the latter is rendered **more readily ignitable** by reason of their presence. 3. The presence of the smallest percentage of a combustible gas assists to that extent the ignition of a **dust-laden atmosphere,** and increases the violence of its explosion when ignited.

The Inflammable Gases—The inflammable or combustible mine gases, in the order of their importance, are methane (CH_4), carbon monoxide (CO), ethane (C_2H_6), ethene or olefiant gas (C_2H_4), hydrogen (H_2) and hydrogen sulphide (H_2S). Each of these gases is not only combustible but forms an **explosive mixture** when mixed with air in certain proportions.

Inflammable Range of Gases—The combustion of an inflammable gas, under mining conditions, requires the presence of air or available oxygen. The relative proportion of air and gas in the mixture determines the character and completeness of the combustion and the range of inflammability of the gas.

The maintenance of flame throughout a gaseous mixture requires that the **heat of combination** between the combustible and the atmosphere supporting the combustion shall be equal to that lost by **radiation, conduction** and **absorption** by the air and gaseous products formed. Two conditions are possible.

1. The proportion of gas to air may be such as to give a low **rate of combination** and a correspondingly small generation of heat, which is insufficient to raise the adjacent gaseous molecules to an equal temperature, resulting in a still lower rate of combination and a lesser generation of heat as the action proceeds through the mass till it finally ceases.

2. Again, the proportion of air to gas may be such as to cause an **absorption of heat** greater than that generated when the condition will likewise be a falling one and there can result no general extension of flame throughout the mass.

The first of these two conditions (excess of gas) determines the **higher inflammable limit** of the gas, while the second condition mentioned (excess of air) marks the **lower inflammable limit.** Beyond these two limits the gaseous mixture is not inflammable. In mining practice, mixtures above the higher limit are more dangerous than those below the lower limit, as more air will make them explosive.

Explosive Range of Gases—A combustible gas is always inflammable in proportions of gas to air outside of the explosive range of the gas. In other words, the **range of inflammability** is wider than and embraces the **range of explosibility.** The same principles, however, apply in respect to each of these conditions.

The **degree of explosiveness** of a gaseous mixture is increased as the rate of combination is more rapid and the loss of heat less; or decreased as the rate of combining is slower and the loss of heat greater.

The Coal Age Pocket Book

Maximum Explosive Point—It is quite generally assumed that the maximum explosive force of a gas is developed when the proportion of air or oxygen is just sufficient for the **complete combustion** of the gas. While this is sufficiently close for all practical purposes, it is stated (Emich) that the inflammability is not necessarily greatest at this point.

Inflammable and Explosive Limits—The following table gives the lower and higher inflammable and explosive limits and the maximum explosive point of the three most important combustible mine gases, except only the higher inflammable limit of carbon monoxide, which has not been determined, but is probably about 80 per cent. The table shows the **percentage of gas** present in the mixture, at each of the five stages given. The lower inflammable limit and the maximum explosive point have been calculated for each of these gases, while the other data are the results of experiment. A normal condition of the air is assumed:

TABLE GIVING THE INFLAMMABLE AND EXPLOSIVE LIMITS AND THE MAXIMUM EXPLOSIVE POINT OF METHANE, HYDROGEN AND CARBON MONOXIDE

Gas	Lower Inflam. Limit	Lower Explo. Limit	Maximum Explo. Point	Higher Explo. Limit	Higher Inflam. Limit
Methane	2.5	7.1	9.5	16.7	29.5
Carbon monoxide..	8.4	16.5	29.5	75.0	...
Hydrogen	5.0	9.5	29.5	66.3	72.0

The same data, in reference to olefiant gas (ethene or ethylene), C_2H_4, are: Lower explosive limit, 4.0 per cent.; maximum explosive point, 6.5 per cent.; and higher explosive limit, 14.5 per cent. These, however, have only a relative importance in respect to mining, because the percentage of this gas present in mines is very small.

Peculiarities of Explosion—A peculiarity in the explosion of a mixture of **methane and air** is that, at the temperature of ignition (1200° F.), about 10 sec. are required before the gas will ignite (Mallard and Le Chatelier), while both hydrogen and carbon monoxide ignite at once, upon contact with the flame. The **time required** for the ignition of methane grows rapidly less as the temperature is increased.

The same authorities also claim that mixtures of methane and air in any proportion are explosive at **high temperatures,** and the same effect has been observed at **high pressures.** In other words, an increase of temperature or pressure has the effect to widen the explosive range of a gas.

A mixture of **carbon monoxide and air** will not explode in the **absence of moisture.** The explosion, in this case, seems to require two stages, the carbon monoxide taking the oxygen from the water, which is replaced immediately by the oxygen of the air, as represented by the following equations:

$$CO + H_2O = CO_2 + H_2$$

and

$$2\,H_2 + O_2 = 2\,H_2O$$

It has been argued that, since carbon monoxide, which is distilled from coal dust floating in the mine air, is not explosive in dry air, the safest condition is a dry mine atmosphere, which, however, is practically impossible

Inquiries of General Interest

Equalizing the Hoisting Ropes in a Shaft

I want to ask the opinion of COAL AGE and its readers in regard to a problem that has caused considerable discussion at our mine. We have a double-compartment shaft, there being two cages and two ropes that wind on a single drum. When either cage is at the lower landing, the other cage is about 1 ft. below the upper landing.

The question is, How much should each rope be shortened in order that both cages will reach their respective landings at the same time? The length of each rope is such that there are still two coils remaining on the drum when the cage is at the bottom landing.

To illustrate this I have drawn a rough sketch, which shows the lower cage at the landing at the bottom of the shaft, while the upper cage is about a foot below the landing at the surface. It would seem that if a foot is cut off of this rope so as to bring this cage to the upper landing, the difficulty would be overcome, as both cages would then be at their landings at the same time. If this is wrong, kindly set me right.

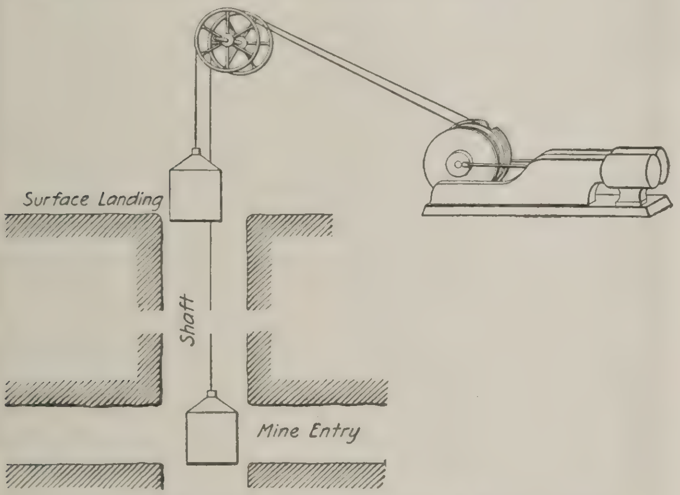

DIAGRAM SHOWING ELEVATION OF MINE HOIST

MARTIN SCHUBLE, Engineer,
Vandalia No. 8 Mine.

Linton, Ind.

It is true that cutting a foot off of, say the east rope in the shaft would bring that cage to the upper landing when the west cage is at the lower landing. If now the cages are reversed, the west cage being raised and the east cage lowered, it is clear that the east cage will have to be lowered 1 ft. further than before, in order to reach the lower landing; and in doing this, the west cage will rise to the desired height at the upper landing. Therefore it will not be necessary to cut anything off the west rope.

If it is desired, however, to cut an *equal* amount off each rope, only one-half of the amount that each cage falls short of the landing at the surface when the other cage is at the bottom should be cut off each rope.

This may be made clearer by supposing both ropes to be marked to correspond to a mark on the frame when the west cage is at the lower landing and the east cage is 1 ft. below the upper landing. Now, if 6 in. be cut off of the east rope, that cage will be 6 in. *below the upper landing.* Likewise, if 6 in. be cut off the west rope, that cage will be 6 in. *above the lower landing.* Now, if the engine is started and the drum rotated 6 in. by the mark on the rope, bringing the east cage to the upper landing, the west cage will at the same time be brought to the lower landing. Or, *vice versa,* if the drum be rotated so as to raise the west cage to the upper landing, the east cage will be lowered the same distance to the lower landing.

⁂

Cost of Producing Coal in Iowa

In order to settle a controversy we would like to have the following questions answered in COAL AGE: What is the average cost of producing coal in Iowa and Missouri? Also, what are the relative percentages of lump coal and screenings produced at the mines in these states?

FRED. MORCK.

Tuscaloosa, Ala.

The only available figures showing the cost of production of coal in the different states are those given in the *Bulletin* of the 13th Census of the United States (1910). The "Census Report" for 1910 gives the following figures for Iowa: Coal production for the year 1909, 7,725,679 tons; value at mines, $12,679,225; total expenses reported to produce this coal, $12,816,076.

The same report gives the following figures for Missouri: Coal production for the year 1909, 3,596,691 tons; value at mines, $5,879,972; total expenses, $5,715,727.

In speaking of the cost of the production of coal in the several states, the report states that, while the figures for the entire United States show a profit of about 5c. per ton of coal produced, the figures for Arkansas, Iowa, Kentucky, Oklahoma, Oregon, Tennessee, Virginia and West Virginia all show the expense of production as exceeding the value of the product mined. The report advances the opinion that, while the figures given "cannot be taken as showing accurately the amount of profit or loss in the coal-mining industry of the several states, they do seem to indicate clearly that in many states the industry obtains only a very low rate of profit, if any." Correspondence with many coal operators on this point brought the statement that, "while there was a loss in their coal-mining business proper, this was more than counterbalanced by the profits from selling merchandise and renting houses."

No figures are available showing the relative percentages of screenings and lump coal produced. The mining laws of both Iowa and Missouri, however, require the weighing of the coal for the payment of miners before it is screened.

Examination Questions

Alabama First-Class Mine Foremen's Examination, Held Jan. 25-28, 1915

(*Selected Questions*)

Ques.—If when making an examination of a mine you found a large body of explosive gas, state what precautions you would take to prevent an accident from the same.

Ans.—If the gas is found in the morning examination, before the men have entered the mine, the matter should be reported at once at the shaft or slope bottom or the entrance of the mine, and adequate measures should be at once adopted to prevent anyone from entering that section or district in which the gas was found. If the accumulation is of such volume as to endanger other portions of the workings, the entire mine should be closed and no one permitted to enter, except those authorized to perform the work of removing the gas.

If, on the other hand, the gas is found when the men are at work, no change should be made in the ventilation—not a door should be opened or closed to alter the circulation of the air in the affected section, until the men in that section have been notified to extinguish their lamps and withdraw as quickly and quietly as possible. The work of withdrawing the men should be done promptly. If necessary, the men should be withdrawn also from the adjoining sections.

Having withdrawn the men, every entrance to the affected portions of the mine should be guarded to prevent anyone from entering. Competent firebosses should then be selected and equipped with safety lamps. None others should be employed in the work of removing the gas, which must be started from the intake end of the section. The circulation of air in that section should now be increased so as to provide an adequate air volume to effect the removal of the gas.

The work should proceed slowly and tests be made, from time to time, to determine the progress. All safety lamps should be carefully guarded against any outrush of air and gas caused by roof falls or otherwise. Ample time must be given for the current to sweep away the gas, and special brattices should be erected to deflect the current to the face of the workings and into any void places, where gas might find lodgment.

Ques.—If you were the foreman of a mine generating gas and an accumulation of firedamp had collected on the falls, what method would you adopt to remove it?

Ans.—First, withdraw all the men from the return of the air current in that section of the mine and in any adjoining sections that might be endangered by a possible roof fall that would drive out the gas into other workings. A strong air current will then be required to dislodge the gas above the falls, since, owing to its low specific gravity, the gas tends to rise into the cavity made by the fall of the roof. It will generally be necessary to erect a special brattice to drive the gas out of these cavities above the falls.

Ques.—State fully your opinion of the principal causes of explosions in mines, and give in detail any method you would recommend for their prevention.

Ans.—The causes chiefly responsible for gas and dust explosions in mines are the following: The permitted use of mixed lights in mines; insufficient or careless inspection of the workings while the men are in the mine; hurried and incomplete examination of the mine in the morning, before the men enter for work; permitting the accumulation of fine coal and dust in the workings and on the roads throughout the mine; the excessive use of black powder in blasting the coal; badly placed shots and failure to properly mine and free the shots before firing; the use of coal slack or other combustible matter for tamping the holes; failure to properly ventilate the abandoned workings of a mine; the use of defective or poorly designed or improperly cleaned safety lamps; the use of safety lamps by inexperienced men; carrying matches into a gaseous mine for the purpose of smoking; tampering with a safety lamp; fooling with safety lamps and with gas, or lighting the latter for fun. These, together with the numerous risks taken by many miners, are the chief causes of mine explosions.

Ques.—Will coal dust extend a mine explosion throughout the entire mine, in the absence of explosive gas?

Ans.—Coal dust allowed to accumulate on the roads, timbers and walls of a mine will extend any explosion of gas or dust in a mine when the explosion has been once started, whether or not gas is present on the roads or in the entries. The force of the explosion, which would otherwise extend itself but a short distance, throws the dust into the air and the flame of the explosion, feeding on this dust suspended in the air, is extended throughout the workings as long as there is dust to burn and oxygen to support the combustion.

Ques.—Give your opinion of the best method of humidifying the air in mines.

Ans.—As stated in Coal Age, Feb. 27, p. 386, there are many types of apparatus used for this purpose, and it is difficult to say that any single type will give the most satisfactory results under all conditions. In humidifying mine air, practically, it is absolutely necessary to heat the air entering the mine to a temperature somewhat above that of the mine workings, before introducing water vapor (steam) into the air current. This heating is necessary in order that the air shall take up as large a quantity of the water as possible.

This heated moist air will be slightly cooled in its passage through the mine and, as a result, some of its moisture will be deposited in the workings; while at the same time the saturated air is prevented from absorbing moisture from the mine and drying out the workings. However, under the varying conditions in mines, it is generally observed that the air current alternately deposits and picks up moisture in its passage through the workings. In other words, in actual practice, the air current serves as a carrier of moisture from one portion of the mine to another, and it is difficult to avoid this condition.

Coal and Coke News

Washington, D. C.

According to announcements made here, the question of higher rates on coal and coke moving over the lines in Western Trunk Line and Southwestern Tariff Committee territory will be heard before Interstate Commerce Commissioner Daniels in Chicago on Apr. 14-16. The entire new series of hearings, covering proposed advances on hay and broom corn, cotton piece goods, grain, rice, fruits and vegetables, packing house products, live stock and other products will extend to May 10.

Various statements on different phases of the case have already been filed, and are receiving study here. One of these presents the reasons of the roads for proposing an advance in the rates on coal and coke. According to the presentation of the roads' case in the written briefs, the basic reason for advancing rates on coal and coke is that the burden on shippers would be small while the aid to the carriers in the territory under discussion would be large.

This increment to railroad revenues from the proposed higher rates on coal and coke is estimated at $1,266,000 annually while the per ton cost to shippers would be less than 8c.; or, based on consumption per inhabitant, would be about 5c. per annum per person throughout the territory, assuming that the extra rates were added to the charge for coal to the consumer at retail.

From the traffic standpoint, it has already been orally argued in the hearings thus far held that coal at present rates of transportation brings no real income to the roads owing to the unsteadiness and uncertainty of the traffic and the frequent periodical strikes leading to suspensions of business—total or partial—which cut off tonnage and derange the whole freight adjustment.

The seasonal nature of the industry and the added uncertainly brought about, as just indicated, by labor troubles and strikes, differentiating it from many others, necessitates the maintenance of an unduly large supply of cars, and otherwise adds greatly to the cost and trouble of the whole trade. Hence, it is claimed, the justification for an advance.

Producers and shippers have seemed disposed to rebut these arguments in much the same way that was resorted to in the North Dakota coal rate cases—by showing that the roads are prosperous and able to make up on other commodities what they fail to earn on coal. Much the same point of view was developed in the Eastern hearings of last spring (a year ago) when it was clearly shown, in addition, that the bituminous coal operators had for some time been in most cases on so narrow a margin of profit that to add to the shipping expense would put some, at least, out of business by making it impossible for them to compete at the points where prices were most keenly contested.

Shippers' representatives generally are endeavoring to show that the roads are as well as, or better fitted than, the shippers, to bear the brunt of present conditions, and that the general state of business consequently affords no warrant for any effort to shift the load from the shoulders of the carriers to those of the public. It is understood that the entire series of hearings is to be finished by May 10 and that the briefs of the roads are to be in hand by the end of May and the answers of the shippers by the middle of June next. The whole case will, it is expected, be in by the beginning of the month of July and this, it is supposed, would render possible a verdict immediately after the summer recess.

PENNSYLVANIA

Anthracite

Pittston—The site of the former Ewen breaker of the Pennsylvania Coal Co., which was burned to the ground several months ago, is at present a busy spot with preparations going on for rebuilding. It will be replaced by what will be one of the most modern breakers in the entire anthracite region, absolutely fire-proof in every respect, and with modern equipment for the preparation of coal. The work is to be pushed rapidly so that the place may be running within a year.

Scranton—After two months of low production, the output of anthracite last month was slightly larger than that of March, 1914. This increase was due partly to the stimulus of the heavy April discounts and partly to the fact that three successive months of low production would cause a coal shortage later in the year that it would be difficult to make up. It is not possible to increase the number of railroad cars and the rate of output to any considerable extent to meet an increase in demand.

Edwardsville—Officials of the Woodward Colliery, of the Delaware, Lackawanna & Western R.R. Co., are proud of the record made on Mar. 29, when 2262 cars of coal were dumped at the breaker. R. M. Keifer, outside foreman, and Richard Thomas, assistant superintendent at the colliery, are receiving congratulations for the new record. The former record for this breaker made several years ago was 2143 cars.

Wilkes-Barre—A rather important and interesting case is being tried in the courts here, in the case of the Kingston Coal Co. against the Plymouth Coal Co., in which the courts are asked to make permanent a temporary injunction to restrain the Plymouth Coal Co. from stopping its fan at the abandoned Dodson Colliery. The Dodson Colliery adjoins the Gaylord Colliery of the Kingston Coal Co. and the barrier pillar between the two operations has been crushed or punctured at two or three points. Several months ago a suit filed by Plymouth Borough to restrain further mining by the Plymouth Coal Co., in Dodson Colliery, under charge that it would endanger surface property, forced the Dodson to be abandoned. The Kingston Coal Co. charges that the stopping of the fan would be dangerous to employees of the Galyord Colliery and testimony is being taken to determine whether the Dodson Colliery fan will have to be kept in operation, since the mine has been abandoned.

Lansford—The Lehigh Coal & Navigation Co. has suspended operations of the two steam shovels engaged in removing the huge culm banks between Lansford and Coaldale.

Jeansville—A forest fire in the vicinity of the Lehigh Valley Coal Co.'s breaker recently threatened the structure to such an extent that the officials of the concern ordered out all its employees to fight the flames, which were finally gotten under control.

Hazelton—It was recently decided by Judge George Gray, umpire for the Anthracite Conciliation Board, that electricians, electricians' helpers, watchmen, firebosses, stable bosses, engineers and other monthly men in and about the anthracite mines, are entitled to a wage advance of 10 per cent. in accordance with the amended agreement in effect between the operators and their employees since 1912. The contention of the employees of the G. B. Markle Co., who sought pay for brattice work, was not sustained since the complaints were not supported by evidence.

Pottsville—The Kaska William colliery, one of the largest operations in Schuylkill Valley, will resume work shortly. Owing to the dull condition of the coal trade, water was allowed to fill a portion of the workings, but orders have been issued to pump this out. This colliery is leased to the Lehigh Coal & Navigation Co., and during its period of idleness many improvements have been made, including the sinking of a new shaft.

It is reported that the coal mines of the Philadelphia & Reading Coal & Iron Co. will be operated full time until further orders. It is believed that 40,000 men engaged in the 50 collieries and washeries in Schuylkill and Northumberland Counties will have a summer of unusual activity.

Bituminous

Connellsville—The weekly production of coke is now in the vicinity of 285,000 tons as compared with about 200,000 tons for the beginning of January. Present increases are due almost entirely to merchant ovens.

Pittsburgh—River shipments of coal during the month of March have been the smallest for many years, if not for the coal industry. This is due to the low stage of the rivers.

Greensburg—The stable of the Berwind White Coal Co., at Herminie, was recently burned, entailing the loss of considerable live stock. The total loss is estimated at $20,000 and the origin of the fire is undetermined.

Leisenring—A safety first demonstration was recently held by the employees of the Leisenring No. 2 mine of the H. C. Frick Coke Co. This is said to be the first exhibition of its kind ever held in this section, and on account of its success similar demonstrations will be held at various other plants of the company.

Noblestown—The Fayette Coal Co. has closed its mine indefinitely.

WEST VIRGINIA

Huntington—Coal operators who recently returned from Washington where a meeting of coal men from West Virginia was in session for several days predict that a permanent state organization will be perfected in the near future.

Montgomery—It is reported that the mines of the Sunday Creek Co. will resume operation shortly after a shut down of several months. These mines are now under new management, and it is said that orders for Lake trade have been received which will keep all the operations running for some time. About 2000 men will be given employment.

Bluefield—It was reported here recently that the Lake Superior Coal Co., operating a shaft a few miles from Welch, which has been shut down for about two weeks on account of a cave in, would resume work shortly.

Charleston—Plans are being perfected for an extraordinary meeting of coal operators representing every field in West Virginia to be held in Huntington on Apr. 12, for the purpose of a thorough conference on the subject of the coal industry in general and a discussion of means for extending the trade. This meeting will be a sequel to the one recently held in Washington.

It has been announced that the Sunday Creek Coal Co. will make a number of changes in the preparation for market of the product of its mine. The production of the sizes formerly prepared will be discontinued and supplanted by new ones. A number of changes in the tipples, including the installation of new screens, will be made to conform to the new requirements.

According to Chief Mine Inspector Earl Henry, of the Department of Mines, violation of the mining laws of the state has been responsible for many of the recent accidents in the mines. This factor, in connection with elements of danger left to the inexperienced and ignorant, constitutes the greatest source of risk. Attention to detail, therefore, and strict compliance with the law, is suggested as the means of avoiding many accidents.

TENNESSEE

Petros—Large portions of the state's coal holdings at Petros, where the mines are worked by convict labor, are exhausted, according to the report of Dr. L. C. Glenn, of Vanderbilt University, to the chairman of the Tennessee Board of Control. Mine No. 3, he says, has a reasonable expectancy of about 10 years, unless the area of good coal west and northwest of the mine should prove large. The seam now being worked is the only one above drainage suitable for mining by convicts, and this seam in the western part of the property is too thin and too badly broken by partings to be of any value.

KENTUCKY

Lexington—Creditors of the bankrupt Wolf Valley Coal Co., of Roosevelt, Breathitt County, have elected F. B. Rodman, of Mt. Sterling, trustee and the property of the Wolf Trading Co., which conducted the commissary of the mining company, has been ordered sold.

Paducah—Work has begun here at the barge-building plant of the West Kentucky Coal Co. on 40 barges, and 150 men have been put to work. Each of the barges will be 125 ft. long, 26 ft. wide and 8 ft. deep. When completed they will be placed in the river trade of the company.

Wayland—A ruling is looked for before long in the case of Tandy Martin against the Elkhorn Mining Corporation on a demurrer filed by the defendant in the United States District Court at Catlettsburg where a $100,000 damage action is on trial. The action is for damages over alleged rights exercised by the coal company in developing and working its coal operations on land now owned by Mr. Martin. Several years ago, before the Elkhorn & Beaver Valley R.R. was built up Beaver Creek the coal companies bought the coal under most of the land in this section, and in taking deeds from the farmers the purchasers claimed numerous rights which the farmers now contend are inconsistent with the farming rights when the development comes. This is the first operation in Beaver Valley by any coal company and Mr. Martin contends that the coal company has gone beyond its rights, the suit being the outgrowth of the alleged infringements of the plaintiff's rights. Every landowner in the section who has sold his mineral rights is anxiously watching the outcome of the suit and many have volunteered to help defray the costs. If the demurrer should be overruled the case would probably be called for trial at the May term of court.

INDIANA

Vincennes—The Oliphant-Wasson Coal Co. is now shipping from its new Bruceville mine. The quality of coal is high. The plant is equipped to take out 5000 tons a day.

Petersburg—After a month's idleness, the Blackburn mines are preparing to begin operating again.

ILLINOIS

Murphysboro—The dismantling of the Harrison mine of the Big Muddy Coal & Iron Co. means the elimination of washed coal from the Big Muddy District. The washer, however, will clean up the huge pile of screenings, something like 100,000 tons, which were piled up on the ground last fall, and when this is completed, it will also be dismantled.

Benton—It is expected that the first coal will be taken out some time this coming month, from the new mine of the Middle Fork Mining Co. The electrical machinery by which the mine will be operated entirely is practically ready.

Hanaford—The mine at Hanaford recently acquired by a Chicago coal syndicate has been thoroughly reorganized, and put in condition, and will soon be one of the busiest spots in the country. This mine is owned by the John A. Logan Coal Co., and an effort is being made to change the name of the post office to Logan.

Greenville—Seven men are known to have been killed by an explosion of gas in the mine of the Shoal Creek Coal Co., near here, while 10 more are missing. The 7 bodies have been recovered. The explosion occurred 200 ft. underground, and ¼ mile from the main shaft. Only a small portion of the mine was damaged, and to this is attributed the small loss of life.

FOREIGN NEWS

London, England—The committee appointed by the Board of Trade to inquire into the cause for the rise in the retail price of coal for domestic use has recommended that if prices do not return shortly to a reasonable level that the government should consider a plan for assuming control of the output of the collieries during the continuance of the war.

Toronto, Canada—The anticipated trouble between operators and miners in the Crows Nest Pass mining district has been averted. There have been frequent industrial disputes and strikes in this district, and three years ago the Labor Department at Ottawa succeeded in getting an agreement settling all matters in dispute signed by both parties. The agreement expired Mar. 31, and the operators were anxious to reduce wages, while the miners claimed that they should be increased. Eighteen mines and about 6000 miners were involved. A compromise was effected on practically the same basis as the former wage scale, and a new agreement made for a term of two years, which has been duly ratified by the unions.

PERSONALS

George Crankshaw, assistant to Vice-President Ludlow, of the Lehigh Coal & Navigation Co., has been named as successor to Charles Dorrance, who recently resigned as superintendent to go with the Delaware & Hudson Co.

M. L. Trotter, foreman for the Empire Coal Mining Co., Empire, Ky., has resigned his position to take effect at once. It is not known where Mr. Trotter will locate. He is considered one of the foremost mining men in the Kentucky field.

Harry J. Burnett, who for some time has been employed by the Colonial Coal Co., at Dorchester, Va., has severed his connection with that firm, and accepted a position with the Algonquin Coal & Coke Co. at Algonquin as chief engineer. He has already assumed his new duties.

George F. Schwartz, who has been connected with the sales department of the Sunday Creek Co. for 13 years, has been made assistant general sales agent with headquarters in Columbus. Mr. Schwartz started to work for the company Apr. 1, 1902, and his latest promotion came on the 13th anniversary of that event.

John Evancho, a miner of Freeland, Penn., has the distinction of being the first anthracite coal miner to ride to and from his work in his own automobile. He is employed in the Lehigh Valley mine at Eckley, four miles from home. On Sundays he utilizes the machine in taking his family to church and on joy rides after dinner.

Lewis Peterson, aged 72, the oldest employee of the Central Coal & Iron Co., is suffering from a broken leg which he sustained when caught under falling coal. Some time ago he was retired on account of his advanced age but objected to enforced idleness and at his own request was restored to a place on the pay roll.

Paul B. Liebermann, formerly assistant chief engineer of the Sprague Electric Co. has joined the Hyatt Roller Bearing Co. as engineer of tests. In his new position he will have full charge of all tests, both laboratory and field, for the purpose of determining the exact saving to be effected by the adaption of the Hyatt roller bearing to all applications.

George Cochran, of the Cochran Coal Co., has installed a wireless station in his office, the first of its kind in Bessemer, Ala. He uses it more for pleasure than business, although he belongs to the wireless association, and has his call. The station has attracted much attention. It has a range of 350 miles for sending messages, but can catch them at a far greater distance.

OBITUARY

Adrian Bush Cather, late superintendent of the Bowood Mine of the Republic Iron & Steel Co., died at Smithfield, Penn., Apr. 2. He was buried from his home at Flemington, W. Va., Apr. 4. Mr. Cather was well known among a large circle of acquaintances throughout Fayette and Westmoreland Counties to whom his death was unexpected. He stood high in his chosen profession of mining in which he had made a proud record. He is survived by his father, J. B. Cather, a prominent resident of Flemington, his mother, four brothers and two sisters.

Robert L. Martin, 67 years of age, a veteran Connellsville coke operator, died at his farm near Princeton, N. J., Apr. 1. Mr. Martin was born in Philadelphia, coming to the coke regions in the '70s and locating at Fairchance where for some years he was manager of the furnace and coke plants of the Fairchance Iron Co. Later he became interested in the coke business, eventually becoming manager of the Bessemer Coke Co., one of the leading merchant interests of the Connellsville region. He retired as manager of the Bessemer plants when they passed into the control of the Hillman interests, and in 1913 moved to his New Jersey farm. He was of a genial disposition, and had many friends throughout Fayette County, Penn., to whom he was universally known as "Bob" Martin. He is survived by his widow, two sons, and three daughters.

RECENT COAL AND COKE PATENTS

Smoke Consumer. O. A. Schroeder, Lodi, Calif. 1,124,066 Jan. 5, 1915. Filed Oct. 25, 1913. Serial No. 797,273.

Grate Bar. L. G. Van Nostrand, Scranton, Penn. 1,122,338 Dec. 29, 1914. Filed Aug. 1, 1913. Serial No. 782,402.

Coal Loading Device. T. H. Smith, Decatur, Neb. 1,122,546 Dec. 29, 1911. Filed Feb. 24, 1914. Serial No. 820,639.

Furnace Grate. W. C. Armstrong, Springfield, Ohio. 1,124,252 Jan. 12, 1915. Filed May 20, 1912. Serial No. 698,366.

Mining Machine. S. M. Mavor, Glasgow, Scotland. 1,124,159 Jan. 5, 1915. Filed May 12, 1914. Serial No. 838,118.

Dumping Mine Car. C. Layton, Mount Pleasant, Penn. 1,124,147 Jan. 5, 1915. Filed Feb. 24, 1914. Serial No. 820,747.

Method of Handling Coal. G. D. Curtis, New York, N. Y. 1,122,577 Dec. 29, 1914. Filed May 18, 1912. Serial No. 698,089.

Fastening Device for Boxes for Mine Drilling Machines. G. Griffith, Des Moines, Iowa. 1,123,731 Jan. 5, 1915. Filed Mar. 9, 1914. Serial No. 823,360.

Fire Bridge for Marine Boilers. F. J. Blake and R. C. Caldwell, Southampton, England. 1,124,102 Jan. 5, 1915. Filed Apr. 8, 1913. Serial No. 759,727.

Smoke Eliminating and Draft Apparatus for Furnaces. L. W. Pietsch, Post Falls, Idaho. 1,124,513 Jan. 12, 1915. Filed Mar. 25, 1913. Serial No. 756,641.

INDUSTRIAL NEWS

Chicago, Ill.—The Roberts & Schaefer Co. has been awarded a contract by the Oliphant-Wasson Coal Co. of Vincennes, Ind., for equipment for a Marcus patent coal tipple for installation at the mine at Braceville, Ind.

Philadelphia, Penn.—The federal grand jury on Mar. 31 returned three indictments against the Philadelphia & Reading Coal & Iron Co. for violation of the interstate commerce law in connection with coal shipments to and from Philadelphia.

Columbus, Ohio—The general and executive offices of the Hocking Valley Products Co. have been moved from the Harrison Building to a remodeled structure near Town and High St. One entire floor is now occupied, giving additional space.

Denver, Colo.—The Denver office of the Sullivan Machinery Co. announces that following May 1 it will be located at 837 Equitable Bldg., and that it will continue to carry the same stock of repair parts and complete machines at Denver as heretofore.

Youngstown, Ohio—The Republic Iron & Steel Co. recently let a contract to the H. Koppers Co. of Pittsburgh, for 92 byproduct coke ovens to be erected at a cost of one million dollars. The company already has a byproduct plant of 68 ovens in operation.

Columbus, Ohio—The Lorain Coal & Dock Co. has awarded a contract to the Roberts & Schaefer Co. for the designing and building of a large Marcus patent coal tipple of steel construction complete with screening and picking facilities for installation at the mine at Craneco, W. Va. The contract price is $45,000.

Pittsburgh, Penn.—Attorney George H. Calvert was recently appointed in Common Pleas Court, master, to sell the properties of the Pittsburgh-Buffalo Coal Co., which are included in the foreclosure proceedings of the Union Trust Co. Six coal mines of the defendant are to be sold according to the decision of Judge Thomas J. Ford.

Birmingham, Ala.—By Apr. 15 the gates in the $3,750,000 lock (17) in the Warrior River will be placed and barges loaded with coal, lumber, etc., will be plying regularly between Cordova and the Gulf. This will mark the completion of the $12,000,000 job of giving 6 ft. of water all the year round from Sanders Ferry to Mobile.

Grafton, West Va.—Instructions have been issued by officials of the Albright Smokeless Coal Co. to immediately complete the work on the plant of that company started last year. This plant, it is said, will be in operation by May 1. The Kingwood Colliery Co., it is understood, expects to open its mines at Snider near Kingwood shortly.

Buffalo, N. Y.—Secretary of War Garrison has instructed the Delaware, Lackawanna & Western R.R. Co. not to moor Lake vessels at the north pier, where the company's shipping trestle has stood for many years. A request that the company be allowed to move the dock back 60 ft. has been denied. Just how the company is to supply coal to vessels during the coming Lake season is in doubt.

Allison, Penn.—Orders have been received by the Allison plants Nos. 1 and 2 of the Rainey interests near Uniontown, to fire all ovens and the two plants are operating to capacity with something like 300 ovens burning. The No. 2 plant is of recent construction and for some time past only a part of the block of 100 ovens has been burning. The ovens at these two plants are of the square type.

Philadelphia, Penn.—Through its attorneys, the Pennsylvania R.R. Co. on Mar. 31 entered a plea of "not guilty" before Judge Dickinson in the United States Court to two indictments of 5 counts each charging it with the granting of rebates to the Glen-White Coal & Lumber Co. on the transportation of bituminous coal and coke from Kittanning Point, Penn., to points in New Jersey and New York.

Scranton, Penn.—The sinking fund of the Nay Aug Coal Co. was drawn upon recently to satisfy collateral trust notes due this year, and all of the notes thus due were retired. Additional money of the sinking fund was used to redeem some of the 1916 notes although they were not yet due. The total of the obligations thus redeemed amounted to $6000. This coal company has a small colliery on Meade St., Dunmore.
